essayist no doubt points to one principal cause of the attention given to the theories of Schopenhauer and von Hartmann when he says: "In their system the fundamental metaphysical unity seems to be in harmony with the most recent physical conceptions." One may add that the general indifference of trained savants to this philosophy shows this harmony to be rather apparent than real. The editor's account of the history and present condition of philosophy in London deserves to be well pondered by all who have an interest in the welfare of our educational institutions. Prof. Robertson's experience, both as a teacher and as an examiner in philosophy, enables him to criticise with peculiar competence the effects of the system of examinations of the University of London. The results of "the formal divorce of the University from any system of instruction," by the throwing open of its examinations to all comers (in 1858), are said to be as follows:—A full half of the candidates for philosophical examinations now acquire their knowledge by private reading only. As a consequence of this, the average state of preparation of the men is such that the examiners are unable to maintain and enforce the standard of knowledge defined in the excellent scheme of philosophic study marked out by the promoters of the University, and in an eminent degree by the late Mr. Grote. The reading of one or two text-books comes to be regarded as an effective mental discipline.

To the Natural History Museum of the Royal Dublin Society, we gather from a recently-issued Report, have been added some portions of a gigantic cuttle-fish, captured off Boffin Island, Connemara. The animal was observed floating, and on attempting to capture it the fishermen were obliged to cut off its arms, one by one, so that the head and portions of the shorter arms, which measured seventeen feet in length, and the greater part of the long tentacular arms, which measured thirty feet, were all that could be secured. The horny beak, the size of which fully corroborates the account given of the magnitude of the animal, is now exhibited. Three specimens of the recently-discovered gigantic Sea Pen (*Osteocella septentrionalis*), collected during a residence in Vancouver's Island, were presented to this museum by Dr. E. L. Moss, of the new Arctic Expedition.

Natural or Wild Hybrids.—Practical horticulturists have long known how easy it is to obtain hybrid plants by artificial cross-fertilisation. These hybrid forms are frequently sterile, owing to the deficiency either of the male organs or of the female organs, or sometimes, perhaps, of both; but this phenomenon does not appear to be governed by any law, inasmuch as the hybrid offspring of closely allied species may be barren, while the contrary is sometimes the case in the issue of very different species. Until quite recently few botanists have attempted to investigate this important branch of enquiry, though much time and patience have been thrown away in useless, if not fruitless, endeavours to discriminate "critical species." The probability of the existence of natural hybrids in such genera as *Salix*, *Quercus*, &c., has, of course, long been suspected, and certain intermediate forms designated as such; but the study of the origin of wild hybrids is in its infancy. It is a time-consuming subject, requiring inexhaustible patience and scrupulous care, for no form or variety can be accepted as a hybrid until it has been proved to be such by actual experiment. The great extent of seminal variation in a species is abundantly illustrated by several plants in cultivation; and this side of the question should not be lost sight of in tracing the descent of supposed hybrid plants. The principal part of six recent numbers of the *Botanische Zeitung* has been devoted to this subject, and a perusal of those articles gave rise to the preceding remarks, as there appears some danger of ascribing too much to the effects of cross-fertilisation. In Nos. 30 to 33 Mr. J. Schmalhausen contributes some

"Observations on Wild-growing Hybrid Plants," more particularly on the hybrids between *Ranunculus bulbosus* and *R. acris*, between the former and *R. polyanthemus*, and between various species of *Epilobium*, as *palustre*, *roseum*, *hirsutum* and *parviflorum*. From the distinct character—which the author has set forth with great industry—of the parent species of both series of hybrids, some interesting results might be expected, especially as hybrids between some of these species are not infrequent; and so far as Schmalhausen's researches go they are exceedingly interesting. Unfortunately, he gives little absolute information respecting the sterility or otherwise of hybrid plants. The investigations began with germinating seeds or young plants (doubtful in the case of hybrids), and extended to the ripe fruit, through all stages of growth, flowering, and fertilisation. A double plate is given illustrating the roots, flowers, pollen, stigmas, and seeds of some of the parent species and their hybrid offspring. We have not space here to particularise, but we may state that Schmalhausen found, as a rule, that a very large percentage of the pollen of the hybrid plants was imperfectly formed, and the anthers soon shrivelled, and very few seeds were formed. The flowers of the *Epilobium* hybrids were frequently larger than those of the parent species. Tabular views are given of the characters of the parent species and their hybrids. The percentage of imperfectly developed pollen grains in *Ranunculus bulbosus* (mean of nineteen countings) was 25.9; in hybrids between this and *R. polyanthemus* coming nearest to the former, 44.1 (mean of nine countings); in hybrids having more the characters of the latter, 18.7 (mean of sixteen countings); and in *R. polyanthemus* itself, 7.4 per cent. (mean of nine countings). It should be mentioned that *R. bulbosus*, as a rule, does not seed freely. The percentage of shrivelled carpels was in about the same proportion. In the hybrids of both classes the percentage was about 42.9; in *R. bulbosus* 31.8; and in *R. polyanthemus* 8.3. The same writer gives an enumeration of the hybrid and intermediate forms found growing wild in the government of St. Petersburg, in Nos. 33 to 35 of the *Botanische Zeitung*. In addition to the genera already mentioned, the following are some of the principal ones:—*Viola*, *Nymphaea*, *Cirsium*, *Arctium*, *Hieracium*, *Verbasicum*, *Lamium*, *Rumex*, *Salix*, *Carex*, *Alopecurus*, and *Calamagrostis*. It is not to be supposed that the author attempts in all cases to decide which are hybrids and which are mere seminal varieties; but under *Arctium* he says that the numerous fully-developed achenes of a certain form tell against the assumption that it is of hybrid origin; while under *Hieracium* he observes that one can scarcely help thinking that the origin of new species is here the consequence of hybridisation effected by nature. But new species incapable of sexual reproduction would seem to be a retrograde movement. We may add that an article on "Hybrid Primulas," by A. Kerner, appeared a short time ago in the *Oesterreichische Botanische Zeitschrift*; and there are some interesting notes on the forms ("sub-species or hybrids?") of *Pyrus Aria* in the *Report of the Botanical Exchange Club*, reprinted in Trimen's *Journal of Botany* for September, 1875.

PHILOLOGY.

THE new *Bullettino Italiano degli Studi Orientali* has begun well. The six numbers (four issues) as yet published, amounting to 120 pages in octavo, contain much valuable matter, and so far from falling off from the first number, the publication has certainly improved as it has proceeded. The first twelve pages or so of each number are occupied by reviews, generally short, of current Oriental literature. A considerable space is next allotted to notices of manuscripts—a most valuable and almost unique feature in the *Bullettino*, and one which alone makes it worthy of every encouragement. After this division follows

generally "Correspondence," which at present is too scanty. The number ends with Obituaries of Orientalists, and notices of Oriental work now going on in every part of Europe. The principal contributors are the five Oriental professors of the Instituto di Studi Superiori at Florence, Angelo de Gubernatis (the director of the *Bullettino*), David Castelli, Fausto Lasinio, Carlo Puini, and Antelmo Severini (the editorial council). But among the other contributors we notice not only Italians, such as Pizzi, Guidi, and Géza Kuun, but Englishmen—Sayce and Bunnell—and the distinguished Russian archaeologist, Tiesenhausen. It is to be hoped that the cosmopolitan character of the publication may be sustained by a larger number of foreign correspondents and contributors, who should be allowed to write in their own languages, as Prof. Sayce has done in the sixth number of the *Bullettino*. The review certainly promises well; and deserves more subscribers in England than it is to be feared it has at present obtained.

In the *Zeitschrift der Deutschen Morgenländischen Gesellschaft*, vol. xxx., part 2, the Abbé Martin publishes, in Syriac and French, some letters of Jacques de Saroug to the monks of the convent of Mar Bassus, which throw some light upon the religious opinions of the writer, about which there has always been considerable uncertainty. Among the coins of the find of Trebenow, described by Jul. Friedländer and L. Stern, there are few of much importance or rarity. The dirhem of 'Amr ibn el-Leyth, however, is a very remarkable piece; there are also some highly curious Sāmāni dirhems; and examples of the rare dynasties of the Abū-Dāwūdīa, the Benū-Wejīh, and the Khāns of the Wolga. A. H. Sayce refutes Prätorius's assertion that the Assyrian Perfect does not exist. E. Schrader has a paper "On an Assyrian Name of a Beast," to wit, *parī*. Dr. von Niemeyer has picked up from a Sheik's fragment of the Stele of Mesha, which fills up a *lacuna* at the end of the third and fourth lines, and corresponds with and corroborates Nöldeke's conjecture. Jul. Euting publishes a Phœnician mortuary inscription; and Mordtmann continues his "Inedited Himyaritic Inscriptions." There are also papers by Jacobi, Schodde, Spitta, &c.

FINE ART.

L'Art en Alsace-Lorraine. Par René Ménard. (Paris: Delagrave, 1876.)

"NOTRE intention en commençant ce travail," says M. Ménard, "était d'indiquer la nationalité pour laquelle avait opté chacun des artistes dont nous avons à parler," and, he adds with satisfaction, "all without exception, both in Alsace and in the annexed parts of Lorraine, have remained French" (p. 110). This is, M. Ménard thinks, the less surprising as the population of Alsace properly belongs to the Latin race. On this question artistic aptitude furnishes an exact test. If we look at the map, he continues, we shall be easily convinced that the artistic development of modern Europe has been checked by the limits of the Roman empire. The Rhine forms an almost absolute boundary line in artistic geography, and all towns containing celebrated monuments are situated on the Gallo-Roman bank of the river.

A book written with a bias of this sort is necessarily put at a disadvantage with an unprejudiced reader. Alsace-Lorraine, unlike Burgundy and Touraine, has never been an art-centre, has never had any special school; and the impulse which has resulted

in the production of the present work has had a political rather than an artistic origin. M. Ménard, indeed, scarcely so much intends to contribute a chapter to the history of art as to appeal to that sentiment which for the moment invests with popularity everything concerning the two provinces recently retaken from France by Germany; and in order to make this appeal more effective some manipulation of fact is necessary. We must forget, for instance, that Nürnberg is not on the Gallo-Roman side of the Rhine, and in swelling the number of Franco-Alsatian artists we must resort to various expedients. If some are to be claimed as Alsatians who, like Louthembourg, were born but never lived in the district, others are to be put on the list because, though not born in Alsace, they may perhaps have spent a few years of their lives there. Among these last we observe Omacht, a born Würtemburger, set down to the account of Strasbourg, which city he certainly never inhabited, even on M. Ménard's own showing, until he had passed his fortieth year. But a yet more extraordinary instance of the shifts to which an author may be driven who collects facts to "verify his convictions" is to be found in the case of Etienne Delaune. This celebrated goldsmith and engraver was born at Orleans about 1520; the dates of long series of his engravings confirm La Croix du Maine's statement that he lived at Paris, where he had relations, in whose enterprises he was associated; but he was a Huguenot, and twice had to fly for his life. On one of these occasions he went to Augsburg, on another (after the St. Bartholomew) he made a stay of perhaps two years at Strassbourg (then a free city of the German Empire), and on this ground M. Ménard turns Delaune into an Alsatian, and adds "il passa presque toute sa vie à Strasbourg"!

The arrangement of the letter-press is simple and convenient. From the meagre preliminary chapter, on the art of the district before its constitution into provinces, we learn only that the destruction of the monuments left by the Romans has been all but complete; the history is then continued in a brief sketch which carries us down to "Les artistes contemporains." This sketch contains an account, abridged from M. Gérard's *Histoire des artistes de l'Alsace pendant le Moyen-âge*, of the noble *Hortus Deliciarum*, which was chiefly the work of Herrade de Landsberg, Abbess of Hohenbourg. The splendid volume presented one of the most perfect remaining examples of pure Byzantine tradition in miniature; it was destroyed during the siege, and we have no adequate record of its contents. M. Ménard's text is, however, enriched with eleven outline reproductions which had been made from the original designs before the destruction of the book. The list of contemporary artists, in which we find the names of MM. Henner, Bastien le Page, Bernier, and others equally distinguished, is arranged alphabetically, and followed by an article on the architectural monuments and other objects of artistic value to be found in the various towns of Alsace. The same scheme is repeated in treating of Lorraine, which occupies the latter portion of the volume.

The illustrations, which number over three hundred, are admirable. The facsimiles from Callot and Claude, the sketches from modern pictures, the reproductions from antique statuettes, every little touch of illustration, every letter, shows artistic spirit, taste, intelligence, and care. The least successful are perhaps those which deal with modern sculpture: the popular *Jeanne d'Arc* of Clerc looks very heavy and lumbering on p. 407; the forms beneath the draperies are scarcely felt, and the half-crazed expression to which the original owed much of its character has entirely disappeared from the face. This is, however, almost an exception; the greater part are quite remarkable for excellence, and the seventeen beautiful etchings which form the most important series in the volume have a substantive value. Among them may be specially noticed that after *La Vierge aux Roses*, a painting by Martin Schongauer preserved in the sacristy of the church of St. Martin at Colmar. This etching by Gustave Greux presents the finest qualities of French work of the class; it is brilliant, full of colour, and, at the same time, faithfully and delicately interprets the peculiar character of the master. M. Léon Gauchet, to whose conscientious supervision all the illustrations have been submitted, contributes four etchings, of which *Etude d'hiver* after Bernier is, perhaps, the most masterly in its skilful rendering of very slightly gradated tones. M. Lançon's reproduction of Delacroix's *Bataille de Nancy* makes a capital frontispiece, full of spirit, and admirable for breadth and depth of colour.

Regarded simply as a *prachtwerk*, *L'Art en Alsace-Lorraine* attains, it must be confessed, an importance and an excellence to which we in England are not accustomed. It would be indeed vain to look for anything like these illustrations in an English book of similar character, and the text, if not without blemishes, is bright and readable. There are several curious misprints to be noticed of German words. Frahenenthal (p. 94) stands probably for Frankenthal; M. Louis Schneegans, Keeper of the Archives and Librarian to the town of Strasbourg, figures (p. 40) as Schenegans; and who can recognise Rotweil in Rothwell (p. 94)?

E. F. S. PATTISON.

THE RETROSPECTIVE EXHIBITION OF THE "UNION CENTRALE."

Paris: Sept. 1, 1876.

I would gladly have sent you an account before this of the various exhibitions, retrospective and modern, opened in the Palais des Champs Elysées by the Union Centrale; but the catalogues have only been issued to the public within the last few days. Knowing that they were drawn up by competent men, and that they were to contain new documents, I felt it to be only just and prudent to wait. I shall shortly have to speak to you about the exhibition of modern products, which occupies the floor of the nave—that is to say, the entire ground-floor of the Palace. The ceramic work, furniture, jewellery, ordinary metal work, all that constitutes the honour and the fortune of Parisian industry, are well represented. Last week the juries elected jointly by the administration of the Union and by the votes of the exhibitors met under the presidency of M. Paul

Dalloz. They honoured me by electing me for their secretary. This position enables me to furnish you with more authentic information.

The catalogue of objects exhibited in the rooms on the first floor contains the historical monuments, the views of ancient Paris, and the history of tapestry from Louis XIV. to the present time. I must, however, observe that this last, the history of tapestry, is not complete, and that a supplement is announced.

The Archives of the Commission of Historical Monuments have been lent by the Government. They consist of architectural drawings, photographs, and casts. It was in 1830 that the Chambers opened a credit of 80,000 francs upon the budget of 1831, thus associating themselves with the general movement which gave rise to Romanticism, and recognising the character of public interest attaching to a number of civil, religious, and military monuments. M. Vitet was entrusted with the organisation of this work. He made a tour in the departments, and signified to the Minister, in a report worthy of the best times of the first Revolution, the edifices which most urgently needed assistance. Some required restoration, others to be saved from the pickaxes of the destroyers who, under the name of the "Black Band," had formed a vast association to buy the old *châteaux*, and sell the materials and furniture at a low price. In 1833, Vitet was replaced by Mérimée, who, though more popular as a writer, was also an eminent archaeologist. The question was, moreover, one which depended less on science than on common sense and patriotism. The abominable Academic school of architecture under the Empire and the Restoration had thrown contempt upon the Middle Ages and the Renaissance. The epithet "Gothic" was a term of scorn to a degree of which it is impossible to form an idea at present, and remained so until the day when Victor Hugo wrote his *Notre Dame de Paris*, when a whole school of historians took for the subjects of their labours the Carolingian and Merovingian periods, when Lassus became the chief of a group of architects who raised the art of the Restoration by the most delicate conceptions. Mérimée was Inspector-General until 1853. His reports, much admired when they appeared, may still be consulted with advantage. He was very intimate with Viollet le Duc, and this intimacy was useful to both. In 1837 the Chambers raised the credit to 200,000 fr., and the Commission for Historical Monuments was instituted. It was composed of architects, archaeologists, and even eminent amateurs. It brought about the first regular classification of the treasures of our departments, and that classification resulted for the local administrations in the prohibition to carry on any works without preliminary authorisation from the Ministry of Public Works and of Fine Arts. In the majority of cases the restorations carried out by ignorant or unskilled architects have in a far greater degree distorted the physiognomy of the past, and the very nature of church or townhall, than the effects of time or the hand of man. The changes in style and the religious wars have caused immense disasters, but the fatuity of architects who had received a so-called education in Italy; who despised the national genius of their ancestors; who ignored the value of the materials furnished by the soil of their country; who understood nothing of the exigencies of past times, which always appeared to them tainted with barbarism—all these misapprehensions, unhappily not altogether dissipated at present, have caused losses for which the present generation cannot console itself.

The credit for the historical monuments was raised to 800,000 francs by the Republic in 1848. The Empire showed but little interest in it. The last Commission of the Budget had the happy inspiration of asserting its patriotism by raising the sum to 1,360,000 francs. Even this is not much, for the question at stake actually involves the

archives of our history. But this credit is specially applied to those typical monuments which are the most complete expression of one of our ancient schools—of the Ile de France, of Champagne, of Provence, &c.—or which mark the phases of architecture in each of our provinces. Nearly everywhere the local administrations have offered pecuniary assistance.

The architects attached to the Commission are specially directed to devote their labours and studies to the monuments in one particular district. Important economies are thus effected, and the general as well as more special significance of the buildings is better guaranteed. To this system France owes her more skilful builders, and workmen worthy of those ancient corporations the violent abolition of which has been so prejudicial to all professions. The drawings executed on the spot by our architects are very different in point of interest from the useless and costly projects of restoration which the pupils of the Villa Médicis send from Italy every year. These materials for a general history of French art in all our provinces will be published some day. At the present moment they comprise, in the Archives of the Ministry of Public Instruction and Fine Arts, 7,000 drawings, 3,000 engravings, 4,500 photographs, and 1,200 works on architecture, some ancient, some modern.

In 1867, the Ministry exhibited a certain number of these drawings, often worked up and coloured by men of the greatest talent. This time a much larger number have been lent. They are classed in the catalogue under 351 numbers. The principal divisions are as follows:—Monuments called Celtic: lines of Carnac. Roman dominion in Gaul: the amphitheatres of Nîmes, of Arles; the theatres of Orange and Arles; Pont du Gard; the triumphal arches of Orange, of Langres, of Saintes, &c.

Religious architecture: Schools of the Ile de France, Burgundy, Poitou, Saintonge, Périgord, Auvergne, Languedoc, Provence, Picardy, Normandy, Brittany. Do all these subdivisions answer to changes of style, to very different methods of construction? Evidently not. The architect was a wandering artist, invited here or there according to his reputation, and who brought his own plans. But one feels that in times when the provincial life was intact, he would meet almost everywhere with masons, with master-smiths, with carpenters, carvers of images, who themselves also had had practical, traditional instruction. This diversity engendered the peculiar savour, unknown in our day, of the local schools. The interest of this exhibition consists in the clearness with which we can compare at one glance these divers styles, and receive a durable impression of them. The drawings represent crypts, cathedrals, churches, towers, abbeys, chapels, synodal halls, doors of monasteries, the famous *puits de Moïse* at Dijon, cloisters, convents, sepulchral monuments, tombs, crosses, rood-lofts, and the two famous Calvaries of Pleyben, of Plougastel and Saint Thégonnec in Brittany.

Among the military architecture we find the "Remparts de la Cité de Carcassonne," which have been restored by Viollet le Duc; the "Palais des Papes" at Avignon; castles, towers, fortifications, forts, the Abbey of Mont Saint Michel, dungeons, the Castle of Pierrefonds, the famous Tour de Montlhéry, on the road from Orleans to Paris, &c. Among civil architecture we are presented with the Hôtels de Ville of Orleans, Compiègne, &c., the belfry of Calais, the Palaces of the Dukes of Burgundy at Dijon, and the Dukes of Lorraine at Nancy, several castles—among others that of Amboise—as also hôtels, hospices, old houses at Orleans, Troyes, &c.; the ancient cemetery of Marfort l'Amaury, in imitation of the Campi Santi of Italy, &c.

Lastly come the monuments of Algeria, and some mural paintings and mosaics; then the plaster-casts and impressions. Every number of the catalogue is accompanied by an historical

account of the origin and style of the drawing exhibited. In the rooms which follow one another, a number of drawings and paintings have been arranged under the title of "Picturesque Documents referring to the History of Paris." They are grouped in topographical order: the right bank of the Seine, the Pont Neuf and the islands, and the left bank. They are plans, general views, or details which escape notice in a mere analysis, and would demand a special article. But this would be wanting in real interest because it could not be accompanied by explanatory plates. There are drawings from all parts and of all times. I have no doubt that this exhibition extracted a mass of useful documents from private sources. It was promoted by a very learned and intelligent man, of a modest and independent character. During the last years of the Empire he had formed a collection of maps, drawings, engravings, printed works relating to Paris and its history, analogous to M. Bonnardot's collection. When the library of the town had been destroyed in the fire at the Hôtel de Ville, M. Jules Cousin (it is to him I allude) offered the gift of his library and collection. They were gratefully accepted, and installed in the Hôtel Carnavalet, formerly Madame de Sévigné's, in the so-called Marais Quartier. M. Jules Cousin was appointed guardian over them. He performs his functions with a devotion and a disinterestedness which his modesty would certainly reproach me for making public, if by some unforeseen chance these lines were to come under his notice. He devotes his salary, and perhaps even more, to the improvement of this rich library. He has thus acquired general esteem and sympathy, and the Municipal Council of Paris testify to this by always readily meeting his modest demands for funds. I would draw the attention of English writers to him, in case of their requiring information about the history of Paris, not merely in political matters, but more especially in the smallest details as to topography, manners, *fêtes*, theatres, monuments, streets, &c., &c.

Very little space remains for me to speak to you of the ancient and modern tapestries belonging to the State, exhibited by the Conservation de Mobilier Général, and by the manufactories of Gobelins and Beauvais. There are no less than 252 pieces of all dimensions hanging upon the walls. Some are very beautiful, but the interest they excite is above all historical; they form the materials for a history which is barely sketched out. The most curious thing is to see that the tapestry was fabricated, even up to a late period, at a number of different places, and always by tapestry-workers from Flanders. With regard to this I would draw your attention to a pamphlet in octavo, published by A. Aubry, under the title of *Une manufacture de tapisseries de haute lisse, à Gisors, sous le règne de Louis XIV. Documents inédits sur cette fabrique et sur celle de Beauvais*, by Baron Charles Davillier. This pamphlet is adorned with the photograph taken from the portrait of Louis XIV. executed in tapestry, at Gisors, and lent to the Union Centrale by that town. I must also mention two other extremely important pamphlets, one of them extracted from the *Bulletin de l'Union Centrale*, and entitled *Notices sur les manufactures italiennes de tapisserie du XV. et du XVI. siècles*, by Eugène Müntz; the other, *La tapisserie à Rome au XV. siècle*. M. Eugène Müntz, who had been sent on a mission to Italy by the Government of the Republic, drew the material for the greater number of these precious documents from the State Archives preserved in the convent of Campo Marzo. This is but a cursory view of the labours of the young scholar; already one feels how interesting it is for critical purposes to see the Flemish tapestry-workers bringing their style to Florence, Ferrara, Siena, Genoa, Mantua, Correggio, &c. PH. BURTY.

NEW FRAGMENTS OF THE FRIEZE OF THE MAUSOLEUM.

SOME years ago I was shown in the courtyard of a Turkish house at Rhodes two small fragments of reliefs, which I at once recognised as belonging to the principal frieze of the Mausoleum. After long delay I have at length obtained these two fragments, and on comparing them with the remains of the Mausoleum found at Budrum I had the satisfaction of uniting each of the Rhodian fragments with one of the many stray pieces of the frieze which are preserved in the British Museum. This new combination gives us the greater part of a wounded Amazon who is in the act of falling, and the upper part of a Greek warrior armed with a shield, who is moving to the right. These two figures do not appear to be connected with each other. During this recent re-examination of the Museum fragments, I made another curious discovery. There is in the Imperial Museum at Constantinople part of an Amazon in relief, which I long ago recognised as a figure from the frieze of the Mausoleum, and of which a photograph is given in my *Travels and Discoveries in the Levant*. Of this Amazon the British Museum possesses a plaster cast, to the fractured surface of which a fragment of left thigh and leg found by me on the site of the Mausoleum has just been adjusted. We have, therefore, now absolute proof that the two Rhodian fragments and the Constantinople fragment came from the Mausoleum. The Turkish house where I saw the two Rhodian fragments had been one of the ordinary houses built by the Knights of St. John within their fortress. It is, therefore, to be presumed that some knight brought these two fragments from Budrum some time in the fifteenth century.

It is well known that a fine slab of the Mausoleum frieze was discovered in a palace at Genoa belonging to the Marchese Serra, from whom it was purchased some years ago by the trustees of the British Museum. I have always supposed that this slab was taken to Italy by some Knight of St. John for the decoration of his house. This new discovery at Rhodes awakens the hope that more fragments of the sculptures of the Mausoleum may have been brought to Europe in the fifteenth century, and that they may yet exist built into the walls of Italian villas and palaces.

C. T. NEWTON.

THE NATIONAL ART LIBRARY.

AMONG the rare and valuable works purchased for the National Art Library at South Kensington during the past year are included:—Vandyck, *Icones Principum, Virorum Doctorum, Pictorum*, &c., 100 plates, folio, 1641; Manni, *Osservazioni istoriche, sopra i Sigilli antichi de' Secoli Bassi*, 30 vols., 4to., 1739–86; Dreux du Radier, *L'Europe illustrée*, with portraits, 6 vols.; *La Sainte Bible, ornée de 300 figures* (after Marillier), 12 vols., 8vo., 1789; Douglas, *Nenia Britannica*, coloured plates, folio, 1793, a fine copy; Daryl, *Comic Prints of Characters, Caricatures, Macaronies*, &c., folio, 1778; Hogenberg, *Représentation de la Cavalcade*, &c., à l'occasion du Couronnement de Charles V., plates reproduced in fac-simile, folio, 1875; Jaime, *Musée de la Caricature*, 2 vols., 4to., Paris, 1838; *Iconographie des Contemporains*, 2 vols., folio, 202 portraits, Paris, 1832; Prout, *Fac-similes of Sketches made in Flanders and Germany*, folio, 1833.

Additions have also been made to the classes of early typography, and of book ornament and illustration. Among them may be mentioned an early and rare edition of Aesop's *Fables*, printed at Augsburg in the fifteenth century, illustrated with woodcuts, folio; *Le Roman de la Rose*, Gothic letter, small 4to., Paris, Vêrard (1490), the curious woodcuts of which aid in illustrating early ivory carvings; Voragine, *Legenda Aurea, oder Hist. Lombardica, Holländisch*, folio, Delf, 1499–1500, large woodcuts; Flemish Bible, folio,

Antwerp, 1542, woodcuts and initial letters; *Heures à l'Usage de Rome* . . . nouvellement imprimées à Paris pour Guillaume Godar, &c., 16mo., Paris, 1503, large woodcuts and borders; *Icones Mortis sexaginta imaginibus, &c., insigniæ*, 8vo., Nürnberg, 1647.

To the collection of rare lace-pattern books have been added:—Vinciolo, *Les Singuliers et Nouveaux Pourtraicts pour toutes sortes d'Ouvrages de Lingerie*, sm. 4to., Lyon, 1592; *Nuovo Invenzione di diverse Mostre Così di Punto in aere come d'Rettilcelli, &c.*, obl. 4to., Venetia, 1596; *Maneggi di Ponte Fiamengo, &c.*, obl. 4to. (no date); *Corona di Mostre bellissime, &c.*, obl. 4to. (no date); *Livre Nouveau, dict. Patrons de Lingerie, &c.*, on les Vend à Lys, chez Pierre de Sainte Lucie, &c., 8vo., Lyon (no date).

To the series—very valuable to students of ornament—of the works of the "Little Masters" of the German school in the sixteenth century additions have been made; examples also have been acquired of Aldegrever, Beham, Pencz, De Laune, Gribelin, and others.

The collection of engraved national portraits has been augmented by about 100 works, some of them of considerable interest and importance; the Director reports that the value of these works has so greatly increased within a very recent period as to render their acquisition difficult, without more liberal means of purchase than exist at present.

The number of photographs added to the collection during the past year has been 1517. Among these are a series of 135 fac-similes of original drawings by old masters, existing in the collection of the Royal Academy of Fine Arts at Venice, presented by the Baroness Meyer de Rothschild; fifty-four photographs from rare engravings of ornament by the early German masters in the British Museum, presented by Mr. Cundall; a collection of 250 photographs of various objects of art, armour, ornamental metal, works, &c., in the Museum of Art Industry, at Milan, received in exchange from the authorities of that Museum; a remarkable series of 131 large photographs of tapestries in the Royal Palace, at Madrid; ninety photographs of casts of ornamental details in the Royal Architectural Museum, Westminster: forty-five photographs of the results of explorations recently undertaken in the city of Paris, received in exchange from the Préfet de la Seine; twenty-three photographs of art objects preserved in the Metropolitan Museum of Art, New York; nine large photographs of the Triumph of Julius Caesar, taken from the original cartoons by Mantegna, at Hampton Court; sixty-three photographs of ancient Indian sculpture, and other antiquities, obtained through the Madras School of Art; &c.

Mr. Poynter states that an attempt has been made to increase by purchase the series of British oil-paintings of which Mr. Sheepshank's gift was the foundation. The British pictures belonging to the National Gallery having been lately removed to Trafalgar Square, the South Kensington Museum is left without any adequate representation of some of the greatest masters of the English school. The limited amount of the vote for this purpose, however, precludes the possibility of any rapid progress being made in this direction.

NOTES AND NEWS.

WE understand that the Council of the Arundel Society will, early in November, appoint a secretary in place of the late Mr. F. W. Maynard, who held also the office of secretary to the Artists' General Benevolent Institution.

ON the 24th ult., in the eighty-sixth year of his age, died Joseph Marryat, author of the *History of Pottery and Porcelain*. With the exception of the scientific treatise of Brongniart, this was the first work that gave an extended account of the various manufactures, and excited public interest in the subject, and though the increased knowledge of the ceramic art has called forth numerous monographs

on its several branches, yet Mr. Marryat's work still retains its popularity, as the best general history that has been written of pottery and porcelain.

OFFICIAL notification has been received that six medals have been awarded to artists in water-colours, and twenty-three in oils, at the Philadelphia Exhibition. Among the artists will be found the names of Mr. Luke Fildes, Mr. Holl, and Mr. Jopling.

THE Report of the Science and Art Department of the Committee of Council on Education for the year 1875 has just been issued. It records that the number of pupils receiving instruction in the Art Schools connected with South Kensington amounted to 449,690, showing an increase on the previous year of 108,430, or more than 27 per cent. The attendance at the Art and Educational Libraries of the South Kensington Museum also continues to increase.

THE National Gallery of Hungary at Buda-Pest is not one that has acquired much fame among the great collections of Europe. It is even stigmatised in Baedeker as "mediocre," but recently the old Esterhazy collection, which was formerly exhibited separately, has been added to it, so that it now really includes a good many first-class works, especially of the Netherlands schools. Several of these have lately been reproduced in etching by William Unger, and are published as a series called *Die Landes-Gemäldesgalerie zu Buda-Pest*. Unger's etchings are almost sure to be good and faithful to the originals, so that we have here an excellent means of becoming acquainted with this little-known gallery without the necessity of a visit to Buda-Pest. They are published by the Society for *Vervielfältigende Kunst*.

THE nineteenth part of E. A. Seemann's important publication, *Kunst und Künstler des Mittelalters und der Neuzeit*, is now ready. It contains a comprehensive history of Andrea Mantegna, by Dr. Alfred Woltmann, illustrated with numerous woodcuts. No. 16 of this publication was devoted to Fra Bartolomeo and Andrea del Sarto, whose lives were written by H. Luecke and H. Janitschek; while Nos. 18 and 19 dealt with the landscape, sea, and animal painters of the Netherlands in the seventeenth century.

Two of the celebrated art-workers of Nürnberg in the fifteenth century are having honour paid them in their native town by the reproduction of their works. Herr Schrag, the Nürnberg bookseller, announces a large work to be brought out in twelve parts upon *Adam Kraft and his School*, with sixty illustrations from his sculptured works in Nürnberg and its neighbourhood. The text is by Fr. Wanderer, Professor of the Royal School of Art in Nürnberg, and will appear in German, French, and English. The same publisher also announces a series of photographic reproductions of the works of the wood-carver Veit Stoss, with letter-press by R. Bergau, to appear in three quarto parts containing eight sheets each.

THE veteran German sculptor Ernest von Bandel died last week at Donauwerth. He will long be remembered as the devoted sculptor of the great national monument to Hermann, or Arminius, which was inaugurated last year with so much patriotic enthusiasm.

THE Antwerp Society for the Encouragement of the Fine Arts, under whose auspices the annual Salons of Antwerp are organised, has lately drawn upon itself much ridicule and criticism by an unusual access of modesty, by virtue of which almost all the nude subjects presented to it for exhibition this year have been rejected. Unfortunately, it has not been consistent in its rejections, for it has admitted M. Garnier's *Supplée des Adultères*, a picture which provoked indignant criticism even at the French Salon this year, where there certainly was no thought of excluding the nude. By what code of virtue this particular picture was accepted and others of simpler nudity re-

jected it is difficult to say. The Antwerp painter of most note at the present exhibition is M. Van Beers, who contributes two large historical works representing the *Funeral of Charles the Good* and *The Death of Jacob van Artevelde*, and a remarkable painting of a line of railway, with a signalman signalling the passage of a train. M. Van Beers is a young artist who has acquired great celebrity at Antwerp, and will soon, it is predicted, make himself known beyond the limits of that city. Another young Belgian artist whose works are noteworthy at the Antwerp Salon is M. de Brackeleer, the nephew of Leys, and who has been to some extent formed under his influence. His style, however, has considerable originality, and his subjects are drawn from a lower class of life than Leys usually depicted. He especially delights in Flemish peasant interiors, with strong contrasts of light and shade, such as Rembrandt and some other of the great Dutch masters loved to deal with. *The Interior of the Atelier*, by M. Munkacsy, is also a work that has called forth great admiration, particularly from the artistic public. There are likewise many excellent examples of landscape in the Antwerp Salon, Belgian artists having as great a predilection as English for this branch of art. They generally choose, however, different effects, and snowy landscapes and grey twilights prevail at Antwerp instead of the bright green fields and full sunlight of our English exhibitions. The French contributions are numerous, but by no means remarkable, and many of the works exhibited made their *début* at the French Salon, and so have already had their share of notice.

AN exhaustive monograph on the Potteries of Delft, giving the result of careful researches into the archives of Delft, the Hague, and the State archives of Holland, many of which have yielded results of the highest importance, will shortly be published by M. Henry Havard.

AN appreciative article on "Old" Crome is contributed by Mr. Frederick Wedmore to last week's *L'Art*. Unfortunately it is not illustrated. A reproduction of one of Crome's charming etchings would have had great interest for lovers of his art.

THE Archaeological Congress of France, under the direction of the Société Française d'Archéologie, held its forty-third session last week at Arles, in the Hôtel de Ville. Numerous pleasant excursions were made by the members into the country round Arles.

THE new arrangement of the Renaissance Galleries in the Louvre necessitated by the setting up of the great gates of Cremona is now complete, and they will be opened immediately to the public. M. Barbet de Jouy, who has been entrusted with the redistribution of the various monuments and sculptures, has accomplished his work, it is said, most satisfactorily, and has at the same time prepared a supplement to the catalogue of the Sculpture of the Middle Ages and the Renaissance, which includes all the new acquisitions. These, according to the *Chronique*, are so numerous and important that "quite a surprise is in store for the public" with regard to them.

PROF. FR. MERKEL contributes to the current number of the *Zeitschrift für bildende Kunst* an article on the anatomy of the group of the *Laokoon*, in which he gives measurements of the normal height of boys and young men at different ages, and finds that the proportions of the sons of Laokoon do not agree. From this and other indications he considers the sons to have been represented as children, and not, as most critics suppose, as striplings advancing towards manhood. J. A. Wolff finishes his interesting study of the painters Johann Joest and Johann Stephan von Calcar, and gives us some romantic details of the life of the latter master, who, it seems, only escaped being murdered in some horrible thieves' den in Dordrecht by fleeing with the compassionate daughter of the house, with whom

according to official documents, he was still living in Venice in 1536, some years after the misadventure. Adolf Rosenberg also concludes in this number his long series of articles on the "Activity in Building in Berlin." Unfortunately, he is obliged to admit that his hopes of a development of architectural beauty and fitness in the buildings of Berlin have been disappointed, and that at the moment when he ends his study of the subject, the "building activity of Berlin, regarded from an artistic point of view, is in a state of complete stagnation."

THE Athens correspondent of the *Allgemeine Zeitung* reports that a marble figure of great beauty was lately discovered near Mitylene by workmen engaged in excavating the rock at Vunarak. This statue, which represents a female figure, double life-size, has unfortunately undergone considerable injury, and the head and arms are more especially mutilated, but enough remains to show that it came from the hand of a master. The statue has been claimed by the Governor of the island as national property, and will speedily be transferred to the Archaeological Museum at Athens.

THE excavations at Olympia were partially resumed in the middle of last month, but they cannot be prosecuted with full vigour till after the termination of the harvest. Dr. Hirschfeld and the Greek Commissioner, Dimitriades, are still engaged in making the arrangements necessary for their winter campaign, preparatory to the arrival of Prof. Curtius, who is expected to reach Greece before the middle of October, when he will assume the direction of this season's operations at Olympia.

THE STAGE.

"JANE SHORE" AT THE PRINCESS'S.

MR. W. G. WILLS'S *Jane Shore* has been brought to London by Miss Heath, who has been representing the heroine in this play for many months past in provincial towns. It is now being performed nightly at the Princess's Theatre before audiences who appear greatly to enjoy its rather melodramatic situations and its picturesque views of London streets and interiors in the time of Edward IV. Rowe's play of *Jane Shore* was, perhaps, the most successful historical drama of the last century, although its favour with managers and leading actresses seems to have outlasted its power to please. It was indeed a rather doleful production, written in blank verse, which its author fondly imagined to be in "Shakspeare's style." Some dramatic passages there certainly are in Rowe's play, besides situations which could not fail, if fairly acted, to excite and to awaken compassion. But a sort of funereal gloom pervades it, inasmuch that its revival in these times would be a step requiring on the part of a manager more than ordinary courage. Yet it has been performed at theatres in the suburbs within a very few years past, and the time is even not remote when Rowe's *Jane Shore*, by way of introductory piece to the Christmas pantomime at one of the "patent" houses, was an infiction only to be escaped on condition of submitting to the still more drowsy and melancholy influences of Lillo's *George Barnwell*. Folk were prone to believe that the object of this subjection of audiences to an exhausting penance was simply that of so depressing the spirits of pit and gallery that the dullest of pantomimes following immediately thereupon would be certain to be hailed as a welcome relief. But that could hardly be; for these mournful specimens of the *lever de rideau* were invariably performed amidst such uproar that the whole proceedings on the stage were reduced to inexplicable dumb show. The truth is that these pieces had, oddly enough, acquired a sort of reputation for holding up an awful example to vice and encouraging penitence boys and servant girls

at holiday time to persevere in the exercise of all Christian virtues. Their performance, therefore, was a cheap concession to employers and the graver class of the community, who have ever looked with a cold eye upon the entertainments of the stage. Mr. Wills's verse is encumbered with familiar imagery, and does not attain the level of his *Charles I.*, which contains many fine passages. Nor is his picture of the sorrows of the Royal favourite less depressing than that of the old play. His drama, however, has the advantage of greater variety of scene and generally of a picturesque air which is wanting in Rowe's work. Its most striking defect is its want of harmony of treatment and of definite purpose. Rowe's heroine is an abject penitent whose sufferings at last win the sympathy of her husband; and the tragic interest of the story is deepened by the fact that the succour extended to her by the man she has injured brings down upon him ruin and destruction. In the modern play the lady is also represented as sorrowful and contrite; but her speeches and actions convey rather the impression that she regards herself as a martyr to undeserved persecution. A repentance, moreover, which does not manifest itself till the death of her paramour, and which thereupon leads her at once to seek the shelter of her husband's roof, is necessarily open to some suspicion. Mr. Wills follows Rowe in representing Jane's husband as relieving her necessities in spite of the Duke of Gloucester's interdiction, but in deference, we presume, to the prejudices of modern playgoers, he provides for her a happy ending of her troubles in the manner of Kotzebue's *Stranger*. It is unfortunate for the play that Miss Heath performs the part of the heroine with so restless a tendency to attitudes and gestures; still more that she adopts so artificial a style of declamation. Little, indeed, could be justly said in favour of the acting of *Jane Shore* at the Princess's.

"PERIL" AT THE PRINCE OF WALES'S.

THE shortcomings of the gentlemen who have been entrusted with the work of adapting M. Sardou's *Nos Intimes* for performance at the Prince of Wales's Theatre do not arise so much from the attempt to transfer their story to English ground as from their tendency to overlook the spirit and purpose of that amusing production. An inappropriate name may easily be forgiven in the presence of substantial merits, and it is in itself a matter of little importance; but in this instance there is a significance in the choice of the title of the English piece which can hardly escape the attention of anyone who has witnessed the admirable performance of M. Sardou's work by M^{me}. Fargueil, M. Delaunoy, M. Parade, and their supporters. What sort of "peril" is referred to by these adapters, who choose to conceal their identity under the playful pseudonyms of Mr. Bolton Rowe and Mr. Saville Rowe, will be easily inferred. It is that peril at the hands of an unscrupulous admirer with which M^{me}. Fargueil, not without occasional damage to the furniture of her boudoir, was wont to wrestle with an energy and adroitness that always moved her audience to a high pitch of enthusiasm. It may be assumed that the slight amount of risk which adapters must necessarily run who decide upon converting that rather exciting incident into a scene in an English comedy did not enter into their calculations, for in the English piece attention is specially directed to this feature, as if it constituted the essence of the story, or the source of what moral, or what phase of social life, was intended to be set forth. It is evident, indeed, that to Messrs. Bolton Rowe and Saville Rowe, the comedy of *Nos Intimes* commended itself as leading to what is technically known as a powerful situation, in which Mrs. Kendal would find abundant opportunity for displaying her talents as an actress, and for awakening an anxious interest in the fate of so handsome and pleasing a heroine. That the expectations of the authors

in this respect were in great degree fulfilled must be acknowledged. The boudoir scene in *Peril*, albeit acted with a moderation to which the more uncompromising spirit of French audiences does not limit M^{me}. Fargueil and her stage lover, could hardly fail to absorb the attention of the audience, and to keep them in that sort of suspense which finds relief at last in enthusiastic plaudits. When by a *ruse* the too-pressing admirer is induced to step out on the balcony, and is then dexterously prevented from re-entering, it is equally clear that the authors are not likely to have been under any mistake as to the reception that awaited this clever stage-surprise. All this, however, is really only incidental to the purpose of M. Sardou's production. French managers, it is true, take care to give as much reality as possible to this celebrated scene; and this was unquestionably the author's intention. They would certainly choose for the lover, if the strength of their company would permit, a *jeune premier* of a more or less commanding aspect: for "peril" here arises more from the display of physical power on the part of the gentleman than from the ardent nature of his declarations. Hence they would not willingly make the mistake of entrusting this part to so boyish-looking a young gentleman as Mr. Sugden, who, though he acts in the Prince of Wales's version with spirit and with good taste and careful attention to the little details of the stage, appears throughout the business to be far less likely to carry off the comely wife of Sir George Ormond than he is to be taken out and soundly whipped by the direction of that lady. Yet, for all this, M. Sardou clearly had no intention either of reading a lesson to sentimental wives or of giving a warning to husbands too simple minded or too much preoccupied in the pursuit of a hobby to keep an eye upon matters that concern them within their own households. On the contrary, he treats this incident in a spirit of mirth, and has no sooner allowed its due impression to be made than he proceeds to efface it by that predilection for humorous and whimsical incidents which is characteristic of the comedy. *Nos Intimes* is simply a satire upon false friendship. As a picture of life it is not more open to objection than other famous comedies—the *School for Scandal*, for example—in which for the sake of effect a particular human failing is brought into a degree of prominence that in every-day affairs it could hardly be conceived to assume. M. Sardou's hero is M. Caussade, a good-natured gentleman who, having made a fortune in commerce or on the Bourse, supplements his Paris life with the attractions of a villa in the pleasant neighbourhood of Ville d'Avray, where he keeps open house for friends and acquaintances, and seeks to win them by his hospitality, and to inspire them with something of his own passion for agriculture and gardening. The result is in every case disappointing; but this M. Caussade, in his easy-going way, is slow to perceive. A peevish, selfish, exacting guest, named Marécat, who grumbles at the choice of his bedroom, and at the alleged annoyances of country life, brings with him his son, who is believed by the fond parent to be an exemplary youth, but is, in fact, a remarkable example of early depravity. With Marécat, who is apparently a well-to-do person, the author contrasts another guest and his wife, who are poor relations of the host, and who accept his hospitality eagerly while sneering at his ostentation, and regarding his very kindness as a cruel reminder of their less prosperous condition. No less amusing than these persons is an energetic military Algerine, calling himself Abdallah, who partakes of the enjoyments of the villa in a jovial blustering way, and nearly involves its proprietor in a duel about a matter in which he is no wise concerned, before it is discovered that he is only in the villa by reason of his having mistaken M. Caussade for a gentleman of the same name. By way of climax, the young gentleman guest, who is sheltered because suffering from an accident, and who,

being nursed by Madame Caussade, requites the kindness he receives from all in the house by making love to that lady. In contrast to these there is an eccentric, good-tempered, meddling family doctor, who takes a warm interest in the household, partly out of regard for M. Caussade—who, however, regards him with little favour—and partly because he is in love with Mme. Caussade's step-daughter. The function of the doctor in the piece somewhat resembles that of the experienced bustling, middle-aged lady who, in so many French comedies, contrives to look so charming and to do so much to protect the youthful heroine from the consequences of her own indiscretion; for it is he who administers reproofs to the false friends, and who, discovering the secret of the tender relations between Mme. Caussade and her young admirer, is ever at hand to baffle the young gentleman's schemes, to rescue the lady from painful embarrassments, and finally to remove the cause of the danger while leaving M. Caussade in happy ignorance of the grave aspect which affairs had been permitted to assume.

This story Messrs. Rowe have dealt with in the customary way of English adapters; the *cottage orné* at Ville d'Avray becomes Ormond Court in some English county, while the lucky stockbroker is converted into Sir George Ormond, Baronet. Marécot becomes Sir Woodbine Grafton, a testy old Indian officer with a diseased liver, and other characters undergo like transformations. This fancy for changing localities and persons cannot at least be attributed in the present instance to a common motive—a desire to conceal the source of the adapters' appropriations—and it may be excused in some degree by the natural preference in the minds of English playgoers for a comedy dealing, or purporting to deal, with English life and manners. But the modifications introduced have been attended with damage to the play, which is the more to be regretted because there seems to be no reason why false friends and selfish parasites should not be found in an English house as much as in a French one. Imperfect sympathy with the spirit of the comedy, in fact, seems to have had more to do with this result than any inherent difficulty in the task. If the adapters, for example, had been as mindful of the vein of satire which runs throughout as they have been careful to give importance to Lady Ormond's incipient intrigue, they could hardly have fallen into the error of converting the good-natured *parvenu* stockbroker into the English gentleman of old family, whose ancient mansion furnishes the two scenes to which the action is now confined. It is obviously not the country gentleman but the successful City man whose wealth, tending naturally to assume an appearance of ostentation, excites the envy and malicious gossip of old acquaintances. The guests in *Nos Intimes* are fond of referring to the partiality of fortune which has enabled their friend to grow rich before them; but nothing of this kind can apply to Sir George Ormond. The conversion of the mean and selfish Marécot into the Anglo-Indian Sir Woodbine Grafton is not to be atoned for even by Mr. Arthur Cecil's admirably-finished portrait of that arbitrary and testy old gentleman; for the personage has no place in M. Sardou's story. From these and similar causes the comedy of *Peril* presents throughout that indefinable air of insincerity which is rarely altogether wanting in adaptations of this class. Mr. Kendal, under the influence of some unhappy misconception, converts the lively, eccentric medical man, with his rattling tongue and inspiring gaiety and self-confidence, into a rather wearisomely didactic and serious personage, whose influence over all around him is not easily to be explained. It is hardly the fault of Mr. Bancroft that he cuts a somewhat humiliating figure in the character of Sir George Ormond. In these matters a very slight difference in position or in relation with other personages is apt to make a vast difference. The audience cannot help feel-

ing that Ormond Court, which adorns its breakfast-room with suits of mediæval armour, must have existed sufficiently long to get rid of ill-bred and impertinent guests, who might, on the other hand, be accepted readily enough as early associates of the *parvenu* stockbroker, meeting him in the character of owner of a picturesque villa and a newly-purchased estate. In the original play M. Caussade creates much unnecessary alarm by discharging his gun outside at a moment when he is erroneously supposed to be suffering the pangs of jealous despair; and he is able, or at least M. Beauvallet and M. Parade in this part were able, without much sacrifice of self-respect to appear immediately afterwards bearing in their hands a fox, whose depredations among their poultry had previously been referred to. In the English piece the fox becomes for obvious reasons a hare, which is a slightly less dignified animal; but the truth is that to carry off the trivial character of this incident required the full tide of gaiety which runs through the original play. The thin, tremulous tones by which Mr. Bancroft is accustomed to indicate strong inward emotion failed to excite sympathy with Sir George's distress at the first hints of his wife's supposed improprieties; but this may be explained by the lack of reality in the situation and the tendency of the adaptation to present him in a ridiculous light.

The two scenes which have been provided for the comedy by Messrs. Gordon and Harford and the gentlemen who are accredited in the play-bill with "the upholstery work" are even more elaborate and sumptuous than past efforts in this way under Mrs. Bancroft's management. Lady Ormond's boudoir is hung from the centre of the ceiling to the surrounding cornice with valuable lace, and the panels are decorated with paintings of birds in gold and colours. The more remarkable of the two scenes, however, is the hall on which the curtain rises, with its wide oak chimney, its armour, steep oak staircase and gallery, and its endless exhibition of *bric-à-brac* and nick-nackeries. The revelation of all this profusion of ornament and display of eccentric luxury was the signal on Saturday evening for enthusiastic applause; but it should be borne in mind that scenes in a play are to be commended rather for their fitness than for the pains and expense bestowed upon them. The time and the means at the disposal of the dramatist for producing his effects are so limited that nothing on the stage is really desirable which tends to make an unnecessary demand on the attention of the spectator. But so striking and unusual an exhibition as the hall of Ormond Court is apt to engender a feeling that there must be some hidden relevancy—some necessary indication of the character of the owner, or his surroundings, or something suggestive of the tenor of the story, in such laborious accumulation of details. No such fitness, however, is to be discovered in the eccentric furnishing of Sir George's residence. If there is anything necessary to be insisted on for the ready apprehension of the authors' theme, it is that the owner of the house loves his garden so much and is so preoccupied with his choice flowers and rare plants that he pays little heed to aught else, and is hardly capable of doubting that visitors will share in his enthusiasm. Hence M. Sardou's play opens very properly in a conservatory visibly communicating with gravel paths and ornamental flower-beds. There is obviously no such appropriateness in the interior referred to. In like manner the excessive luxury of Lady Ormond's apartments, no less than her magnificent costumes, tends rather to justify the envious complaints of overpowering ostentation made by the poor visitors in humble black than to enlist the sympathies of the audience in favour of the good-natured host and against envious detractors and disturbers of his peace. Many points in the performance won applause; and, though the humours of the guests are greatly curtailed, much laughter was occasioned. But interest in the story was not sustained; nor is it to be expected that *Peril*

will rival the past successes of this prosperous theatre.
MOY THOMAS.

THE Olympic Theatre has reopened with a revival of Mr. John Brougham and M. Fechter's version of *Le Bossu*, which has been slightly modified, and is now called *The Duke's Device*, instead of *The Duke's Motto*. The change of title does not seem judicious, because a motto can signify nothing else than a motto, whereas a "device" conveys no definite meaning to those who do not happen to know the play. This is, however, of little importance. *The Duke's Device* is a strong and picturesque melodrama, the improbabilities of which will not be much objected to by those who have a robust appetite for the entertainments of the stage, while the part of the hunchback hero is admirably suited to the vivacity and breadth of Mr. Henry Neville's style of acting. The play is fairly acted, and put upon the stage with care.

THE management of the Gaiety have withdrawn Mr. Byron's comedy *The Bull by the Horns*, after so short a run that the recent complaint of Mr. Hollingshead of somebody who had prophesied that its career would prove less enduring than that of *Our Boys*, by the same author, is necessarily deprived of any force it may have had a fortnight ago. This is, however, immaterial. Audiences at the Gaiety are clearly gainers by the substitution of Mr. Byron's amusing comic drama *Not such a Fool as he Looks*, in which the author performs, as before, the part of Sir Simon Simple.

MRS. JOHN WOOD will reopen the St. James's Theatre on the 14th inst. with an eccentric comedy, in four acts, entitled *Three Millions of Money*, which may be guessed to be a version of *Les Trente Millions de Gladiator*.

MISS LYDIA THOMPSON and her company will return to the Charing Cross, henceforth to be known as the Folly Theatre, on the 16th inst., when a version of *Martin Chuzzlewit* will be produced under the title of *Pecksniff*; to be followed by a revival of the extravaganza entitled *Blue Beard*.

Rome Vaincue, the new tragedy at the Théâtre Français, is a remarkable achievement for a man who is more Greek and more Italian than French. M. Parodi has chosen, however, to cultivate French literature, and having, as the fashion is, made a first appearance with ambitious work at the Matinées Balande, he has knocked at the doors of the Théâtre Français, and they have been opened to him. He has added a piece to the French stage; hardly perhaps a work to literature. The action of his piece takes place in the time of Hannibal, and has much in common with the *libretto* of Spontini's *Vestale*. What there is of newest in the conception is the character of the grandmother, who rather than that her grandchild shall suffer the conventional punishment of a lonely death by hunger—the punishment of love where love is forbidden—stabs her with her own hand. And the two characters most remembered by the playgoer, in a drama of which the earlier acts tax the attention very sorely, are those of girl and grandmother. The girl is played by a *débutante* from Brussels, who calls herself Mdle. Adelaide Dudley; but she has nothing English about her but her assumed name. Apart from certain faults of diction which Belgium is answerable for, she is already a capable actress of such a part as she now plays; she is a handsome blonde, more gifted in looks than in voice. The grandmother is played by Mdle. Sarah Bernhardt, and the part is her first assumption of a character so "much more elder" than her years. We shall not lengthily describe her performance, as she has been so often (and so recently) written about in this journal. We happen, indeed, to have been among the first to predict a success at that time little believed in. She is now praised everywhere; and this last performance is already most praised of all. The part

is by no means wholly terrible, or she could hardly succeed in it so completely as she does. Before the sombre despair of the fifth act there is the magnificent pleading of the fourth—the pleading of grandmother for girl—one of those famous recitals, too, on which the French dramatist and the French actor vaunt themselves, and this Mdle. Sarah Bernhardt accomplishes with extraordinary pathos and an amazing variety of power, subversive of the lately popular doctrine that she had “one note only, though it was a charming one.” Mounet-Sully has often quitted himself better than as the slave in *Rome Vaincue*, and there is nothing that the dignified and excellent Maubant does in this tragedy which he has not done as well before. Finally, Mdle. Reichenberg has much to look and little to do, and these conditions are both of them very much in her favour.

THE new little piece at the Gymnase, called *Andrette*, has made no mark, and it is difficult to account for its production on any other theory than that M. Montigny wished to bring out something new, but thought it was too early in the season to bring out something good.

Les Deux Orphelines, so enormously successful at the Porte Saint-Martin and in London, is finding favour at the Théâtre du Mont Parnasse, where it has just been revived.

MUSIC.

WAGNER'S “FLYING DUTCHMAN” AT THE LYCEUM.

BY the production of an English version of *Der Fliegende Holländer* at the Lyceum Theatre last Tuesday evening, Mr. Carl Rosa has fulfilled what is in many respects the most important of the promises of his prospectus. The work had, it is true, been previously heard in England: it was brought out in 1870 at Her Majesty's Opera, under the management of Mr. Wood; but it was only played two or three times at the close of a season, and has not been since repeated. There is, moreover, at the present time, so much more general knowledge on the subject of Wagner, and so much greater interest felt in his music than was the case six years ago, that I was by no means surprised to learn, on arriving at the theatre, that there was not a seat to be had in any part of the house.

The story of the *Flying Dutchman* is so generally familiar that it will be needless to dwell upon it in any detail. Suffice it to say that the three acts of the opera, as laid out by Wagner, show us, the first the ill-fated hero, the second his meeting with the maiden (Senta) who is to redeem him from the curse resting upon him, and the third the self-sacrifice of Senta and the consequent salvation of the Dutchman. For the episodic incidents of the drama, readers may be referred to the libretto itself.

The *Flying Dutchman* was first produced at Dresden, under the direction of the composer himself, in 1843; and after a recent visit to Bayreuth it was most interesting to compare and contrast the Wagner of thirty years ago with the Wagner of the present day. At first sight it would seem as if two works could hardly be more unlike than *Der Fliegende Holländer* and *Der Ring des Nibelungen*. In the former we find abundance of concerted music, in the latter scarcely any: in the former the various numbers of the work are mostly detached, and we find airs, duets, and choruses, much as in an opera of Mozart's; while in the latter, one piece runs on continuously into another throughout an entire act, and, in the *Rheingold*, throughout a whole drama: in the former the melody is of the conventional form, with a very large predominance of four-bar rhythms; in the latter we find the “unendliche melodie” so difficult, nay, often so impossible, to separate into its component parts. And yet, with all these important differences, no one who is tolerably familiar with Wagner's music can fail

to perceive that in the earlier work are to be seen the germs of every one of those innovations which make the Bayreuth tetralogy so different from everything that has preceded it. True, the composer has not carried out his own theories to their logical issue; he has in more than one number made concessions to public taste which now he would certainly repudiate: such, for example, as the double cadenza at the end of the slow movement of the great duet between Senta and the Dutchman in the second act, or the occasional repetitions of the text for the sake of musical rather than dramatic effect. But we see here throughout the work an early instance of Wagner's masterly employment of “Leitmotive,” of which the opera contains several; we meet with examples of his strikingly novel and abrupt harmonic transitions—such as the remarkable modulation from A major to G minor in Senta's ballad (act ii.)—nay more, we find passages in which purely musical beauty is sacrificed for the sake of dramatic appropriateness. Such is especially the case in the Dutchman's first song, “How oft i' th' ocean's deepest gloom.” Yet, on the whole, the difference of style between *The Flying Dutchman* and *Lohengrin* is even greater than that between *Lohengrin* and the *Ring des Nibelungen*.

If there were any present in the Lyceum on Tuesday evening who still believed the often refuted but hardly less often repeated calumny that Wagner cannot write melody, they must, if capable of appreciating melody at all, have been considerably astonished. The work absolutely abounds in “pretty tunes.” In the first act, the second subject of the overture, the Steersman's song, and the whole duet between Daland and the Dutchman; in the second act, the celebrated spinning-chorus, Senta's ballad, and the final duet; and in the third act, the Sailors' chorus, and Erik's song, “Is that fair day no more by thee remembered,” are overflowing with melody; and many other pieces might be named which, though less popular in style, and perhaps less attractive, are hardly inferior in real beauty. A curious and interesting point with regard to the melody is the coincidence in rhythm between the chief subjects in the great duet between Senta and the Dutchman in the second act, and those in the duet between Elsa and Lohengrin in the third act of *Lohengrin*. As there is very little resemblance between the dramatic situations, this coincidence is probably due to the fact that the poetry of both scenes is written in the same metre—the decasyllabic verse.

In one respect, the healthy influence of Wagner on our audiences is unmistakeable. It was most gratifying to observe how every attempt at applause in the middle of an act was resolutely hushed down. Even Mr. Santley, on making his first appearance in the work, had to forego the customary tribute. There was, indeed, an attempt made to interrupt the performance, but it was immediately suppressed in an energetic manner by the majority of the audience. That the silence did not arise from indifference was clearly proved on the fall of the curtain; and we may feel sure that Mr. Santley is far too genuine an artist not to rejoice at finding himself thus ignored for the sake of the work, while the opera was actually in progress.

A few words will suffice to speak of the performance, though a column would hardly do more than justice to Mr. Rosa's exertions in presenting so difficult a work in so thoroughly satisfactory a manner. The part of the Dutchman was splendidly sung and acted by Mr. Santley; while Mdle. Torriani, as Senta, could hardly have been surpassed. The part is one of her best, which is no mean praise. Mr. Packard was very satisfactory as Erik; but Mr. A. Stevens, as Daland, seemed scarcely to possess a sufficiently powerful voice for the part, being in places over-weighted both by the orchestra and by those who were singing with him. The small parts of Mary and the Steersman were excellently given by Miss

Lucy Franklein and Mr. J. W. Turner. The orchestra was, as it always is, perfection, and the chorus singing was most admirable, especial praise being due to the elaborate double choruses which open the third act. The whole performance was one reflecting the highest possible credit on Mr. Rosa.

CRYSTAL PALACE CONCERTS.

LAST Saturday the new musical season may be said to have been inaugurated by the resumption of the winter concerts at the Crystal Palace. These excellent entertainments have so long since taken the first place among our musical enjoyments, and are so universally appreciated at their true value, that it is needless to say one word about their merits. That the attendance last Saturday was but thin was no doubt owing to the miserable weather. None but genuine enthusiasts would travel down to Sydenham in such rain as fell during the whole morning. The esteem in which Mr. Manns is held by the visitors and subscribers to these concerts was shown by the prolonged applause with which he was greeted on taking his place at his desk—applause as hearty as it was well-deserved.

True to the traditions of past seasons, the first concert opened with a work from an English pen—the late Sterndale Bennett's overture to the *Merry Wives of Windsor*. This unpublished work of its lamented composer was produced at the Philharmonic concerts last season; but the present was its first performance at the Crystal Palace. The overture, which is an early work of Bennett's (having been written in 1834 while he was studying at the Royal Academy) is a composition of much beauty, and very remarkable as the production of a lad of eighteen. The connexion of the music with the title is by no means very apparent.

The second novelty on Saturday was a piano-forte concerto, in F sharp minor, by Hans von Bronsart, a pianist of repute in Germany, and a pupil of Liszt's. The work shows the hand of a thorough musician, but is distinguished by cleverness rather than by inspiration. The first *allegro*, though the subjects are not uninteresting, produces as a whole the effect of heaviness; the scoring is in places too thick, and much that is really ingenious, and looks very well on paper, does not come out clearly in performance. The slow movement is charming, and very delicately orchestrated, a part for a solo violoncello (admirably played by Mr. Robert Reed) being an important feature of the music. The finale is extremely brilliant, and the most popular of the three movements, but the least individual in style. Though hardly a work of genius, the concerto was quite interesting enough to deserve a hearing. The solo part was very finely played by Mr. Fritz Hartvigson, one of our best resident pianists. Mr. Hartvigson possesses not only enormous execution but true musical feeling, and combines the greatest fire and force with (where required) the utmost delicacy. Later in the afternoon he was heard, without orchestra, in one of Liszt's “Hungarian Rhapsodies,” in which he created even more effect than in the concerto.

The symphony of this concert was Beethoven's No. 7 in A, which was given by the band with such charming finish as to warrant the prediction that the orchestral playing this season will be just as delightfully perfect as hitherto. Yet another novelty concluded this most excellent concert—an “Intermezzo and Carnival,” from a suite by M. Guiraud, a French composer, whose opera *Piccolino* is at present very successful in Paris. For the “Intermezzo” I did not greatly care; the “Carnaval” is a most ingenious movement, full of pleasing melody, and charmingly scored.

The vocalists were Mdme. Sinico-Campobello, and Signor Campobello, who happily gave us a much better selection of pieces than has occasionally been heard at these concerts. The lady

sang Mendelssohn's *scena* "Infelice," and Mozart's "Deh vieni, non tardar," from *Figaro*; her husband brought forward "Rolling in foaming billows" from the *Creation*, and the two joined in the duet "Sorge la notte" from the *Puritani*.

This afternoon a programme of special interest is announced, including, among other items, Wagner's "Philadelphia" March, and the Funeral March from the *Götterdämmerung*.

EBENEZER PROUT.

WE regret to announce the death, on the 26th ult., of Dr. E. F. Rimbault, in the sixty-first year of his age. For many years Dr. Rimbault held a very high position as a musical antiquarian. He was one of the Council of the Musical Antiquarian Society, and himself edited some of the more important of its publications. He was also a member of the English Handel Society, which only discontinued its labours on the formation of a similar society in Germany. His works on the piano-forte and on the organ (the latter written in conjunction with Mr. E. J. Hopkins) have long since taken a place as standard authorities. Dr. Rimbault was also an energetic collector of music, and is said to have left behind him a most valuable library, especially rich in old and scarce books on music. He also published a large quantity of arrangements for the piano, organ, and harmonium.

NEXT Thursday afternoon Mdme. Arabella Goddard will make her reappearance in public, after an absence of four years, at the first of two recitals which she announces at St. James's Hall.

MR. W. REEVES, of Fleet Street, has forwarded to our office the Calendar for the academical year 1876-7 of Trinity College, London. Most of our readers will probably be aware that this college, formerly known as the "Church Choral Society and College of Church Music," has for its object the advancement of Church music and the improvement of musicians, not only in matters relating to the exercise of their profession, but in their general education. For this purpose evening classes have been established, at which, in addition to musical subjects, instruction is given in classics, mathematics, English composition and literature, natural science, and the French and German languages. Musicians are, we are happy to believe, becoming increasingly awake to the importance of a good general education, and Trinity College is doing admirable work in assisting its members in this direction. The Calendar gives complete information as to the arrangements of the college, the examinations, free scholarships, &c.; and it will be found useful by all who may be desirous of becoming members.

At the Hoftheater in Hanover two new operas are intended to be produced—*Edda*, by Carl Reinthaler, and *Jery und Bätely*, by Ingeborg von Bronsart, the wife of Hans von Bronsart, whose concerto is noticed in another column.

BOIELDIEU's *Caliph of Bagdad* has been revived with success at Frankfort-on-Main.

THE King of the Belgians has founded at the Brussels Conservatoire two scholarships for singers, of the value of 1,200 francs each, for which both male and female pupils are eligible.

THE theatre at Barmen, which was burnt down on November 25 of last year, has been already rebuilt, and was to be opened on Sunday last with a performance of Mozart's *Figaro*.

THE prospectus of the Glasgow Choral Union for the coming season, which has just been issued, shows no falling off in the enterprise previously exhibited by that excellent institution. Though the last two seasons have resulted in a financial loss, the directors have wisely resolved to try again. Such high-class concerts as those given by the Union require time to make good their footing; with perseverance, there can be no doubt of

their ultimate success. During the winter three choral and six orchestral concerts will be given, the former being conducted by Mr. H. A. Lambeth, and the latter by Mr. Arthur Sullivan. The chief works announced for performance are *St. Paul*, Gade's *Zion*, Gounod's *Gallia*, Rossini's *Stabat Mater*, and the *Messiah*; Beethoven's symphonies in C minor and F (No. 8), Mendelssohn's "Scotch" symphony, Raff's "Lenore," Schumann's symphony in C, Spohr's "Weihe der Töne," and overtures and miscellaneous pieces by Adam, Auber, Bach, J. F. Barnett, Beethoven, Cherubini, Gade, Gounod, Guiraud, Massenot, Mendelssohn, Meyerbeer, Nicolai, H. Reber, Rietz, Rossini, Rubinstein, Saint Saens, Schubert, Spohr, Sullivan, Wagner, and Weber. The orchestra, led by Mr. Carrodus, will consist of about fifty performers, the list including many London professors of eminence.

LITERATURE.

Turkistan: Notes of a Journey in Russian Turkistan, Khokand, Bukhara, and Kuldja. By Eugene Schuyler, Phil. Dr., &c. With Three Maps and Numerous Illustrations. In Two Volumes. (London: Sampson Low & Co., 1876.)

SAMARKAND, Bukhara, and Khokand were places of mysterious renown not many years ago, associated with feats of the most courageous, enterprising travel, and with visions of unfortunate Englishmen and Russians devoured by ticks in deep dungeons, or led out to torture and execution. That period of Central Asiatic travel may be said to have ended with Dr. Joseph Wolff's extraordinary journey to Bukhara in order to discover the fate of Stoddart and Connolly; and then came a long interregnum when nobody went to Central Asia, and it passed very much out of sight. News of Russian conquests and Vambéry's famous travels again brought that region before the public, and of late years we have had a good many books of travel relating to it. Of these by far the most important are the two elaborate and richly-illustrated volumes now before us, by the gentleman who has just attained a world-wide celebrity as the American Consul-General at Constantinople, who went lately to report on the Bulgarian atrocities. His journey in Central Asia was made in 1873, when he was Secretary of Legation at St. Petersburg, and ran from the Aral Sea along the valley of the Syr Darya to Tashkent, the headquarters of Russian dominion in Turkistan. From thence he visited Khokand, Samarkand, and Bukhara, and then bisected Eastern Turkistan, going as far as Kuldja, which is close to Mongolia, to Chinese territory, and to the dominions of the Yarkand ruler. This latter part of his journey presents the most of novelty; but it is as a general account of Turkistan, and of the Russian position there, that this work has the most importance; and though most unusual opportunities were given him for enquiring into the condition of Turkistan, that has not prevented him from commenting in the severest manner on the conduct of the Russians.

Mr. Schuyler's work will convince the most fastidious that he is very far from being a sensational writer, either in a low or in a high sense. His work is perfectly free from the strained efforts of sensational newspapers and novelties, nor does it indicate those pictorial powers of genius which never mislead a really great mind, but which sometimes afford a convenient pretext for

raising the cry of "exaggeration." On the contrary, throughout these volumes the author is remarkably sober-minded, critical and painstaking. He does, indeed, present us with a good deal of information which must rest on very slender authority; but he is careful, in making such statements, to insert such words as "it is said." His style is never particularly graphic or forcible, but it is always exceedingly clear, and he manages, without any apparent art or effort, to present an intelligible, interesting, and tolerably vivid reproduction of what he saw and learned in Central Asia. Considering the strangeness and roughness of his matter, and the vast amount and variety of detail which he presents, his work is a decided literary success, and even the general reader will have no difficulty in getting through its 800 pages. The chief cause of this success is evidently a shrewd, practical, official mind, possessing great power of both collecting and arranging information; but along with this our author writes clear nervous English, and some of his unpretentious descriptions, as that of Tashkent, for instance, are models of their kind.

Mr. Schuyler's well-known linguistic capacity, his knowledge of Russian, and the ease with which he picked up enough of the dialects of Central Asia to serve a traveller's purpose, have been of essential service to him; and he has not failed to make himself acquainted with, and to turn to good use, the large mass of European, and especially Russian, literature relating to his subject; but it is apparent that in one important respect he was not well prepared for a journey in Asia. More acquaintance with Mohammedanism and with the results of European scholarship in regard to the East generally could scarcely have failed to make his work a more interesting and valuable one than it really is, and it may easily be seen that here is his weak point, though the natural *aplomb* of an American, and the shrewdness of a man of the world, have usually prevented him from falling into egregious mistakes, or even often committing himself seriously when he was on unfamiliar ground. No one well acquainted with Mohammedanism would seriously remark in regard to a Takhti-Suleiman, or "Solomon's Throne," so common in many various parts of the East, that "probably, this Solomon was some local saint or hero, who has become confounded with the Jewish king." Neither would he write of the "*pir*, or leader," of a religious community, because *pir* simply means a saint: the *pir* of such a community is not necessarily its leader, for he may be dead or otherwise inaccessible, and the word belongs to the alphabet of Central Asiatic theology. But the errors of this kind are wonderfully few as well as insignificant, and our cause for regret on this head lies more in some of Mr. Schuyler's more general remarks, and in what he has not said rather than in what he has. For instance, in discussing the existence of Asiatic customs in Russia, and of Asiatic words in the Russian language, he entirely overlooks the fact that the Russian language and the Slav dialects of Southern Europe approach more nearly to the Sanskrit than do any other of

the languages of Europe, and that in the people speaking these languages we have the latest Aryan, and possibly Indo-Aryan, emigration into Europe. The Russian word for fire, *agoun*, is a simple but very crucial illustration of the proofs for this conclusion. The existence of "Eastern words" in Russian is by far too vague a ground on which to argue that the "Mongols or Tartars" have exercised a great influence on Russian customs and language. No doubt they have; but the subject cannot be treated of in anything like a satisfactory way except by those who are competent to enter into the larger subject of the relations of Russian words and customs to those of the earlier Aryans.

We should also like to know why a gypsy race in Central Asia which bear the name of Jiutchi "are probably Kafirs from Kafiristan." If that were true, they would be exceedingly interesting as illustrating the ethnology of the hitherto unvisited Kafirs; but the name Jiutchi would seem to point rather to a connexion with the Jats of the Indus valley, who have long been recognised as the congeners of the European gypsies.

A still more important point in Mr. Schuyler's book on which we desiderate further information is the formidable accusations which he brings against Russian conquest in Central Asia in general, and against General Kaufmann in particular. His courage is to be admired in his fearless exposure of what he saw, and his reports of what he heard; but there is another side to this kind of literature. Everyone who has had experience of a camp knows what "shaves" mean; and connected with every movement of a large force, or the civil arrangements of a newly-conquered district, there are always some weak or shady characters who, in their disappointment, have stupendous stories to tell, and are able to put a pessimist gloss on everything which has been done at the headquarters where they were not sufficiently appreciated. It is well that the knowledge of such observers should be taken into account; but a rapid traveller is hardly in a position to estimate the value of their statements, and, while they themselves remain in an obscure background, he is not always warranted in presenting such statements to the world. It is hardly the duty of a diplomatist to act the otherwise useful part of an able newspaper reporter. The concluding chapter of this work is defective in indicating the sources of much of Mr. Schuyler's information, and, therefore, can hardly be admitted as yet as an altogether trustworthy contribution to contemporary history. To a certain extent its statements are supported by reference to official documents; but even there much is unsatisfactory. We have an account of the character of the expedition against the Yomuds by a certain "Mr. Gromof," without the slightest indication as to who Mr. Gromof is, or as to how far his statements may be relied on. And when we come to a great variety of statements as to duplicity, mean motives, and dishonourable conduct, the critic can only observe that all this may be quite true, but no indication is given of any sufficient grounds for believing it, and that it is not very likely that Mr. Schuyler's hasty journey afforded

him sufficient opportunity of distinguishing between trustworthy information on the one hand and camp gossip, along with the statements and insinuations of *mauvais sujets*, on the other. However, he does quote an order of General Kaufmann's which appears to show that the General ordered the destruction of a whole tribe and of their families; and the Russians will be none the worse for having their conduct in Central Asia reported upon by a clever American. So long as they reserve that part of the world as sacred for military officialdom, they have no reason to complain even if they should be misrepresented.

If Mr. Schuyler, previous to his journey, had paid a visit to India, he would have seen that some weaknesses which he points out in Russian rule in Central Asia belong not so much to Russian character as to human nature, and especially to official and military nature. We have noticed something in Simla very like this in Tashkent: "Should the Governor-General be seen shaking a person warmly by the hand, or conversing with him for five or ten minutes, the man so honoured immediately becomes a figure in society." After all, this does not count for much. The quidnuncs are always on the look out for a new celebrity, and if a Governor-General acts wisely he will spend ten minutes, or ten hours, in talking where talking justifies itself.

It is more important to notice that common human nature leads to one of the most natural as well as one of the most dangerous of our mistakes in India, though in India it attaches itself not so much to individuals as to the Government in general. In almost every district there is some shrewd native who has learned to speak Russian, who has succeeded in ingratiating himself with the officials, and *uses them for the purpose of oppressing the natives, and making the fortunes of individuals*. It is interesting to notice that the Russians, with all their military aristocracy, have fallen into this snare. A good deal of this sort of thing goes on in India; but it is no doubt worse in Central Asia, owing to the impecuniosity of the Russian officers and their relations to the people.

Mr. Schuyler's observations on the position of the Russians in regard to India, and to Asia in general, will be read with interest, but they do not add very much to our knowledge of that subject, for it is not altogether news that Russian policy in Central Asia has been perhaps more confused, contradictory, and hand-to-mouth than even that of England in India. Most sensible people, too, will not require much persuasion to lead them to admit that the Russian advance in Central Asia has not been a thing planned, or even desired, at St. Petersburg, but has been forced upon the Czar piecemeal by the ambition of Russian officers and the difficulty of maintaining peace with warlike semi-savage tribes. But this does not render the Russian position there a less threatening one. Moreover, there is a distinct danger in the fact that the Central Asiatic provinces do not pay, and cause a large yearly deficit. Mr. Schuyler suggests that the best way of meeting this would be to colonise Central Asia with the thrifty Chinese, but such an

expedient is not likely to be approved of in Russia. The occupation of these non-revenue-paying provinces is exceedingly likely to lead the Russians on to the revenue-paying provinces beyond—that is to say, to India or to China, but in all probability to China.

ANDREW WILSON.

A Popular History of France, from the earliest Period to the Death of Louis XIV. By Elizabeth Sewell. (London: Longmans & Co., 1876.)

THE time is not yet very long past when a historical work, especially an elementary and popular work, was scarcely anything but an endless series of names, dates, and facts arranged in regular succession, in which the actions of kings and princes, and battles lost or gained, played the principal part. Now, however, our conception is changed. We ask of the historian, not to load our memory with facts and dates, but to recall the dead past to life, to give us a vivid, animated, and truthful picture of the times that are no more. We require him to make us live the life of our forefathers; to initiate us into their ideas, their beliefs, their passions; to disclose to us all the motives, good or evil, on which they acted; to reveal to us their virtues and vices, their joys and sorrows. We require him to depict the condition of the poor and lowly, of the people, of the masses, as well as that of kings, princes, and the great; and we thus say of the historian, what used to be said only of the poet, that he must be a painter.

Even in the case, not of a long and detailed history, as complete as it can be made, but of a summary, an elementary book, the object of which is to narrate briefly in one short volume the history of a whole people, we require the author not to confine himself to a simple record of dry and lifeless facts, but to present to us a picture addressing the imagination as much as the memory, and enabling us to understand what were at various periods the manners, the intellectual condition, the character, the tendencies of the nation which is the subject of his work.

Such then is the end which the author of this *Popular History of France* has kept in view, and this end she seems to us to have attained. Drawing her inspiration from Michelet, from Duruy, from Bonnechose,* and other authorities, she has composed an attractive story, which, while easy reading, is fully adequate to instruct the readers for whom it is intended, and to prepare for more complete studies those who wish for a minute acquaintance with a special period of French

* The author has fallen into a slight mistake in her preface (p. vi.). She attributes a History of France which she has consulted to the Cardinal de Bonnechose. We believe that she is in error, and that this History is not by the Cardinal, who, to the best of our knowledge, wrote nothing on the subject. But an elder brother of the Cardinal, M. Emile de Bonnechose, now deceased, left an elementary History of France which is very widely circulated. M. E. de Bonnechose was a highly distinguished writer, but instead of being a Cardinal he belonged to the Protestant Church, and his numerous writings (*Les Réformateurs avant la Réforme, L'Histoire de France, &c., &c.*) bear the stamp of the religious and liberal spirit of Protestantism.

history. Eight maps of the country at various dates, genealogical tables of the various Houses which have reigned in France, and a very complete alphabetical index, which greatly facilitates the student's researches, combine to make the book a very convenient manual, which will doubtless have the success it deserves.

The composition of such a book needs much art, and also really scientific knowledge; the author possesses both qualifications, and has acquainted herself with the most recent works. For instance, her account of the St. Bartholomew appears to us very accurate. It is well known to what long controversies the dark events of that night of blood have given rise. At the present day the responsibility seems to be justly divided between the guilty parties, and the memory of Charles IX. is cleared to some extent at the expense of that of his mother and the Guises. Of this the author seems to have a very distinct perception.

A book like hers has to contend with many kinds of difficulties. Intended for all classes of readers, young girls included, the author is forced to pass lightly over many facts, which, shameful and ignoble as they may be, have often exercised a great influence over the destinies of a people. Louis XIV. cannot be understood without La Vallière, Montespan, and Maintenon; but this side of his history is too perilous ground to allow the author to give it as much prominence as historical reality would demand. There is here no ground for complaint or astonishment; but we are inclined to find fault with our author for a too constant inclination to take a lenient view. She does not seem to us sufficiently severe towards Henry III., one of the most infamous princes known to history. Nor does she blame as severely as it deserves the abjuration of Henry IV.; certainly she brings out the fatal consequences which that act of hypocrisy brought in its train, from the moral and religious point of view: but there is yet more to be said. The abjuration of the Béarnais was the most useless of treasons; it did not hasten by a single day the submission of his enemies; had he remained a Huguenot he would have reigned all the same, and his reign would perhaps have founded a more durable state of things. On this point we cannot agree with Miss Sewell, who seems to believe that but for his abjuration Henry IV. would have remained Henri de Béarn; but clearly this is one of those problems which will always remain open to discussion. On the other hand, the judgment passed by the author on Louis XIV. appears to us to be just and perfectly well founded.

The narrative ends with the death of the "Grand Roi." The author in her preface promises to continue it to our own days if her volume meets with a favourable reception from the public. Its reception has been favourable; and we sincerely trust that the promise may be kept.

ETIENNE COQUEREL.

M. LEMERRE will very shortly issue in a luxurious form a little collection of poems by M. François Coppée—about three hundred lines in all.

The Complete Poems of Sir John Davies.
Edited, with Memorial Introduction and
Notes, by the Rev. Alexander B. Grosart.
Two Vols. (London; Chatto & Windus,
1876.)

SIR JOHN DAVIES has always been a favourite with poets, but his works are little known except by repute to the ordinary readers of poetry. Mr. Grosart is therefore to be congratulated upon the publication of his elegant edition, and we trust that the circle of readers of this true poet will be greatly enlarged thereby.

Mr. Grosart is so thorough an admirer of his author that none of the praise that has been lavished upon the fine poem *Nosce Teipsum* is strong enough for him. He will allow of no reservations, and Hallam's criticism is treated as inadequate, and Dr. George Macdonald's remarks as superficial. In all this Mr. Grosart seems to have been misled by his own high appreciation of the poem into a misapprehension of the public taste. Sir John Davies's position as an author has long ago been settled, and, although this edition will gain him new readers, we cannot agree "that he has not yet gathered half his destined renown." At all events until the day arrives when this prophecy is fulfilled the wording of the dedication to Mr. Gladstone will appear highly inappropriate. Mr. Grosart writes that "in common with all Great Britain and Europe and America," he recognises in the ex-premier the equal of Sir John Davies "in nearly every department wherein the elder distinguished himself." In other words, many nations recognise "England's foremost living name" as the equal of a man of whom most of them never heard, and who, in spite of his greatness, was certainly not "the foremost name" of his own age. Some excuse for Mr. Grosart's unmeasured praise of his author may be found in the uncompromising industry which induced him to "read and re-read every page, sentence, and word" of the work by Nemesius on the Nature of Man, and Wither's dreary translation of the same, in order to refute the charge made by Alexander Dalrymple, "the great hydrographer," that *Nosce Teipsum* was chiefly drawn from a forgotten author.

Our poet must not be confused with several other authors who bore the same Christian- and sur-names, three of whom also seem to have worn the knightly title. Our John Davies, whose name has been spelt at least seven different ways, was born at his father's house of Chisgrove, Wilts, apparently in 1569, as on April 16 of that year he was baptised in the parish church of Tisbury. He was entered on the books of the Middle Temple in 1587, and took his degree of B.A. in 1590. In 1593 his poem *Orchestra* was licensed to John Harrison, and in 1595 he was called to the bar. At this period he seems to have lived a ruffling, roaring life, and in 1598 he was disbarred and expelled from the Middle Temple for an aggravated assault upon Richard Martin, who two years previously had been his "owne-selves better halfe." After this sudden annihilation of his prospects, he retired to Oxford, turned sober and wrote his *Nosce Teipsum*. He soon afterwards

obtained the favour of Elizabeth, made his mark in the world, and in 1601 was reinstated in his position at the bar by a parliament of the Middle Temple. On the accession of James I. his great work in Ireland was commenced. In November, 1603, he was appointed Solicitor-General for Ireland, and in the following month was knighted. Three years afterwards he was promoted to the Attorney-Generalship, and in 1612 was chosen Speaker of the Irish House of Commons. In 1619 he finally left Ireland, having achieved all that he set himself to perform. During this period he published those valuable works on Irish affairs which have been so highly praised by all competent judges. He died in 1626. Davies had friends among the most eminent of his contemporaries. Lord Chancellor Ellesmere was one of these, Bacon was another; but the one with whom he was on the most intimate terms was the learned Sir Robert Cotton, called by him in his letters "sweet Robin." He was not so fortunate in his wife, who gave him and the Government much trouble by her claims to prophetic powers. She was Eleanor, fifth daughter of George Audley, Earl of Castlehaven, and in the fulsome Latin inscription to her memory which was set up in the Church of St. Martin's in the Fields she was said to have been meek, humble, affable, and learned, and to have possessed a man's spirit in a woman's body. She was a great believer in the virtues of anagrams, and made a special point of the fact that she could resolve her name, *Eleanor Audley*, into *Reveale O Daniel*. On one occasion she showed her husband his doom written in his name—*John Daves—Jove's hand*—and then told him that he would die within three days. She constantly warned men of their approaching death, and gave so much trouble generally that she was brought before the Court of High Commission. Here she flaunted the motto of *Reveale O Daniel* in the faces of her accusers, until the Dean of Arches settled her claims by turning her arms against herself, and handing her a purer anagram than her own—

"*Dame Eleanor Davies:*
Never see mad a ladie."

We have already alluded to Sir John Davies's chief work: the next in importance is his *Orchestra*: or, a Poeme on Dauncing. Mr. Grosart does not notice Ben Jonson's references to this in his conversations with Drummond of Hawthornden. On two separate occasions Ben censured the opening lines; once he said that "he scorned such verses as could be transposed":

"Where is the man that never yett did hear
Of fair Penelope, Ulysses Queene?
Of fair Penelope, Ulysses Queene,
Wher is the man that never yett did hear?"

At another time he related an anecdote in illustration of his view. "A gentleman reading a poem that began—

"Wher is the man that never yett did hear
Of fair Penelope, Ulysses Queene?"

calling his cook, asked if he had ever heard of her? Who answering, No, demonstrated to him—

"Lo, ther the man that never yett did hear
Of fair Penelope, Ulysses Queene!"

This is, of course, highly hypercritical, and there must have been some reason why Ben

Jonson was blind to the merits of this elegant poem. Is it not to be found in the fact that Richard Martin, who was bastinadoed by Davies, was Jonson's staunch friend? In the "Orchestra" Davies attempts to prove that dancing "with the world in point of time began," and he brings many elegant fancies to bear upon his argument. The beautiful description of the sea that "with his arms the timorous earth embrace" is a stock quotation, but the following stanza is not so well known:—

"For when you breath, the ayre in order moves,
Now in, now out, in time and measure trew;
And when you speake, so well sho dauncing lores,
That doubling oft, and oft redoubling new,
With thousand formes she doth her selfe endow,
For all the words that from our lips repaire
Are nought but tricks and turnings of the ayre."

Besides "Nosce Teipsum" and "Orchestra" the first volume also contains twenty-six "Hymns to Astraea," all acrostics on the words "Elizabetha Regina," in which Davies very cleverly manages to appear unconstrained; but to some readers the contents of the second volume will be the most interesting. Here are those epigrams which have been so largely used by critics in illustration of the Elizabethan literature. They were laid under contribution by Malone in his edition of Shakspeare, and by Gifford in his edition of Ben Jonson. They made Davies's name popularly known, and obtained for him the epithet of the "English Martial." J. Ashmore, as an old translator of Horace, wrote the following upon Davies and his works:—

"If Plato lived and saw those heaven-breathed
lines
Where thou the essence of soule confines;
Or merry Martiale read thy epigrammes,
Where sportingly these looser times thou blames:
Though both excel, yet (in their severall wayes)
They both ore-come, would yeeld to thee the
Prise."

These epigrams contain vivid pictures of the habits of the time; although it must be said that they do not do much credit to the morals of the actors. Davies seems to have been much taken with the newly-introduced term "gull," which he defines in one line:—

"A gull is he which seemes, and is not wise."

Besides an epigram on the subject he wrote nine "gulling" sonnets. The rural situation of some of the old theatres is shown by the expression—

"He rides into the fields playes to behold,"

and the habits of the frequenters when there by the line—

"He that dares take tobacco on the stage."

The hours of the man about town are clearly set down in the epigram on Fuscus:—

"Fuscus is free, and hath the world at will;
Yet in the course of life that he doth lead,
He's like a horse which, turning round a mill,
Doth always in the self-same circle tread:
First he doth rise at ten, and at eleven
He goes to Gyls, where he doth eate till one;
Then sees a play till sixe, and sups at seven,
And after supper straight to bed is gone;
And there till ten next day he doth remaine,
And then he dines and sees a comedy;
And then he suppes and goes to bed againe:
Thus round he runs without variety."

In epigram No. 6, among the chief London sights "the elephant" is mentioned; upon this Mr. Grosart makes the note:—"It is curious to find 'the' Elephant. . . . But

query is it the famous inn named by Shakespeare, 'I could not find him at the Elephant' (*Twelfth Night*, iv. 3)? If, however, he had looked on to No. 30 he would hardly have hazarded this conjecture, for there it is shown that "the elephant" was exhibited like Bankes's still more famous horse. Dacus is said to have written speeches for the showmen:—

"The man that keeps the Elephant hath one
Wherein he tells the wonders of the beast."

Bishop Hall also alludes to this sight (*Satires*, Book iv., Sat. 2). The entertainment of Queen Elizabeth at Harefield by the Countess of Derby is an interesting reminiscence of a place glorified by Milton's footsteps, and till lately supposed to be also associated with Shakspeare. Mr. Grosart has, however, not been very clear in his mode of editing it, for in his note he says: "the entertainment has the additional interest of having been that wherein the 'Lottery' was introduced." On turning, however, to p. 87 we read that this Lottery was presented to the Queen in the year 1602, at York House, the residence of Thomas Egerton, Lord Keeper, and, on going still farther back to the "Memorial Introduction," we find that Nichols is wrong in assigning the Lottery to York House instead of Harefield.

Mr. Grosart has added to this edition a considerable number of hitherto unpublished poems from a MS. in the possession of Mr. David Laing, among which is a paraphrase of some of the Psalms.

In despite of certain shortcomings, which have been noticed above, this book will be a welcome addition to the literary man's bookshelves, and we ought perhaps to excuse a certain amount of overpraise of one who was described by so sober a writer as Lord Stowell as "a man of various and extraordinary talents; a poet, a lawyer, and a statesman; and highly distinguished in every one of these characters."

HENRY B. WHEATLEY.

The Romantic Legend of Sakya Buddha.
From the Chinese Sanscrit. By Samuel Beal. (London: Trübner & Co., 1875.)

THE book of which we have here a translation is one of the most interesting in the whole range of the Buddhist library. It is a record of Buddha's life, with a full supply added of the marvellous legends which grew up during the first few centuries after his death. To acquire an understanding of northern Buddhism it is more important to have a book with the legends than without them, because we can here trace the steps by which Buddha came to be worshipped as a being higher than the gods themselves and better able to help mankind.

We shall feel very thankful indeed to know the exact truth about what Shakyamuni was as a man; and we owe much already to Burnouf, and the investigators who have followed in his track, for their descriptions of the historical Buddha. Here we have rather the legendary Buddha, and it is a picture worth a careful study.

The secret of Buddha's immense popularity must be sought more in his moral qualities than in his metaphysical belief. It

was his intense sympathy with suffering that won to him the hearts of the millions of northern India; and it was contempt for the world's pleasures that secured their admiration. Had the Brahmins who were his contemporaries been as self-sacrificing as Buddha was, and had as compassionate a heart, they would not have lost the spiritual control of India for a thousand years. His great eminence in these two qualities made his followers willing to accept his metaphysics with all their direful consequences.

To travellers in a Buddhist country like China or Tartary it seems at first view impossible to believe that this religion is atheistic. Very many persons who visit such countries never come to see how the perfectly true statement that Buddhism is an atheistic religion is to be reconciled with the patent fact that the Buddhist believer adores images without number. This anomaly is explained in the volume translated by Mr. Beal.

Shakyamuni holds a discourse with Alāra on the question whether one supreme God alone deserves worship, and argues that the Great Brahma cannot be supreme because at the time of the next great catastrophe, when heaven and earth will be destroyed, he in whom Alāra believed as the Creator will be destroyed also.

Buddha believed in an impersonal fate, which determines the life and death of gods and men, and this made him necessarily an atheist. He also denied, when discoursing with Alāra, that there could be a supreme Creator, because (Ishwara) that Creator would have made the world free from misery, from change, and from a division of power among various divinities. All things would have been good. Evil would have been impossible. There would have been no belief among the people in Brahma as distinct from Ishwara. Religious belief and every other good thing would have been perfect and invariable.

When Alāra hinted that if the world owed its existence to a law of necessity, at any rate a Creator must have originated that law, Buddha declined to continue the discussion, on the ground that he spoke as a man who participates in the great mass of existing evil, and seeks only a physician to give him health.

The Buddhist mind is keenly alive to the existence of evil, and regards the origin of the world as a matter of unprofitable discussion. Buddha thought he discovered the cure for all misery, and his followers believed him. They adopted his view that the gods are finite in power and in the period of their existence, and so they all became atheists also. But they immediately proceeded to put Buddha in the place of the dethroned gods, and, true to the Hindoo instinct, as they had been polytheists before, they became polytheists again. Every Buddhist saint, real or imaginary, became to them a god, and deserved an image because they had each helped, or desired to help, others to escape from misery.

Buddhism was the product of an age when critical discussion on knotty points was quite the fashion in India. We cannot wonder, then, that the popular belief in Brahma and Ishwara (later called Shiva) received a rude shock. But metaphysical

opinion cannot become shared in by the people. The only possible result, therefore, was a new polytheism.

The translator has omitted the legend of the origin of Buddhist images. I have read it in a work called *Fo tsuo pen ke*, in which the part referring to Buddha covers much the same ground as the *Fo pen hing tsi king*, which he has here given us so seasonably in English dress. He has also omitted the last scenes in Buddha's life. Either he has not felt the want of these from the circumstance that he was bent on rendering "the stories which throw light on contemporaneous architectural works of India," or they are not found in the book at all. The plan of abridgment is much to be approved, for Buddhist books carry to an intolerable excess the habit of repetition and turgid exaggeration. The translator was wise in resolving to curtail. But the close of Buddha's life is particularly important, because it shows what the Nirvana really was. The death of this greatest of all the Hindoos is regarded and spoken of by every Buddhist as the entrance into the Nirvana. What the Nirvana was has been much disputed. There is one historical instance in which it has been seen to take place. The manner in which the early followers of Buddha chose to describe the death of their master needs special study for the illustration of this subject. Other men when they died were still within the circle of transmigration. Not so Shakyamuni. In his death was an example of the attainment of perfection which to every one else has been in this life unattainable. But Buddha being from the moment of his death more than ever the object of veneration to his followers, and clothed by them with all divine attributes, it seems impossible, in accordance with the views of the Northern Buddhists, to regard the Nirvana as the extinction of existence. It is to them rather the attainment of a very pure and exalted immortality coming as near as possible to absorption into the Absolute.

There are some other very interesting points on which information may be derived from this book. What usages already existing in India did Buddhism retain? How was Buddha the child of his age, and not purely original?

The Kashāya was an old hermit robe worn by ascetics who lived in the mountains and forests, and it was on that account adopted by Buddha and his followers.

The cutting off his hair-locks and the clean shaving of the remainder seems in the book to be a thought of Buddha's own, but may also have been imitated. These customs have been ever since retained by the monks in all Buddhist countries.

The gold-coloured body of Buddha leading to the practice of gilding clay images, originated, as here shown, in the old Hindoo idea of the beauty of such a colour in the body.

Sheep were slain in sacrifice in Buddha's time by the worshippers of the Indian gods. Buddha opposed this custom on the ground that, if a man in slaying an animal to propitiate the gods does well, he will in slaying a child, a relative, or a dear friend, for the same purpose do better. He succeeded in checking animal sacrifice, and in spreading

widely the belief that to save animal life is meritorious. Other believers in transmigration may have aided in the extension of vegetarianism in food and pity for all forms of animal life, but the Buddhists were the chief instruments. Yet Buddhism showed itself capable of adapting itself to climate when in Tibet, at the foundation of Lamaism in the fifteenth century, animal food was allowed to the priests, and has ever since been retained there and in Mongolia.

The legends that embody the first worship of the clothes and rice bowl of Shakyamuni are very curious. A Deva disguised as a hunter exchanged an old tattered hermit's robe for Shakyamuni's Kasika garment, worth one hundred thousand lakhs of gold pieces. When he had received it from the new *muni* he assumed his original god-like form and flew away with it to the heaven of Brahma, in order that Brahma might pay it religious worship.

Delicious food was once offered to Shakyamuni, when weary, by Sujata, daughter of a village lord, upon a golden dish. She urged him to keep the golden dish, but when he had concluded his meal he threw it into a river. The river dragon seized it, and was carrying it to his palace, when the great god Indra, assuming the form of a Garuda, snatched it from his hand and flew with it to the heaven of the thirty-three gods, his own imperial abode, where it is still, says the legend, an object of worship.

This remarkable depreciation of the mightiest Hindoo gods noticeable in the representation of them as serving Buddha as worshippers, shows most clearly at once the nature of the Hindoo atheism of the time, and the impossibility of preventing a new polytheistic development suited to all the common class of minds under the influence of Buddhism. The degraded character of the new polytheism, which elevated into gods Buddha and all Buddhist saints, is manifest in the adoration paid to vessels, clothes, and especially the Shâkira, over which the towers called Stupas and pagodas were erected.

Buddha is described by the legend-makers as pleased with the worship of his discarded garment, but he can scarcely be viewed as the originator of relic-worship in India, for contemporary Rishis are in this book described as the objects of extraordinary veneration on the part of the people; and after his death the garment of any holy man would be worshipped.

Monasticism was Buddha's creation, and it was intended by him equally as a refuge from worldliness and a preaching institute (p. 287). Here lies a prime element of his wonderful success. The support of man in India costs little and the soil is very productive. A grant of land to a monastery would ensure the sustenance of a larger number of preaching monks than in most other parts of the world. Just at that time the art of writing began to prevail and the new monasteries became identified with education. The success of the new religion was aided not so much probably by the patronage of Buddhist kings, though that was a powerful help to it for many centuries, as by the monastic system, so long as the zeal of the monks in teaching and in acts

of self-denial attracted to the new religion everywhere the favour of the people.

By a wise process of abridgment the translator has reduced within a space of not more than a third of our English Bible one of the Lives of Buddha written probably about the time of Christ. Some Buddhist works extend to six times the space of our Bible. The reader may judge how grateful he should feel to the translator in this case.

In his Introduction Mr. Beal criticises those writers who tell us that Buddhism teaches the non-existence of the soul after death, annihilation and atheism. Of the two latter I have spoken; of the former it is a curious confirmation of Mr. Beal's opinion that the controversy between Buddhism and Confucianism in China hinged for some centuries on this pivot. The Buddhists defended the future existence of the soul and the Confucianists denied it.

JOSEPH EDKINS.

Geschichte Toscana's seit dem Ende des Florentinischen Freistaates. Von A. von Reumont. Erster Theil: Die Medici, 1530-1737. (Gotha: Perthes, 1876)

It is to be regretted that the form of the present work has prevented Herr von Reumont from carrying on his History of Florence in a continuous way from the point where he left it in his *Lorenzo de' Medici*. His work is one of the series *Geschichte der Europäischen Staaten*, originally edited by Heeren and Ukert. It is, consequently, a History of Tuscany and not of the Medici family. There is a gap in Herr von Reumont's writings which the accident of form, and not any want of interest or knowledge in the writer, has prevented him from filling up. The period from the death of Lorenzo in 1492 to the rule of Alessandro de' Medici in 1532 is only briefly touched upon. Yet these years were years of momentous importance for Florence and for the Medici. We hope that Herr von Reumont will at some future period return to them, and so make his sketch complete.

The book before us is an important contribution to Italian history of a period which is often overlooked. Historians of Florence are apt to stop with the fall of the Florentine Republic, and bring their work to an end with eloquent reflections on the blessings of liberty in general. Yet neither the importance nor the interest of Florentine history ceases at that period. The sixteenth century was destructive to the political system of Italy. It brought in foreign domination, which checked the free development of the individual spirit, destroyed political life, and burdened the people with ruinous taxation. Still, it is important to notice that Florence suffered less than did any other part of Italy. It was no longer a free State, as it had been in the days before the domination of the Medici: nor had it the forms of its old freedom, as it had under the rule of Cosimo the Elder and Lorenzo, in the fifteenth century. But it was not oppressed by any foreign conqueror. It was governed by the Medici as it had been before, though the predominant influence of a powerful citizen had passed into the rule of a prince. In fact, Florence in the six-

teenth and seventeenth centuries had as much independence and freedom as Milan had enjoyed under the Visconti, or Verona under the Delle Scale in the fourteenth century. While foreign domination prevailed elsewhere in Italy, Florence still retained, under princes of its old ruling family, much that was distinctive of its former self.

In bringing forward this fact Herr von Reumont has done good service to Italian history generally. He has helped to define its general outlines more clearly. He has especially thrown light upon the meaning of the relations of the earlier Medici to the Florentine State. Sprung from the people, and deriving their power from popular sympathy, they owed their position in the State to the fact that they were the ablest and most powerful exponents of the popular will. They ruled over Florence because Florence recognised in them fit representatives of herself. Under their rule Florence enjoyed a consideration in Europe far beyond what she could reasonably claim.

The Medici gained their position partly by their merits, partly by their mastery of political intrigue and statecraft. Friends or foes may emphasise either of these qualities at will. It is the great merit of Herr von Reumont that he sets both sides of their domination clearly before his readers. In his pages for the first time the Medici are impartially portrayed. Their relations to the entire system of Florentine politics and society are carefully marked out. They are not encircled with a halo because they were munificent patrons of art and letters, nor are they dismissed with angry denunciations because they were the subverters of liberty. Without any *a priori* conceptions, Herr von Reumont shows us what the Medici did at Florence, and leaves us to draw our own conclusions.

The Medici were the only dynasty in Italy which gained its position by civil and not by military means. Their dominion was not founded upon force: nor did the presence of a bodyguard of soldiers secure them in their power. Their rule rested at the bottom on popular consent. Their measures, good and bad alike, were the expression of the feeling of Florence. The aspirations of Florence became so clearly and definitely embodied in Lorenzo de' Medici, that a traditional policy was formed for the Medici family, which ultimately led to their restoration. The religious enthusiasm kindled by Savonarola, the restoration of old Florentine feeling by Soderini, were not strong enough to overcome the conception of Florence which Lorenzo had expressed and defined. This conception was strong enough to outlive even the dangers and difficulties into which Italy was plunged in the sixteenth century. If Florence had maintained the appearance of a Republic, it would probably have fallen a prey to a foreign conqueror. Florence, under a prince of the house of the Medici, realised in many points its old ambition. It became the undisputed ruler of Tuscany; it held an independent, and often an important, position in the politics of Europe; it was still the centre of the art and literature of Italy.

Under the later Medici, Florence reaped the fruits of her past efforts; she received

both the good and the bad which she had sown. The Medici were, in fact, a great link of continuity in the history of Italy. They preserved much of the old sentiment, because they alone were strong enough to hold out against the overwhelming pressure of foreign influences. Florence suffered much in the evil days of Italy; but it retained more of the old Italian spirit than did any other of the famous cities of Italy's past days. It had, at least, trained up a ruling family under whose sway it could still retain in some degree the marks of its individual character.

The interest of Florentine history goes on increasing up to the time of Lorenzo de' Medici; from that period it gradually declines. Hence Herr von Reumont has undertaken rather a thankless task in the work before us. Page after page his subject becomes less important and less interesting. Perhaps in the case of a writer like Herr von Reumont we regret this fact less than we would do in one who aimed at greater picturesqueness of style. Herr von Reumont is careful, accurate, and trustworthy rather than pictorial or brilliant. He does not seize on the dramatic side of things, nor does he excel in bringing characters before us in all their force and intensity. He can amass details and give us sound results of his judgment and of his criticism. He is animated by no desire except that of discovering the truth, and showing the full importance of the events which he is narrating. But he cannot combine the separate traits of a man's character so as to make him live and move before us, nor can he combine the facts of a people's history so as to make his pages animate with the impulse of the times he is treating of.

The character in whom Herr von Reumont feels the greatest interest is Cosimo I., a man worthy of study in every respect. After the siege of Florence in 1532 the party of the Pope and of the Medici were supreme within the city. A committee was appointed by the assembly of the people to reform the constitution. The old institutions were swept away by a new scheme. The *signoria*, the *gonfaloniere*, the *balia* were all done away. An hereditary duke of Florence was put in their place, and the shadows of the old councils were retained in a harmless fashion. Alessandro de' Medici was the first duke: but he had neither the prudence nor the vigour to establish and define the new form of government. After five years of his rule the old Florentine spirit found an unexpected champion in Lorenzino de' Medici, who, in the name of liberty, treacherously stabbed his cousin, with whom he lived on terms of intimacy, and then fled without endeavouring to carry out any plan for the future (1537). In much uncertainty the Council met together. No voice was raised for the restoration of the Republic of Florence. Various members of the Medici family were discussed, but on the proposal of Guicciardini, Cosimo, a youth of seventeen years of age, was elected.

The change of government in Florence gave hope to the numerous exiles scattered throughout Italy. A plan was formed for attacking the city and again establishing the old form of government. The young Cosimo

found himself immediately in danger. The exiles were, however, defeated in their attempt, and their defeat at Montemurlo was a great epoch in Florentine history. It formed once for all the character of Cosimo; it both showed him the end to be attained and gave him the means of attaining it. The chief men of the Republican faction were prisoners in his hands: by getting rid of them his position in Florence would be made independent. The clear-sighted boy understood this at once. Calmly, quietly, but with deep tenacity of purpose, he set about the destruction of all who had opposed him. One by one they were put to death. Different charges were brought against them, but not one escaped.

Moreover, Cosimo made his position strong not only by the destruction of his enemies, but by the removal of his too-powerful friends. The old Florentine party was slowly but gradually annihilated. The men who had hoped to rule in Cosimo's name were put to one side. Guicciardini spent the end of his days in retirement, without any voice in public affairs. Cosimo made himself independent and took the control of all business into his own hands. He raised up a body of officials dependent only on himself. The Florentine people were reduced to the position of subjects under the rule of a master. The history of Florence lost from henceforth its richness of colouring, as the people lost their many-sided activity of thought and action.

Cosimo lived long enough to bring about this great change. He was a born ruler, and to great natural gifts of intellect he added untiring diligence in State affairs. Nothing escaped his observation, and he knew how to use every opportunity. His object was to establish in Florence a monarchical government, and at the same time to make use of the condition of foreign affairs so as to assert the independence of Tuscany and convert Florence into the capital of a considerable State. At these ends he laboured unceasingly, and with success. Macchiavelli's ideal of an Italian Prince was more nearly realised in Cosimo than in anyone else. In political wisdom and statecraft Cosimo was all that Macchiavelli could have wished. Unfortunately, the stranger had laid such firm hold upon Italy that Cosimo could not aspire to the end which Macchiavelli had proposed. He could not hope to unite all Italy under his sway; but he succeeded in forming Tuscany into an independent and powerful State.

The history of Cosimo's rule is the most important and most valuable part of Herr von Reumont's work. Here for the first time his character and policy are clearly and dispassionately traced. We see in Cosimo a natural and worthy result of the age which had gone before. We see the policy of the Medici and the ambition of the Florentine people worked out to their natural conclusion in the altered state of Italy.

We have not space to follow Herr von Reumont through his history of Tuscany under the later Medici. It is written with the most thorough carefulness and with great breadth of view. The character of its rulers and the place of Tuscany in European politics are not sketched with greater care

than are the conditions of life and society, the improvements in agriculture and the fertility of the country, and the state of art and literature. Herr von Reumont has given us for the first time a philosophic estimate and an adequate account of Tuscany in the sixteenth and seventeenth centuries.

M. CREIGHTON.

The Teacher's Handbook of the Bible: a Syllabus of Bible Readings and connecting Epitomes, with Comments. For Use in Schools and Families. By Joseph Pulliblack, M.A. (London: Longmans & Co., 1876.)

Not long ago, Lord Northbrook, when describing the gradual overthrow of the ancient religious systems in India by the solvent agencies of European civilisation and Christianity, predicted that out of the approaching chaos of religious thought there would at length emerge a purer and simpler Christianity than that taught by any of our existing Churches. To those who in our own country are watching the signs of the times a similar thought suggests itself when reviewing the influence of the School Board system upon our elementary religious teaching. Elected as most of them are by constituents who, though agreeing in the desire to give children a religious education, are still at variance as to the peculiar shade of Christianity to be inculcated, the School Boards have been forced to adopt an eclectic system of religious teaching which enables them to modify all that is harsh, and to lay stress upon that which is common to all, in the many tenets of the various Christian Churches. And of this necessity the *Teacher's Handbook* is a conspicuous example. It is an honest and commendable attempt to simplify the difficulties which arise from sectarian expositions of Christianity.

Mr. Pulliblack's book has already been unanimously adopted by the Liverpool School Board as its Handbook of religious instruction. In its schools, therefore, the children will be taught—we quote from Mr. Pulliblack's preface—"the fundamental truths which are generally held by the Christian Churches." These "fundamental truths" are set forth at length in a series of 219 lessons, which range from the felicity of Eden to the persecutions of the early Christian Church. The lessons are, it appears, designed for the especial perusal of school-teachers, who are requested to simplify what they read, so as to meet the capacity of the children under instruction. In some cases they will have a peculiarly difficult task before them. For Mr. Pulliblack is singularly unfortunate in his explanations of common Biblical words. Most people are aware of the usual Sunday School explanation of the word "parable," as an earthly story with a heavenly meaning. That definition, however, is wonderfully simple as compared with that which Mr. Pulliblack unearths from Dr. Lowth, who substitutes for the one difficult word "parable" the following luminous sentence—"a continued narrative of a fictitious event, by way of simile to the illustration of some important truth" (p. 298). The simplest explanation of what is meant by the word "prophet" Mr. Pulli-

blank conceives to be "the man whose eyes are open" (p. 256), which would convey to children an idea which is simply ludicrous. Such a common book as Dean Stanley's *Lectures on the Jewish Church*, vol. i., or the article "Prophet" in Smith's *Bible Dictionary*, would certainly have furnished material for an explanation much more explicit and intelligible to ordinary minds.

We do not expect in reading a Handbook to meet with many graces of style, and Mr. Pulliblack does not disappoint us. We expected it to be heavy, and it is heavy. This is, perhaps, unavoidable in the nature of the undertaking; but still sentences of the singular infelicity of the following: "One of our poets makes a man say," ought to be expunged from the next edition. A superabundant use of synonyms is also very noticeable, and it would add much to the brevity and usefulness of the work if the obvious reflections scattered throughout were uniformly omitted. Nor do we always agree with Mr. Pulliblack's comments. The notion that Elisha by requesting a double portion of Elijah's spirit desired to be looked upon as Elijah's first-born (p. 194) seems to mystify an incident which, without any fanciful supposition, is explained simply enough in the Biblical narrative itself. It would be useless, however, to offer these suggestions if there were not excellent matter in the book which deformities such as these tend to obscure. The matter and aim of the lessons is, in the main, well thought out, and those on Hospitality, Intemperance, and Health are worthy of special notice, as bringing out social life in its relation to religious teaching.

But it is as an exponent of School Board Christianity that this book is chiefly valuable; and with its aid we are enabled to arrive at the "fundamental doctrines" now "generally held." Several of these doctrines stand out with the utmost distinctness. Throughout the whole book the absolute historical accuracy of the Biblical narrative is unhesitatingly accepted. The three words in the Genesis account of the Creation, "after their kind," furnish a sufficient basis for the demolition of the whole of the Darwinian theory of Evolution. This *Handbook* keeps clear of chronological difficulties altogether; but exhibits a complete belief in the reality of the miracles both of the Old and New Testament. On such a matter as the nature and manner of Baptism the author expresses no opinion of his own, but quotes a striking passage from one of the sermons of the late F. W. Robertson. When he speaks in his own person, baptism is represented as a "ceremony." Again, the many difficulties which have arisen as to the Lord's Supper are never once alluded to, which in a Teacher's Handbook is an omission difficult to account for: but the narrative of the first Supper is very carefully given. Probably the idea of the compiler of this manual is that the children are to be taught the facts upon which such ordinances are based, and afterwards allowed, with the assistance of Sunday instruction, to evolve from them their own particular theory. Throughout the book there is a decided reaction against Scholastic definitions, and a steady return to the teaching of the Author of Christianity and that of

his immediate followers. Hence we do not find any such thing as a "Sacrament" mentioned; nor is there any "scheme of salvation" hinted at, such as in an ordinary theological book would find a distinct place. If one should obtain a first glimpse of Christianity by means of this book, there would seem to be perfect unanimity as to its facts, and absolute uniformity in its teaching. How different this is from the real state of things unhappily becomes more evident day by day; but it is as aiming to bring in, under the auspices of School Boards, a more golden age that this book merits a more than ordinary degree of attention.

JOSEPH R. DIGGLE.

NEW NOVELS.

The Two Destinies. By Wilkie Collins. In Two Volumes. (London: Chatto & Windus, 1876.)

In the Counsellor's House. From the German by E. Marlitt. Translated by Annie Wood. In Three Volumes. (London: R. Bentley & Son, 1876.)

The Sun Maid. By the Author of "Artist." In Three Volumes. (London: R. Bentley & Son, 1876.)

Madame. By F. Lee Benedict. In Three Volumes. (London: Samuel Tinsley, 1876.)

The Chapel Girls. By Edward Garrett. In Two Volumes. (London: Tinsley Brothers, 1876.)

MR. WILKIE COLLINS has chosen a subject connected with spiritualism for his latest romance, but he has cleverly avoided committing himself to any opinion. His plot is based on the supposed power of the brain of one living person upon that of another, and the supernatural element gives interest to a story which from its wild improbability would otherwise be without it. The hero and heroine are devotedly attached to each other at the tender ages of twelve and thirteen. They are then separated for many years, and meet again without mutual recognition. The heroine is married to a scamp, and is saved from suicide by her old lover, who also exerts a curious spiritual influence over her. Their spirits, without recognising the old bonds, are supposed to be *en rapport* at once, and that of the woman appears supernaturally on two or three different occasions to her lover, and makes written appointments in his pocket-book—the writing fading out as she wakes from the trance-like sleep in which she is disembodied. An episode in the second volume concerning a veiled lady in the North of Scotland rather tends to dissipate the interest of the book. In the end the discovery of a childish gift brings about a recognition at a critical juncture, and the *Two Destinies* become united. There is a curious complication in one of the spiritual appearances where the child of the heroine is part of the apparition; but, on the whole, the supernatural element is too much confined to one class of manifestation to make a powerful story, and the reader feels wronged that when he has been expecting a really thrilling ghost-story from Mr. Wilkie Collins, and has given himself up to be

startled, he gets only the somewhat monotonous hallucinations of two people of apparently weak intellect.

From the powerful opening of the novel *In the Counsellor's House* it seemed likely to be a strong and well-sustained story, but like too many other German stories it becomes prolix. At the beginning there is a well-conceived and well-grouped scene of a miserly miller, an ambitious merchant, and a clever young doctor. The miller's life is lost by his disobedience to the doctor's orders; the merchant is cognisant of the fatal act, but as his own reputation is involved in it he allows the blame to be shifted on the doctor, thereby ruining his prospects, which depended largely on his success as an operator. Here was the opening for a really fine story. The merchant might have formed a good study of remorse, while he witnessed the gradual decline of the doctor's reputation and success, and the doctor's nobler character might have been dramatically contrasted; but instead of this the story wastes itself in petty details, just as a stream, after flowing rapidly in a deep channel, will waste itself over a large tract of sand before it joins the sea. The doctor gets immediate employment in Court, and becomes prosperous. The merchant suffers no remorse, but goes on to commit one fraud after another. The proud girl, who has tried to ruin the peace of the doctor, becomes a nonentity, and the real heroine is only a vehicle for the moral. In spite of this falling off, the book is so pleasantly translated that it is very readable.

The story of a mysterious Russian lady who has a charming villa at Pau, while her husband is a convict in his native land, is told in *The Sun Maid*. But a very large proportion of the book is taken up with descriptions of the scenery of Pau, and gives the impression that it consists of leaves from some diary kept during a winter season, into which a little story has been introduced as a happy thought. It overflows with princes and princesses, possibly in compliment to the Princess Amelia of Schleswig-Holstein, to whom it is dedicated, and the beautiful Russian says softly to her English lover, "I feel more at home in the world, I feel more at home in this wide wide world, now that the Princess has returned to Pau." The lover "smiled, and they pursued the subject a little." We must enter a protest against the misquotation of the exquisite sonnet commencing:—

"Thou, in whose presence I forgot to smile,
Counting the moments that too quickly flee."

The third line does not run as this autho has written it:—

"Oh hide, oh hide my fearful eyes awhile,"

but ought to be:—

"Couldst thou but blind my dazzled eyes awhile
To that dark future where thou wilt not be."

The story of *Madame* is also that of a mysterious and wealthy lady living abroad; but this time the lady herself, and not her husband, is supposed to be under a cloud. Madame is believed to be a noted murderess, who has poisoned her husband, but has escaped justice. The whole story is written in a highly excited and over-coloured style, and might be most fitly described a

one long shriek from beginning to end. The plot is utterly improbable, and the feverish action and hysterical dialogue become wearisome, so that by the time justice is done to the wrongfully-accused Madame, we are heartily tired of her.

The Cupel Girls is a book with high moral teaching in it, and the story is made subservient to this. There is talent and originality shown in much of the dialogue, only we fear that, as a fact, when "the carpenter's young man" comes to tea with the cook on the happy occasion of their engagement, they would not be likely to discuss the spiritual meaning of the oppression of the children of Israel, as Tom and Pops are made to do. Neither is it very probable that a lady could work as a charwoman in the house with her husband and daughters, without having her identity discovered, but with these exceptions the story is a soberly-tinted picture of common life, and the hint which is given about the sympathy which ought to exist between servants and their employers is really useful, while the whole book is full of moral reflections such as the following:—

"We all might be [great]. If I had kept true, heart and life, to my husband when he slighted me; if I had kept my reason, and not been bewildered into thinking the love of God to be a cheap price for a false man's base passion, then I should have been a great woman, though none but God would have known it. We just grow to the height that is in us."

F. M. OWEN.

RECENT VERSE.

The Jerusalem Delivered of Torquato Tasso. Translated in the Metre of the Original, by the Rev. Charles Lesingham Smith, M.A. (Samuel Harris and Co.) Mr. Smith has preserved the form, and very fairly rendered the meaning of Tasso's great poem, but he has failed, as all translators from Italian must fail, to give any true idea of the pomp and beauty of sound which does so much to carry the reader over whatever is heavy or strained or affected in the *Jerusalem Delivered*. Mr. Smith has not dethroned Fairfax and Hoole from their supremacy as translators of Tasso, though there is much that is meritorious in his attempt. Tasso, far less than Dante, is independent of his translator: the great thoughts of the man who had in spirit seen hell and scaled the heights of Paradise can penetrate even the dullest rendering; but Tasso needs the genius of his interpreter to be read with satisfaction in another tongue. We take, as an instance of what we mean, fair translation, yet falling wholly short of adequacy, the famous description of the trump of hell in the fourth canto:—

"Chiama gli abitator dell' ombre eterne
Il rauco suon della tartarea tromba;
Tremar le spaziose atre caverne,
E l' aer cieco a quel rumor rimbomba.
Nè si stridento mai dalle superna
Regioni del cielo il folgor piomba;
Nè si scossa giammai trema la terra
Quando i vapori in sen gravida serra."

Here is Mr. Smith's rendering, but the pomp of sound is gone:—

"The hoarse sound of the hellish trumpet calls
The tenants of the eternal shades around;
The dark caves tremble through their spacious
halls;
And at that roar doth the blind air rebound:
Never with crash so great the thunder falls
From heaven's supernal regions to the ground;
With shock so great the earth is never rent
When vapours in her labouring womb are pent."

The second verse of the birds' song in Armida's garden is thus given by Mr. Smith:—

"Thus passes with the passing of a day
The flower and verdure of the life of men,
Nor, though young April may return, and May,
Rebloss-oms ever, nor grows green again.
Pluck we the rose then in the morning ray,
For the day's calm may fall we know not when;
Pluck we love's rose: for love now let us yearn;
While loving, we too may be loved in turn."

And now we turn to the true poet, and see that a translation may be, even without the Italian in our ears or thoughts, a fair and lovely poem:—

"So passeth in the passing of a day
Of mortal life the leaf, the bud, the flower;
No more doth flourish after first decay,
That erst was sought to deck both bed and
bower
Of many a lady and many a paramour.
Gather, therefore, the rose, while yet in prime,
For soon comes age that will his pride deflower:
Gather the rose of love, whilst yet in time,
Whilst loving thou may'st loved be with equal
love."

It is true that Spenser has interpolated some ideas that are not in the original, but of the lines he has literally turned how great is the beauty and force. But Mr. Smith's work has no doubt already done one good service; it must have taught himself to enter into the true beauties of Tasso, and it may be a useful help to other Italian students.

Rakings over Many Seasons. By Richard Trott Fisher. (Pickering.) This is a somewhat misleading title. We were at first afraid that Mr. Fisher was, like Justice Shallow, about to "prate to us of the wildness of his youth and the feats he had done about Turnbull Street," but we have only harmless poems, English, Latin, and Italian, gathered from those written between, at least, 1832 and 1861. They are the lines of a scholar and a gentleman, show a neat turn for versification—classic as well as modern—and are worth preserving. The paper, print, wide margin, and simple binding, are all delightful in these days of cheap and pretentious books, and the volume is one which may live by these merits, and find a place on library-shelves. We can fancy some old scholar of the future, some Fellow of a College—if any still survive—finding a copy in some ancestral house in years to come, and turning over the pages with the same interest with which we light on verse written when gentlemen were termed the "ingenious Mr." So and So, and wore knee-breeches and three-cornered hats. Mr. Fisher's "Pan is Dead" is very different from Mrs. Browning's. His "Shepherd's Lament," though put into the mouth of a keeper of sheep, seems to spring from the heart of a shepherd of souls, who, having left the academic towers and courts for distant meadows, looks at his pastoral neighbours and thinks how they would feel if they had his education. Here are three stanzas in answer to the question "What shall a modern shepherd do now Pan is dead?"—

"He may play the lord and master in his puppy's eye,
He may converse with the raven watching him hard
by.

He may count his sheep at morning, and again at
even;

He may dream of Amaryllis, and a shepherd's
heaven.

Such was yesterday his pastime, and to-day the same;
Such shall be his sport to-morrow, such the next
day's game:

Day by day his face grows duller, and more slow
his tread:

O that Pan were still alive, or he with Pan were
dead!

For, though nought of poesy now soothes a shep-
herd's life,

Foot-rot, scab, and fly, and tick, are very very rife:
Who then would a shepherd be, where things like
these are bred,

And not a Hamadryad left, and Pan himself is
dead?"

The translations and imitations are good. There is an especially excellent one of Goethe's "Der Snger," at which so many have tried their hands in vain.

Songs of a Song-Writer. By W. C. Bennett. (Henry S. King and Co.) How many singable songs, or first-rate lyrics under that name, have even great song-writers given to the world? Campbell will live for ever by less than half a dozen; Burns and Heine, greatest of all, will live by far less than Dr. Bennett here gives us, some hundred and seventy in all. It cannot, therefore, be expected that all should satisfy us as songs, or even many; it is enough that some do, and that as a whole, it is a collection of lyrics for which he has no need to blush. Of the longer lyrics, one at p. 161, "Soon, o'er the cold heart, the still grass will be growing," is very graceful; a shorter one at p. 65 has great merit:—

"Of gipsy blood you surely came;
Those eyes are light and fire,
Love leaps along your veins in flame,
In throbs of dear desire.
And he who wins a burning kiss
From that delicious mouth,
Has surely known the rapturous bliss,
The wild love of the south.

I press your hand, and I forget
The world beneath my eyes;
Before me clicks the castanet,
And vine and olive rise.
O deep dark eyes! who looks from you
To see soft gleaming forth
The tender faith that sparkles through
The blue eyes of the North?
In you the storm and lightning sleep,
And hate and death are there;
Life that must know a love how deep!
And O what wild despair!"

For these poems, and they do not stand alone, we may thank Dr. Bennett. But he should not provoke comparisons with his masters. He writes:—

"I'm a lad to war bred, who's proud to wear the red,
And this coat and this bearskin you see upon my
head

By the Russians they were seen
On the Alma's slopes of green," &c. &c.,
which would be poorish in any circumstances, but most poor to those who remember the lyric which suggested it, Burns's glorious soldier-song, which stirs the blood like wine:—

"I am a son of Mars, who have been in many wars,
And show my cuts and scars wherever I come:
This here was for a wench, and this other in a
trench,
When welcoming the French at the sound of the
drum."

Epistles, Satires and Epigrams. By James E. Thorold Rogers. (R. Bentley and Son.) Critics, says Mr. Rogers, in the first of his imitations of Horace,

"Spare their eyes,
And rarely read the books they criticise."

He thinks also that there is "a good deal of mutual compliment on the part of such reviewers as write books or have friends who write them. The world has lately witnessed an extravagant illustration of this contingency." "Let the galled jade wince, our withers are unwrung," for we have read Mr. Rogers's volume, we have not the honour of his acquaintance, and we are able to say that it is extremely amusing, which probably is all he claims for it. He is a good hater, a hard bitter, and no respecter of persons, and he clothes his thoughts in terse and vigorous English. His adaptations of modern instances to Horace's and Juvenal's most Roman allusions are sometimes very happy.

"England was not in those remoter years
Crowded by such a crushing weight of peers,"
with the note

"nec turba deorum
Talis ut est hodie," &c.

Everyone knows how reverentially the average Englishman treats the peerage, and what excellent reason he has for his polytheism" (p. 130). For the Satires themselves, no doubt many will say that they are too violent, too personal, and the like; but this raises a question, not as to Mr. Rogers alone, but one in which those he imitates, and Pope, Dryden, Byron, and a dozen others, are equally concerned, a question which we cannot here discuss. It may be said, however, that to mere political foes Mr. Rogers is always good-humoured, if rough, and that real vituperation is reserved for real wrong-doing, not for differences of opinion. The Epigrams at the end of the volume are not, with one or two exceptions, at all of the same merit with the rest of the book.

Poems. By Henry Weybridge Ferris. (Henry S. King and Co.) We presume that this volume can only be printed in order that the labour of many pleasant hours to the writer should be embodied in a permanent form and laid before friends who will prize it. Mr. Ferris has no reason to be ashamed of his work, which is even and painstaking; his translations from the Greek are careful and scholarly. He has probably called his verses "Poems" because it was difficult to give the volume a distinctive title, but to speak of him as a Poet would be in excess of his merits.

The Weirwolf: a Tragedy. By William Forster. (Williams and Norgate.) The *Weirwolf* is dramatised, as the title-page tells us, from a story by Mrs. Crowe. The author of the present form of the work is, we believe, a Colonial Prime Minister, who, like the Earl of Beaconsfield, alternates the toils of office with literary pursuits. We are glad he should find such innocent *délassement*, but for the readers Australian Blue-Books would be lively study by the side of Mr. Forster's *Tragedy*. A lyrical Chorus of Peasants which concludes it is, however, pretty and fluent. The following lines have decided merit:—

"True hearts at thy tale shall kindle—young breasts
at thy name shall glow—
And the fame thou hast earned this morning with
the growth of the grass shall grow;
And the music and songs of ages, from the lips of
the brave and just,
Shall out of the mazy (?) future make sacred thy
mouldering dust.
Yet never let tongue bewail thee, nor voices lament-
ing say,
'Too early her fate pursued her—too soon was she
called away.'
'Twere vain to have lingered after thy work was so
bravely done—
'Twas well to go out in glory, as a comet that sets
in the sun."

Llewellyn: a Tragedy. By A. E. Carteret. (Remington and Co.) Of *Llewellyn* we have only to say that it is hopelessly unreadable, and that, like M. Jourdain, poor Mr. Carteret talks prose quite unconsciously. To print such prose in lines of ten syllables each does not, *ipso facto*, convert it into poetry.

Cumberland Talk: being Short Tales and Rhymes in the Dialect of that Country. By John Richardson, of Saint John's. Second Series. (Bemrose.) Neither as poetry nor as throwing light on English dialects has Mr. Richardson's book interested us. There is no glossary to the few words which are not quite intelligible, and surely Cumberland should have a far greater wealth of local words than is here indicated. Nor can we trust his ear for the pronunciation of dialect words, if, as we suppose from his spelling, he makes any difference between the sound of "said," the past of "to say," as usually pronounced, and "sed" as the word is here spelt. If we can say little for the book as a help to the scientific study of dialect, it has none whatever as coming under the heading of our section and considered as a volume of verse.

Adventures of Ulysses. By Abel Reid and A. N. Broome. (Washington.) This pamphlet

of twenty-four pages, which bears no publisher's name, is intended as a satire on President Grant, and is meant to be funny, but signally fails. General Grant retiring from office, somewhat damaged in reputation, is not indeed so kingly as to remind us of Aesop's dying lion, but the fable is nevertheless presented to our mind by the behaviour of the creatures who thus fling up their heels in his face.

NOTES AND NEWS.

PROFESSOR SIDNEY COLVIN has in preparation a complete prose translation of the Homeric Hymns, to be published with introductions and illustrations from Greek art.

We learn that Messrs. Macmillan are just about to publish a fifth edition of Prof. Fawcett's *Manual of Political Economy*. The book has been carefully revised, and two new chapters have been added bearing on the depreciation of silver, a subject which is now attracting so much attention.

MESSRS. TINSLEY BROTHERS will shortly publish the notes of Mr. and Mrs. Arthur Arnold's ride through Persia.

THE second volume of Prof. E. H. Palmer's edition of the Arabic Poet, Behâ-ed-din Zohair, containing the translation in English verse, is now completed, and will be published shortly by the Cambridge University Press. Prof. Palmer has also in the press a volume of *Legends and Lyrics*, consisting of verse translations from the Persian and Arabic, and original humorous pieces in English verse. Messrs. Trübner are the publishers.

THE editors of the *Sheffield Post* have resolved to devote part of their space to law and questions of law reform. Mr. Philip Aldred, B.C.L., of Hertford College, Oxford, has been appointed editor of this department.

PROF. W. K. PARKER, F.R.S., and Mr. G. T. Bettany, B.A., of Caius College, Cambridge, are preparing a work on the Morphology of the Skull, in which for the first time will be brought together for comparison descriptions of the remarkable succession of modifications through which the skull passes in development in the principal types of vertebrate animals. The forms illustrated will be the Sharks and Rays, the Salmon, the Axolotl, the Frog, the Snake, the Fowl, and the Pig. A simple description of each form at successive stages will be followed by a chapter dealing with theoretical questions, and summarising the results of study. The work will be illustrated by a large number of woodcuts, and will be published by Messrs. Macmillan and Co.

AT their last meeting the Council of the Camden Society decided upon issuing the following books for the year 1877-8: 1. *Letters from and to the Members of Christ Church, Canterbury*, to be edited by J. B. Sheppard; 2. *Wriothesley's Chronicles*, vol. ii., containing the reigns of Edward VI. and Mary, to be edited by W. D. Hamilton; 3. *The Debates of the House of Lords in 1624*, to be edited by S. R. Gardiner. Of the issue for the present year, Mr. Gairdner's volume of the *Collections of a Citizen of London* will be almost immediately in the hands of members, and the *Documents Relating to William Pryune*, with the late Mr. Bruce's biographical fragment, is in the press.

MESSRS. MACMILLAN AND CO. will publish shortly a book on the Californians, by Mr. W. M. Fisher, who has spent some years in that country collecting materials for Mr. H. H. Bancroft's *Native Races of the Pacific States*. The volume is divided into ten chapters, dealing respectively with the Country, its Pioneers, its Spanish Inhabitants, its Chinese, its Reprobates, its Women, its Men, its Politicians, and its Writers. The last chapter is an ardent protest against the religious quackery which is gaining ground in California.

IN accordance with the express wishes of the late Dr. Strauss, his friend and co-labourer Dr. Eduard Zeller, of Berlin, has undertaken the task of collecting and re-editing his works. The first volume of the series, which is to include his best-known writings, has appeared, and the remaining volumes will soon follow. It is understood that after the publication of this first series, which is to comprise the purely literary remains of the author, the older and strictly theological writings of Strauss will be collected and published in a similar form, in order that the two may supply one complete collection of his works adapted for purposes of reference.

THE increase of the Society of Biblical Archaeology has obliged its committee to establish an office and reading-room at 33 Bloomsbury Street, W.C., where the library will be deposited and arranged for the use of the members. The attendance will probably be at first on Monday, Wednesday, and Friday, from 10 till 5 p.m. The meetings will take place as usual at 9 Conduit Street, W.

MESSRS. HURST AND BLACKETT have in the press the following new works:—*Historic Châteaux*, by Alexander Baillie Cochrane, M.P.; *My Year in an Indian Fort*, by Mrs. Guthrie, author of *Through Russia*, &c.; *Tales of our Great Families*, by Edward Walford, M.A., author of *The County Families*, &c.; and new novels by Mr. Hepworth Dixon, Mr. George MacDonald, Miss Kavanagh, Miss Georgiana Craik, Miss Isa Duffus Hardy, Mrs. Spender, Mrs. Mackenzie Daniel, and the Author of *St. Olave's*, &c.

MR. W. B. TEGETMEIER'S *Shilling Handbook of Household Management and Cookery*—the appearance of which has been unfortunately delayed by the illness of the author—is now all but ready, and will be published in a few weeks by Messrs. Macmillan and Co.

THE new volume of "Hurst and Blackett's Standard Library" is to comprise the popular story of *My Little Lady*, by Miss E. Frances Poynter, with an illustration by Mr. E. J. Poynter, R.A.

THE Bulgarian delegates now in England are both men of letters. M. Zankof is the author of a Bulgarian History, and also of a Bulgarian Grammar, written, at the suggestion of Miklosich, in German. At Constantinople, where he was Professor of Bulgarian at the Imperial Lyceum, he was also employed in the Bureau de la Presse. M. Balabanof, besides being the author of many documents relating to the Exarchate of Bulgaria, to which he was the chief secretary, was the editor of a political journal called the *Viek*, or "Age," which used to appear, in Bulgarian, a couple of years ago at Constantinople. Another Bulgarian now in London, Dr. Protich, Professor of Medicine in the University of Bucharest, has just printed for private circulation a poem in French, with the English title of "The Voice of Bulgaria." It is dedicated to Mr. Gladstone, whose name forms the subject of an acrostic occupying the first page.

THE name of Herr Pertz, who has just passed away in his eighty-second year, is one which has for ever associated itself with the great collection of German mediæval writers known as the *Monumenta Germaniæ historica*, the first volume of which appeared in 1826. He attracted the attention of Baron Stein by an early work on the *Merovingian Mayors of the Palace*, published in 1810, and was set by him upon that which proved to be his life's work, though he did not altogether neglect independent labours, such as those which led to his Life of his early patron, Stein. The *Monumenta* continued to be his chief occupation till advancing age made his further participation in its compilation impossible. The funds for its production were formerly found by the old German *Bund*. It is now to be continued by other hands, and it has the proud distinction of being the only

object to which the whole of the German States, including Austria, contribute in common.

DR. CARL HORSTMANN of Sagan, Silesia, is printing in Herrig's *Archiv* the Miracles of the Virgin from the Vernon MS. in the Bodleian, and two texts of the Legend of St. Alexius, of which Mr. Furnivall has five in type for the Early English Text Society. The Alexius story is like part of that of Guy of Warwick: the bridegroom leaves his bride, and after years comes back as a beggar to be fed continually in her hall. Not till he is dead does she find out who he is.

THAT unwearied editor of black-letter books, Mr. A. B. Grosart, has lately circulated a list proposing a subscription for fifty copies of twenty-two more rare tracts, many of which are very valuable as illustrations of the manners of the time. He also gives hopes of editing from MSS. *The Poems of Richard James*, *The Poems of George Daniel*, and last, not least, *The Monarchy of Man* of the great Parliamentary orator whom he calls Sir John Elliott, but whom modern usage and his own signature combine in styling Sir John Eliot.

THE Chaucer Society has at press an essay by Dr. Hugo Simon of Schmalkalden, on the Parson of the *Canterbury Tales*, and his Tale. Dr. Simon contends that the General Prologue and the Man of Law—Shipman Link prove the Parson to be a Lollard, and that his tale justifies the title, as the first part only is genuine, according to Dr. Simon, after certain insertions of Roman Catholic doctrine have been removed. Dr. Simon believes the tale to have been recast and corrupted by some monk directly after Chaucer's death, and before any separate copy of the genuine treatise by Chaucer had been made. This view is not likely to find favour in England, though it is urged with great ingenuity.

MR. SKEAT has just finished the notes to his fine three-version edition of William's *Vision concerning Piers the Plowman*, for the Early English Text Society, and they will be issued in one volume in the society's Original Series early next year. Mr. Skeat has also in the press for the society's Extra Series this year the completion of his edition of Barbour's *Brus*, and the alliterative romance of *Alexander* from a MS. in the Bodleian. At the foot of the pages of the latter he has added the Latin version from which it was written and altered.

UNDER the title of *John Cheap: the Chapman's Library*, Porteous Brothers, of Glasgow, propose to issue a classified reprint of the Scottish chap-literature of the last century. It will be in shilling monthly parts, but in various sizes, which we think a mistake. The publishers say that—

"An examination of a few of the tracts under the Religious head soon brings out the popular creed in forms of thought and illustration quite unexpected, and with a definiteness and force the originality of which cannot be mistaken. . . . That the most instructive of the chap-books, from a student's point of view—those of Scottish origin—are faithful reflections of the manners and modes of thought of our agricultural and village populations from very remote times till a recent period, and in some out-of-the-way places still, is shown by the striking resemblance of the *mêlée* in *Christ's Kirk on the Green*, by King James I., so popular in 1716, when reproduced by Ramsay, and that at the bedding of *Jockie and Maggie*, by Dougal Graham; and justifies their preservation on far higher grounds than those of mere literary curiosity."

Part I, the "Comic and Amusing Adventures," is to contain *The Life of Dougal Graham*; *The Witty Sayings and Exploits of George Buchanan*; *Adventures of Bamfylde Moore Carew*; *Daniel O'Rourke's Voyage to the Moon*; *The Comical Tricks of Lothian Tom*; *Comical History of the King and the Cobbler*; *John Cheap, the Chapman*.

M. CHARLES BIGOT'S *Portraits littéraires*, reprinted from the French magazines, will before long be gathered together into a book.

M. EDMOND DE GONCOURT is writing a new novel; the first he has written since the death of the brother with whom he collaborated.

THE Christmas number of the *St. James's Magazine* is now in the press. The principal story is written by Mr. Ellis J. Davis, author of *Pyrra*, *Coralia*, &c.

THE Council of the Society of Arts have accepted an offer of a medal from Mr. Benjamin Shaw, to be awarded every fifth year "for any discovery, invention, or newly-devised method for obviating or materially diminishing any risk to life, limb, or health, incidental to any industrial occupation, and not previously capable of being so obviated or diminished by any known and practically available means." The medal will be of the value of 20*l.*, and the first award will be made in May, 1877.

A CORRESPONDENT sends us the following statistics on the subject of university education in Scotland for 1864-5 and 1874-5 respectively:—

Universities	Matriculated Students		Increase	Decrease
	1864-5	1874-5		
St. Andrews . . .	174	143	...	31
Glasgow . . .	1,242	1,484	242	
Aberdeen . . .	560	635	75	
Edinburgh . . .	1,393	2,076	683	
	3,369	4,338	1,000	31

"The population of Scotland in 1875 was about 3,500,000, and the number of students attending the universities was 4,338, which gives one student for every 806 inhabitants. For 1865, when the population was about 3,250,000, and the number of students 3,369, the proportion was one in 964, so that the number of students has increased in a much greater ratio than the population."

THE number of Gymnasias or high schools supported by Government amounts in Prussia to 231, with a staff of 3,544 teachers. The number of pupils during the summer was 58,924, during the winter 57,956. Of 7,916 pupils who left, only 1,279 were able to pass their "Maturitäts-examen;" 2,766 migrated to other schools, 3,736 found different employments, and 135 died. Preparatory schools, connected with some of the Gymnasias, had in addition 7,847 pupils during the summer, 7,526 during the winter, while the so-called Pro-gymnasias, 34 in number, taught 3,611 pupils in summer, 3,378 in winter. The "Realschulen" of the first class, 80 in number, taught 22,957 boys, the preparatory "Realschulen" 3,620, while the number of pupils at the "Realschulen" of the second class amounted to 4,437, at the preparatory schools to 1,414. Lastly, 11,021 pupils frequented the 92 higher "Bürgerschulen," and 3,001 the preparatory schools. Altogether, if we may trust the last statistics, the number of boys taught at the public schools in Prussia has been diminishing.

In the *Contemporary Review* Mr. Lowe gives the following neat summary of our present legislation for the protection of animals:—1. Absolute liberty to torture all non-domestic animals, except by way of scientific experiment. 2. Practical liberty for any one who can afford to pay five pounds to torture domestic animals, except by way of scientific experiment. 3. No punishment for painful experiment, except by leave of the Secretary of State. II. G. Hewlett writes severely on the imperfect genius of William Blake, pointing out the want of originality even in his Antinomian and Apocalyptic writings.

In the *Fortnightly Review* Sir Charles Dilke tells us a little about English influence in Japan, and a good deal about the leaders of the revolution: he also informs us that the pensions of the Daimios, amounting in the aggregate to

2,500,000*l.*, are likely to be largely reduced, and that there will soon be no foreign *employés* but a few French lawyers. Mr. Stephen's paper on Godwin deals with his shyness and the other constituents of his curious personality, and observes in passing that women generally are attracted by conceit and priggishness, to account for Godwin's influence on those he did not try to marry. The article concludes with a short summary of the creed he held, which Shelley probably accepted from him.

THE *Gentleman's Magazine* contains a paper on *Daniel Deronda* by Mr. Francillon, who thinks that it is a romance, and the first that George Eliot has written; an account of Truganini, better known as Lallah Rookh, the last survivor of the Tasmanians, who did much to help Mr. Robinson to collect the remnant of her people and conduct them to quarters where they could die in peace; and a most entertaining translation of most of the speeches made by the Basutos at a "Pitso," or parliament, held by the agent, Mr. Griffith, in 1874 at Maseru. Most of the speakers were enthusiastic about the benefits of British rule, and anxious at the narrow extent of their territory: there was a good deal of divergence of feeling as to how much authority the chiefs were to retain, some fear that the new lords dealt too favourably with women and children, and some soreness on the part of some members of the tribe who thought they had not had their fair share of the spoils of Langalibalele.

THE *Revue des Deux Mondes* for September I contains another paper by M. Vacherot on "Modern Science and Final Causes," which sets forth a rather original view of the First Cause as infinite in power, wisdom, and goodness, but not therefore perfect, because perfection is only intelligible in relation to human ideals, which are never realised and always surpassed, as the continual progress of the world compels us to revise them. M. de Laveleye gives an interesting account of Winkelblech, Rodbertus Jagetzou, and Marx, the chief German Socialist theorists, laying especial stress on the economical orthodoxy of the premises from which Marx deduces his revolutionary conclusions. M. Adolphe d'Assier writes as a Positivist of the historic evolution of peoples, which have their ages like individuals. According to him humanity, as a whole, is still young and just passing from the period when belief is swayed by imagination into the period of manhood and knowledge; on the other hand, the planet is old. The essay is avowedly tentative and full of good suggestions.

THE following Parliamentary Papers have lately been published:—Report from the Select Committee on the Depreciation of Silver, with Minutes of Evidence, &c. (price 3*s.*); Index to Ditto (price 6*d.*); Report of the Metropolitan Board of Works for 1875 (price 1*s.* 5*d.*); Copy of Correspondence of Royal Irish Academy on the proposed Science and Art Museum in Dublin (price 3*d.*); Return showing Places to which Weather Intelligence was sent in 1875, Number of Telegrams, Storms Reported, &c. (price 3*d.*); Report from the Select Committee on Employers' Liability for Injuries to their Servants, Minutes of Evidence, &c. (price 10*d.*); Annual Statement of the Navigation and Shipping of the United Kingdom for 1875, Part II. (price 1*s.* 5*d.*); Ditto, Part III. (price 11*d.*); Report of the Commissioners of Patents for Inventions, 1875 (price 1*s.* 2*d.*); Return relating to Savings Banks (price 1*s.*); Report to the Secretary of State for India for 1875-6, by Juland Danvers, Esq., Government Director (price 1*s.* 9*d.*); Standing Orders of the House of Commons, 1876 (price 1*s.* 1*d.*); Return of Owners of Land, Ireland (price 2*s.*); Return of Railway Accidents and Casualties during April, May, and June, 1876 (price 1*s.* 2*d.*); Fifth Annual Report of the Local Government Board (price 4*s.* 10*d.*); Twenty-third Annual Report of the

Science and Art Department of the Committee of Council on Education, with Appendices (price 3s. 6d.).

NOTES OF TRAVEL.

On the first of January next a new monthly magazine, entitled *Revue Géographique*, is announced to appear at Paris under the editorship of M. Ludovic Drapeyron.

We believe that Messrs. Sampson Low and Co. will this season publish a volume of his experiences for Sir Rose Lambert Price, Bart., late of the Royal Marines, an officer who saw a good deal of service in the last China war.

THE eminent Danish mineralogist, Prof. Johnstrup, who was commissioned by his Government to investigate the present condition of the volcanic district of Thingoe, in Iceland, has given in his report. From this it would appear that during the present summer, which Prof. Johnstrup has spent near the scene of the active eruptions that occurred in 1875, no earthquake or other violent exhibition of volcanic activity has been observed. He considers that the present regular emission of gases from the various craters constitutes a safeguard against any destructive manifestation of energy, and he is, moreover, of opinion that a long period will probably elapse before the internal heat will be so far diminished as to admit of the formation of sulphurous gases in any considerable quantities.

News has just been received at the Geographical Society that Mr. Lucas, to whose Central African expedition we have frequently referred, has been obliged through ill-health to turn back from his attempt to penetrate the lake region by way of the Nile. He reached Lado (near Gondokoro) on May 30, and was warmly received there by Colonel Gordon, who persuaded him to alter his original plans, and to make for the south end of the Albert Lake as a starting-point whence to endeavour to reach the Congo at Nyangwe. It appears that before reaching the Albert Lake Mr. Lucas was prostrated by repeated attacks of fever, and was ultimately compelled to turn back towards Egypt to recruit his health, intending afterwards to make another essay by way of Zanzibar.

In the *Geographical Magazine* for this month Mr. Ravenstein supplies a quantity of very useful statistical information on the distribution of the population of European Turkey, mainly derived from the tables drawn up by the Director of the Statistical Bureau in Belgrade from the enumerations of the year 1864. This he has illustrated by means of four maps, two of which especially, those showing the nationalities of the inhabitants of Turkey and the percentage of Mohammedans in each of its provinces, will not fail to be of high interest at the present time. Mr. David Ker gives a graphic little Central Asian sketch of a walk over the hills from Samarkand to Tashkent. In a note on the Geographical Conference at Brussels it is stated that a Swiss lady, Mrs. Heine, has presented 20,000 francs to the New African Association; this with the 100,000 francs subscribed by the King is a good sum to begin upon, but very large sums will be required if the plans proposed are to be realised.

At a meeting of the members of the London Missionary Society and of the Friends' Foreign Mission Association, which was held at Antananarivo, the capital of Madagascar, on August 10, 1875, a paper was read by Mr. J. S. Sewell on a journey recently made by him in company with the Rev. W. Pickersgill, to the Sakalava country of the west. A lively discussion ensued on the paper, and, seeing the interest excited, Mr. Sibree suggested that the missionaries should prepare every Christmas or New Year's Day a pamphlet containing accounts of any journeys made or new information gained about little-known parts of the island. His suggestion was cordially adopted, and as a result some copies of *The Antananarivo*

Annual and Madagascar Magazine for Christmas, 1875, have just been sent home from the mission press at Antananarivo. The magazine contains no fewer than seventeen papers, embracing a great number of new facts on the topography, natural productions, customs, traditions and languages, of different parts of Madagascar. Those who are aware of the exceedingly imperfect state of our knowledge of the geography of Madagascar will at once estimate the value of this yearly collection very highly: excepting in the region of the central provinces, mapped by Dr. Mullens in 1874, and the districts visited by M. Grandidier between 1865 and 1870, the interior of the island is almost a *terra incognita*.

The sixth number of the *Verhandlungen der Gesellschaft für Erdkunde* for this year contains a capital account of the scientific expedition of the German Government ship *Gazelle* during 1874-75, by her commander, Captain Freiherr von Schlegelitz. Fitted out for marine exploration after the pattern of the *Challenger*, the *Gazelle* left Kiel in June 1874, and returned to the same port in April 1876, after having examined the Atlantic sea-bed in two crossings, the Indian Ocean on three separate lines, and the Pacific between New Guinea, Australia, and South America, in a voyage of nearly 50,000 nautical miles. The methods employed in sounding, and their results, bear out completely those obtained in the *Challenger*, and will form a valuable adjunct to these, especially in those parts of the route which pass over separate ground. Among the special discoveries made in the *Gazelle* was that of a great rise of the Atlantic sea-bed on the line between Liberia, Ascension Island, and the mouth of the Congo, in West Africa; and of the remarkable effect of the interruption caused by this submarine elevation in the system of distribution of the colder waters moving up along the bottom from the Antarctic Ocean.

SEVERAL letters from Dr. Lenz, of the German African expedition, describing a stay of three months in Asimba Land, a district on the Ofue, a tributary of the Ogowe, with notices of the peoples of the Ogowe, and the geology and meteorology of the region, are published in the same part of the *Proceedings*. From Asimba Land Dr. Lenz has been in vain trying to penetrate farther into the country, to reach the districts of Oshebo and Aduma: still he says, "the Okanda people are now very friendly, and I have not altogether given up hope of reaching the desired goal."

In a little book called *The Cruise of the "Freak,"* newly published at Launceston, Tasmania, the Rev. Canon Brownrigg has given a most interesting little narrative of a cruise among the islands of Banks and Bass' Straits between Tasmania and Australia. He describes their inhabitants, natural history, and scenery, and has illustrated the narrative with auto-lithographed sketches and plans. The profits arising from the sale of the work will be devoted towards supplying useful books for distribution among the islanders.

THE publication of the scientific work accomplished during the voyage round the world of the Swedish frigate *Eugenia* from 1851 to 1853 has just been completed in the issue, by the Royal Academy of Sciences at Stockholm, of the third part of the Physical Observations. This section, which is published in French and Swedish, contains the final result of the magnetic observations made by M. Johansson, of the University of Upsala, and the Baron C. J. de Skogman, then a lieutenant in the Royal Navy. After the death of the former observer the reduction of the data was taken up and has now been completed by M. J. Ångström.

In *Les Missions Catholiques* of September 29, Père Jean Damascène, Missionary to the Gallas in East Africa, gives a good account of the town and people of the neighbourhood of Zeila, which lately passed under Egyptian dominion.

THE journal kept by Mr. Lewis, the leader of a Government expedition to examine the country north of Lake Eyre in South Australia in 1874 to 1875, has newly been received from the Secretary of State for the Colonies. Though the expedition has mapped out a great deal of previously little-known territory, no new features of importance have been noted; the same uniform scrub and saltbush appears to have presented itself day after day, with here and there a little oasis of possibly useful grassland.

A BULGARIAN FOLK-TALE.

THE *Archiv für slavische Philologie* has completed its first volume. The third part, just published, contains an invaluable record by Prof. Jagić of the books which have appeared since 1870 on Slav antiquities and philology. It occupies no less than 142 pages, giving critical summaries of the principal works referred to, as well as a complete classified index to the literature in question. Besides this, Prof. Jagić contributes an excellent article of seventy-five pages, *Ueber einige Erscheinungen des slavischen Vocalismus*, and critical notices (occupying pp. 412-453) of Miklosich's *Comparative Grammar of the Slav Languages*, vols. ii. and iv., and of that scholar's recent contributions to Slav grammar—i.e., his *Altslovenische Formenlehre in Paradigmen*, 1874; *Beiträge zur altslovenischen Grammatik*, 1875; *Ueber den Ursprung einiger Casus der pronominalen Declination*, 1874; and *Das Imperfect in den slavischen Sprachen*, 1874. Among shorter contributions may be specially noticed three letters addressed in 1811 by Dobrowsky to Jacob Grimm, on Slav Popular Tales and Poems. Also an interesting article by Prof. Alexander Wesselofsky, on a Bulgarian Popular Tale about Alexander the Great, in which he calls attention to the curious mixture of *Volks-glaube* with literary tradition, which so often occurs in Slav folk-lore. The story, which occurs in the collection of Bulgarian Songs published at Agram in 1861 by the late Brothers Miladinovich, is to the effect that: King Alexander travelled far, through a land where no daylight was, in search of the Water of Immortality. Having at last found it, after passing between opening and shutting mountains (Symplégades), he filled a flask therefrom, which, on his return, he entrusted to his sister. Through her carelessness it was broken. Whereupon he was so angry that she threw herself into the sea, and became a dolphin, which always sinks to the bottom as soon as it hears uttered the name of Alexander. With this popular tale Prof. Wesselofsky compares a literary tale extracted from a Bulgarian MS. of the fifteenth or sixteenth century, referring his readers for its origin to the Greek Alexander romance of the Pseudo-Callisthenes. The Bulgarian tale (which is given in the original and in Latin) relates how the Water of Life was accidentally discovered by a youth named Andrew, to whose care a flask of it was entrusted by Alexander, who intended to drink it when his end should draw near. But Alexander's daughter, Panora, extracted the secret of its virtue from Andrew, whereupon she killed him, and drank the water herself, thereby becoming invisible and immortal, but subject to her father's curse. Attention has more than once (see ACADEMY, vol. x., p. 385, vol. xi., p. 42) been called in these columns to the great value of the *Archiv* to all who are interested in Slav philology, &c. Now that a complete volume, with a good index, has appeared, the time is a fit one for doing so again, and emphatically.

W. R. S. RALSTON.

RESULTS OF SOSNOFSKY'S EXPEDITION.

St. Petersburg: Sept. 29, 1876.

The return to St. Petersburg at the beginning of this year of the Russian Scientific-Commercial Expedition to Western China has resulted in the

opening of an exhibition of various articles of Chinese industry collected and brought home by its chief.

It may be remembered by some of your readers that in 1874 the Russian Government organised an expedition to the least known and most inaccessible parts of North-Western China with the view of ascertaining the true state of these countries, the possibility of opening a new trade-route for Russian commerce, and of developing commercial relations with China. It was also intended to collect every information on the so-called Dungan insurrection, its vitality, and the resources at the disposal of the Chinese Government to suppress it. For this purpose ample funds were granted from the Imperial Treasury, and two trained officers, Dr. Piassetsky and Surveying-Engineer Matusofsky, were selected for the task. The whole expedition was placed under the orders of Colonel Sosnofsky.

The final equipment of the party was completed at Semipalatinsk. Hence they took the overland route through Eastern Siberia *via* Kiakhta, the Gobi, and Kalgan to Peking, which was to be their starting-point. According to the original plan, as stated in the Russian newspapers in 1874, it was intended that the expedition should proceed overland from Peking to Han-kau; but this part of the programme was, for reasons best known to the commander (perhaps as being the most expensive), omitted; only the two interpreters were sent by this route, the rest of the party proceeding by sea *via* Tientsin and Shanghai to Han-kau on the Yang-tze-Kiang. Leaving the great river at Han-kau, they ascended its tributary, the Han-Kiang, for about eight hundred miles, to Han-chung-fu, whence they journeyed overland, skirting the south-western border of the province of Shensi, and—without turning aside, as had also been originally intended, to visit Ching-te-fu, the capital of Sze-chuen—took the direct road through Tsing-chau, Kun-chau-fu, Lan-chau-fu, Liang-chau-fu, Kan-chau-fu, and Suh-chau. From the last-named of these towns they crossed the desert of Gobi to Hami, situated one day's march from the eastern branch of the Thian-shan Mountains, the pass over which is 9,000 feet above sea-level. Barkul, their next halting-place, is to the north of these mountains, and beyond it lies the well-beaten track through Guichen, touching the Russian frontier at Fort Zaisan in the valley of the Black Irtysh. We have given a brief outline of a journey which might have produced brilliant results, but these are certainly not to be found in Sosnofsky's collection nor in his Report published in the second number of the Imperial Geographical Society's *Proceedings* of this year. As for the exhibition, arranged in a room adjoining the suite lately occupied by the Oriental Congress, the various articles displayed possess a minimum of scientific interest, and are intrinsically of little value, with the exception of some lumps of silver in a glass case, and an embroidered Chinese silk dress at one end of the room. For the rest the collection consists of such objects as one would have expected from their triviality to escape the notice of a scientific traveller entering a new country for the first time. On a long table occupying the centre of the room are disposed a few specimens of Chinese industry, small models of houses and instruments of torture, joss-sticks, scales and weights, tea samples, bank-notes, chop-sticks, &c. All these are familiar to every traveller in the best known parts of China, and it is only when we examine the photographs by M. Boiarsky that we can realise how much interesting and almost untrodden ground has been gone over, and what a rare field for scientific research has been thrown open to the travellers. The only Europeans who have visited these countries in modern times are Baron Richthofen, Colonel Prejevalsky, and Père Armand David. The first of these in the course of his explorations in China went alone from Peking to Han-kau, ascended the Han-kiang by

water to Lao-ho-kau, proceeding thence by land to Sin-gan-fu, and from this city to Ching-te-fu, whence he retraced his steps to Sin-gan-fu and returned to Peking by a more direct route, his line of march crossing that of the Russians in the plain of Han-chung-fu.

Prejevalsky passed some months in Kan-suh in 1872-73, and Père Armand David extended his adventurous journeys in 1865-68 considerably within the eastern border of this little-known region. But these are the only travellers upon whom we could rely for information. For the cartography we had still to depend on Klaproth's maps founded on the Jesuit surveys in the eighteenth century. Circumstances were unusually favourable to Sosnofsky, as he himself tells us in his Report (vol. xii. No. 2, *Russ. Geog. Soc. Proc.*, 1876), for the Chinese authorities, warned by the recent events in the extreme south-west of the empire, and the deep indignation excited in England by the murder of Margary and the consequent return of Colonel Browne's party, received the Russians with courtesy and were willing to give them every assistance. But, notwithstanding these advantages, the Report of the chief is remarkably scanty, only twelve pages being devoted to it. One might have inferred that time did not allow of his writing more. That this is not the case, however, is evident from the lengthy and verbose descriptions of unimportant matter contained in it. Many of the statements are exaggerated and highly coloured; thus, on page 146 of the *Proceedings* we read as follows:—

"But what a fearful picture of ruin! Extensive towns, numerous independent settlements, only a short time ago boiling with life and activity, stand even at the present time in gloomy silence, stained with bloody ruins. All is empty—not a soul—only here and there from a hastily-constructed hut, or from a hole dug out of a glebe of earth, appears a shrinking, emaciated figure. It is not old age that has furrowed the face with deep wrinkles and laid a stamp of infirmity upon it; but the lot of hard sufferings, sufferings of times hardly yet passed by. This is the only surviving member of a numerous family—all of whom perished, sacrificed to internecine war, and laid down their existence for ever in the family burial-mound hard by. The country has undergone terrible sufferings: it was so bad that a pound of beef cost three to four roubles, a bag of bread 100 roubles; the people ate dead bodies—ate *their own children*."

Why they should have devoured their own children when they could have eaten other people's passes our comprehension. But it is at all events satisfactory to learn that this frightful state of affairs is not likely to last, and that order is at length being restored. The above extract, which we have translated literally from the Russian, is a fair specimen of Colonel Sosnofsky's style. More than half a page of the Report is devoted to a description of the Chinese Governor-General Tso-tsung-tang, with whom the Russian colonel entered into a contract to provide grain for the army. "He positively astonished me," writes the Colonel, "by the soundness of his views, and his accurate information about Russia." Yet the same functionary is said to have enquired of one of the members of the expedition whether the Russians ate dead horses. Instead of interesting facts such as one would have expected from a work of this kind, we meet with the broadest generalisations (pp. 147, 148, 150, 151, 152, and 153). Indeed, the Report is worth reading for the sake of knowing, not what a Russian scientific expedition has done, but what it has left undone. The rapidity of their march did not allow sufficient time for the scientific observations for which the other members of the expedition were prepared. They left Han-kau in January, 1875, and in October the same year arrived in Russian territory. It is astonishing that under these circumstances it was possible to make any observations at all, and we cannot speak too highly of Dr. Piassetsky and Matusofsky, who strove gallantly to redeem the success of the enterprise. In the 4,000 plants, 200 skins of birds and animals, insects and reptiles,

and minerals collected by the former and topographical and meteorological observations of the latter we have special scientific information of the highest value. But besides these labours, Dr. Piassetsky has made no less than 1,000 water-colour and pencil drawings which bring before us the whole country with a fidelity and art which no word-painting or even photography could rival. Nearly 300 of these sketches were exhibited at the Imperial Academy during the meeting of the Oriental Congress, and from their remarkable artistic merit claim a more detailed notice than we can give in this article. We have pleasure, however, in announcing that their author proposes opening an exhibition of his works in London during the ensuing season.

CORRESPONDENCE.

A COMMISSION FOR GREEK ANTIQUITIES.

King's College, Cambridge: Oct. 7, 1876.

I am glad to see in Mr. Newton's letter in today's ACADEMY a recognition of the fact that fragments of ancient sculpture of the highest importance may be expected to be found scattered about in various buildings of Europe. My object in writing to you is to ask whether there is not special reason for supposing that such fragments may be discovered in our own country, and whether it would not be quite worth while to institute a regular search for them.

It is well known that Thomas, Earl of Arundel and Surrey, was a strong lover of ancient art, and his name has been justly given to one of our societies which has contributed as much as any other to the intelligent study of mediæval painting.

Peacham, writing in 1634, speaks of Lord Arundel as of one

"to whose liberal charges and magnificence this angle of the world oweth the first sight of Greek and

Roman statues, with whose admired presence he began to honour the gardens and galleries at Arundel House about twenty years ago, and hath ever since continued to transplant old Greece into England."

It is not, however, so generally notorious that Charles I. and the Duke of Buckingham were equally active in the same field, and that they did not confine their researches to Italy, but extended them into Greek waters. In 1650, 450 pieces of ancient marbles which had belonged to Charles I. were sold for 16,000*l*. Peacham says of him:—

"King Charles also, ever since his coming to the crown, hath amply testified a royal liking of ancient statues by causing a whole army of old foreign emperors, captains, and senators, all at once to land on his coasts to come and do him homage and attend him in his palaces of St. James's and Somerset House."

Milton, after travelling in Italy, had intended to proceed to Greece if he had not been recalled by the Civil Wars, and his description of Athens in the *Paradise Regained* shows how well he had prepared himself for his journey. Happy, indeed, if he could have beheld the Parthenon before its destruction by Morosini! The knowledge of the treasures of ancient art existing in England induced Profs. Michaelis and Matz to undertake a journey to this country in the autumn of 1873 for the purpose of cataloguing the ancient sculptures which they might find. The results of their labours are contained in the first number of the *Archäologische Zeitung* for 1874, and it must have been a discovery to most of those who have read this catalogue that English country houses contain such unexpected wealth. My object in writing to you is to urge that steps should be taken to organise a systematic search throughout England for remains of this kind. Marbles differ very widely from pictures, they are liable to be ill mounted, disfigured, wrongly described, neglected, or even destroyed. The possessors of these treasures are extremely likely not to understand or appreciate their value, whereas there is no danger of their value being impaired by the inspection of the learned. The owner of a reputed Raphael may be reluctant that his delusion should be destroyed by the judgment of an expert, but no one would be sorry to learn that he possessed in a neglected lump of mutilated marble a fragment of the work of Pheidias. The best means for effecting this purpose would be the formation of a commission similar to the Historical MSS. Commission, whose duty it should be to examine all collections of ancient marbles throughout the country and to report on their value. Such a commission would be fortunate in being able to employ the services of Mr. Newton, whose skill in practical diagnosis of this kind is unsurpassed in Europe. It is not too sanguine a hope that if this were done England would be found to supply a very large material for the stimulus of that new Renaissance which has only in these later days begun to reveal to us the deeper and purer half of Greek thought and culture which the earlier Renaissance of literature had left unknown and even unsuspected.

OSCAR BROWNING.

LEFFLER'S PHYSIOLOGY OF CONSONANTS.

Cambridge: October 9, 1876.

I hope it will be clear to everyone that my polemic is directed solely against Dr. Leffler's views, not against Mr. Rhys's review of them. On the contrary, we have every reason to be grateful to Mr. Rhys for presenting us with so clear and concise a summary of those views. Nor should I be justified in reproaching Mr. Rhys with want of familiarity with the details of Swedish pronunciation. The sole point in which I think Mr. Rhys himself is mistaken is in his idea that *p* in *öp* is necessarily different from *p* in *öp*, although even here he is only following Dr. Leffler.

The leading difference between us is now, as Mr. Rhys indicates in his last note, the question of *tenuis* and *media*. The valuable remarks of

Mr. Ellis show how endless are the details of this question. In my own remarks I endeavoured to make clear that the problem, as usually discussed, is an insoluble one, owing to the vague way in which the names *tenuis* and *media* are employed. As Mr. Rhys has alluded to the views of Prof. Sievers as confirming those of Leffler, I may state that I have not only read Prof. Sievers's book, but have had the great advantage of hearing the sounds from the writer himself, who possesses a fineness of ear and power of imitation which are very uncommon among German philologists. It seems quite clear that the distinction between voice and voiceless consonants is in South Germany represented by one of force only, *p* and *b*, for instance, being both what I would call "half-voice" consonants, the *p* being pronounced with more force than the *b*. But I consider that Sievers fails entirely in his attempt to apply the criterion of force to other languages as well. I can only repeat that the South German distinction has nothing whatever to do with the English and Swedish, except in the mere accident of being written in the same way.

HENRY SWEET.

P.S.—In the third paragraph of my last note read "after" instead of "before [short vowels]," and substitute "happy" for the example given.

JAMES HOWELL.

Bottesford Manor, near Brigg: Oct. 7, 1876.

My authority for stating that James Howell "was a Caermarthenshire man" is Anthony Wood, the Oxford antiquary. He says that "James Howell was born in Caermarthenshire, particularly, as I conceive, at Abernant, of which place his father was minister. In what year he was born I cannot precisely tell you." As his authority for this statement, Wood puts "Lib. matric. P. pag. 473." (See *Athenae Oxon.* edit. 1721, vol. ii. col. 381.)

EDWARD PEACOCK.

Fairwater, Taunton: October 9, 1876.

In my note on the above in last ACADEMY, October 7, there is a misprint of Cwnbryn for Cevnbryn. Having since looked through the "Familiar Letters," I may here add that they contain several allusions to the author's family leading to the conclusion that he was a Breconshire man. A letter addressed "To my Father, from London" (*Epistolae Ho-Eliaanae*, third edition, vol. i., sect. 4, letter vii., pp. 171-2), ends "with my love to all my brothers and sisters at the Bryn, and near Brecknock." This "Bryn" I take to be the hill-farm of that name on the side of the chain of hills called Epynt in the county of Brecon. In another place (vol. i., sect. 1, letter xliii. p. 67) he refers to these "Eppint" hills, contrasting them with the Alps. It appears also from the "Letters" that there were members of his family living at Trecastle and Devynnock in the same county; and that one of his sisters married a Hugh Penry, possibly of the same family as the Welsh martyr John Penry, who lived at Cevnbrith, a few miles from the Bryn.

T. POWELL.

SHAKSPERE'S POSSIBLE TROTH-PLIGHT.

3 St. George's Square, N.W.: Oct. 7, 1876.

Many folk, troubled by the too speedy birth of Shakspeare's eldest girl after his marriage, find relief in believing that he had gone through a form of troth-plight with Ann Hathaway the due time before, and that that was looked upon as essentially a marriage. As I have not heard of an old form of troth-plight being reprinted in any modern book, I think it will interest Shakspeare students to see the one that Mr. John Wilson has referred me to, in Robert Cleaver's *Godly Form of Household Government*, 1598, which I suppose is not his own imitation of the marriage-service, but one that was in general use in his time. But still, if only those young people used it who

desired "to marie in the Lord," one may doubt whether young Will Shakspeare of eighteen troubled himself much about that kind of marriage. And as the consent of parents was to be part of the troth-plight, one may also doubt whether John Shakspeare was a consenting party to his boy of eighteen's pledge to marry a woman seven years older than himself. I believe that the said John would have been much more likely to say to his son, "Don't make such a young fool of yourself, Will!" However, this is what Cleaver says on the matter (p. 111):—

"There must needes bee before the publicke act of marriage, some speciall time appointed, wherein both Parents, and parties, may Ratifie and signifie their mutuall liking and consents, vnlesse they despise to marie in the Lord. . . .

"Now then, in the next place, let vs see and learne, what a contract is. to the end, that vpon sound knowledge and right judgement, wee may alwaies vse it well, and neuer ill, for want of good vnderstanding.

"A Contract, is a voluntarie promise of marriage, mutually made betweene one man and one woman, both being meete and free to marry one another, and therefore allowed so to do by their Parents.

"This short sentence, sheweth the whole nature, qualities, propertie, vse, and abuse, with all other things, that are to be obserued or eschued in a right Contract, as shal appeare by the unfolding of euerie word contained therein . . . [and the author then unfolds them all].

"And least we should bee ignorant, or forget what those errors are, which disauowe and lawfully frustrate a Contract, these they be. First, if there be onely a naked shewe of a promise, and yet no promise in deede. Secondly, if any other thing bee promised then marriage. Thirdly, if the promise bee conuincied to be meere hypocriticall or forced. Fourthly, if one of the parties alone, do promise, and not both. Fifthly, if it were made betweene other creatures, or other persons, or betweene more then one man and one woman. Sixthly, if the persons contracted, or either of them be formerly betrothed, or have committed adultrie after the contract, or be alied or a kin, or for any other cause not at libertie to marie. Eighthly, if there lacke the consent of y^e parents.

"If al or any of these be undoubtedly known and clearly proued, they doo ioyntly and seuerally frustrate or nullifie the contract, so as the Magistrate may lawfully dissolve the same, and set the parties at libertie.*

"But contrariwise, if all these concur and accord, the contract is inuoluable as marriage it selfe, neither can the parties bee set at libertie by themselves, or by any power whatsoeuer,* because this contract, and euerie parsell thereof, is in the Lord . . .

P. 36. "This being done, the Parents and parties are to bee charged in the name of God, as they will answer at the day of judgement, plainly to bewray and declare, if they know any of the foresaid impediments in themselves or in their children, for which this Contract ought not to bee made. If they say, they know none, or if they declare none, then the consent of the Parents is to bee demanded; which, if they yielde, then the consent of the parties is also to bee required. And so the parties are to bee betrothed and affianced in these words, or such like.

"I N. do willingly promise to marry thee N. if God will, and I lue: whensoeuer our parents shall thinke good and meet: til which time, I take thee for my onely betrothed wife, and thereto plight thee my troth. In the name of the Father, the Sonne, and the holy Ghost: So bee it.

"The same is to be done by the woman, the name onely changed, and all in the presence of the Parents, kinsfolkes, and friends.

"After this, the Parents are to be admonished, to set and appoint the day of marriage, neither too neare nor too farre of, but to appoint a competent space of time, that it may be sufficient for the learning and triall of all lets and impediments, whereby promised marriage might be hindered, and yet giue no occasions, by reason of the length thereof, to prouoke the parties to incontinencie. In the meane time, the parties affianced are to be admonished, to abstaine from the

* This was Cleaver's doctrine, and not the law of the land. What he knew about "the Lord" was, of course, fancy.

use of marriage, and to behave themselves wisely, chastly, lowly, and soberly, till the day appointed do come. And so with a Psalm and prayer, to conclude the holy action.

"1. Because there might be some preparation for the things pertaining to house-keeping, betwixt that time and the celebrating of marriages: but this is not a chief cause.

"2. Because the Lord would by this meanes make a difference betwixt brute beasts and men, and betwixt the Prophane and his children.

"For they, even as beasts, do after a beastlike manner, being led by a naturall instinct and motion, fall together: but God will have this difference, whereby his children should be seuered from that brutish manner, in that they should haue a certaine distance of time, betwixt the knitting of affection, and the enjoying one of another, and a more neere ioyning of one vnto another.

"3. That they should in that time, thinke on the causes why they are to marrie, and the duties of marriage: For many enter therinto, not considering at all, of the great duties belonging to them in the same, nor thinke of the troubles and afflictions that followe marriage.

"But the Lord would haue these things thought on, and a consideration to bee had, both of the causes of marriage, and the duties to bee performed, and the troubles to be undergone."

Had Cleaver's opinion of Shakspeare been asked, he would evidently have set him down as a "bruite beast," and one of "the prophane."

F. J. FURNIVALL.

P.S. In connexion with this subject I may note that in the picture now owned by Mr. Jn. Malam, of a betrothal—probably Flemish, but professing to be Shakspeare's—the lad of 18½ is (so far as the photograph shows) represented as a bald-headed, bearded man, and the intended bride is evidently younger, and not seven years older, than her husband. The inscription now on the picture:—

"Rare Lymminge
with vs dothe make appere
Marriage of Anne Hathaway
with William Shakespere
15—"

"only came to light when the picture was being restored by Mr. Holder, at Scarboro', in 1872, who sold it to Mr. Malam." Can it not be put in darkness again? To suppose that the picture represents Shakspeare's betrothal is too absurd a notion to be entertained for one moment.

SCIENCE.

The Chemistry of Light and Photography in its Application to Art, Science, and Industry. By Hermann Vogel, Professor in the Royal Industrial Academy of Berlin. Second Edition. (London: Henry S. King and Co., 1876.)

History and Handbook of Photography. Translated from the French of Gaston Tissandier. Edited by J. Thomson, F.R.G.S. (London: Sampson Low & Co., 1876.)

DR. VOGEL'S book is a flagrant case of mere book-making without sufficient capital; and, like that of Tissandier, is almost completely useless as a scientific or practical text-book or manual. Neither the one nor the other follows the practical applications of photography to the latest improvements, and neither of them gives any direction which would enable a tyro to help himself out of the elementary or advanced difficulties. Tissandier's title was not, however, like that of the translation, a misnomer. It was "The Marvels of Photography," and the work did not pretend to be a manual, but simply an interesting book about photography, which it is; and the appendices added by the editor are not so complete or so lucid

as to add much to the practical value of the book. The chemical accuracy of it may be judged of from such expressions as "a sheet of paper which had been soaked in iodised silver"—"fixed the picture by means of gallic acid." However, the book is not so ostentatiously ignorant of scientific matters as that of Dr. Vogel, who insists on showing how superficial is his knowledge of astronomy, chemistry, and acoustics, of art and perspective, all in one book. At least in this he has succeeded.

The re-editing of the second edition of the book should not be allowed to affect the scientific notoriety of Dr. Vogel, which is based on an alleged discovery in spectrum photography which shall be stated in his own words:—

"The writer of this work succeeded, in the end of 1873, in making photographic plates sensitive even to colours that were before considered to be inoperative—i.e., yellow, orange, and red. He found that if certain coloured substances that absorb light were added to bromide of silver, which is by itself too little sensitive to green, the sensitiveness of this bromide to green is considerably increased. In like manner, if coloured substances absorbing yellow or red light are added to it, they make bromide of silver sensitive to yellow and red light. After this discovery we may hope that the difficulties attending the taking of coloured objects may be soon overcome."

This "discovery" has, thus far, not found any confirmation at the hands of any chemist of authority, and is discredited by those who have repeated Dr. Vogel's experiments. His original statement was less vague than this, and was to the effect that the addition of a red substance to the bromide film makes it sensitive to the red lines of the spectrum, &c. So far every observed modification in the range of the bromide of silver in reference to the spectrum rather disproves than confirms such an hypothesis. Certain substances do affect the range of the bromide of silver in this respect, but their colour has no observed relation to this fact. The very substances, moreover, which Dr. Vogel reported on, tried by the leading photographic chemists, produced no such effects as he claimed. Nor is it correct, as he states, that certain rays were considered inoperative. Becquerel long ago produced a complete photograph of the spectrum on a silver plate, and Dr. Draper, of New York, repeatedly succeeded with the same expedient, while his son, Prof. Draper, has since produced a collodion negative going through the extremes—the fact being, as shown most conclusively by Dr. Draper (*Researches in Actinic Chemistry*), that every part of the spectrum is photographically operative to a greater or less degree, and that all that is necessary to a complete image of it is to protect the most advanced lines from over-exposure until the retarded ones are impressed. Of all these results Dr. Vogel seems to have been ignorant.

Tissandier's book, as an amusing one, deserved better translation and better editing than it has had.

W. J. STILLMAN.

MESSRS. HENRY S. KING AND Co. send us, under the title of *The Races of Man and their Geographical Distribution*, a translation of Dr. Oscar Peschel's *Völkerkunde*, reviewed by Mr. E. B. Tylor in the ACADEMY of June 13, 1874.

ORIENTAL ARCHAEOLOGY.

An Archaic Dictionary. By W. R. Cooper. (London: Bagster & Sons, 1876.)

Cory's Ancient Fragments. New and Enlarged Edition, by E. R. Hodges. (London: Reeves & Turner, 1876.)

Dates and Data relating to Religious Anthropology and Biblical Archaeology. (London: Trübner & Co., 1876.)

Histoire Ancienne des Peuples de l'Orient. 2nde Edition. Par G. Maspero. (Paris: Hachette & Cie., 1876.)

THE startling discoveries that have been made of late years in Egypt and the East, the decipherment of forgotten languages, and the disclosure of primitive civilisations, have all combined to revolutionise the history of the ancient Oriental world. Instead of the scanty and half-fabulous legends reported by Greek and Latin writers, we now have the contemporaneous records of the monarchs and nations of the East; facts have taken the place of fiction, and actual knowledge the place of conjecture. A new light has been shed on the origin of the culture and civilisation of to-day, the history of civilised humanity has been tracked back, if not to its beginnings, at all events to its earliest era, and the study of comparative religion has received new and important illustrations. Races and populations, kings and priests, wars and conquests, have become familiar to us, the very existence of which was unknown but a half century ago. And though what has already been recovered from the past is but a tithe and an earnest of what remains to be done, yet the new material is already so abundant and so important as to claim comparison with the old stores of classical learning.

Mr. Cooper's *Archaic Dictionary* of the proper names occurring on the Egyptian and Assyrian monuments comes, therefore, at an opportune moment. Now that so general an interest has been excited in the revelations of the cuneiform inscriptions, a Dictionary was greatly needed which would do for Egypt and Assyria what Lemprière did in the last century for Greece and Rome. The time has not yet arrived when the whole tale of the monuments can be read in its completeness, and the conclusions derived from it treated in accordance with a strictly scientific method: Oriental archaeology is still in its descriptive or natural history stage, and must be dealt with accordingly. Those who want to be told in a few words what is known about Hatasu or Horus, about Assur-bani-pal or Hea, ought to find Mr. Cooper's work very useful. Its usefulness is increased by the Appendices he has added, as well as by his excellent introduction and "Suggestions for a Systematic Study of Egyptian History." Besides the proper names taken from Egyptian, Assyrian and Accadian monuments, the names of divinities found in Etruscan inscriptions have also been inserted in the volume. Whether the author was right in adding to these a selected number of proper names from Hindu and Scandinavian history and mythology may perhaps be questioned.

Of course in a work of the kind, misprints and errors are unavoidable; but Mr. Cooper seems to have done his best to render them

few; the hope, however, may be expressed that in a future edition some of the more important articles may be expanded, and that references may be added wherever possible. A list of references at the end of each article is the surest way of securing the reader's confidence, and at the same time of enabling him to control the statements of the text.

While Mr. Cooper has been arranging the results of Assyrian and Egyptian decipherment for the use of the historian, Mr. Hodges has been no less usefully employed in re-editing Cory's *Ancient Fragments*, which bring together every scrap of classical literature that bears upon the history and antiquities of the ancient East. The importance of the fragments can hardly be over-rated; they contain all that remains to us of the works of Manetho and Berosus, by whose assistance alone the materials furnished by the monuments can be thrown into chronological order. The historical study of the inscriptions is in great measure an inductive one; a hint here, a stray word there, are often all that the historian has at his disposal for the re-construction of the past. Hence the great value of the fragments which record the order and duration of successive dynasties, unsatisfactory and conflicting as may be the channels through which they have been transmitted to us.

Mr. Hodges has brought Cory's work up to the level of modern knowledge by adding illustrative notes and prefixing two very interesting Introductions, one on "The Origin, Progress, and Results of Hieroglyphic and Cuneiform Decipherment," and the other on "Phoenician Literature." He has also published some new fragments not given by Cory, one of them being the important extract from Nicolas of Damascus (contained in the *Πρόδρομος Ἑλληνικῆς Βιβλιοθήκης*), in which the legend of the Assyrian Nannaros is given. As M. Lenormant has pointed out, Nannaros is the Assyrian Nannar or Moon-god.

Mr. Hodges has made the book at once more convenient and cheaper by omitting the Neo-Platonic fragments which Cory had placed at the end of it, as well as Cory's learned but antiquated preface. He has also omitted the Greek and Latin texts, no doubt wisely. Those who want to consult them will have no difficulty nowadays in doing so, while the translations given in the volume before us may be fully trusted. The student of the native monuments will be grateful for having them placed before him in so handy and well-printed a form.

The anonymous author of *Dates and Data* states that the object of his work "is to bring together, in consecutive order, under specific dates, some of the results of recent researches in Prehistorical and Biblical Archaeology and Comparative Mythology, with the view of attempting to furnish trustworthy materials for the advancement of the study of Religious Anthropology." The idea is a good one, and has been carefully carried out. Under various specific dates, beginning with 14,000 B.C., the chief facts furnished by geology, ethnology, language, or monumental evidence as to the early history and civilisation of man have been grouped together. A great mass of very

interesting materials has thus been collected and arranged in a form convenient for reference. The author has generally gone to the best authorities, though now and then the statements he adopts are somewhat questionable. In one point, however, he has laid himself open to severe criticism, and that is in his philological flights. When will students remember that the science of language is as serious and exacting as the sciences of chemistry and physiology, and that only those who have undergone the requisite training and education can be qualified to deal with linguistic questions? Had the author made himself acquainted with the first principles of Comparative Philology he would never have compared certain Aryan, Semitic, and Egyptian words in the way that he has done on pages 31 and 32. What can be said of a writer who classes the Egyptian *ra*, "the sun," with the Sanskrit "*Ra(j)*" and (*Mit*)*ra*" and the non-existent "Chaldean" *ra*? By the latter word I suppose is meant the termination of the Accadian *dimirra* or *dingirra*, "god." Equally preposterous is the comparison of the names Jonah and Oannes. Apart from his philology, however, and an inclination to assign too definite dates to the palaeolithic and neolithic relics of early man, the author has succeeded in the task he proposed to himself, and has produced a really useful little book.

A reference is all that is needed to the new edition of Prof. Maspero's well-known *Ancient History of the East*. The work is simply indispensable for all those who wish to have some acquaintance with the subject. The maps which have been drawn up by the author, and the final chapter on writing and alphabets, add greatly to the value of the book. M. Maspero's profound knowledge of the Egyptian monuments renders his account of ancient Egypt and its history the best accessible to the ordinary reader. It is only when dealing with Assyrian subjects that his information has had to be derived at second hand, and his statements upon Assyrian history, therefore, are not always quite correct. The new edition is provided with an index, which will be highly appreciated by those who use the work.

A. H. SAYCE.

SCIENCE NOTES.

PHYSIOLOGY.

What becomes of Salicylic Acid after it is absorbed?

—Two answers have been given to this question. It is believed by some authorities that the acid enters into combination with the alkaline bases of the blood as soon as it mingles with that fluid, and that it is subsequently eliminated as a salicylate. Feser and Friedberger, on the other hand, assert that it unites in the first instance with the albuminates of the plasma, and is only converted into a salicylate when those albuminates are broken up—i.e., just before it is excreted by the kidneys. The former of these views is adopted by Binz, but with one important modification. He argues that the carbonic acid generated in the tissues is able to decompose the salicylate and to liberate minute quantities of salicylic acid in immediate proximity to the germinal centres. The question has been investigated afresh by Fleischer (*Centralblatt für die Med. Wiss.*, September 2, 1876). He finds that free salicylic acid is never present in the blood, and that it forms a permanent compound

with a base immediately after its absorption. A portion of it displaces carbonic acid from the carbonates; another portion acts upon the neutral sodic phosphate of the plasma. Salicylic acid, like hippuric and benzoic acid, is able to withdraw sodium from the neutral phosphate, sodic salicylate and acid sodium phosphate being formed. This fact is all the more curious as phosphoric acid readily expels salicylic acid from its combinations.

On Recurrent Sensibility.—It has long been known that irritation of the peripheral end of a divided nerve, whether motor, sensory, or mixed, may, under certain conditions, give rise to pain. MM. Arloing and Tripièr have performed a great variety of experiments with a view to the more complete elucidation of this anomalous fact (*Archives de Physiologie*, Mars-Avril, 1876). They have studied it in the branches of the fifth nerve, of the portio dura, and in the mixed nerves of the extremities, and hold themselves justified in asserting that recurrent sensibility is manifested, more or less distinctly, by all nerves, at any rate in mammals. It is always more marked as the peripheral expansion of the nerve is approached, and may be altogether absent, especially in a mixed nerve, when the division takes place high up. The sensibility of the distal end of the divided nerve is due, in every case, to the presence of fibres whose connexion with the percipient centres has not been interrupted by the operation, of fibres derived by anastomosis from other nerve-trunks. These fibres are derived, in the portio dura, from the fifth; in the purely sensory nerves, from their homologues on the opposite side of the body. They pass upwards to a variable distance in the nerve-trunk to which they are affiliated, diminishing in number from the periphery towards the centre. Their existence was anatomically demonstrated in every case by the method of Waller. Whenever the phenomenon of recurrent sensibility was manifested by the distal stump of a divided nerve, microscopic examination showed that amid the mass of degenerated tubules there were always a few that retained their normal aspect, thereby testifying to their continued connection with their centres.

The Action of Lactic Acid on the Bones.—It has been repeatedly asserted that lactic acid is capable of withdrawing the earthy salts from bone-tissue during life; and theoretical views concerning the pathology of such diseases as rickets and malacosteon, in which the skeleton undergoes partial softening, have been based on this supposed fact. Heiss has succeeded, by means of one very complete experiment, in proving that the assertion in question is incorrect (*Zeitschrift für Biologie*, xii. 2). A dog was kept for 308 days upon a diet of known composition, consisting of flesh, lard, and distilled water; during the whole of this time an average dose of 7·4 grammes of lactic acid was administered daily. When the experiment was at an end, the bones were found to be quite normal, both in structure and chemical composition; moreover, the normal proportion between the amount of earthy salts in the food and that contained in the urinary and intestinal excreta was maintained throughout. Doubtful traces of the acid were occasionally detected in the urine; but by far the greater part of it appears to have undergone oxidation in the system, and to have been got rid of as carbonic acid and water.

On some Effects produced by Stimulation of the Cortex Cerebri.—Besides the co-ordinated contractions of the voluntary muscles which result from stimulation of the surface of the brain with weak induction-currents, many other phenomena are simultaneously produced. There may be a rise or fall of blood-pressure; the pupil may contract or dilate; the secretory activity of the salivary glands, of the pancreas, of the liver, may be excited; the respiratory movements may be modified in rate and rhythm; the bladder, the intestinal tube, the spleen, the Fallopian tubes, may be thrown into a state of contraction. These phenomena have

been experimentally studied by Bochefontaine (*Archives de Physiologie*, Mars-Avril, 1876). He lays great stress on the fact that any one of the above results may be achieved by stimulating small areas of the cortex which are topographically distinct from one another; while, on the other hand, several of those effects may be simultaneously produced by faradisation of a single localised spot. Moreover, the modifications thus induced in the functions of organic life are always associated with co-ordinated muscular movements. If, therefore, we regard the cortical areas as centres localised in the grey matter of the convolutions, we are constrained to admit that one and the same fraction of the cortex may be the centre for a great variety of wholly independent actions, some of which are normally controlled by the will, while others are always involuntary. Rather than accept so improbable an hypothesis, Bochefontaine adopts the reflex theory of Schiff and Brown-Séquard. It is unnecessary, he says, to believe that the grey matter is itself excitable; provided that electrical currents are capable, as they undoubtedly are, of being diffused through it, and thus reaching the fibrous layers of the convolutions, we may explain our experimental results without difficulty. Accordingly, these results afford no convincing proof of the existence of special centres, localised in the grey matter of the cerebral cortex.

Researches on a West African Arrow-Poison.—MM. Gallois and Hardy have succeeded in isolating a poisonous principle, which they call *erythrophlaeine*, from the bark and leaves of *Erythrophlaeum guineense* (Nat. Ord. Leguminosae) and an allied species from the Seychelles, *E. Coumunga*. It exerts a specific influence on the tissue of the muscles, above all on that of the heart. When introduced into the circulation of a warm-blooded animal it causes muscular twitchings, followed by great dyspnoea and cardiac paralysis. In cold-blooded vertebrates, the muscular system is gradually paralysed and relaxed, the nerve-centres and fibres retaining their functional vitality long after the heart has ceased to beat and the voluntary muscles have lost their contractility. The heart fails before the other muscles, simply because it receives a greater supply of the poisoned blood in the same time. Atropia is unable to rouse the heart when paralysed by erythrophlaeine; curare seems to delay the manifestation of the symptoms.

CHEMISTRY AND MINERALOGY.

The Book of the Balance of Wisdom.—Dr. Carrington Bolton, of the School of Mines, Columbia College, New York, has published in the current number of the *Quarterly Journal of Science* an interesting sketch of the Arabic treatise on the water-balance, which was written in the twelfth century (about 1121–1122 A.D.), and bears the above title. For the discovery of this remarkable work science is indebted to the Chevalier Khani-koff, sometime Russian Consul-General at Tabriz, an important city of Northern Persia, who communicated copious extracts from the work, translated into French, as well as a transcript of the original Arabic version, to the *Journal of the American Oriental Society*, and the Society have rendered his notes into English. *The Book of the Balance of Wisdom* treats exclusively of the balance and of the results obtained by the use of that instrument. Its exposition of the principles of centres of gravity, of researches respecting the specific gravity of metals, precious stones, and liquids, shows these Orientals to have possessed a knowledge of physical science, entirely unknown to the ancients, and of a character which cannot fail to excite deep interest. The dedication of the work proves it to have been composed during “the year 515 of the Hegira of our Elect Prophet Mohammed,” and at the Court of the Saljuke Sultan Sanjar, who reigned over a large part of the ancient Caliphate of Bagdad from A.D. 1117 to

1157. The author of the treatise, who speaks of himself in the third person, is “Al-Khazini;” the weight of evidence of Oriental scholars who have examined the question of authorship is, it is stated, in favour of regarding him as the same with Alhazen, the Arab optician and physiologist. Al-Khazini describes at great length several forms of balances, giving details for their construction and use, one attributed to Mohammed Bin Zakariya, of Rai, differing from that of Archimedes by the introduction of the needle. “The Balance of Wisdom,” of Abu-Hatim al-Muzaffar Bin Ismail, of Isfazar, is stated to have had a length of beam equal to four bazaar cubits (two metres), and to have been constructed of iron or bronze; it is remarked, moreover, that “the length of the beam influences the sensibility of the instrument.” In the fifth chapter of the first lecture of this treatise the following passage occurs:—“When a heavy body, or whatever substance, is transferred from a rarer to a denser air, it becomes lighter in weight; from a denser to a rarer air, it becomes heavier.” A table of the specific gravities of metals, given by Al-Khazini, and a similar list drawn up by Abu-Raihan, who lived A.D. 970–1038, and wrote *The Book of the Best Things for the Knowledge of Mineral Substances*, when compared with one of the determinations of density made in the present day, show a very remarkable accordance, “when we take into consideration the coarseness of their means of graduating instruments and the backward state of the mechanical arts at that period.” Other tables of specific gravity of solid and liquid substances, more than forty in number, are also given, and in these instances also the close agreement with modern observation is astonishing. Dr. Carrington Bolton ends his paper with the following summary of the principal propositions contained in this curious treatise on chemical physics:—(1.) *The Book of the Balance of Wisdom* shows the Arabian philosophers of the twelfth century to have entertained advanced views regarding attraction. They recognised gravity as a force, and attributed to it a direction towards the centre of the earth; they also knew that it diminishes with the distance, but erroneously supposed its diminution to be in direct ratio to the distance. 2. They were acquainted with the connexion between the weight of the atmosphere and its increasing density. 3. They understood the theory of centre of gravity, and applied it to the construction of the balance and the steelyard. 4. They made frequent use of the hydrometer, which they inherited from antiquity; and possibly they employed this instrument as a thermometer for distinguishing by variations of density the different temperatures of liquids. 5. They observed the action of capillary attraction. 6. They compiled full and accurate tables of the specific gravities of most of the solid and liquid substances with which they were acquainted. 7. Their system of philosophy was founded on experiment and observation.—It is satisfactory to gain any additional information regarding the history of this book, with which Dr. Draper had already made us acquainted in his *Intellectual Development of Europe*, and to which Prof. Tyndall directed the attention of the British Association in his presidential address. Many will remember a sentence in the American author: “I join,” says Draper, “in the pious prayer of Albazen, that in the day of judgment the All-Merciful will take pity on the soul of Abur-Raihan, because he was the first of the race of men to construct a table of specific gravities.”

Hesperidin.—It has been shown by E. Hoffmann that hesperidin, when treated with acid, breaks up into glucose and a crystalline body, to which he now gives the name of hesperetin (*Ber. Deut. Chem. Gesell. Berlin*, ix. 685). The reaction is as follows:—

By the action of alkalis on the new body phloroglucin and an acid are formed:—

When heated with water to 250° C. in closed tubes it decomposes, a product possessing the odour of vanillin being formed. Hesperidin is found in almost every portion of the plant *Citrus aurantium*, *C. Limetta*, &c., and probably occurs in other varieties of the genus *Citrus*. The hesperidin of De Vry is shown not to be identical with the above glucoside, the compound described by Lehreton and Pfeiffer, but the same with what Hoffmann terms aurantiin, a substance occurring in the flowers of *Citrus decumana* and possessing the composition $\text{C}_{23}\text{H}_{30}\text{O}_{12} + 4\text{H}_2\text{O}$. Murrayin, another allied body, which De Vry obtained in Java from the flowers of *Murraya exotica*, has the formula $\text{C}_{15}\text{H}_{22}\text{O}_{10}$. The composition of limonin, which occurs in the seeds of several species of *Citrus*, has not yet been established.

Tritylene.—A ready means of preparing this gas in large quantities is proposed by A. Claus and Kerstein (*Ber. Deut. Chem. Gesell. Berlin*, ix. 695). They mix with concentrated svrupy glycerine, having a boiling point of 196°–200° C., as much zinc in powder as it can moisten, and then heat the mixture, when a larger amount of gas is given off; 100 grammes of glycerine yield from thirty to forty-five litres of gas, consisting of about equal volumes of hydrogen and propylene. No other gases, apparently, are found. When treated with bromine, about one half of the gaseous mixture is absorbed, forming a yellow oily liquid which boils at 142° C. and possesses the formula $\text{C}_3\text{H}_4\text{Br}_2$.

The Action of Hydrocyanic Acid on Insect Life.—It has been noticed by A. Gautier (*Bull. Soc. Chim. Paris*, xxv. 433) that rabbits which have been poisoned with anhydrous hydrocyanic acid may be restored to life some minutes after death has apparently intervened, by inducing artificial respiration of air containing chlorine. He now finds that insects which have been subjected to the same treatment, and which are apparently dead, can in like manner be restored by the agency of chlorine.

Ozone.—In the *Comptes Rendus*, lxxxii. 157, De Carvalho describes an apparatus for ozonising the unhealthy air of dwelling-rooms; such air is to be passed, by means of an aspirator, through a tube, in which the silent discharge of a Ruhmkorff's coil takes place; and the author is of opinion that air subjected to this treatment will be freed from the organic matter suspended therein and its harmful characters destroyed. To his paper are appended some remarks by P. Thenard, who says he considers it is high time (*il serait grandement temps*) that not only the public, but learned men, should be made acquainted with the erroneous nature of the views generally held respecting the action of ozone on organisms. So far from having a beneficial effect, ozone is one of the most energetic poisons known; and the grave accidents which have happened in his own laboratory do not leave the slightest room for doubt about the matter. While leaving the physiological aspects of the question to M. Arnould Thenard, who has a work on the subject in preparation, he confines himself to stating that under the influence of ozone, even when very largely diluted, the blood corpuscles rapidly cohere, and even change their form, the pulse beats more slowly and in so very marked a degree that in the case of a guinea pig where the beats were nominally 148 per minute they fell to $\frac{1}{30}$ th after the exposure of the animal for a quarter of an hour. In the present day, when medicine possesses in a knowledge of temperatures so excellent an indication of the stage of a disease, it is possible, he considers, that an agent may be found in ozone for controlling them when too high; to

introduce, however, without further consideration ozone into our rooms with the fallacious notion of thereby destroying bad air is highly dangerous. While the most powerful poisons, when rightly administered, constitute some of our best remedies, we must first have learnt how to apply them lest we fall into error as regards the right time for application and the strength of the dose. Thenard then asks the question: Are we sure that there is ozone in the air? Its presence in our atmosphere is determined by the change in the depth of colour of prepared paper. Do we know that there are no other substances in air which can affect the paper in the same way? By passing a current of air through a gas-blast Wittmann obtained air which acted on the prepared paper as ozonised air does: while, however, this air disinfected putrid water without rendering it acid, ozone, so it is stated, did not disinfect it, but turned it acid. Moreover, it is known that ozone cannot exist above 200°, and yet the air modified by Wittmann's method had been exposed to the temperature at which glass softens. Although he is not prepared to deny the possible presence of ozone in the atmosphere, he holds it rash to regard as proved what is still vague and uncertain, and, may be, dangerous. Since the publication of Thenard's paper in January last this important question has not been solved, and in the presidential address which Dr. Andrews delivered before the British Association last month he states: "the chemist can furnish a simple test of this (unhealthy) state of the atmosphere in the absence of ozone, the active form of oxygen, from the air of our large towns."

Mineralogical Notices.—Vom Rath continues his mineralogical notes in *Pogg. Ann.* 1876, clviii. 387. He has examined the phacolite of Richmond, Victoria, and finds the crystals to be rhombohedral and to have the formula:—

11·17 per cent. of the water of crystallisation passes off at temperatures between 40° and 200°, which, curiously enough, is taken up again by the crystals after exposure to the air for twenty-four hours. He describes crystals of sanidin which he met with as a product of sublimation on a doleritic lava from Bellinghen, in Westerwald. The yellow augite of Vesuvius, the crystallographic characters of which he had previously studied, he now finds to have the composition:—

		Oxygen.
Silicic acid	53·2	28·34
Alumina	1·5	
Iron protoxide . . .	2·3	0·51
Lime	23·4	6·68
Magnesia	19·3	7·72
		14·91

99·7

It very closely agrees, therefore, in constitution with the light-coloured varieties from Achmatowak, Orrijärvi, Gulsjö, &c. In the "bombs" of Vesuvius augite presents itself in three different colours, and under equally modified conditions: the black variety forming a constituent of the outer crust of the sanidin rock, the green kind forming especially the walls of cavities, and the light-yellow variety as a constituent of the magma composing the interior. Vom Rath also describes new or rare forms of calcite from Elba and Oberstein, and a remarkable crystal of mica from Vesuvius.

A Conducting Surface for Electrotypes.—P. Cazeneuve (*Comptes Rendus*, lxxxii. 1341), discusses the different materials the use of which has been proposed for the formation of a good conducting surface for objects on which it is desired to form a metallic deposit by aid of the battery, especially such as have a frail structure. He considers the objections raised against the reagents already in use, and recommends a 10 per cent. solution of nitrate of silver in methylated spirit, to which 3 per cent. of nitric acid has been added.

When thoroughly saturated with this liquid the object is wrung as dry as possible, exposed to the action of strong ammonia for a few seconds, and then placed in the vapour of mercury. It is then ready for immersion in the copper bath. By this method he has succeeded in covering flowers, leaves, insects, &c., with a perfectly regular metallic layer.

In his presidential address to the British Association this year, Dr. Andrews speaks of the fall of meteorites at New Concord, in Ohio (May 1, 1860) as "the most remarkable fall on record." The largest stone which fell on that occasion weighed forty-seven kilog., and the total weight of the masses discovered is estimated by Buchner to have amounted to 350 kilog. As regards the size and weight of the masses, they were exceeded at the fall of Knyahinya, in Hungary (June 9, 1866), where the largest stone weighed 293·3 kilog., and the total weight of material collected is stated to have been from eight to ten cwt. In point of composition the New Concord stones have been shown to contain no other constituent minerals than such as are present in a large class of meteorites. When we regard the composition of these bodies in respect to peculiarities of chemical constitution: the carbonaceous meteorites of Kaba, Kold Bokkeveld, Alais, Orgeuil, &c., on the one hand, and the siderolites of Rittersgrün, Breitenbach, and Steinbach, on the other, containing as they do a new form of silicic acid, or that of Busti enclosing spherules of calcium sulphide; or, again, when we consider their physical characters, such as that of the stone which fell at Dhurmsala in India, which was icy cold, or of those which fell at Hessel, in Sweden, some of which were exceptionally minute and accompanied with a substance containing 51·6 per cent. of carbon, we can hardly allow to pass unchallenged the statement that the New Concord meteorites occupy the first place in point of interest. Dr. Andrews also states that Apjohn determined the presence of vanadium "in a meteoric iron." Apjohn found a trace of this metal in the stone which fell at Adare (September 10, 1813). This stone contains 19 per cent. of nickel-iron; but Apjohn inclines to the belief that the trace of vanadium is present as an oxide associated with the chromite constituting 1·75 per cent. of this stone. Dr. Andrews, moreover, leads us to suppose that as regards the metallic masses of meteoric origin with which we are acquainted "no record exists of their fall." The descent of at least seven iron meteorites has, however, been witnessed, and in one instance in the British Islands.

FINE ART.

THE EXCAVATIONS AT OLYMPIA.

Die Ausgrabungen zu Olympia. I. Uebersicht der Arbeiten und Funde vom Winter und Frühjahr 1875-1876. Herausgegeben von E. Curtius, F. Adler, und G. Hirschfeld. (Berlin: Wasmuth, 1876.)

Just as the second campaign at Olympia is about to open, we receive from Berlin this most interesting record of the first. Much has been said, and said, in some quarters, with a very unreasonable asperity, on the reserve which the promoters of the undertaking have been supposed to maintain concerning its progress and results. The present publication is headed with a note intended, it would seem, as a reply to these strictures. Of course, say the authors, it has been from the first a part of their plan to give the world a mature and adequate scientific account of the Olympia discoveries when they should be complete. But in view of the universal interest awakened by the early successes of the enterprise, it has seemed

impossible in the meantime to withhold its fruits from the just curiosity of students. In order, therefore, to give these fruits a proper measure of provisional publicity, it has been resolved—in addition to the monthly official reports and to notices of inscriptions, &c., in the *Archäologische Zeitung*—to issue each summer a portfolio of photographs and text in illustration of the preceding winter's operations. The portfolio now before us, illustrating the first season's work, contains twenty-nine sheets of illustrations and twenty folio pages of text; it will be followed by another every year until the exploration is complete; and it is hoped in future years to bring out the publication at the beginning instead of, as this time, at the end of summer.

One plate, which the reader should consult first though it stands last in order, gives a thoroughly serviceable sketch plan of the scene of the operations and the adjacent ground. Another exhibits facsimiles of some of the more important inscriptions. The rest are all photographs executed on the spot, just before the suspension of the works last spring, by the brothers Romaidis of Patras. First of all comes a long folded sheet, showing, in three parts, a general panorama of the valley from a slight elevation on the east side of the Kladeos; this, together with the aforesaid plan, and the explanations on pp. 13, 16, and 17, will give the student at home, what no description could give him, an effective general conception of the site. Perhaps it would have been well to add another such panoramic view taken from a different side—say, looking south and west from the slope of Kronion. The next four sheets, numbered iv.-v., vi., vii., and viii., give us views at close quarters of the actual excavations on the south and east sides of the temple of Zeus. At first sight, in the photographs as in the reality, one seems to have before one here a mere jumble of fallen drums and wrought masses without order, imperfectly to be distinguished from the soil about them; but a little examination, again with the help of Dr. Hirschfeld's explanations, will make this chaos intelligible. Next we come to the statues themselves, and here the quality of the photographs varies greatly. On the whole they are creditable to the Greek provincial artists by whom the negatives were, under no small difficulties, taken; although, like all the productions of this indispensable but exasperating art, they render the originals sometimes with unaccountable omissions and vacuities, sometimes with perverse exaggerations. The student who has not had the good fortune to see the works themselves will need to see casts from the moulds now in Berlin before he can thoroughly supply deficiencies, and make allowances for what would otherwise be unsatisfactory or misleading, in these photographs. Plates ix., x., xi. and xii. show from four different points of view the now famous *Victory of Paeonios*. Of these Nos. x. and xii. are satisfactory, and give a really adequate idea of the rhythmical motion and rich flow of line in this noble fragment; in the other two views, the figure does not seem to have been set at a sufficiently forward inclina-

tion. Nos. xiii. and xiv. are front views of the colossal female torso, to which, from its general resemblance to the Giustiniani Vesta, its discoverers have given the provisional name of the *Hestia-Torso*.

Coming to the pedimental and other fragments, Dr. Hirschfeld's notes to the plates give exact and valuable information on the date and place of the discovery of the several sculptures, but with only enough description for purposes of reference, and without entering at all into questions of style. Will the reader, therefore, acquit me of presumption if I venture to refer, in the absence of a more authoritative account, to my own imperfect descriptions made on the spot, and published in the *ACADEMY* of April 22 last? Plate xv. represents adequately enough the male colossal torso, No. 1 on my list. The colossal arm, my No. 2, is not figured. Plate xvi. exhibits my Nos. 3 and 4 united, and forming, as it was apparent they would do, one male figure. Plate xvii. and xviii. represent my Nos. 11, 12, and 13, fitted together and forming the head and body of a seated aged man—the river god Kladeos as he was at first called; but since this attribution is now put forward only in a very doubtful form (*Sitzender Mann—Flussgott?*) it is to be presumed that the authors have seen reason to call it in question. The second of these two photographs is not good. The next sheet shows the head of the same figure from two different points. It is remarked by the authors that the thumb and remaining fragment of hand attached to the beard do not belong to the right hand of the figure itself, but to the left hand of some other personage (Daumen und Stück der Innenfläche einer fremden linken Hand). Plates xx. and xxi. give two views of my 8 and 9, the parts of one kneeling figure, put together. Plate xxii. is, perhaps, my No. 6, placed reclining instead of erect as we saw it, and now discovered to fit with the pair of legs figured on Plate xxix. a (my 14), and identified as belonging to a river-god of the pediment angle. If I am mistaken in this identification, then my No. 6 is missing altogether. Plate xxiii., in which the modellings of the original are almost lost, is my No. 7; the authors accept it as one of the grooms of Oenomaos (*Torso eines Hippokomen*). xxiv. and xxv.—the latter a good, the former a very bad photograph—give two different views of the spirited figure in the act of one about to rise (my No. 5) which was at first identified as Myrtilos, but which is here described simply as a *Sitting Boy*. Plate xxvi. gives what seems an excellent representation of a very important fragment which I had not the luck to see; it was found during the clearance of the area of the temple itself, two or three weeks after the time of our visit. It is one of the metopes of the ceiling, and is more complete than any of the same series found long ago by the French expedition and conveyed to Paris. The subject is Herakles receiving the apples of the Hesperides from Atlas. Herakles stands relieving Atlas for awhile, with his arms bent back over his bowed head, and a cushion doubled in to the bend; Atlas faces him, holding out the apples which he has been away to fetch; and behind Herakles stands Sterope with one arm raised, helping

him to sustain his burden. This fine composition of three erect figures is architecturally conceived; no orb, or other representation of the burden, being introduced in it, but the bent arms of Herakles touching the top of the metope, and the cornice above being meant to be conceived as the load which he bears up. If the reader wishes to realise that similarity of style, which equally struck Mr. Newton and myself, between the sculptures of the metopes and those of the east pediment, the photograph of this new metope will partly enable him to do so. He can recognise in the conception of this action the same frank directness and energetic naturalism, in the modelling of these flesh parts the same vigour and accomplishment, as in the sitting and kneeling figures of the pediment (Plates xx., xxi., and xxiv., xxv.); in the treatment of the hair and beards the same or a greater decorative generality as in the head of the river-god; and, above all, in the draperies of the female figure the same quality which is common to the draperies of all the pedimental figures. Nowhere among these Olympia marbles, except in the *Victory*, do we find draperies either rich and lovely in themselves, or subtle in the expression of what is under them. Compare, for example, the folds about the shoulders and breast of Sterope, on plate xxvi., with those on the left shoulder or about the loins of the kneeling pediment figure (xx., xxi.), and judge if there is not in both the same inferiority, a thick heaviness, a poverty, and a feeling as though the sculptor had studied his effects from models wearing thicker and coarser textures than those which lend their charm to the draped figures of the ripe Athenian school.

Prof. Curtius, in his section of the preface, which is shorter than one would have hoped for, says with justice that it is not yet time to put forward positive judgments on differences of style, or other results in the history of art arising from the new discoveries. But neither is there reason for quite ignoring what may be inferred from first impressions. And Prof. Curtius, in his brief summary, uses one or two general phrases which do seem to ignore such inferences, and to imply judgments one would hardly have expected. For instance, referring to the *Nike*, and speaking of Paenios, he says:—"A scholar of Pheidias, of whom we had nothing but the name, now stands before us as a master whose art we know by an important monument, precisely dated, and preserved with a dedicatory inscription and one of the artist's own." This sentence seems either to pass by or to reject the theory of Prof. Brunn, that Paenios, at any rate when first he came to Olympia, was in no sense a scholar of Pheidias at all, but an artist trained in the traditions of an independent school; a theory which is certainly strengthened by the character of the sculptures of the east pediment, supposing we are to accept them as the work of the same master. Again, what are we to understand by *genau datirt*? I should have supposed that there was still room for ambiguity concerning the exact date of the *Victory* dedicated by the Messenians of Naupaktos; unless, indeed, we are definitively to associate it with the affair of Sphakteria, rejecting the other account which associ-

ates it with an engagement, not distinctly to be identified, in Akarnania. A few lines farther on we read as follows:—"Then, too, the local school of sculpture, which was employed upon the temple before the arrival of Pheidias, is presented to us in full evidence for the first time in works so distinguished as the Atlas metope and the so-called Hestia torso." This sentence seems to imply two assumptions of which the truth is by no means fully established: first, that the metopes were really the work of a local Peloponnesian school, and not—as Prof. Brunn thinks, and as the new discoveries, I should again say, confirm—of the same school (and that not a Peloponnesian one) as the sculptures of the east pediment: next, that the so-called Hestia has qualities in common with the metopes, which it has not equally in common with the pedimental fragments. However, the time to criticise the views of Prof. Curtius will be when that illustrious scholar has put them forth explicitly and not merely by implication.

The remaining sections of the preface are contributed by Dr. Hirschfeld, who acted as head of the expedition during its first months until fever compelled him to a change of climate, and has now returned to his post; and by Dr. Adler, who is especially concerned with the architectural part of the investigations, and who paid a visit to the site last April. These sections, giving in a brief shape a lucid and exact summary of the actual state of progress of the works, and of the conclusions which can thus far be drawn as to the architectural details of the temple and the changes which have befallen the site, complete a publication for which the authors deserve all our gratitude, and to the promised continuance of which every student will look forward with eager interest. SIDNEY COLVIN.

THE RAEURN EXHIBITION.

THE exhibition of the works of Sir Henry Raeburn, R.A., which opened last week at the Royal Academy Galleries in Edinburgh, is of great importance, both from an historical and an artistic point of view, in the opportunity it affords of studying the method of one of Scotland's greatest artists, and at the same time becoming familiar with the lineaments of some of the greatest men that Scotland has produced. The treasures here displayed have been lent by many noblemen and gentlemen: among others, by the Duke of Buccleuch, the Marquis of Bute, the Marquis of Lothian, the Earl of Wemyss, the Earl of Hopetoun, the Earl of Rosebery, Lord Balfour, Lord Moncreiff, and others.

Two previous exhibitions solely of Raeburn's works have been held in Edinburgh—the first in the artist's studio, 32 York Place, in 1824, the year after his death; the second in the University Buildings, on the occasion of the meeting of the British Association in Edinburgh in 1850—but on both of these occasions the number of portraits exhibited was comparatively small. On this occasion there are nearly 400 portraits exhibited, and, large as is this number, they are only a portion of the pictures which emanated from the painter's studio.

It is more than half a century since Sir Henry Raeburn died, but his reputation, which was very high in his lifetime, is still rising, and his pictures are now much sought after. He was born on March 4, 1756, at Stockbridge, one of the suburbs of Edinburgh, where his father was a manufacturer, and his parents died when he was little more than six

years old. At an early age he gave proofs of taste and ingenuity in his profession of goldsmith, to which he was apprenticed, and showed a great bent for drawing, which first took the form of caricatures of his comrades. Having devoted his leisure time to miniature painting, he made such progress that he at length devoted his whole time to painting portraits. He was self-taught—as one of his biographers says: “There is no ascertaining that he ever received any direct instruction in the mysteries, or even in the manual operations, of his art”—and he early acquired reputation as a portrait-painter. At the age of twenty-two he married a young lady of fortune under rather romantic circumstances (she had gone to his studio to sit for her portrait, and artist and sitter seem both to have fallen in love), and afterwards proceeded to London, where he worked for some time in the studio of Sir Joshua Reynolds. Acting on his advice he went to Rome, with introductions to various artists—among these, Pompeo Battone, the favourite painter in Rome at that time. Having spent two years in Italy, he returned to Edinburgh, where he followed his profession till his death on July 8, 1823.

Raeburn seems from the first to have looked closely at the works of Sir Joshua Reynolds, and his style was modelled on that artist's, possessing many of those qualities which Reynolds carried so far, particularly breadth. He produced his effect by massing the lights and shadows and keeping them as far as possible distinct, painting with a sharp touch in a low tone of colour. One of the strong points of Raeburn, besides his colouring and breadth of handling, was his success in penetrating a man's character and transferring to canvas the expression of the best qualities in his sitters; and this, to a great extent, he did by his pleasant manner and admirable conversational powers. Thus Tennyson in one of his idylls:—

“As when a painter, gazing on a face,
Divinely thro' all hindrance finds the man
Behind it, and so paints him that his face,
The shape and colour of a mind and life,
Lives for his children, ever at its best
And fullest.”

But this power of catching at the salient points of a face with the first strokes of his brush makes the work in some few instances, from the thinness of texture, look somewhat crude.

While depicting with much felicity the grace and loveliness of many high-bred beauties of his time, and the ingenuous innocent glance of childhood in the comparatively few instances of the younger generation who sat to him, he was especially successful in his portraits of men, giving the characteristic expression in a simple and effective manner, his style being admirably suited for the delineation of the marked physiognomy of his countrymen.

His method of work is thus described by one who sat to him:—

“He spoke a few words to me in his usual brief and kindly way, evidently to put me in an agreeable mood; and then, having placed me in a chair on a platform at the end of his painting-room in the posture required, set up his easel beside me with the canvas ready to receive the colour. When he saw all was right, he took his palette and his brush, retreated back step by step, with his face towards me, till he was nigh the other end of his room. He stood and studied for a minute more, then came up to the canvas, and, without looking at me, wrought upon it with colour for some time. Having done this, he retreated in the same manner, studied my looks at that distance for another minute, then came hastily up to the canvas, and painted a few minutes more. I had sat to other artists. Their way was quite different: they made an outline carefully with chalk, measured it with compasses, placed the canvas close to me, and, looking me almost without ceasing in the face, proceeded to fill up the outline with colour. They succeeded best in the minute detail; Raeburn best in the general result of the expression: they obtained by means of a multitude of little touches what he found by broader masses: they gave more of the man; he gave most of the mind.”

Some of the most celebrated men whom Scotland has produced, in literature, science, and art, are represented in the gallery, and there is quite a galaxy of worthies learned in the law, while many theological stars add their glory to the walls. Sir Henry Raeburn himself looks out from the canvas facing the spectator as he walks to the furthest room—a fine thoughtful face with bright eye and firm mouth, the chin resting on his hand. Around him, among the many whose lineaments he transferred with a master's pencil, may be mentioned Sir David Brewster, Francis Horner, Sir Walter Scott, the Rev. John Thomson of Duddingston, Henry Mackenzie (author of *The Man of Feeling*), Lord Cockburn, Prof. Playfair, Francis Jeffrey, Lord Meadowbank, President Dundas, Viscount Melville, Prof. Gregory, Viscount Duncan, Prof. Wilson, Robert Sym (the original of “Timothy Tickler” in the *Noctes Ambrosianae*), Lord Justice-Clerk Braxfield, Lord Abercromby, Dr. Adam Ferguson, Principal Robertson, and many others.

While the pictures are as a whole admirable whether as regards colour, breadth of effect, or vigorous handling, some of them are especially noticeable for their artistic excellence. Among these are the half-length of *Alexander Adam, LL.D.*, Rector of the High School of Edinburgh, a fine example of breadth and simplicity of treatment; the youthful-looking *William Blair of Arontoun*, Advocate; and the boyish face, ingenuous and intelligent, of *William Ferguson of Kilrie*. The full-length portraits of *Patrick, Earl of Dumfries*, and *Flora, Countess of Loudon*, are excellently grouped, and the proud, amused expression of affection most happily rendered.

A very charming picture is the full-length of *Lady Raeburn*, taken when somewhat past her meridian, in a loose-fitting costume, with folded arms leaning against a garden wall—a well-featured face, with a kindly, intelligent look. Of the many lovely female faces on the walls, we may mention *Lady Grant Suttie* and her two daughters *Margaret* and *Janet, Mrs. Vere* of Stonebyres, *Mrs. Oswald* of Auchencruive, *Lady Mackenzie* of Coul, and *Lady Mailand*, wife of Admiral Sir Frederick Maitland, to whom Bonaparte surrendered on board H.M.S. *Bellerophon*, and whose portrait is also here; as is also that of *Admiral Lord Duncan*, full of life and expression, the hard-lined face and resolute look bespeaking the hero of glorious Camperdown.

An acknowledged fine portrait of *Sir Walter Scott* is the half-length on which Raeburn was engaged immediately before his last illness, in which there is a depth of expression in the face that one would scarcely expect to see in such a yeoman figure. Another likeness of Scott is the famous Bowhill full-length, painted in 1810 for Archibald Constable, the publisher, and acquired by the Duke of Buccleuch in 1826, which is perhaps the best portrait of the great novelist that was ever painted. He is represented in dark dress and Hessian boots, note-book and pencil in hand, sitting on a rock with his dog Camp at his feet, and Hermitage Castle and the mountains of Liddesdale in the background.

A most striking figure is that of *The Macnab*, chief of the clan, in the costume of an officer in a Highland regiment, stalwart and martial-looking, his stern features illumined with the kindness of age, his native heath and hills forming a pleasing bit of landscape. Another Highland chieftain is *Macdonnell of Glengarry*, represented with gun in hand standing in his entrance-hall, the walls of which are ornamented with shield and swords. A full-length of *Dr. Nathaniel Spens* represents that redoubtable physician in the uniform of a Royal Archer, with bent bow about to pierce his unseen adversary, while a Scotch thistle blossoms rather ostentatiously at his feet.

The full-length of the fourth *Earl of Hopetoun* is an admirable example of Raeburn's management of colour, the mass of scarlet being so treated that it harmonises perfectly with the other parts of the

picture. Also somewhat remarkable in colour are the half-length of the *Right Hon. T. F. Kennedy of Dunure*, in a red striped dressing-gown and a white night-cap on his head, and that of *Hugh Blair, D.D.*, Professor of Rhetoric and Belles Lettres in the University of Edinburgh, in a crimson robe, his head being adorned with a curious black cap.

The comparatively few portraits of children in the gallery give abundant evidence that the artist could treat them with felicity equal to those of the many lovely women and men of mark whose features he transferred to canvas. Most natural in expression, the details showing much care in manipulation, are the portraits of the children of the *Right Hon. Sir John Sinclair* of Ulbster, also the group of *Mrs. Ferguson* of Raith and her two children; while in a somewhat different style is the group of *John Tait* of Harrieston and Cum-loden, amusing his grandchild, the ex-sheriff of Perthshire, with his watch.

That Raeburn could paint animals as well as men is shown in the numerous equestrian portraits on the walls, in which the horse is generally drawn standing beside his rider. One of the finest examples of the class is that of *Professor Wilson*, the famous “Christopher North” of *Blackwood*, in the spring-time of life, his lithe figure as he stands beside his horse in a firm yet easy posture, full of manly beauty, and the decided expression on his face a sign of his mastery over the impatient animal.

Among the whole of the portraits in the gallery there are few that do not possess much merit. They are in an admirable state of preservation, though one or two have succumbed somewhat to the influence of time, and, alike from the subjects and the artistic excellence which they evince, possess peculiar attractions for all who take an interest in Scottish art.

STEWART ROBERTSON.

NOTES AND NEWS.

AN exhibition of illuminated MSS. has recently been opened in the rooms of the Liverpool Art Club. The examples on loan (of which there is an excellent catalogue) comprise nearly every school of illumination, and furnish to the artist and antiquary a continuous series of pictures of the manners, customs, and dress of our forefathers, as well as illustrations of religious art. Among the contributors are the Archbishop of Canterbury, Lord Derby, the authorities of Stonyhurst College, Messrs. Bowes, Newton, Quail, Walker, and others. The committee of the Liverpool Free Library contribute “Books of Hours” and a sacred book of the Buddhist priests of Burmah, written in square characters on lacquered silk. It would be impossible to particularise the many interesting examples, but there are several which distinctly offer unusual features in the border patterns, in the Scripture scenes, in legend and fable, thus proving of great service to the connoisseur and dilettante. As the Social Science Congress is to comprise an Art Section, this collection will, by the liberality of the club, be open to the members of that Conference. The periodical exhibition of artistic works is one of the features of the club, whose members take every pains to ensure excellence and rarity in the objects displayed.

THERE is now on exhibition at South Kensington a collection of ancient engraved gems and a few other objects of classical antiquity, lent by the well-known collector Mr. Francis Cook. It is a small collection, and, though interesting in many respects, might with advantage be made smaller. For example, it contains several imposing amethysts which are not above suspicion. One represents the familiar motive of Victory writing on a shield; another the no less familiar bust of Silenus; while a third, which is cut in the form of a scarab, presents a male figure sitting to the front on the ground with his hands on his left

knee, and his head resting on his hands. It is very bold, and curiously, also, there are pieces of the drawing left out entirely, such as, one would suppose, no modern engraver would dream of. But when the modern engraver becomes a forger he dreams of more things in his philosophy than one gives him credit for at first. Really beautiful gems are very scarce anywhere, and, considering how much of real beauty is to be met with among other classes of ancient art, it is not strange that the engraved gems are now so generally abandoned to strictly antiquarian taste. Among the gems in Mr. Cook's collection which can hardly be called antique we noticed a carnelian intaglio of Leander swimming; a head of Pluto apparently cut through agate and signed **ΑΥΑΟΥ**; a carnelian intaglio of a warrior signed **ΤΕΥΚΡΟΣ**; a portrait of a Roman empress on an amethyst of very much the same appearance as the amethysts mentioned above; a large carnelian of a Satyr rushing wildly as in the Blacas cameo in the British Museum. Among the cameos is a small fragmentary head, probably of Claudius, in sardonyx, which looks very prepossessing in its fresh clean workmanship and simplicity of design. Another cameo in chalcedony, representing a Victory, but also fragmentary—wanting the legs from below the knees—strikes one as a study from the motive which occurs in two pastes in the British Museum collection. That it has not the charm of an original conception, such as they have, is very certain. Perhaps the most valuable among the objects of classical antiquity exhibited by Mr. Cook is the bronze mirror with stand, in the form of a female figure, in the familiar attitude perpetuated in the Roman goddess Spes. Beside her head swing two winged female figures in long drapery. It is called "Etruscan," but resembles rather the mirrors found in Greece, and on what authority its date is given—conjecturally, it is true—as 300–200 A.C. (which we suppose means B.C.), we cannot imagine. The work, as has been said, is closely like archaic Greek, and would naturally be assigned to not later than 500 B.C.

GERMANY is still gratifying her national vanity with the erection of war-monuments. One was unveiled last month at Augsburg with the usual ceremonies. The Augsburg *Tageblatt* describes it as "noble and perfect beyond description," but probably some allowance must be made for the enthusiasm of patriotic journalism. Most of the German monuments of this class are owned to be miserable failures. The present "perfect" work is from the design of Prof. Zumbusch, of Vienna. It represents a young warrior boldly placing his foot upon various trophies. It is cast in bronze.

SEVERAL important auctions of prints are announced to take place this month in Germany. Among others, Herr Lepke, of Berlin, will sell a rich collection of Rembrandt's etchings. Herr Aumüller, of Munich, offers a large collection of both German and Italian engravings, many of them first impressions and of the highest interest; and Herr Börner, of Leipzig, a celebrated collection of etchings by the chief engravers of the present day.

THE monument to Sylvain van de Weyer was inaugurated last week in his native city of Louvain, in presence of the King and Queen of the Belgians. The monument is a simple statue of the eminent statesman, and is said to be an excellent likeness. A medal was also struck on the occasion inscribed "La Ville de Louvain à Sylvain van de Weyer."

A LONG article on our English painter Bonington appears in the *Gazette des Beaux-Arts* this month. It is true, as the writer, M. Paul Mantz, remarks, that Bonington is but little known in his own country, nor is this to be wondered at, for in point of fact he merely did us the honour of being born here, and was entirely French by education and sympathies. The reason of this French education has never been clearly stated in

his English biographies. It appears that his father, who was at one time a painter in Nottingham, was seized at a later period with what the inhabitants of that town called "the bobbin-net fever," and went over to Calais with a certain James Clarke, in 1816, when his son was fifteen years of age, to establish a manufactory for bobbin-net there. From thence he went to Paris, and the treasures of the Louvre were revealed to the eyes of his artist son, who had from his earliest years shown a wonderful artistic precocity. In 1819 he entered at the Ecole des Beaux-Arts, where Delacroix knew him, and has described him as "un grand et beau jeune homme." Unfortunately, his brilliant career was of short duration. He died at the age of twenty-six, after having exercised, says M. Mantz, "pendant six ans la douce autorité d'un chef d'école" in France. An etching from his painting of *Boulogne*, and an admirable portrait of a wrinkled old school-mistress, represent his art in the *Gazette*. Under "Les Artistes Contemporains" M. O. Timbal continues his excellent biographic study of Gérôme, and a Goupil reproduction is given of one of his drawings. M. Champfleury describes "Cinq violons de faïence;" M. Demay deals with "Le type chevaleresque" in the seals of the national archives; M. A. Darcel continues his elaborate account of the tapestry exhibition of the Union Centrale; M. Goussier describes various sculptures newly arranged in the Salle de Michelange in the Louvre; and Sig. Gaetano Milanesi, the eminent Italian archivist, contributes some entirely new documents which he has discovered relating to the *Juste* family, whose history has before been traced at great length by M. Anatole de Montaiglon in the *Gazette*.

THE colossal memoir in the *Compte-Rendu de la Commiss. Arch.* of St. Petersburg with which Stephani accompanied his publication of the now celebrated Kertch vase has provoked a great deal of hostile criticism in Germany, both as regards the method followed by him in explaining the vase and the correctness of the result. He had described his method as "inductive," and had claimed for it a general application to classical archaeology in place of the now not uncommon practice of allowing artistic representations to explain themselves. The new method was subjected to a detailed and in many points damaging criticism by Petersen in the *Archäologische Zeitung* last year. But the main result still remained—viz., that the central group on the Kertch vase was a study from the central group on the western pediment of the Parthenon, of which we have Carrey's drawings made previous to its destruction by the Venetian bombardment. Even before then it had been considerably injured, and it was hoped that this previous damage might be restored in the imagination by the vase discovered in the Crimea. But now Brunn, whose authority in this matter is entitled to the highest consideration, comes forward with a paper (*Sitzungsberichte* of the Bavarian Academy) admitting that the vase represents the contest between Athena and Poseidon on the Acropolis of Athens, as did the pediment in question, but pointing out that the vase represents a later and entirely different stage of the contest from that of the pediment—viz., the stage which succeeded the victory of Athena when Poseidon, enraged at his failure, threatened to inundate the coast of Attica. It is quite clear that nothing like a strict agreement can be found between the vase and the drawings of the pediment, and that, therefore, the former must be set aside as useless for the restoration of the latter. On the other hand there is every appearance of the vase being a loose study from the sculptures of the Parthenon, selected and adapted at the caprice of the vase-painter. The little rough sketch of a temple which he has placed on the vase seems to be nothing more nor less than his means of saying, "my design has been taken from this temple," and if taken from a temple it could only have been, so far as we know, from the

Parthenon. From this point of view it seems absurd to identify this sketch with the neighbouring Erechtheum, a proceeding which, under any circumstances, looks like a last resort. But Brunn, instead of taking this view, considers that the vase represents a complete scene—not a scattered reminiscence, as we propose—and very naturally he finds it hard to discover an original model from which it could have been copied. Poseidon's revenge upon Attica may have been a satisfactory enough subject for poetry or even for a drama, but for a work of plastic art it certainly does not appear to be very fitting. The secondary characters on the vase become local personifications in accordance with Brunn's theory of the secondary characters in the pediments of the Parthenon.

THE *Art Monthly Review* has now reached its ninth number, and promises well to hold its place among the various art-publications of the day. It gives this month, beside other illustrations, a second large photograph from Blake's wonderful watercolour designs to *Paradise Lost*. *Satan calling up his Legions* is one of the grandest conceptions of the whole series, more spiritually powerful than even the *Rebel Angels*, given last month. Lovers of Blake's art will doubtless be glad to have these faithful photographic reproductions of it. The text of the *Art Monthly* seems chiefly devoted to reviews of art-exhibitions, both English and foreign. The well-known writer Mr. T. Adolphus Trollope contributes to the current number an interesting account of the studio of W. W. Story in Rome, and of the monumental figure of America which that distinguished sculptor has just accomplished. "I have seen many statues of America," writes Mr. Trollope:—

"they are generally more or less (excuse the vulgarity) *bumptious* in expression, or at least melodramatic. There is not a shade of either quality about Mr. Story's America. . . . She looks out and forward as one conscious of the unbounded career before her to be run, and is instinct with the vigour undisturbed by semblance of effort, and purpose unfurled by taste, and confidence unalloyed by boasting, which are needed for the running of it."

Mr. Trollope also describes two remarkable Shaksperian embodiments, a *King Lear* and a *Lady Macbeth*, which are still in the clay in the poet-sculptor's studio.

A LONG article is devoted to Verdi, and an excellent portrait given of that popular composer, in last week's number of *L'Art*. That enterprising and admirable journal has apparently met with much of the success that it deserves, for it has just begun its seventh folio volume. The great difficulty for contributors with moderate-sized libraries is to know how to make room for such a bulky publication.

A CORRESPONDENT writes to propound the theory that the decidedly plain Madonna in Michel Angelo's well-known circular *Holy Family* at Florence is a portrait of the artist's own mother, painted, not from life—for she died some years before the date (1503) at which Michel Angelo is supposed to have executed this picture for his friend Angelo Doni—but from a drawing made by her son at some earlier period. This original study, according to our correspondent, is still in existence in private hands in England. He describes it as a bust-portrait of a woman with features bearing a striking resemblance to those of the Florence Madonna, and of much the same age. The hair is treated in the same style as in the profile-portrait assumed to be of Vittoria Colonna, and for this reason this portrait also has been called by her name, but it is much more probable that it represents the mother of Michel Angelo, for, strange to say, a distinct likeness can be traced in it to Michel Angelo's own portrait as given in the second edition of Vasari. The same type of head also occurs in the unfinished painting of the *Entombment* assigned to Michel Angelo, in the National Gallery. And here again the head of Joseph of Arimathea closely corresponds to the head of St.

Joseph in the Florence *Holy Family*. It seems not unlikely, therefore, that these two types of heads, which evidently could not have been chosen for any particular beauty, and yet were often repeated by Michel Angelo, were those of his own father and mother, and thus endeared to him by affection.

THE second part of the *Mittheilungen* of the German Institute at Athens contains the original Latin autobiography of John George Transfeldt, a native of Strassburg (born 1648), who on being taken prisoner by the Tartars at Batow in 1672 was sold into slavery. Two years afterwards we find him at Nauplia, a rowing slave in the galley of a Turkish merchant, which, pursuing its voyage, is wrecked off the coast of Attica. He escapes and reaches Athens, where he found shelter at first with the Venetian consul and afterwards in the cloister of the Capucines, remaining there over a year, during which time he became acquainted with Giraud, of Lyons, then acting as English consul at Athens, at whose house he appears to have met Giraud's townsman, the celebrated Dr. Spon, when, accompanied by Wheler, he arrived in Athens in February, 1676. Transfeldt, during his stay in Athens, was enthusiastic in the study of its ruins, but of his notes and observations very little of importance now remains. Next he went to Aleppo and settled there, occupying himself in collecting coins to be sent home to Spon at Lyons, and continuing to do the same after Spon's death for J. P. Pigord and Cuper. In Aleppo he wrote his autobiography, and sent it, in 1694, to Cuper. Four years after, he died at Aleppo, leaving his papers in disorder. They appear to have been sent to his brother in Dantzic and have not since been heard of. The autobiography passed to the library of the Hague. The present transcript, with introductory notice, is by Prof. Michaelis, by whom a sketch of Transfeldt's life and adventures was lately communicated to *Im Neuen Reich*. The same number of the *Mittheilungen* gives a new transcript of the inscription of Iulis in Keos, in which the law concerning burial is laid down, showing in some points that the limitations of expense imposed by Solon in this matter extended beyond Athens—e.g. that a corpse should not be allowed more than three articles of dress. A peculiar interest attaches to this decree from the fact of its coming from the island of Keos, the inhabitants of which were almost proverbial for their views about death, burial, and mourning. In the inscription it is ordered that the vases used for libations at the tomb shall be carried away, but had this been the case in Athens we should not probably have seen so many fine *Lekythi* in our museums as now. On the side of the stone is a decree referring to the celebration of the anniversary (*ῥὰ ἐνιαύσια*) of a death. Bergk, who published this inscription in the *Rhein. Mus.*, 1860, p. 467 fol., regards *ἑνιαύσια* as a general festival in commemoration of the dead, held annually. This decree Köhler assigns to the middle of the fourth century B.C., while the inscription on the face of the stone he places, on palaeographical grounds, in the latter half of the fifth century B.C. A third article in the *Mittheilungen* is O. Benndorf's continuation of remarks on the history of Greek art, dealing at present only with the series of figures of Gauls, Amazons, and Persians, which Brunn identified as part of the gift of Attalos to the Athenians. Benndorf adds one more to the series from the Museum of Aix. We may add that in the British Museum are two small unpublished bronze figures of a wounded Gaul and a wounded Amazon which are obviously ancient reproductions of the same class of figures.

THE bust of Commodus, one of the most interesting of the recent discoveries in the excavations at Rome, is the subject of a long article contributed by M. Charles Gindriez to the *Port-folio* this month. This bust has lately been placed in one of the new galleries of the Capitol,

where it appears to have given rise to many reflections in the mind of M. Gindriez, not only upon the art, but also upon the life, of the Roman world under the Empire. "Were this composition," he writes, "a mere artist's fancy without a history and without a date, criticism could scarcely fail to discover the date of it," so curiously does it embody "the customs, mind, and tendencies of the end of the second century." But more than this, the examination of this work, according to the speculative writer, "brings us involuntarily to our own time, because there exists the strangest affinity between the Roman civilisation of the second century and ours." Two effective little etchings, called *Wrecked* and *Saved*, by Mr. Percy Thomas, taken, we are told, from a real incident which happened off the coast at Littlehampton, and an etching from Reynolds's *Robinetta* in the National Gallery, are given.

THE *Nagasaki Rising Sun* states that the Japanese Government has sanctioned the holding of an exhibition of native and foreign "curios" and works of art, to be held at Nagasaki in the spring of next year.

MR. OULLESS is now engaged upon a portrait of the Recorder of London.

THE plan of the decoration for the new Town Hall at Manchester is, we believe, not yet finally decided. It is said that Mr. Waterhouse, the architect of the building, is disposed to favour the claims of two Belgian painters whose talent he considers to be peculiarly fitted for the execution of paintings that are destined to enrich the effect of Gothic design. There is ample scope, however, in the building for the expression of more than one style of painting, and we may venture to express a hope that the whole of the available space may not be given up to the particular kind of conventional decoration which is popularly supposed to enjoy the approval of modern architectural taste. There is a better chance now than there was at the date of the paintings at Westminster of finding artists who are willing and able to observe the conditions proper to mural painting, and it would be matter for regret if our architects in their despair over former failures should make up their minds that a flat tint with a dark line round was the only kind of decoration prudent to attempt.

THE STAGE.

"FROMONT JEUNE ET RISLER AÎNÉ."

Paris: October 10, 1876.

M. Alphonse Daudet has observed life and has read Balzac and Dickens. The result of the combination, thus far, is the novel of *Fromont jeune et Risler aîné*: the most successful French story of our generation. The novel having reached very rapidly its twentieth edition, no one can wonder that it was thought fit to see how it could be adapted to the Stage. It is now played at the Paris Vaudeville, with a cast that is well-nigh perfect. But before we speak of the acting, what are the qualities of the book and the play?

M. Alphonse Daudet, after the manner of novelists, deals with the passion of love; but the marriage of paternal arrangement—habitual, as everybody knows, in France—limits the French novelist's sphere of observation, and for the most part he is driven either to depict the love of some married person for some other married person not her husband, or to depict the survival in married life of some love which the marriage of arrangement prevented from running its course. An exceptional story of good society, such as *Le Roman d'un Jeune Homme Pauvre*, gets free of these fetters. An exceptional story of an isolated household, like that of *Eugénie Grandet*, has less difficulty in getting free of them. A play like the *Danicheff*, in which with other men there are other manners, avoids them altogether. But generally fiction in France is written under strange restrictions, which those who condemn it on

account of its themes omit to consider. Now, Daudet's novel, judged by its bare theme, may readily be objected to. But the book has really two quite different elements, and so has the play.

The work deals, it must be said, if we are telling its story in three lines, with the adultery of one Sidonie Risler, who married the elder of two brothers because he was much the richer, but who would have married neither had she been able to marry the elder's partner—one Georges Fromont, a gilded youth of *le haut commerce*, who inherited a business in which Sidonie's husband was until lately but a foreman. Frantz Risler, the younger of the brothers, has much loved Sidonie, but he accepts loyally her choice of the elder, and goes away to his own work in Egypt without thought of treachery on his own part or dissembling on hers. He is summoned back a year or two afterwards, to find her—unknown to her husband—the mistress of Fromont, and he intends to denounce her; but she persuades him that she was careless of Fromont from the first, and had suffered him only that she might forget her love for himself. She has had no love at all for him, but he believes her, and for half an hour he is lost. She is secure, she thinks, from his denunciation, for she holds in her possession a letter which was written by him in his lost half-hour. He had said in it, "Eh bien, oui, je t'aime. A quoi bon lutter? Notre amour est plus forte que nous." She had laughed at the letter, and put it very safely in her pocket. After that he could not denounce her; but the extravagance of Fromont on Sidonie's behalf has by this time embarrassed the business. Risler, at last—who had been kind to her in her childhood, when she was poor, and had been blindly her servant since she had been his wife—has discovered her guilt. The sale of her untold luxuries will keep the house above water, and Risler is devoted to its interests because of Fromont's uncle, its founder, who had first befriended him. The woman goes, and the man may lead his lonely life without further sacrifice. He has still his brother, the soul of honour. Then there falls into his hands this letter, which the brother had written to the wife. He commits suicide.

That is the bare theme, changed, indeed, a little in the play, for the sake of an ending less absolutely tragic. There, also, when the credit of the firm is made safe, and the woman has fled, the letter falls into the hands of Risler; but a girl, Désirée Delobelle—a little *fleuriste* who has been devoted to Frantz—takes the letter as one from him to her. She knows it by heart, and Risler is appeased. Frantz is in truth repentant, and in love with Désirée at last. They, at all events, are to be happy, and Risler is content.

But if we are telling the story as it really is, and not in the three lines of bare main theme, its interest is chiefly this—that it depicts for us with a hundred keen and delicate touches the life of the obscure trading world, generally thought by novelists to be hopelessly prosaic: the trading world, not of the Boulevards and the Rue de la Paix, but of the streets and factories of Le Marais—a bit of the provinces in the heart of Paris. The profound study of every phase of that society recalls Balzac, and the manner of its expression recalls Dickens. But the mind and manner of each has been much too wisely followed for the charge of mere imitation to be laid at M. Daudet's door. An accurate observer and a writer with many gifts of imagination and expression has chosen to make these men his masters. But he is not very far in this novel and play from being also a master himself.

Of the four leading characters we have mentioned, two indeed are hardly individualised. Georges Fromont is a common type of a life of feebleness and ill-doing relieved by an hour or two of good intentions; Frantz Risler, of a life of everyday goodness, shattered suddenly by an hour of ill. But Risler and Sidonie are more studied. The Alsacian or Swiss-German quietness of Risler in

his life and ways; his love for his brother; his fondness for the old cashier with whom he smoked a pipe every evening at the beer-house; his absorption first in designs for his wall-papers and then in the invention of a machine which shall print them; his entire simplicity, his slowness to believe in the wiliness of others, his quickness to punish it when he has once understood it—the punishment being still punishment of restitution rather than of revenge—these things are all realised as the master of French fiction would himself have realised them. Schmück and the Cousin Pons of Balzac are no keener nor more elaborate studies. Sidonie is elaborate and individual, too, though she owes still more to the actress than she does to the author; and for French readers and playgoers she gains something in interest if she is looked at as Mdlle. Pierson by some fine inventions of her own is determined she shall be looked at, somewhat as the incarnation of the discontent of the poor with the wealth which is on the floor below them. Sidonie was bred in an apartment of garrets, and sent at sixteen to learn the trade of false-pearl making. Something of their falseness stuck to her finger-tips to the end of her life. A neighbour made friends with her, and she envied her her ease. When she married she felt it necessary to adopt the other's tastes in matters of dress and furniture; but she owed the other a grudge for having to do so, and she took the other's husband.

But it is the minor characters that are seen the most clearly, and finished in the picture with the most accurate touch. Sigismund Planus, the cashier, with whom a reason of business is a *raison d'état*; Chêbe, erewhile a shopkeeper; Sidonie's father, now a man well-managed by his wife, but grumbling that his son-in-law will not start him afresh in business; Mdlle. Delobelle, who believes implicitly in the genius of her husband; Désirée, fragile, and kept for years to an arm chair, from which day by day she bends to her work in arranging small foreign birds for bonnets, the produce of that work supporting her father at the *café* and the theatre; and lastly, Delobelle himself, are all living characters: not one of them the mere puppet to the novelist's or dramatist's hand. Delobelle himself is certainly the best of them; he is a type that will live. A comedian fifteen years ago at Alençon and Metz, but since those days a comedian out of employment, he deems himself forbidden by a due regard to Art to renounce a profession in which he counts for nothing; and, being against his will no more a comedian and an artist in sight of the public, he is a comedian and artist in sight of his friends. He is an affectionate man, but he exaggerates every demonstration of affection. If he hears a piece of news that interests him, he hears it with stage effect. And when in the play his wife, or in the novel his daughter, dies, he is lost less in personal sorrow than in the stage spectacle of domestic grief. All this imaginative working of the feelings beyond their natural limits, all these exaggerated pretensions, blown to a big and showy bubble of blighted affection and social repute, which has but to burst to show a man who is mainly selfish and a nobody whom the public has forgotten, are seized and analysed with an accurate art. Of course there is a touch of Micawber in the character to boot, which together with the reiterated "Mdlle. Planus, ma sœur" of the old cashier; the reiterated catchword, "je suis content," of Risler; the insistence on Désirée's little stuffed birds for bonnets partaking in their attitudes of her own thought, now happy, now dejected, justify one in saying that in the manner of his work M. Daudet has had Dickens very much in view.

No part is badly acted. Mdlle. Lafontaine has, indeed, hardly the distinction required by the representative of the wife of Georges Fromont, from whom Sidonie learns to be distinguished, but she has all the expressions of calmness and rectitude needed also in the part. Mdlle. Blanche Pierson is too sympathetic an actress to be per-

fectedly placed as Sidonie, and, moreover, she is not sufficiently a dramatic actress to do what Fargueil might have done for the character in the last moment of her rage and discomfiture. The cry of her exit is wanting in impulse and passion. But where it is sought to represent Sidonie either as a girl spoilt by poverty or a woman spoilt by indulgence—selfish and cowed, or selfish and triumphant—Mdlle. Pierson is full of resources. Fresh intonations and fresh looks succeed each other at every moment, and there is not one that is wrong. Her part, like all her parts, is full of significant inventions of her own, which prove the care with which a character is studied by her, beyond and away from the stage-effect of the moment. Désirée Delobelle is played by Mdlle. Bartet with singular freshness and delicacy, and she has an advantage here that is not Mdlle. Pierson's—the character is precisely suited to her delightful stage-qualities. Parade is always conscientious: he is rarely varied. What he fails in here is in sufficiently expressing the love that the slow, silent Risler had for Sidonie. Where we come to the expression of his simplicity, of his bewilderment, of his grief, he is excellent as heretofore. Georges Fromont has but a small and poor part, and Train, though inoffensive, does nothing to make it greater or better. As Frantz Risler, Pierre Berton gets three good scenes, and in each is wholly admirable. A little tender scene with Désirée, when (in the Dickens manner) we do not hear "all that the small chair had to say to the great fauteuil;" the scene with Sidonie in which Frantz is first upbraiding, then passive, then conquered; and lastly the scene with Sidonie again, in which Frantz in rage and disgust would tear from her that letter which is the weapon she will keep—these give to Berton opportunities he has not recently been fortunate in having, and opportunities which he has never used so well. And he is both happy and sagacious in bringing into strong relief the worthiest side of Frantz Risler's character. The man's indignation with himself for having yielded for an hour to Sidonie, or better, his indignant refusal to recognise that such a wrong could be, M. Pierre Berton expresses in the eager "Non, non, je n'ai rien entendu, je n'ai rien entendu!" with great dramatic power. FREDERICK WEDMORE.

MR. CHATTERTON, following the example of the manager of the Gaiety, has issued an appeal to the public against a criticism published in the *Times* upon the recent revival of *Richard III.* at Drury Lane. It appears that nine years ago a writer in that journal not only spoke very highly of Mr. Barry Sullivan's performance of the part of the crook-backed usurper, but complimented Mr. Chatterton himself warmly upon the taste and judgment displayed by him in preferring Colley Cibber's *pasticcio* to Shakspeare's play. Such being the case, Mr. Chatterton is naturally shocked to find that the present dramatic critic of the *Times* "ignores" the views of "his illustrious predecessor," censures the preference for Cibber, and declines to regard Mr. Sullivan as worthy "to be acknowledged as the leading legitimate actor of the British capital." Nevertheless, the public to whom Mr. Chatterton appeals will perhaps be inclined to think that the second thoughts of the *Times* are after all the best. The laudatory things which Mr. Chatterton says of the gentleman who wrote so enthusiastically about him and his theatre nine years ago are no doubt just enough; and it may be true that his censor is, as he says, "a youthful critic." It is, however, a well-known legal maxim that presumptions founded on general character are of little value where there is direct evidence bearing on the case. In this instance the public have fortunately the means of judging for themselves. The truth is that, though the ability displayed by the late dramatic critic of the *Times* was unquestionable, he had notoriously a good-natured tendency to be

indulgent towards defects and shortcomings on the stage, which deprived his judgments of a great deal of the value they would otherwise have possessed. This is probably what Mr. Chatterton refers to when he urges that dramatic criticisms in the *Times* "should lean to the side of kindness." Perhaps "the public" will prefer that they should lean only to the side of truth.

LORD LYTON is making arrangements with Mr. Hollingshead for the production of his late father's unacted play, which is founded on the *Captivi* of Plautus.

THE new name chosen for the Charing Cross Theatre does not seem particularly happy. The "Folly Theatre" is no doubt suggested by the Paris "Folies-Dramatiques;" and if so, it may serve a useful purpose, by reducing to absurdity the fashion of copying the names of French play-houses. We have already the Opéra Comique, the Gaiety, and the Vaudeville, besides a "Varieties" theatre in the suburbs.

THE Lord Chamberlain's rule that no living person shall be counterfeited on the stage does not seem to be much regarded by the manager of the Royal Clarence Theatre, Dover, who has been entertaining his patrons during the past week with a new drama in three acts entitled *The Whitechapel Tragedy*. It is true that the two leading personages in this piece are no longer among the living; but with this exception there is reason to believe that every one of the *dramatis personae* constitutes a distinct violation of the licenser's regulation. As will be inferred, the hero of the affair is Henry Wainwright, the murderer. He is represented by Mr. Charles Cooke, who is described as "a grandson of the celebrated George Frederick Cooke;" while Thomas Wainwright, who is now undergoing a sentence of penal servitude, is personated by Mr. Rock. The other characters are Stokes, Harriet Lane, the Warder of Newgate, Alice Day, Policeman 298, Mrs. Forster, Miss Willmore, Mrs. Wainwright, and Mr. Sankey. The action opens in the "interior of Wainwright's brush manufactory in Whitechapel Road," and the scenes comprise other localities equally celebrated in connexion with the case. No play can be lawfully acted anywhere in the United Kingdom without the Lord Chamberlain's sanction; but practically managers of obscure provincial theatres seem to do pretty much as they please in these matters. Up to forty or fifty years ago the minor theatres of the metropolis were even more adventurous in this way. It was, we believe, the manager of the Surrey who produced a drama dealing with the murder of Weare by Thurtell while judicial proceedings were still pending, and who even provoked an indignant but ineffectual remonstrance from Mr. Baron Parke, whose name occupied a prominent place in the playbill. With even greater courage, the manager of the Cobourg ventured to represent the "apotheosis of his Majesty King George the Third," who was loyally described on the occasion as "the father of his people." It will be seen, therefore, that the manager of the Royal Clarence Theatre has some sort of precedents for his proceedings; which, however, seem a little out of date.

MUSIC.

CRYSTAL PALACE CONCERTS.

LAST Saturday's concert was in some respects of particular interest. It commenced with Haydn's "Military" symphony, one of its author's best works, which (curiously enough) had not been heard at the Saturday Concerts since 1863. Though nearly ninety years old, the symphony sounds as fresh as if it had only been written yesterday. The employment of the "military" instruments, big drum, cymbals, and triangle, gives the music a peculiar colouring, and distinguishes it from all the other symphonies,

or, at least, from all the published ones, of the old master. Except that the trumpet-call in the *allegretto* was played by both trumpets instead of, as directed in the score, by the second trumpet only, the performance was as perfect as could be. An interesting novelty was furnished in the performance by Mr. G. A. Clinton of Weber's concertino for clarinet and orchestra. This most characteristic little composition is the first of a series of six master-works which the author wrote for this instrument, the others being two concertos with orchestra, a quintett with strings, and a sonata and a set of variations with piano. The short introductory *adagio* of the concertino is admirably adapted for the display of a fine tone and an expressive style; it is followed by an original air with four variations, the last of which is in the form of a short *rondo*. The theme is of that peculiarly romantic tone which stamps it as Weber's at once, and the variations are mostly of extreme brilliance, and by no means easy for the solo instrument. In the hands of Mr. Clinton, however, for whom there seems to exist no such thing as difficulty, they were given with the most faultless precision. The performance possessed even higher merits than that of mere accuracy. The delivery of the *cantabile* passages showed a thorough appreciation of the composer's ideas, and for expression and style left nothing to desire.

The most important part of the concert was the latter half, which was selected entirely from the works of Wagner. The selection was especially well arranged, as enabling hearers to compare the composer with himself at various periods of his career. First came the overture to his earliest published opera, *Rienzi*, written nearly forty years ago (in 1838) at Paris, a work which, though not without traces of the individuality which subsequently manifested itself, is as a whole written under the influence of the French school of opera. It is very brilliant and full of spirit, but in parts (especially in the second subject) commonplace, nay almost vulgar. The introduction to *Lohengrin*, and "Elsa's Dream" from the same opera, presented us with Wagner in the transition period. *Lohengrin* was so fully noticed in these columns at the time of its first production in London that it is unnecessary now to dwell upon its peculiarities, or on the differences existing between it and operas written on the usual plan. These differences were hardly noticeable in the excerpts presented on Saturday. In both the numbers given it is not so much the form that is new as the harmonic treatment and the orchestration. Two of Wagner's most recent compositions concluded the concert. These were the Funeral March following Siegfried's death in *Götterdämmerung*, and the Centennial March composed for the opening of the Philadelphia Exhibition.

I have before had occasion to speak of the enormous orchestra needed for the performance of the *Ring des Nibelungen*; and it is characteristic of the completeness with which the musical arrangements of the Crystal Palace are carried out that the directors went to the expense of engaging nearly twenty extra instrumentalists merely for the Funeral March, in order that the piece might be adequately rendered. The result certainly justified the outlay; and even those who went with the highest expectations could hardly have anticipated that the music would produce so great an effect without the aid of stage accessories. No doubt it lost less than would be the case with most other parts of the work, because in the drama the March is an *intermezzo*, and leads from one scene to another. But the great impression it produced was the result partly of the beauty and power of the themes on which it is constructed, and partly of the wonderful gorgeousness of the instrumentation. The March, which is played while Siegfried's corpse is carried off the stage, is a review of the hero's history. All the leading themes which in the course of the work have been asso-

ciated with his parents and himself are here gathered together, combined and alternated in the most masterly manner. Of course only those who were familiar with the entire work could appreciate the full significance of these themes, the effect of which so largely depends upon mental association of ideas; but even those who heard the March without any previous acquaintance with it at all could not fail to be deeply impressed by it. Of the performance, it is impossible to speak too highly; it may even be said that it was worthy of Bayreuth, which, to my mind at least, it very vividly recalled. The March was rapturously encored, and repeated. Even the most persistent opponents of encores in general would probably admit that in this case an exception was justified; a work so original would be better appreciated (as in fact it evidently was) after the second hearing than after the first.

Wagner is so pre-eminently a dramatic composer that it is perhaps hardly surprising that in other departments of his art his inspiration never seems to reach to its highest level. He has written but little apart from the theatre, and of that little there is hardly one piece which will rank with the best parts of his operatic music. The Centennial March is an instance of this. It is notorious that music written to order, and for a special occasion, is very seldom of the first quality; and most assuredly had Wagner composed nothing better than the Philadelphia march, he would have no claim to a place in the first rank of composers. One is almost tempted to fancy that he had a low opinion of American musical taste, and tried to write down to what he conceived to be its level. The march is rather commonplace, and very noisy—far inferior to the "Huldigungsmarsch," or even to the "Kaisermarsch," though neither of these is among their composer's best works. It is certainly not by his *pièces d'occasion* that Wagner's name will be carried down to posterity.

The vocalists at this concert were Miss Sophia Löwe and Mr. Shakespeare, both of whom are already favourably known at Sydenham. The lady sang Mozart's "Voi che sapete," and Elsa's Dream; while Mr. Shakespeare was heard in Donizetti's "Spinto gentil," from *La Favorita*, and songs by Schumann and Bennett.

This afternoon Herr Wilhelmj is to play, and a new overture by Gevaert, *Le Billet de Marguerite*, is to be given for the first time.

EBENEZER PROUT.

THE Sacred Harmonic Society has issued its prospectus for the coming, its forty-fifth, season. Ten concerts are announced, the first of which is to take place on November 24, and the last on May 25. As usual, the performances consist almost entirely of perfectly familiar works. Haydn's *Seasons* is promised—as it was last season, and not performed—there is also to be a miscellaneous concert. The general impression produced by the prospectus is that there is hardly a society of importance in London which does so little for the cause of music as the Sacred Harmonic Society. Performances of well-known works, often coarsely given, and sometimes with an obvious disregard of the intentions of their composers, can do nothing to advance the progress of musical art.

WE understand that Mr. Rosa, encouraged by the success of the *Flying Dutchman*, has serious thoughts of bringing forward next season Wagner's *Meistersinger von Nürnberg*, a work which has never yet been heard in this country, and which, unless it be under Mr. Rosa, we should imagine there is but small probability of our hearing. It is earnestly to be hoped that Mr. Rosa will carry out the idea. Though absolutely novel in style, the work is likely to be a great success. The libretto is most amusing, but it will present no ordinary difficulties to the adapter of the English text.

ONE, at least, of Wagner's innovations at Bayreuth is already beginning to be imitated. In the theatre at Dessau the orchestra has been sunk three feet, and a screen has been erected which renders it totally invisible to the spectators. In the new theatre now being erected at Dresden, and which is expected to be opened in the latter part of next year, the same plan is to be adopted. Would it not also be worth the consideration of Mr. Mapleson for the new opera house on the Thames Embankment? As to its advantages there can be hardly two opinions.

HERMANN GOETZ, the composer of the very successful opera *Der Widerspänstigen Zähmung*, has nearly completed the score of another opera, *Francesca von Rimini*, of which he has himself written the libretto. Another of the younger opera-composers, Edmund Kretschmer, the author of *Die Folkunger*, has also followed the example of Wagner in writing his own text for a new opera, just finished, entitled *Heinrich der Löwe*.

DR. DAMROSCH, the conductor of the New York Philharmonic Society, who has lately visited Germany, has sent word to New York that he will bring back with him to America a manuscript overture by Wagner, and a new composition by Liszt, which he will produce at his concerts for the first time.

HENRI BERTINI, well known as the author of many excellent sets of studies for the pianoforte, but who also composed much other music for his instrument, has just died at Meylan, near Grenoble, at the age of seventy-eight.

THE *Signale* states that Herr von Hülsen, the General-Intendant in Berlin, has the design of arranging for next year, in co-operation with the first singers and instrumentalists of Germany, a grand Mozart Festival, and of inviting to it all the princes and the artistic celebrities of the German kingdom.

TO BOOKBUYERS.—A List of Second-hand Books, in a 2nd edition, of all History, Poetry, Divinity, and General Literature, for the month of January, 1877. W. HENRY, 17 New Oxford Street, London.

NEW WORKS.

The EDINBURGH REVIEW,
No. 296, for OCTOBER. 8vo, price 6s.

CONTENTS:—

1. BANCROFT'S NATIVE RACES OF NORTH AMERICA.
2. SECRET CORRESPONDENCE ON MARIE ANTOINETTE.
3. THE DECLARATION OF PARIS.
4. SIR PHILIP SIDNEY.
5. DR. SMITH'S CHRISTIAN ANTIQUITIES.
6. DANIEL DEBONDA.
7. MORALITY WITHOUT METAPHYSIC.
8. THE DEPRECIATION OF SILVER.
9. BOSNIA AND BULGARIA.

The ATELIER DU LYS; or, an Art Student in the Reign of Terror. By the Author of "Mademoiselle Mori." 2 vols. crown 8vo, price 12s.

"If all, or at least a fair proportion of the novels that are published each year, were as good as 'The Atelier du Lys,' reading them might become instructive, and reviewing them a pleasure."—ATHENÆUM.

GERMAN HOME LIFE. (Reprinted from *Fraser's Magazine*.) Second Edition, thoroughly revised. Crown 8vo, price 6s.

SELECTIONS from the WRITINGS of LORD MACAULAY. Edited, with Occasional Notes, by G. O. TREVELYAN, M.P. Crown 8vo, price 6s. [On Nov. 1.

The LIFE and LETTERS of LORD MACAULAY. By his Nephew, G. O. TREVELYAN, M.P. 2 vols. 8vo, 36s.

The TRIDENT, the CRESCENT, and the CROSS; a View of the Religious History of India during the Hindu, Buddhist, Mohammedan, and Christian Periods. By the Rev. J. VAUGHAN. 8vo. [On the 26th instant.

BEHIND the VEIL; an Outline of Bible Metaphysics. By the Rev. THOMAS GRIFFITH, M.A., Prebendary of St. Paul's. 8vo, 10s. 6d. [On Thursday next.

LESSONS in ELECTRICITY at the Royal Institution, 1875-6. By JOHN TYNDALL, D.C.L., LL.D., F.R.S. Crown 8vo, with 58 Woodcuts, price 2s. 6d. [On Thursday next.

THROUGH BOSNIA and the HERZEGOVINA on FOOT DURING the INSURRECTION. By ARTHUR J. EVANS, B.A., F.S.A. With Map and 58 Illustrations. 8vo, 18s.

The PRIMAÆVAL WORLD of SWITZERLAND. By Professor OSWALD REER, of the University of Zurich. Edited by JAMES HEYWOOD, M.A., F.R.S. With Map and over 400 Illustrations. 2 vols. 8vo, 28s.

The GEOLOGY of ENGLAND & WALES. By H. B. WOODWARD, F.R.S., Geologist on the Geological Survey of England and Wales. With Map and Illustrations. Crown 8vo, 14s.

The SUN; Ruler, Fire, Light, and Life of the Planetary System. By R. A. PROCTOR, B.A. Third Edition, with 9 Plates and 100 Illustrations on Wood. Crown 8vo, 14s.

A DICTIONARY of the ENGLISH LANGUAGE, abridged from Dr. LATHAM'S Edition of Johnson's English Dictionary, and compressed into One Volume. Medium 8vo, 24s.

WHITE'S GRAMMAR-SCHOOL TEXTS, with English Vocabulary. Dialogues from LUCIAN, 1s. Fables from ÆSOP and Myths from PALÆPHATUS, 1s.

The PUBLIC SCHOOLS ATLAS of ANCIENT GEOGRAPHY, in 25 entirely new Coloured Maps. Edited by the Rev. G. BUTLER, M.A. Imperial 8vo, or imperial 4to, 7s. 6d. [Nearly ready.

Epochs of Modern History.

The EARLY PLANTAGENETS: By the Rev. WILLIAM STUBBS, M.A., Regius Professor of Modern History in the University of Oxford. With 2 Coloured Maps. Fcap. 8vo, 2s. 6d.

Epochs of Ancient History.

The ROMAN EMPIRE of the SECOND CENTURY, or the Age of the Antonines. By the Rev. W. CAPEL, M.A. With 2 Coloured Maps. Fcap. 8vo, 2s. 6d. [Nearly ready.

The ROMAN TRIUMVIRATES. By the Very Rev. C. MERIVALE, D.D., Dean of Ely. With a Coloured Map. Fcap. 8vo, 2s. 6d.

The ATHENIAN EMPIRE. By the Rev. GEORGE W. COX, M.A., Joint-Editor of the Series. With 5 Maps and Plans. Fcap. 8vo, 2s. 6d.

London, LONGMANS & CO.

H. SOTHERAN & CO.

(Established 1816),

BOOKSELLERS — PUBLISHERS — BOOKBINDERS
(NEW & SECOND-HAND). (FINE ART). (HIGHEST CLASS).

36 PICCADILLY (opposite St. James's Church), LONDON.

The LARGEST and BEST COLLECTION of BOOKS, consisting of about 500,000 Volumes, comprising the finest and most important Works in every class of LITERATURE, SCIENCE, and the FINE ARTS, in the best Library Condition, and at the most moderate Prices.

SCHOOL & COLLEGE PRIZES in infinite variety.

COLONIAL and FOREIGN ORDERS executed with intelligence, care, and promptitude.

Their MONTHLY CATALOGUE of NEW PURCHASES, entitled SOTHERAN'S PRICE CURRENT of LITERATURE, which presents each successive Month an Entirely Fresh Collection (nearly 1,000) of SECOND-HAND BOOKS, Ancient and Modern, will appear on the 25th inst. Specimen Number sent gratis.

PART 4 NOW READY.

To be completed in Two Volumes folio,

CONTAINING SIXTY-THREE PLATES (THIRTY-FIVE OF WHICH ARE IN GOLD AND COLOURS),

And nearly 200 pages of Text, with numerous Wood Engravings printed in Colours; the whole being produced from original Japanese works of the greatest beauty, and representing the entire range of Japanese Ceramic Art, Ancient and Modern.

KERAMIC ART OF JAPAN.

By G. A. AUDSLEY, Architect, and J. L. BOWES, President of the Liverpool Art Club.

To be supplied in Seven Parts, at One Guinea each.

Containing a comprehensive Introductory Essay upon Japanese Art in all its various branches, illustrated by thirteen Photo-lithographic and Autotype Plates, and numerous Wood Engravings printed in Colours. Also, a concise Dissertation on the Ceramic Productions of Japan, from the earliest records up to the present day, with sectional articles on the Pottery and Porcelain of the various provinces of the Empire in which manufactures exist.

The Edition is strictly limited to One Thousand Copies, and will be supplied to Subscribers only. ON ITS COMPLETION, THE PRICE FOR REMAINING COPIES WILL BE NINE GUINEAS.

Subscribers' Names will be received by the Publishers, HENRY SOTHERAN & CO., 36 Piccadilly, where specimens of the work can be seen.

From The Architect, July 17.

"Unless splendid plans and the perfection of mechanical execution have lost their old attractiveness, the publication of 'The Ceramic Art of Japan' should be an event of importance not alone for the artist, the connoisseur, and the potter, but for all lovers of beautiful books."

Reduced in Price.

The KERAMIC GALLERY, containing several Hundred Illustrations of Rare, Curious, and Choice Examples of Pottery and Porcelain, from the Earliest Times to the Beginning of the Present Century, with Historical Notices and Descriptions. By WILLIAM CHIFFERS. 227 Plates exhibiting 468 beautiful Objects, all finely executed in Permanent Photography. 2 large thick vols. imperial 8vo, handsomely bound in cloth, 25 lbs. 10s. 6d. (4s. 4d.) Chapman & Hall, 1875.

A beautiful and attractive work. The illustrations are printed by the Woodbury process in permanent ink, under the superintendence of the author, expressly for this work, from examples in well-known collections, thus securing in every instance absolutely faithful copies of the originals.

New Edition, just ready.

RACINET'S POLYCHROMATIC ORNAMENT. One Hundred Plates in Gold, Silver, and Colours, comprising upwards of 2,000 Specimens of the various styles of Ancient, Oriental, and Mediæval Art, and including the Renaissance and 17th and 18th Centuries; with Explanatory Descriptions, and a General History of the Art of Ornamentation. Folio, cloth extra, gilt edges, 160s. or full morocco, gilt edges, 81. 15s. The present elaborate work will be found superior to all existing publications of a similar kind. It is not only sold at a price which renders it available for all purposes of study and manufacture, but it is also so comprehensive that it forms in itself a complete library of the subject.

A work of first-rate excellence.

The BRITISH GALLERY of PICTURES. A Selection of the most admired productions of the Modern School, from the Galleries and Private Collections in Great Britain. Fifty Large Line Engravings, executed in the highest style of the art by the most eminent engravers, brilliant India Proofs, with descriptive letterpress, a magnificent volume, atlas folio, handsomely half-bound morocco extra, gilt leaves, 104. 10s.

— The SAME, full-bound morocco extra, with broad gold borders on sides, gilt leaves, 121. 12s.

The TURNER GALLERY, a Series of 60 large and highly-finished Line Engravings, after the most famous Paintings by J. M. W. Turner, R.A., with Memoir and Descriptions by R. N. WORMUM. India Proofs, royal folio, new half morocco extra, gilt leaves, 6s. 6d.; or, full-bound morocco elegant, gilt leaves, 8s. 8d.

— The SAME, Artist's Proofs, large paper, atlas folio size (only a few copies for sale, new half morocco extra, gilt leaves, 114. 14s.; or, full-bound morocco elegant, gilt leaves, 171. 17s. These latter copies are uniform in size with the *Muse Française*, and the other great English and Foreign Galleries of Engravings. The work contains the choicest productions of Turner's unrivalled pencil, including many fine specimens of Landscape and Marine Scenery not engraved in any other work.

TO EXECUTORS AND SELLERS OF LIBRARIES.

H. SOTHERAN & CO., who have for many years been widely known as the most extensive Purchasers and Sellers of Books of every class in London, beg to inform Executors or Gentlemen having for sale LIBRARIES of BOOKS, either large or small, that they are ready at all times to give the HIGHEST PRICE for them, or to EXCHANGE the same for others, removing them without trouble or expense to the Seller. They also value Libraries for Probate, either in Town or Country.

H. SOTHERAN & CO., 36 Piccadilly.

Branch Establishments:—136 Strand; 77 & 78 Queen St., City.

SATURDAY, OCTOBER 21, 1876.

No. 233, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

History of the Mongols from the Ninth to the Nineteenth Century. Part I. By Henry H. Howorth, F.S.A. With Two Maps. (London: Longmans & Co., 1876.)

WHEN a new volume of history is submitted to the notice of a critic, he generally appraises its value by one of two tests. He tries to ascertain first whether the book fulfils the conditions of a work of historic art; and, if it fails to do so, he endeavours to find whether it fills a blank in historic literature. This rule, which is usually a just one, must be reversed in the estimate which a reviewer takes of the volume placed at the head of this article. and he feels bound to judge it first by the second of these standards of valuation. Mr. Howorth has undertaken to break fresh ground, and, to the reproach of our national scholarship, his claims are those of a pioneer. The annals of the Mongols have never excited the attention in this country which they have received in France, Germany, and Russia, and among the authorities cited in this volume the name of Colonel Yule alone represents British authorship. It is difficult to account for the neglect to which they have been consigned. The reason is not the scarcity or the untrustworthiness of the sources of information. The portly volume of Mr. Howorth falsifies the supposition. It is not that the stage on which the Mongols played their part is too obscure for a historian: during the thirteenth and fourteenth centuries they were a prime controlling force in the movements of the world, and bridged the chasm between the civilisations of the East and West. It is not that Mongolia is too remote to enlist general sympathy in her fortunes: the story of the chief of a simple horde in the heart of Asia, who started on a career of conquest, made a large part of Asia and Europe to echo to the tread of his armed hosts, and established the most colossal empire on which the sun had ever shone, cannot lack the elements of epic grandeur and wild romance. Nor can it be that the record is barren of moral and political instruction. And yet the story, abounding in all that is wonderful to the imagination, and fruitful of lessons to the politician, has hitherto remained untold in the English tongue. What we know of the Mongols has been gathered chiefly from chapter lxiv. of Gibbon's *Decline and Fall*, and perhaps the very brilliance of his narrative has acted as the Pillars of Hercules to deter from further exploration. Lord Macaulay speaks somewhere of the trick which Gibbon brought into fashion of telling a tale by implication. But he often conveys by a few

rapid touches a more truthful impression of the character and career of his hero than any of the dull and prolix narrators whose tomes he has condensed into a single chapter. A consummate painter like Turner has sometimes given play to his own fancy in limning a particular scene; but his picture revives it to the memory of the beholder more livingly than any photograph, however correct in detail. To Mr. Howorth belongs the merit of the photographer rather than of the painter. He has had the daring and the industry to explore the remote corners and the thorny by-lanes of a territory where he has had no English precursor, and will not soon have a follower. As supplying a desideratum in the historical library his book stands alone.

Brought to the ordeal of the first of the above-named tests, this work cannot so easily pass unchallenged. A great historian essays to portray the life of a nation, and he succeeds in his task when he portrays it vividly as well as veraciously. To give to the dim past the vitality and intensity of the present; to conduct the evolution of a story with dramatic interest; to co-ordinate the minor details and the main design of his picture, and to tone and graduate the several parts into organic unity, is the test and triumph of his art. These are elements of effectiveness the want of which cannot be redressed by orderly arrangement, or reach of plan, or conscientious industry. There are portions of this volume which convince the readers that its author is capable of reaching a higher position as an animated narrator than he has actually attained. But his literary execution is only rarely above the common level—generally it lacks proportion, picturesqueness, and finish. Whether it is due to the tentative nature of his undertaking, or to the intractable quality of the material he works on, his merit is rather that of a compiler than that of an artist; and the book often strikes the reader as a storehouse of facts, a repertory of materials for history rather than a history. He has shrunk from no sacrifice of time, he has spared no labour, to obtain information accessible to him in English, French, and German. He has for years stood on the watch for all the odds and ends, the waifs and strays drifted from the East, and the student is astonished at the lavish hand with which he lays his gleanings at his feet. No difficulty daunts him, his patience never flags; questions which are only collateral are worked out with the same spirit of strenuous elaboration as those which are of moment to his task. And though he has no time to spare on graces of style, or on the distribution of light and shade in his canvas, his composition is usually clear and vigorous. Occasionally it becomes careless and slipshod. While he is on the level road of narrative he advances with perfect ease, he seldom halts till he gets into some controversial and entangled byway; but his foot regains its wonted firmness and elasticity when he reappears in the public thoroughfare.

Mr. Howorth candidly acknowledges his ignorance of the Mongolian language, and resents the *dictum* of his friend Sir H. Rawlinson, that a history should be written only by the man who has access to the

original sources of information. This is a question of literary casuistry which need not be mooted here; but there can be no doubt that a very superficial knowledge of Mongolian would have saved him from many blunders. Considering the difficulties under which he labours—difficulties which would chill an enthusiasm and scare a spirit less indomitable than his own—the wonder is that there are not more. Space allows reference to a few only. The name of the fifth successor of Jenghis, he says, is Mönkè, and adds, "the name in Turkish means eternal; in Mongol, silver" (p. 216). In p. 609 he corrects himself, but only in a way that perpetuates the error. Mungkè is a common name among the Buriats, and means eternal; but the word for silver has no connexion with it—it is Mungung. His reasoning at pp. 374 and 399 about the Tumen and Tumut is vitiated by a mistake as to the meaning of Segon and Baraghon. Baraghon means "right," and not "left," and Segon (Zegung) is "left," and not "right." The Tumen and Tumut have fretted the minds of more readers of Ssuang Setzen than Mr. Howorth, although they have rarely elicited a sagacity, or exercised a patience, equal to his own. Possibly he might have diminished the obscurity of the subject if he had borne in mind that Tumut is the plural form of Tumèn; in the Mongolian, nouns ending in the letter *n* take *t* in the plural. Moreover, when a numeral precedes a noun, the noun remains in the singular: e.g. Naiman Noyan, literally eight prince, and not Noyut, princes. Thus, also Zirghóghan Tumén, literally, six ten-thousand, and not Tumut. Hence, where he speaks of the Tumens, the Mongol equivalent is the Tumut. At p. 691 he says "the Khorin Buriats are the Sheep Buriats;" if so, it would be an example of the *lucus a non lucendo* principle of etymology, since among a pastoral race the possession of sheep could be no note of distinction. The fact is, "sheep" is Khonin—Khorin is "twenty," probably the original number of the clans, though now reduced to eleven.

There is another infirmity to which the reader of this book is disposed to be less indulgent. It relates to orthography. The author says, "I have followed the spelling of Schmidt, in other cases Erdmann" (p. viii.). Safer guides he could not choose. But having once elected his mode of spelling he ought not to vary it: e.g. "Ekè arul, i.e. great island" (p. 47). Although he uses the word (in p. 46) "Yekè," and might have insured himself against the error by his remark in the preceding line, "Ogelen Ekè, i.e. Mother of Nations," while subsequently the word is changed to Ikhe (p. 493), Yeka (p. 557), and Yekhè; the last being the only correct equivalent in English. So Kukhu, blue, is carried through a whole scale of vocables—Koko (p. 22), Keuke (p. 158), Keuke (p. 162), Kuka (p. 341). Why has Mr. Howorth patronised Khakan instead of Khaghan? The proverb which he quotes might have set him right, for the pun is lost in his mode of spelling (p. 379). Dr. Schmidt rightly notes "Ein Spiel mit den Worten Chaghan und Saghan; in solchen Wortspielen liegt öfters der ganze Wit solcher Sprichwörter" (*Geschichte*, &c., p. 411).

These are, however, venial blemishes, and it is only a despicable spirit of literary Pharisaism that would underrate the substantial service rendered by the author to history on account of such eccentricities.

Mongol history properly begins with the man whose portentous genius precipitated his race on a career of conquest. The annals of Ssanang Setzen prior to the apparition of Jenghis Khan are either a dry list of the names, or legends of the migrations, of his ancestors. We wish that some authentic account of him could have been transmitted to us by a European, similar to the living picture Priscus has given us of Attila, or Rubriquis of Mungkè. The anecdotes from an Eastern source which have come to us were composed some years after his death. He never gave up the simple habits of his tent-life, and felt a Quaker's contempt for high-sounding titles. In his way he was intolerant of shams; and there are gleams of a better nature which justify his claim to kinship with the human species. The empire founded by the military genius of Jenghis and Batu, and consolidated by the administrative tact of Oghotai, reached the zenith of its splendour in the reign of Khubilai. The hour of its culminating glory was also the hour of its inevitable decline. Like other Oriental races who have shot into premature renown, the Mongol showed on an equal scale a capacity for a career of nomadic warfare and an incapacity for the pursuits of peace. Mr. Howorth justly dates the decadence of the empire from the transference of the Court to China, and he has traced very clearly the stages of the process of its disintegration. The extraneous growths which were grafted on the Mongol character only hastened on the dissolution of the decaying stock, and the dynasty sank under the weight of the very civilisation it patronised but could not assimilate.

It is one of the contradictions which time works out, that we hardly find a trace of the historic past in the thoughts or aspirations of the Mongols of the present day. The descendants of those fierce horsemen who passed like a whirlwind over the largest portions of the then known world, leaped over the Great Wall in the East, and spread terror and havoc to the waters of the Danube in the West, are now a mild, spiritless race of shepherds and herdsmen. History has no parallel to a change so rapid and complete. How is it to be explained? Mr. Howorth has not faced the problem: he may have reserved it for the second part of his work; but he has forestalled the answer in the very interesting account he has given of the spread of Buddhism in Mongolia. To a people maddened and then sated with human blood, the voice of the prophet from the banks of the Ganges preaching the sacredness of life, and, implicitly, the brotherhood of the human race, came as the breath of heaven. Ssanang Setzen, when recounting the advent of the new evangel, kindles for once into poetry: "It was as the welcome voice of the cuckoo, heralding the approach of summer." Shamanism with its frenzied *ecstasies* and cruel rites gradually retreated before the new faith, and hardly a vestige of it now remains.

This volume is enriched by two maps executed by Mr. Ravenstein; they are a treat both for the eye and the mind.

W. C. STALLYBRASS.

Central Africa: Naked Truths of Naked People; an Account of Expeditions to the Lake Victoria Nyanza and the Makraka Niam-Niam, West of the Bahr-el-Abiad (White Nile). By Colonel C. Chaillé Long, of the Egyptian Staff. Illustrated from Colonel Long's own Sketches. (London: Sampson Low & Co., 1876.)

AMONG the successors of Sir Samuel Baker in the work of extending the Egyptian power in the equatorial Nile region of Africa Colonel Long has won for himself a place of renown, both as a soldier of the Khedive, and as an explorer in the cause of geography. What he has done may be briefly outlined. Having arrived at Gondokoro in April, 1874, he received orders from Colonel Gordon, the chief of the Egyptian staff, to visit M'tesa, the King of Uganda, the country which stretches round the northern and western shores of the Victoria Nyanza, to present him with certain gifts, and to obtain information about his kingdom, which had not been visited by any traveller since its discovery by Speke and Grant in 1862. With hastily-collected *impedimenta*, and a small detachment of soldiers, Long set out on his mission, and, after fifty-eight days of painful marching through the swamps and storms of the wet season, reached Uganda, where a reception attended with the highest barbaric honours was accorded to him by King M'tesa. Ill with fever, he remained for nearly a month as M'tesa's guest, but succeeded meanwhile in persuading him of the advantages to be derived from closing his ivory traffic with Zanzibar, and, in the interests of Egypt's monopoly, sending his ivory by Gondokoro and the Nile. On his recovery, a permission was tardily given him by the king to visit the Victoria Nyanza; but, at the same time, the king secretly instructed his men not to cross the lake. Colonel Long was thus only permitted to see a gulf of the northern shore of the Nyanza, and, mistaking a chain of islands for the opposite coast, reported the Great Victoria to be but fifteen miles in width, an error which it was left for Mr. Stanley to correct in his circumnavigation of the lake in the following year.

An important link in the river system of the lake region was still wanting; Speke had seen the outlet of the Victoria Nyanza at the Ripon Falls, and had crossed what he believed to be the same river at Mrooli, one and a half degrees further north. Baker proved this river of Mrooli to be a chief affluent of the Albert Lake and thence to form the White Nile; but a doubt remained as to whether this was indeed the same river that Speke had discovered flowing out of the Victoria. To resolve this doubt Colonel Long had determined to return from M'tesa's by descending from the Victoria, but to this plan M'tesa flatly refused his consent. "No," he said, "you must not go, you will be killed; the river does not go, as you think, to Mrooli; it goes away to the eastward." In spite of remonstrances and hindrances of every sort placed in his way,

besides the open menaces of Keba Rega, the hostile ruler of the country of Unyoro lying between the already Egyptianised country and Uganda, Long embarked, with two followers and scanty provisions, on the unknown river. Drifting down it, in doubt whether it would lead to friendly territory or not, amid storms and terrible privations, he discovered Lake Ibrahim, and forced a devious track across it through the floating islands of papyrus jungle which cover its surface. Scarcely had he left the lake when his little party was attacked by a fleet of forty boats, carrying about 500 warriors armed with lances, sent by Keba Rega to intercept and kill the travellers. Thanks, however, to firearms and cartridges, this fleet was repulsed with fearful loss, and soon afterwards the voyagers were safe at the island of the friendly chief Rionga, not far from the Karuma Falls.

In Colonel Long's second journey, undertaken in the beginning of 1875, he led an expedition to open a route from the Bahr-el-Abiad to the Niam-Niam country in the West, explored by Schweinfurth, which is rich in ivory, and whose inhabitants are well disposed towards the Egyptian Government. From Lado, the new military station on the left bank of the Nile, some distance below the old post of Gondokoro, abandoned on account of its unhealthiness, the line of this second expedition falls in very nearly with the several routes of former travellers to and from the Makraka country—Morlang's (1859), Dr. Peney's (1861), and Petherick's (1863)—and thus has less of geographical novelty. He tells us in a few lines of a third journey of which we would gladly have had a more particular account; leaving the confluence of the Bahr-el-Abiad and the Saubut on December 25 he reached a point 300 miles up the latter river next day at noon! Doubtless the extreme rapidity of this voyage up an utterly unknown river is the reason why his description of it leaves us nearly as much in the dark as to its character and direction as before. After this Colonel Long returned to Europe to recruit his health before starting again for East Africa.

The book before us is a lightly-written narrative of the scenes and incidents of the two former journeys. If in some places it reads like an indifferent translation from French, and perplexing agglomerations of phrases between full stops occasionally try to pass muster as sentences, there is more than enough of real, stirring adventure, of miseries bravely endured, and hair-breadth escapes, to give it a most romantic interest throughout. This interest culminates in the chapters describing the perilous descent of the river from the Victoria towards the Albert Lake, a story as full of dangers and hardships as any in the whole circle of African travel. There is, however, far more of fighting and slaughter in the narrative than one cares to think necessary to the accomplishment of the professed object of the Egyptian Government, "to open up Central Africa to commerce and civilisation." By representing himself as a great prince at M'tesa's Court, and, perhaps more than that, because of the astonishment produced by his arrival there on horseback, Col.

Long secured the honour of the immediate sacrifice of thirty human victims, a ceremony which was repeated almost at every visit to King M'tesa. In his repulse of the attack by Keba Rega's men at Mrooli, his explosive shells destroyed whole boat's crews at a time.

"In vain they attempted to escape; a well-distributed fire had demolished the greater part of their fleet, now closely huddled together in great confusion. The shells of my Reilly burst among them, tore great holes in their boats, that sank, having nothing to stop the leaks, or bursting in their naked bodies carried consternation and terror."

Again, the Yanbari tribe, some of whom had wounded an Egyptian soldier on the passage to the Niam-Niam country, were almost annihilated in punishment of this offence, Colonel Long's soldiers having burned at least twenty of their villages, besides capturing the women and children. The prisoners doubtless appreciated the lesson this punishment was intended to convey, "that 'Meri' (the Egyptian Government) was the father of all, and as such desired peace and good-will among them," which was duly impressed on them before their release.

While Colonel Long thus shows how he inculcates the fatherly designs of "Meri" on the African tribes, he loses no opportunity of assuring us at home of the humanity and sincerity of the Khedive in his efforts to abolish the slave-trade. At present, in every Egyptian camp and garrison, it is a standing order that a fugitive slave may seek there protection and freedom, which may not be denied by any post-commander, so that the mere establishment of the Government along the Bahr-el-Abiad has struck a vital blow at slavery. Since freedom is interpreted by the negro as a licence to laziness, the Government is obliged to feed these creatures in their idleness at no little expense; the freedmen stations have thus already become a serious burden, and one which threatens to increase very rapidly on the emancipation becoming more generally known. If Egypt is faithful in this cause, Zanzibar, in Colonel Long's opinion, is quite the reverse, and he characterises the proclamation of Seyyid Burgash abolishing slavery in his dominions as a "Pope's bull against the comet." Colonel Long promises to give the naked truth about the parts of Africa that he has explored, and certainly he hides nothing of the darker side, summing up his experiences in this, that:—

"Central Africa is no paradise, but a plague-spot; and that the negro, the product of this pestilential region, is a miserable wretch, often devoid of all tradition or belief in a Deity, which enthusiastic travellers have heretofore endeavoured to endow him with. This is the naked truth that I would present to the reader in contradiction to all those claptrap paeans which are sung of this benighted country."

In receiving this honest opinion, which may be too true for a great part of the vast continent, it may be remembered that all Central Africa does not lie in the fever-stricken swamps of the Nile basin, in making his way through which Colonel Long endured such hardships: even he describes Uganda as "rolling and picturesque; its groves of banana trees,

that everywhere abound, adorn its verdant landscape of hill and dale." Nor will his advocacy of the suppression of European missions, and the substitution for them of the Nubian Dongolowee as the future civilising element of the country, be received without reservation, though this plan would doubtless best suit the policy of "Meri."

Those of the illustrations which are evidently from photographs of the Niam-Niam and Akka people brought back to Cairo are of high value: the rest are only of the ordinary book-of-travel class.

KEITH JOHNSTON.

The English Bible: an External and Critical History of the Various English Translations of Scripture, with Remarks on the Need of Revising the English New Testament. By John Eadie, Professor of Biblical Literature and Exegesis, United Presbyterian Church. (London: Macmillan & Co., 1876.)

THE effort now being made to revise the English Version of the Bible has naturally drawn attention to the history of the various versions already in existence, and Prof. Eadie has given us an excellent book on the subject, which does not suffer by comparison even with Canon Westcott's work; in some respects the author has been able to make use of later information. It is strange to see how inaccurate the accounts even of Tyndale's version have hitherto been. Mr. Francis Fry, of Bristol, has devoted the labour of years to the subject, and we are now expecting his final summing-up of the results. Of course Tyndale's editions are scarce, for the ecclesiastical authorities in England destroyed as many as they could—of one of the editions of 1535 only three copies appear to be known, and those partly imperfect. The version of Tyndale, five times revised, is our present New Testament. Hence Dr. Eadie has paid much attention to him. He gives in succession an account of Wiclif, Tyndale, Coverdale, Rogers, the Great Bible, the Genevan Version, the Bishops' Bible, the Rheims and Douai Version, and the Authorised Version, ending with some chapters on Revision. The book is scrupulously fair, and theological controversy is excluded. Our present version is so much indebted to Geneva and Rheims as well as to the versions specially made by the authorities of the English Church that no element of bitterness ought to enter into the discussion.

"King James's advisers did not give us the English of their own day, but their great merit consisted in so fully retaining the simple and racy idioms of the earlier versions. English was in its first vigour when Tyndale consecrated it in his New Testament, and its consecration has preserved it in immortal youth. The Authorised Version has in it the traces of its origin, and its genealogy may be reckoned. For while it has the fullness of the Bishops' without its frequent literalisms or its repeated supplements, it has the graceful vigour of the Genevan, the quiet grandeur of the Great Bible, the clearness of Tyndale, the harmonies of Coverdale, and the stately theological vocabulary of the Rheims. It has thus a complex unity in its structure—all the earlier versions, ranging over eighty years, having bequeathed to it contributions, the individuality of which has not been in all cases toned down. Some clauses tell their

origin by their lucid distinctness and others by their rhythm. Our Bible is the outgrowth of many years and many minds."

The marginal notes in our version often give notices from other versions, and the marginal notes have had more influence than might be supposed. It may not be generally known that "Rock of Ages" is a literal translation in the margin of Isaiah xxvi. 4, the text having a far feeblener rendering, "everlasting strength." Dr. Eadie notices the loss of compound words since Anglo-Saxon times, when "centurion" could be rendered by "hundredes-ealdorman." Many questions about Tyndale remain to be cleared up, as the destruction of the contemporary literature has been most sweeping. We have only just recovered from the single copy at Vienna William Roye's *Dialogue between a Christian Father and his Stubborn Son* (ed. Adolf Wolf, 1874), just as it was Vienna that enabled Lechler to restore to us Wiclif's *Tractatus de Officio Pastoralis*. Sir Thomas More asserts that Roye was burnt in Portugal. Can nothing about him be ascertained there? He was Tyndale's assistant, though Tyndale disapproved of Roye's satire against Wolsey beginning "Rede me and be nott wrothe, For I saye no thinge but trothe." Wolf's preface to Roye has some valuable notices about Tyndale. The chief want in Dr. Eadie's book is perhaps a short chronological list of the versions and editions referred to, which it is not always easy to bear in mind in the course of a minute discussion, and the question of priority of date is sometimes very important, as in the well-known case of the Thirty-nine Articles and the Decrees of the Council of Trent. We hope that some such help may be added soon in a new edition. A very few corrections may be also made. Thus (p. 23) there is no doubt as to the author of the *Dialogus de Scaccario*; (p. 195) it was Audley, not Rich, who was said to have pleaded as a claim for recompense the *infamy* he had incurred, and Lord Campbell is wrong, as the original reads "injury," not "infamy;" (p. 242) Mr. Froude has been corrected several times by our author, and here Dr. Eadie should not have given the story of Henry VIII.'s 72,000 executions, which Froude has refuted. But these are slight and incidental matters. Dr. Eadie's concluding chapters on Revision are well reasoned. There is little doubt as to the need of corrections in the Authorised Version. The main fear felt, however, is as to the alterations in the language. Bentley long ago issued the warning, "non omnibus datur habere aurem."

C. W. BOASE.

Customary Law [Obuichnoe Pravo]. Part I., Materials for the Bibliography of Customary Law. By E. Yakushkin. (Yaroslaf, 1875.)

THERE is at least one branch of literature in which the Russians must be allowed to excel, that of bibliography. It may be because their materials, so long as they deal with matters relating to Russia and Russian books, are not at present overwhelming; but at all events their bibliographical works are singularly good. The "Materials for a

Bibliography of [Russian] Customary Law now being published by M. Yakushkin may be called as a witness to the truth of this assertion. It contains a systematic catalogue of 1,542 Russian books, pamphlets, official reports, and articles in newspapers and magazines, relating to the customs of the inhabitants of Russia, accompanied by extremely useful notes and summaries, and provided with full indexes, geographical, ethnographical, &c. And it is preceded by an introduction of considerable length, in which M. Yakushkin conveys a great deal of really valuable information with respect to the working of those communal institutions about the merits of which opinions differ so widely. His own opinions deserve to be received with the utmost respect, for he has long paid great attention to all that concerns the Russian peasantry, but more especially to their administration of justice among themselves. He has, moreover, won the confidence, to a singular degree, of the peasants in the vicinity of Yaroslaf, where he fills the important post of President of the *Kazennaya Palata*, or Court of Exchequer, and he is therefore entitled to speak with authority as to their views and feelings.

About the merits or defects of the communal system, so far as the land held by the peasants is concerned, great disputes have arisen in Russia. But the disputants, he complains, seldom base their arguments on any but exceptional facts. In the Government of Yaroslaf, with which he is personally well acquainted, the people are, he says, fully persuaded of the superiority of the communal system of land-owning to all other forms. According to the Emancipation Act of 1861, the commune is bound to assign a separate share of land to any head of a family who has paid up the redemption-money corresponding to his share. In the Yaroslaf Government, from 1861 to November, 1874, the redemption-money has been paid by 679 persons for 1,900 lots. But in only eleven cases, referring altogether to thirty-nine lots, have heads of families asked that those lots should be separated from the communal property. During the period previous to the Emancipation, out of 12,850 peasants who bought their freedom from their proprietors by private arrangement, only one head of a family expressed a wish to divide his share of land from the property of the commune.

"One may decidedly affirm," he continues, "that the ideal of the Yaroslaf peasants consists, not in individual property, but in the here so-called *cherny peredyel* [literally "black repartition," but *chern* signifies the common people], according to which all land, to whosoever it may belong, ought to be shared in common."

A few years ago the rumour that such a partition was imminent spread widely among the peasants. Greedy as they always are for land, they were afraid of purchasing, although many lots were being sold cheap at the time, and it cost M. Yakushkin much trouble, he says, before he could persuade those who came to ask his advice that they might buy without running any risk of confiscation. Among the Raskolniks or Schismatics, the idea still prevails as a religious belief that before the end of the world there will come a time

when justice will rule on earth, and all lands will be equally distributed among all men.

By way of illustration of the working of the communal system with reference to agriculture, a few cases are mentioned. In one Yaroslaf village the Crown peasants had on their property a large extent of flooded meadow land. To drain this they cut a canal three miles long, doing all the work themselves. In another village, containing 137 peasants, 200 roubles were paid some years ago for draining about 75 acres of marshy land; and subsequently 460 roubles were expended on turning about 30 acres more into arable land. The town of Mologa in the same Government possesses a common pasture divided into eleven lots, one to each of the town "hundreds." Each hundred retains its own lot for a year, during which it is managed by a bailiff elected for the purpose, and the profits arising from its hay-crop are divided among the ratepayers. Some years ago the Government authorities ordered the Town Council to farm out the land. The Council obeyed as a matter of form, but the old system remained unchanged, for the persons to whom the land was farmed out were the bailiffs of the different hundreds. In some villages of Crown peasants, likewise, arrangements were made some years ago by the authorities for the division of communal lands into household lots. The intention was to abolish the system of "reciprocal guarantee." But the land has never yet been actually divided, and is still as of old held in common.

The customs relating to all manner of obligations, says M. Yakushkin, have not yet been fully explored, so far as their spirit and moral influence are concerned. But in them may be traced a principle which, as being foreign, and often directly opposed, to the letter of the law, deserves close examination. In the fulfilment of engagements among the common people much allowance is made by custom for those altered circumstances of which the law takes no notice. This fact is too often disregarded by those who write on the subject. Indeed, "most of the ideas about the immorality of the common people, and their want of respect for justice, arise from the application of the demands of strict law to cases to which, according to popular opinion, they are not applicable." This fact must be borne in mind in considering the legal side of Russian village-life, one on which M. Yakushkin complains of a deficiency of practical information. The reports, however, of the commissioners appointed to investigate the condition of the peasants since the Emancipation contain an immense amount of material bearing upon the subject, more than 10,000 decisions of peasant District Courts having been published.

The administration of justice among the peasants assumes eight forms. First, there is that of "Self-Help," or lynch-law, one not yet sufficiently defined, according to which at times the wronged peasant rights himself, often with ferocity, or a community which the law cannot protect secures itself against danger. It is generally in cases of arson that a community has recourse to it, the villagers being afraid to bring before the regular tribunals charges which are of vital

importance but do not always admit of legal proof. Thus, in 1872, the peasants of a village in the Samara Government expelled one of their number, and he was sent to Siberia. Thence he escaped, and returning home, devoted his time to wreaking vengeance on his expellers. He stole, he burnt, and he disquieted the whole community by threats of murder. At last the villagers held a private meeting and determined to rid themselves of him. Headed by their *Starosta*, they surrounded his hiding-place after dark, dragged him out, and killed him. In another instance a community was greatly plagued by drunkenness and horse-stealing. At length it determined that its village peasant-judges should take these matters in hand. And they did so, passing and carrying out sentences of 200 stripes for horse-stealing, and others of equal severity. The second form of peasant-justice is that of the "Family Court," dealing with the mutual relations of parent and child, or husband and wife. Its powers and limits still remain ill-defined, and of a third form, the *Treteiskiy Sud* or "Arbitration Court," no trustworthy information has been given. To a fourth form, that of the "Court of Neighbours," M. Yakushkin makes only a passing allusion. The fifth and sixth are more important: the Courts of the "Village Judges" and of the "Village Assembly." The "Village Judges," who are elected for the purpose by the community, in some places deal with the legal questions which in others come before the "Village Assembly." In some Governments also, as in those of Kiev, Vladimir, Samara, and Saratof, such questions come before the "Volost Assembly," which constitutes the seventh form; the *Volost* being a district containing a cluster or group of village communes. Eighthly, and lastly, there is the "Volost Court," the only one recognised by the law. But before it fewer suits come. The general rule is that, in disputed cases, where the Village Court does not act, the aggrieved person goes to the village *Starosta* or headman. Failing him, he tries the "Volost Elder," and only in case of need does he go before the "Volost Court." About these peasant-courts opinions still vary, some holding that the rich peasants are all powerful in the Village Assemblies, others that the decisions are in the hands of the thriftless and non-paying members.

One of the reasons often given for distrusting the capacity of the Russian peasant for trying criminal cases is the fact that he sympathises with all manner of prisoners, and confers on convicts and exiles the kindly designation of "unfortunates." But, as a general rule, M. Yakushkin remarks, it is only when the criminal is in the hands of the Government officials, or when he is flying from Siberia, that the peasant shows such kindness to him. While a thief or incendiary is at large, the peasants entertain very different sentiments with regard to him, so that their sentences, when a criminal charge comes before them, are not likely to be rendered over-lenient by their sympathies. It frequently happens, however, that the accused appeases the wrath of the accuser, and then the charge is dropped, for the popular mind has not yet fully grasped the idea of crime being an offence against

society at large. There are some infractions of the law, it is true, which the peasants refuse to consider criminal. One of these is the cutting of wood in the Crown forests. A case is mentioned in which a noble land-owner not only winked at such matters—as many of his class did, as well as many of the clergy and most traders—but even sent out his serfs in organised parties to bring in wood, flogging any peasant who felled a useless tree. In some places, also, poaching in preserved waters is considered no crime, and even one man's helping himself to another's superfluous fruits of the earth. In the country of the Don Cossacks it sometimes happens, after a bad harvest, that some people are in danger of starvation while others have heaps of corn lying untouched upon their threshing-floors afield. In such cases it is customary for the needy to "borrow" what they want, sometimes leaving a paper behind to state what they have done. After the next good harvest the corn must be returned, with a few added sheaves by way of interest.

In the Penza Government the idea prevails that he who succeeds in stealing anything on the eve of the Annunciation, without being found out, will be able to steal with impunity all the rest of the year. Consequently, during the night preceding that festival the most respectable peasants will "convey" something from a neighbour's house to their own, with an eye to future successful woodcuttings in the Crown forests, the conveyed property being duly returned next day. Other superstitions, it may be remarked, give rise to more serious crimes. Thus, during one of the outbreaks of cholera, some thirty years ago, at least one old woman was buried alive to keep off the disease, and as late as 1861 a Siberian peasant thought fit to insure his household against a prevailing epidemic by burying alive one of his relatives, a young girl.

Among the punishments inflicted in accordance with customary law death rarely figures. Sometimes a criminal is locked up for a time, but in cases of theft recourse is most frequently had to flogging, the offender being carted or otherwise ignominiously carried through the village. In Little Russia offences against morality are often punished in a similar manner. But M. Yakushkin knows of only one instance in which a Great Russian community carted any offender except a thief. In 1871 a peasant was brought before a Village Assembly, charged by the village officials, the *Starosta* and the *Sotsky*, with having broken a pane of glass in a woman's house. When ordered to pay for it, he refused. Whereupon he was driven through the village in a sledge, followed by the aggrieved woman, who carried a broom and a rod with a kerchief attached to it, and accompanied by a man thumping an iron pot. When a woman is thus carted, she often wears a straw horse-collar round her neck. This is supposed to be a symbol of a kind of "yoking" which is now only occasionally inflicted, and generally by brutal husbands. M. Yakushkin mentions some instances of wife-yoking. In 1872 a case came before the Circuit Court in which a man was charged with assaulting his wife. She had been married against her will to a

man who for two years constantly ill-treated her, beating her daily. At the end of that time she ran away. He brought her back, but a second time she fled, and found a place in another village as a cook. There, also, her husband found her. With the help of his father he harnessed her to his cart, and drove her home, flogging her and his two horses all the way. In 1874, another wife who had fled from her husband's brutality, was driven home by him in the same way. Fastening her to his cart by a rope tied round her waist, he flogged her as she ran beside his horses. After driving three miles he stopped for the night, but next morning he tied her to the cart again, and thus drove her home. One of the most singular among the decisions recorded by M. Yakushkin is that come to by a Village Assembly in the case of a man found guilty of cutting off the tails of other peasants' horses. It was ordered that he should be stripped, bound, and left for a time in a swamp, in order that the gnats might teach him to what kind of sufferings his conduct had exposed the tail-less horses.

Sometimes a criminal is ordered to perform a given number of prostrations in front of a church. Thus, in 1873, M. Yakushkin saw a man in the town of Yaroslaf going through a series of prostrations before the Elijah Church by way of making up for having stolen a napkin. A like punishment used to be inflicted upon those pilgrims to the Troitsa Monastery who abstracted coins from the collection-plates.

Of the kindness shown by the common people to convicts several curious instances are recorded. Thus, in a town in the Moscow Government, it has long been customary, every Easter Sunday, after matins, for the congregation, headed by the clergy, to go straight from the church to the prison, and there to exchange Paschal greetings with the convicts, and to make them presents. Owing to this tenderness of the townspeople, and the prudent kindness of the officials, the convicts in that prison behave, it seems, in the most exemplary manner, quarrelling and drunkenness being almost unknown among them. Much of this kindly feeling towards prisoners is doubtless due to times in which the gaols were often filled with serfs condemned to imprisonment or exile at the instance of their proprietors.

A great number of the books cited by M. Yakushkin refer to marriage. On the ideas and customs of the Russian peasants with respect to it, as well as to some other subjects, he discourses at some length, and what he says is as interesting as it is valuable. But to deal with that part of his Introduction would require more space than now remains. W. R. S. RALSTON.

Shakspeare's Dramatic Art. By Dr. Hermann Ulrici. Translated by L. Dora Schmitz. (London: George Bell & Sons, 1876.)

THE revised translation of Gervinus's *Shakspeare Commentaries* is followed at a short interval by a translation of the third edition of the commentaries of Ulrici. Thirty years ago a translation of the work in its original form was published in Eng-

land; during the long period which has since elapsed this Shakspeare commentary has formed a portion of its author's life; it has expanded and altered, so that in it the enthusiasm of his youth is brought face to face with the calm self-criticism of later years. The scholarly zeal which age cannot extinguish of such men as the venerable President of the German Shakspeare Society, and of the Baron von Friesen, who has at this moment issued the third volume of his *Shakspeare-Studien*, calls for admiring recognition from a younger race of scholars.

When German Shakspeare scholarship is compared or contrasted with that of England, rash, ignorant, and indiscriminating assertions are commonly made. The truth is that in all which concerns textual and verbal criticism English scholars stand unapproached; with the one admirable exception of Prof. Delius, no German student has made a first-rate contribution (taking into account both quality and magnitude of work) to this branch of scholarship. In fine critical insight, in just and penetrating observation from an aesthetic point of view, English writers, again, are at least not inferior to their fellow-students of the Continent. Where, then, lies the advantage of the latter? In this chiefly: German critics have conceived and attempted to carry out the study of Shakspeare's works as a whole. Too often English writers succeed as it were by luck or by grace, and illuminate only particular points; the German student, undiverted by personal preferences and aversions, sets himself down to the complete study of an object. No race of men possesses to a like enormous extent with the German the power of taking an interest in what they do not care about, and with this not altogether enviable power, the thoroughness, and therefore the morality, of scholarship are essentially connected. A German critic is himself incapable of being bored, and he is not nervously afraid of boring *you*. Now, an eminent point of vision, a specular mount, may be attained by swift beat and confident libration of wings; but then one must be a winged creature. German scholars are not winged, and for a human being there are some conveniences at times in the use of legs and not wings; plodding over barren heath, and plunging through deep morass, they attain in the end an altitude from which—though no watch-tower in the skies—much becomes visible.

Three aesthetic commentaries, each dealing with Shakspeare's work as a whole, each possessing special excellences and special defects, stand at the head of this department of German Shakspeare literature—the commentaries of Ulrici, of Gervinus, and of Kreyssig. Something will have been done to sum up the characteristics of the writers if we name Ulrici the philosopher-critic of Shakspeare, Gervinus the historian-critic, and Kreyssig the critic who is primarily a man of letters. Neither Ulrici nor perhaps Gervinus approached the study of Shakspeare with an interested motive; yet it is certain that the one has read into Shakspeare many of his own philosophic religious conceptions, and that in his hands our poet becomes an agency for keeping alive Chris-

tianity in the Fatherland; while the other—Gervinus—employed Shakspeare as a means for rousing his country to political action and a sense of the real world, so that Hamlet and Schleswig-Holstein appear not to be without bearings one upon another. From these non-literary under-currents of thought Kreyssig's *Vorlesungen* is free. The ethical qualities of Shakspeare's work affect Kreyssig strongly, as they affect Gervinus, and he is to some extent sensible of their power not to restrain only, but also to "free, arouse, dilate." The moralising of Gervinus, it must be confessed, is often of a wooden, unvital kind. One sign or consequence of this appears in his too frequent incapacity to sympathise with those bright enthusiastic characters of the dramatist's creation, for whom success and failure exist in an ideal world, and whose ardour hurries them beyond the well-trodden *via media* of prudence and good sense.

Gervinus, however, in the fact that he pursues the chronological method of study, possesses a marked advantage over Kreyssig, who throws the plays into the groups of history, tragedy, and comedy, and over Ulrici, who arranges them for study in an ideal order of his own devising. Ulrici gains upon the others by virtue of his more comprehensive and accurate scholarship in Elizabethan literature; and to many German readers the philosophic cast of his mind will seem to give him a further superiority. Here, I believe, most thoughtful English readers will part company with the German admirers of Dr. Ulrici's work. While recognising the important services which the venerable writer has rendered to Shakspeare study in Germany, and while not insensible to many fine and penetrating observations upon particular characters and scenes, we must express our decided conviction that the main lines of his work are incorrectly drawn, that it is vitiated throughout by an illegitimate method of criticism, and that this illegitimate method is founded upon a false philosophy of art.

Each play of Shakspeare, according to Dr. Ulrici's theory, embodies a distinct and definite view of life; each is the expression of a fundamental idea. Not that the poet was fully conscious of this idea, or conceived it at all in an abstract, philosophical form. Nevertheless, though but vaguely felt by the poet, it is there; it, and it alone, gives to each drama that unity, wanting which a drama would cease to be a work of art. The business of the critic is to discover this idea, to translate it from the language of emotion into the language of thought, and to exhibit the dependence of the several parts of the drama, down to the most minute, upon this vital centre.

Few persons will refuse to acknowledge that every great artist has his dominant view of life, his vision of the world, his *Weltanschauung*. This is to be gathered from all his writings; it is the impassioned expression which is in the countenance of his total art. But it is certainly not developed, consciously or unconsciously, in a series of definite conceptions, each complete in itself, and yet belonging to a higher and more complex conception. When we are told that *Romeo and Juliet* embodies Shak-

spere's idea of love in its generalised form as opposed to hate; that in *Othello* the central idea is wedded love, in *King Lear*, the love of parent and child; and that in *Macbeth* the poet proceeds to investigate the bonds which hold together not the family but the State—we may be beguiled into forgetting that what really gives unity to these plays is not an idea involved in each, but a concrete object for the imagination, a human person or persons thrown into action. When the same method is applied to the Comedies, English readers—and those not superficial or unreflecting readers—will grow impatient of the laborious absurdity. Unity is needed in a work of art? Assuredly, but is not a human creature and his passion and his fate a centre of unity? The special advantage possessed by the Elizabethan dramatists, and that which enabled their art to make such marvellous progress, may be found in this—the theological period of the drama, represented by the Mysteries, had been left behind; the metaphysical period, represented by the Moralities, had been also left behind; and the Drama, under the influence of the Renaissance spirit, had entered upon the positive stage of its history. There is perhaps no body of literature in which such metaphysics as Dr. Ulrici discovers in Shakspeare plays a more insignificant part.

No drama has afforded more delightful exercise to the wits of German aesthetic writers than *The Merchant of Venice*. The story of the caskets, the story of the pound of flesh, and the incident of the rings in the fifth act are the three pieces of the puzzle, and these must be fitted together so as to appear in the form of one idea. *Summum jus summa injuria*, declares Ulrici, is the ideal centre of the play. It delineates, says the more practical Gervinus, man in relation to property. Hebler (a bright-minded critic from Switzerland) finds the fundamental idea of the piece in the opposition between appearance and reality. Unluckily—as Karl Elze notes—some of the critics are obliged to attach a secondary idea to the main idea, and this we think ought to have put them out of the game: it should be against the rules

"To save appearances to gird the sphere
With contric and eccentric scribbled o'er."

I am superficial enough to think of *The Merchant of Venice* as the play of Portia and of Shylock, and to see in the struggle between these two forces for a passive victim set in the midst—the merciless masculine force of Shylock, which holds the Merchant in its vice-like grip, and the generous feminine force of the heiress of Belmont, which is as bright as the sunshine and as beneficent—I am content to see in this the central unity which interested the imagination of Shakspeare. But the play is named after the Merchant because around Antonio the chief persons gather—the Jew who would be his murderer, his friend who is the cause of his distress, and the woman who had brought him sadness at the thought that she was winning from him the man he loved, but who now becomes his saviour, giving him back not only friendship but life itself. Heine has, with characteristic division of sympathy between Judaism and the religion of Joy, brought out the contrast between

the sad, solitary, and loveless life of Shylock and the beautiful human life at Belmont, with its flowers, and statues, and music, its air and light, its friendship and its love. As to the fifth act, and the episode of the rings, we need some relief of playful strife and light laughter, of discovery and reconciliation, after the tension of the real struggle for life and death. From the ducal court of justice we pass gladly to the summer night in the gardens, with the music and the stars, and Lorenzo's lyrical raptures.

The translation is, upon the whole, remarkably well executed. The defects arise rather from an occasional use of an unhappy English expression than from any failure to understand the German aright. One example may suffice: "ein allgemeiner junger Mensch" is very intelligible German, but "a general young man" is very odd English.

EDWARD DOWDEN.

The Reign of Lewis XI. By P. F. Willert. (London: Rivingtons, 1876.)

THIS little volume belongs to the series of historical handbooks published under the direction of Mr. Oscar Browning. We therefore look for the qualities of a handbook in it—accuracy, clearness, and an easy style; and these qualities, taking the work as a whole, are to be found in Mr. Willert's book. In his pages the story is fully and agreeably told, and his narrative is founded on the best authorities. His opinions are in general moderate and fair. The estimate of the character of Louis XI. (p. 31) is penetrating, and what he says of Charles the Bold (p. 235) seems to me equally satisfactory. The political and diplomatic part of the reign of Louis XI., his connexion with England, Brittany, and Burgundy, appears to have been the subject of careful study. It is impossible, however, to refrain altogether from criticism, even if Mr. Willert's book is regarded from his own point of view. A handbook ought to present its matter in the clearest divisions, so as to strike the eye as well as the mind of the pupil, and to impress the main outlines of the subject on his memory. Mr. Green's *History of England* is an excellent model in this respect. The admirable arrangement of his material, the titles and sub-titles, the dates placed in the margin, the complete tables, render that work an eminently useful school-book. Nothing like this is to be found in Mr. Willert's *Reign of Lewis XI.* It preserves merely chronological order; it is divided, not into chapters but only into little paragraphs, each of which has a separate heading, and these headings are reproduced on the tables with their corresponding dates. It is very disagreeable to have to search up and down for the passages which refer to the institutions and administration of the country, not to say that this part of the history of the reign has been greatly neglected by the author. It is true that he has pointed out all the important facts, but I doubt whether he has said enough about them for young English students. How, for instance, can they understand Louis' policy with regard to the Pope unless they have a clear idea about the

meaning of the Pragmatic Sanction of Charles VII.?

Some more precise information, too, is wanting about the interest taken by Louis in the internal administration of France, and we should like to hear more of the part played by his *bourgeois* counsellors, notwithstanding the delay which the publication of Louis XI.'s letters has undergone.

With respect to Mr. Willert's appreciation of the personages of his drama, I should be inclined to differ from him on several points. He judges Charles VII. with exaggerated severity. M. de Beaucourt, in his excellent work on this king's character, has shown very well how much his faults have been exaggerated, and the part which he played lowered, by the love of historical contrasts. In opposition to Joan of Arc he has been called a coward by the side of a heroine, and his indolence has been thrown into relief by the febrile activity of his son. On the other hand Louis XI. is depicted too favourably and too imperfectly by Mr. Willert. He exaggerates his ability, and does not take sufficient account of chance in explaining the causes of his success. Charles the Bold in particular was vanquished rather by his own faults, and in spite of the political faults of his rival, than by the skill of Louis. On the other hand, Mr. Willert is very indulgent towards the vindictive tricks with which Louis XI. pursued his enemies, while he brands with incredible energy the treachery of La Balue and St. Pol. If the morality of the time be taken for granted, those treacheries were as pardonable as the harshness of the king towards them. The *bourgeois*, jovial, and tricky side of Louis XI. is not brought to light. We hear nothing of the *Cent Nouvelles nouvelles*, which, if they did not originate with the king himself, were at least collected by him and gave him intense pleasure.

Moreover the literary part of this reign is completely neglected, the only paragraph devoted to the subject (p. 297) being altogether insufficient.

In fine, then, Mr. Willert's book gives on the whole a fair account of the events of Louis XI.'s reign, so far especially as picturesqueness of treatment and a fair account of its foreign policy are concerned. In writing this account he has made use of contemporary memoirs, as well as of the works of Sismondi, H. Martin, and the excellent sixth volume of Michelet's *History of France*. Though the book is not without merit, it does not present all the advantages which are required in a hand-book.

G. MONOD.

NEW NOVELS.

The Golden Butterfly. By the Authors of "Ready Money Mortiboy." (London: Tinsley Brothers, 1876.)

At Dusk. By Adrien de Valvèdre. (London: Remington & Co., 1876.)

Nora's Love Test. By Mary Cecil Hay. (London: Hurst & Blackett, 1876.)

THE flutterings of *The Golden Butterfly* in its progress through the *World* are probably familiar already to a good many people, and we suppose that the book may be called a clever book without much danger of pro-

test from anybody. Unluckily, however, it is the wont of clever books and men to fancy themselves a little cleverer than they are in reality, and *The Golden Butterfly* is no exception to the rule. The particular form which this very common failing has here taken is that of over-indulgence in asides of miscellaneous comment on things in general, intended, we suppose, to show what accomplished persons the authors are. It is no doubt very tempting to demolish Mr. Robert Browning in a simile; to insinuate that all persons who love ceramic art are lunatics, and that all who love any kind of art are probably humbugs; to dispose of the English university system with a jaunty statement about fellowship examinations; and to indulge in a little rapture about the "fair realm of America," by way of showing that your tremendous cynic can be enthusiastic. Perhaps it would be well for so stern a critic of Mr. Browning not to talk about the "realm of America" at all. But certainly it would be better for the writer of a novel like *The Golden Butterfly* to be more careful about his characters and machinery. Two of his personages, Phillis Fleming and Gilead P. Beck, are good. Mr. Mortimer Collins' idea of a young man of good birth and intelligence who has never been taught to read, through the whim of his parents and guardians, deserved application to the other sex; and Mr. Beck is a pleasant specimen of the universal Yankee. His literary experiences at Chicago and Clearville are as good as anything of the kind known to us, and we must leave to critics more experienced in the ways of the class the question whether he would have been likely to fall such an easy prey to Gabriel Cassilis. This latter gentleman and his wife are the worst characters in the book. Both are hopelessly wooden; there is no life, or semblance of life, about them. As to Jack Dunquerque, the engaging *jeune premier*, we think that it does not need the possession of what Gilead P. Beck calls a "whole-souled, high-toned" morality to make one consider him rather a sorry scamp. No gentleman could possibly have been guilty of the escapade with Phillis, or of the hoax of the "Dinner to Literature," considering the circumstances of the victims. But the greatest shortcoming is in the delineation of the Twins, who seem, at first sight, to be the happiest conception of the book. The authors have forgotten that self-deceit, queer as are its forms, always takes something to go upon. In real life Cornelius would not have had an empty MS. book, nor Humphrey a blank canvas; nor would the one have been ignorant of current poetry and the other of current painting. Cornelius would have had reams of *brouillons* and a theory about Victorian literature; Humphrey, acres of studies and a special fifteenth-century painter. You can keep up a delusion on very little, but you can't keep it up on nothing. This error of judgment, which has turned what might have been an admirable satire into a caricature, is really to be regretted. But we don't think that anyone will regret having read the book.

It is, no doubt, praiseworthy in M. Adrien de Valvèdre to have addressed himself to the labour of writing a book in a language

with which he is obviously not very familiar. But whether the publishing of such a book is a praiseworthy proceeding is perhaps a different question. We think that it would have been well for him to prove his armour before appearing in it. Had he done so he would perhaps have spared us the anguish of reading such sentences as the following:—

"It was said that he had gone there to survey a mass of trees that he had just bought; nothing was more probable but that he had climbed on this rock in order to get a good sight of the purchase he had just made; once there, perhaps his foot had slipped, a gust of wind, or rather, standing on the edge of the rock, some stones gave way and precipitated him to the bottom, for it was also said that some pieces of the rock had fallen over him; anyhow it was visibly an accident."

The persevering reader who struggles to the end will be rewarded by finding a charming Dalmatian recipe for catching the nightmare with a sieve and a stick. And this is all we can say for *At Dusk*.

Attempts have often been made to classify the various types of heroes which have from time to time been fashionable. Everybody knows and can give the parentage of the insignificant hero, the romantic hero, the ugly hero, the muscular hero, and the generally blackguard hero. But there has arisen of late a hero whose exact inventor we do not know, and who presents some curious characteristics. He may be called the cool hero. He is not cool internally, but assumes and maintains an extraordinary frigidity of outward demeanour. He possesses great intellect and much wealth and consequence, and is adored by unpleasant and artificial young ladies, whom, however, he utterly rejects and spurns in favour of the ingenuous heroine. The ingenuous (not exactly *ingénue*) heroine is necessary as a foil to the cool hero, though she is of older date. Such is the hero and such the heroine of *Nora's Love Test*, and very favourable specimens of their kind are Mr. Mark Poyntz and Miss Nora St. George. But we have also (by way of yet further examples of the use of contrast in novels) an ill-regulated villain and an artificial and missish young lady. These are not so good; they both indulge in positive rudeness to an extent unusual in polite society, and the villain's (his name is Dr. Nuel Armstrong) sudden outbursts of temper suggest incipient lunacy. It might be wished also that poetical justice had taken some less questionable form than a brow-beating from a magistrate, on account of peculiar religious opinions. The book has, however, what is very rare in novels, a distinct interest as a story: one is really desirous to know what the *dénouement* is to be, and how Nora will get out of the meshes in which Armstrong has involved her. A good deal may be pardoned to an author who gives one this almost forgotten sensation of interest, especially as the sins for which pardon is required are not very heinous after all. Some of the minor characters, especially Celia Pennington, the matter-of-fact parson's daughter, and Willoughby Foster, an enthusiastic, but not brilliant, curate, are decidedly good. There is perhaps a certain incoherence and want of adjustment in the evolution of the plot, but it is given to but few persons to be thoroughly satisfactory plotters. We should

very much like to know whence Miss Hay derived the quaint crotchet that Boileau of all people had "a mighty intellect." Without intending any disrespect to the author of the *Lutrin*, we cannot help demurring to his being described by words which are not too strong for Descartes or Bacon.

GEORGE SAINTSBURY.

MANUALS OF GARDENING AND LANDSCAPE GARDENING.

BETWEEN the excellent manuals of flower, fruit, and window-gardening constantly issuing from the press the choice is rendered none the less embarrassing by the fact that many of them have reached a second, third, or even a fourth edition. "Quot hortulani, tot sententiæ;" unless, indeed, the explanation is that there is much to be got out of every handbook into which we dive. It is certainly thus with the batch before us: first of which in order is a third and enlarged edition of Mr. David Thomson's *Handy-book of the Flower Garden* (Blackwood), worthy of the editor of the *Gardener* and of the ducal gardens of which he has long had the superintendence. In system and arrangement his original work left little to be desired, but that little has been supplied in the new edition by extension and revision of the lists of hardy border-plants, as well as bedders, found so useful in the first; by more prominent treatment of several hardy genera which have hitherto had less than justice, and by an entire new chapter on one of the newest horticultural fashions, that of carpet-bedding. Notably in pp. 96-99 has Mr. Thomson earned our gratitude, not only by furnishing a selection of some thirty-two *Dolphins* or Larkspurs of rosy lilac, orange-red, and every shade of blue from indigo to azure, but by giving hints as to combination of these in alternate lines with pale or white Phloxes, or with *Acer Negundo variegata*, or in mixed borders, to back up any light-foliaged or flowering plant. Their perfect hardiness, and indifference to rich soils, and their easy propagation by cuttings or division of the stools, ought to invite attention to this most showy and graceful genus. We could wish that the author had been minded to be as communicative as to a similarly old-fashioned genus, the *Aquilegias*, or "columbines," which, to our thinking, equally demand his advocacy. Spreading over the whole summer in their varieties, *canadensis*, *alpina*, *caerulea*, *fragrans*, *pyrenaica*, *truncata*, &c., they tower above the lower growths of a shrubby border, and sometimes start up in the midst of a Berberis clump with a bold beauty which Mr. Thomson has noticed scarcely more than by name. Perhaps, too, he might have done more justice to the newer clematises, though with this climber's charming varieties it is hard to keep pace—at any rate he has recognised the claims of the violas and pansies; and named that very showy and effective *Viola cornuta perfectior* (p. 113). "Carpet-bedding," to which seven or eight new pages are devoted, must be understood as distinct from geometrical flower-beds, and ribbon-borders, "et hoc genus omne," in its almost entire composition of coloured-leaf plants, worked into patterns simple or intricate according to taste, and its almost total exclusion of flowers. Examples of carpet-bedding in butterfly-patterns were to be seen last year at the Crystal Palace, but the *chef-d'œuvre* of this style appears to be found at Cleveland House, Clapham, where raised and gently-sloped beds of matchless carpet—as to leaf-colour, and brilliancy—set off and embellish a circular piece of lawn. For the choice of subjects to be blended in this carpet-work—as to which our experience coincides with Mr. Thomson's, that it is best seen and appreciated from the upper windows of a mansion—we must direct readers to his *Handy-book*, now more than ever commendable for its adaptation to the needs of professional and amateur horticulturists.

From Messrs. Blackwood also comes a second edition of Mr. F. W. Burbidge's *Domestic Floriculture*, a charmingly illustrated *Vade-Mecum* on Window-Gardening, Floral Decoration, and the whole field of adaptation of floral science to domestic ornament. Those who have not seen the first edition as yet are unaware what wrinkles for window or balcony-gardening, on a large or small scale; for bouquet and wreath making; for table arrangement of fruit and flowers; room arrangements of plants, in the form of screen, bower, and arch; and last, not least, church decoration in all its phases, Mr. Burbidge places intelligibly within their reach. When they realise his boon, which now they will be wise in doing with the extra advantage of a revised and enlarged edition, they will find that it is considerably enhanced by an alphabetical list of plants suitable for the aforesaid purposes, as well as of aquatic, succulent, orchidaceous, climbing and foliage plants, with descriptions and cultural directions. Resembling in some respects some of Shirley Hibberd's pretty and suggestive Handbooks, this of Mr. Burbidge strikes us as very resourceful. It is not content with old ways, if a better and simpler is known, as where on pp. 129-30, the author describes and illustrates a much simpler mode of wiring bouquets than that till lately in vogue. A bit of mounting-wire is pressed through the tube of a double tuberose, and then wrapped three or four turns around the short stem, the remaining wire being then straightened out to form the stem. For all stout flowers which last well after being cut, this, we are assured, "is preferable to any other plan." This hint may possibly be more valuable for professionals than amateurs; yet in the interest of ladies who desire their guests to recognise, when they receive them, a home and atmosphere of taste, it must be said that a vast number of hints and details up and down this volume mark it out as an admirable companion for every boudoir. What sounder advice, *e.g.*, could be given than that on p. 142 that each flower in bouquet, vase, or basket, especially if a large flower, should be surrounded by its own leaves, as the royal confectioner said that "each fruit should be garnished"? Or what timelier encouragement to the introduction of inexpensive elegance than a hint or two such as one meets in the decorative sections how to use March stands, or trumpet-shaped glass-tubes (of which there are every day new and lovely varieties) with effect in table-decoration? Especially when, as on p. 147, it is shown that the bill for flowers and ferns for an effective March stand need not exceed ten shillings. Other kindred attractions, enhanced and recommended by the prettiest illustrations, are an "Ivy-draped Mirror" (p. 181), and a device on p. 179 for converting the fireplace during summer by the aid of ferns and trailing plants into a live bean-pot of modern construction. In a new section on "Flowers for Funerals" we like everything except the stilted opening. The relief of sombreness by fresh and appropriate flowers is worthy of all encouragement, short of the extravagance which made the American millionaire's obsequies ridiculous. Of the alphabetical lists and descriptions in part iii. we can speak as full and satisfactory. They include the *Ampelopsis Veitchii* or three-lobed creeping vine, of a bright-green changing to purplish-crimson in autumn, and invaluable for room or church decoration, as well as for outside walls.

To say that Mr. S. Wood's *Plain Guide to Good Gardening*, Second Edition (Crosby Lockwood and Co.), is the most prosaic work of the three, need imply no disparagement; for though his ideal market-gardener is counselled to limit his range and subject, and do a few things well, he himself, in his directions how to grow vegetables, fruit, and flowers, embraces questions of soil, site, structure and appliances, so fully and methodically as to furnish the plainest guidance on all essential details. But his characteristic is matter-of-fact work-

a-day information, and, though he is plainly an appreciative florist, it is very seldom indeed that he is caught speculating on the production of the long-sought *scarlet pansy* (p. 179). As to this he does not despair, if a clear white and the pollen of a good crimson can be combined, and the interference of too much yellow be prevented. More natural to him appear sober precepts on growing early sorts of potatoes, on making asparagus pay, on *pinkling* onions, and so forth. The last-named operation is a synonym for hoeing—thorough hoeing, hoeing not only between the rows, but even between root and root. "Pinkling," remarks Mr. Wood, "is the process to procure good crops of everything. The lesson is worth remembering that in the lightness and openness of the soil and the consequent access to it of the atmospheric influences lies the secret of atmospheric culture" (p. 39). Melons, grapes, and strawberries are fully treated, and, as to the ensuring good crops of the last, resort is had to the old rule of rigidly keeping down all runners and weeds, a kindred process to the before-mentioned practice of "pinkling." Amid description of the "cordon" plan of apple-growing, Mr. Wood reverts to the good old fashion of training apples bower-fashion, of which he gives a pretty illustration, and a parallel instance, of which gooseberries are the subject. Wherever we have consulted him, his information has struck us as trustworthy—*e.g.*, as to laying down garden walks, protecting wall fruit, putting up hothouses and greenhouses at once moderate-priced and substantial, and many other such like matters. He has a good section, too, about the "enemies of the garden." Where, in a section on the Dutch garden, he quotes Krelage and Sons, of Haarlem, as *confidential* growers of tulips on an extensive scale, we presume that he must mean growers on whom purchasers may depend; and where, on p. 192, he enumerates among climbers the *Westeria sinensis*, it is well he should learn, ere going into a horticultural spelling-bee, that that plant is properly spelt *Wistaria*. Its discoverer was a Dr. Wistar.

A new help towards the cognate science of laying-out and planting villa gardens, squares, and open spaces in town and country has been published by Mr. Joseph Newton, F.R.H.S. (*Hardwicke and Bogue*), under the title of the *Landscape Gardener*. It is an adaptation to English tastes of twenty-four plans and designs, novel and foreign, the credit of which belongs to Dr. Siebeck, who has found favour for them on the Continent, where they manage these things better, perhaps, though we are quite certain that an Englishman has a taste for landscape garden and tree planting, if he did but know it. It is only natural that Mr. Newton should deprecate unassisted laying-out of grounds, and quote with approbation Dr. Siebeck's *dicta* on the subject; and no one can doubt that the plans and designs of a Nesfield or Sir W. Newton would be more perfect and deserving of permanence than an amateur's unaided creations; but probably the proprietor who is of necessity his own planner, especially if he has a *penchant* for trees and tree planting, a little time to spare, and an intelligent and conformable gardener, would find a book like that before us a material help to his judgment and arrangements, more especially if his following is not servile, and he reserves to himself what advice to take and what to reject. For instance, nothing is sounder than the maxim, "Don't cut down old trees of noble stature, even if they come in the way of contemplated improvements, without much consideration" (p. ii.), or of thorough draining and deep trenching for the free play of the roots as an important part of the first outlay, which, if thorough, will be the least costly in the end. Generally, too, Mr. Newton's disposition of walks and arrangement of beds, gravel, and greensward, his hints *qua* form and colour in tree planting; his attention to the subject of formation of knolls, hollows, and vistas, deserve commendation; and our only doubt is whether he might not have done more than he has done in

counselling less cumbering of the ground with too many objects and specimens, though here he is more cautious than his foreign model. In Plan iii., for a suburban villa with a good arrangement of grounds as to its walks, clumps, and views, Mr. Newton cuts out of Siebeck's design a group of three firs much too near the house to the right, and brings the turf closer to it, in keeping with the opposite side. In the rear, too, he would remove three trees, and open up the space for a larger flower-garden on the gravel, and by removing three more on the right, fronting the road, and replacing them with rhododendrons (as on the left), consult, at once, to our thinking, symmetry and hygieia. It is the danger of professional planters as well as amateurs that they cannot throw themselves into the far future when the grouped deciduous and coniferous specimens may have waxed into a thicket and an undue "proximity of shade." In this design the Purple Beech is well placed, but we should make the Hemlock Spruce and the *Rhus cotinus*, or Sumach, change place. The latter is a charming object in full view of the windows. Design No. iv. pleases us better with its comparative thinness of plating and increased breadth of lawn, within eye-range of the mansion and summer-houses. *Abies nobilis* is the central tree on the garden side of the dwelling, *Quercus suber* on the road side. In No. v., which comes close to the public road, and looks out rearward from a verandah upon a terrace four feet above the garden-level on a charming and not crowded garden, a *Liquidambar* is the central specimen; but here, too, the Sumach need not have been placed in such obscurity. Plan vii. is a more ambitious design for surrounding with appropriate garden-decorations a terraced residence in the Italian style, which is to have a geometrical garden both in front and to the rear, the former with a fountain, and both with vistas opened from them by skillful and cautious clearings. Here, too, Mr. Newton has benefited the *tout-ensemble* by substituting smaller shrubs for at least five large trees. In this plan first we find a temple of Flora: a signal in those that follow for visions of Cupid and Psyche, Minerva, and other like classical figures. For country grounds, at any rate, these strike as in doubtful taste. Three nice designs (viii., xii., xvii.) deal with that great and beautiful accessory to a garden-landscape, a river frontage, or water contiguous to the grounds. In each case Mr. Newton has made the most of this, and grouped his trees successfully with a view to it. Two or three plans appear from his explanatory letter-press to have been designed to express quietude, and it is in one of these that a temple of Minerva is set upon a hillock! Another clever batch of designs respects a class of residences where kitchen, fruit, and pleasure-gardens have to be combined. In one of these—thanks to Mr. Siebeck's influence, doubtless—we find a vineyard provided for within the enclosed garden-space. This Mr. Newton suggests might with us become an orchard, given a stiff well-drained soil. It would be pretty, if not profitable, to make it a hop-yard. As to Mr. Newton's choice of trees and shrubs, it is unexceptionable; the only question is where to put them: and the purchaser of this volume must beware of being content with even such a reduction of the number as he proposes. Generally their disposition is excellent: the *Wellingtonia*, e.g., in Plan xviii., gets ample space and verge enough. In points of detail, we think the author has been over-particular occasionally—e.g., in marking the places for garden-seats, an after-consideration surely, even if moveable seats are not most useful and pleasant. We think, too, that the work would have been more complete as well as attractive with one or two landscape drawings to show the effect of particular plans, though, as it is, there is no doubt it will be of considerable use to professionals and amateurs. J. DAVIES.

NOTES AND NEWS.

MESSRS. MACMILLAN AND Co. are sending to press Vols. IV. and V. of Prof. Masson's *Milton and his Time*. These volumes contain the History of the Commonwealth, of the Protectorates of Oliver and Richard Cromwell, and of the subsequent Anarchy to the Restoration; together with the Life and Secretaryship of Milton during the whole period. In the biographical portion is included an elucidated account of the entire series of Milton's State Letters for the Commonwealth, Oliver, and Richard. Readers of the former volumes of this great work will remember that Prof. Masson has grouped around the figure of his hero all the chief personages of the time, and has traced the course of the various movements, social, political, and religious, which were then in progress, and which find their most eloquent expression in Milton's life and writings.

PROF. AND MRS. GOLDWIN SMITH are expected in Oxford in November, where they will be the guests of Prof. Rolleston.

PROF. MAX MÜLLER and his family will spend the winter months on the coast of the lake of Geneva.

MR. W. H. PATER will shortly contribute an article on "Romanticism" to *Macmillan's Magazine*; and a study on "Bacchus" to the *Fortnightly Review*.

THE following new volumes of Macmillan and Co.'s series of History and Literature Primers, edited by Mr. J. R. Green, will appear shortly:—*Geography*, by Mr. George Grove, D.C.L.; *Classical Geography*, by Mr. H. F. Tozer, M.A.; and *Philology*, by Mr. John Peile, M.A.

THE Princess Liechtenstein, authoress of *Holland House*, has in preparation a novel entitled *Nora*, taken from the German. It may be described as prelude to an entirely original work by the same authoress. The publishers will be Messrs. Burns and Oates.

MR. GROSART's fresh set of twenty-three books in his "Limited Reprints" of fifty copies each was all subscribed for within two days of his proposal for it being issued.

MR. H. STACEY MARKS, A.R.A., will contribute a book on *Drawing and Painting*, Mrs. Oliphant one on *Dress*, Mr. J. J. Stevenson one on *Domestic Architecture*, and Mr. John Hullah one on *Family Music*, to Messrs. Macmillan and Co.'s forthcoming Art at Home Series.

MR. W. R. S. RALSTON will lecture this evening (Saturday) at the College for Men and Women, Queen Square, on "Russia and the other Slavonic Lands."

MR. WM. E. A. AXON will contribute a paper on the Old English Guilds to the forthcoming volume of the *Companion to the Almanac*.

MESSRS. DALDY, ISBISTER AND Co. announce: *The Health Book*: for Schools and Families, by Dr. B. W. Richardson; *The Christians of Turkey*, by the Rev. W. Denton; *The Laurel Bush*, by the author of *John Halifax, Gentleman*; *Remains of the late Bishop Thirlwall*, edited by Canon Perowne; *Through Brittany*, by Katharine S. Macquoid; *What She Came Through*, a novel, by Sarah Tytler; *Memoir of Alexander Ewing, D.C.L., late Bishop of Argyll*, by the Rev. A. J. Ross, &c.

MESSRS. ALLEN AND Co. will publish during the season a Selection from the works of Dr. Goldstick, with a Memoir.

MESSRS. CROSBY LOCKWOOD AND Co. have nearly ready for publication *The Iron and Metal Trades Companion*, by Thomas Downie; *Pioneer Engineering*, by Edward Dobson; and *Gold and its Uses*, by George E. Gee.

THE New Shakspeare Society is in luck. Colonel J. L. Chester has kindly undertaken to prepare for the Society's Eighth, or Miscellaneous, Series, a volume of the Wills of the Actors and Authors

of Elizabeth's and James I.'s times. An alphabetical list of the names and known dates of these men will be first compiled, and then Colonel Chester will go through every volume of wills in the different Courts, page by page, with his list before him, so that no one named in it can possibly escape him. Copies of all wills of actors and authors thus found will be made, and Colonel Chester will then annotate them, endeavouring to identify all the persons named in them, and explaining any obscure or important passages. He will give all that he is able to ascertain about the parentage or ancestry of every testator, and also about his descendants, and will introduce into his notes extracts from his extensive collections of parish registers, &c., &c. The work will thus not only contain the raw material for future memoirs and biographies, but the notes will, in many instances, shape themselves into almost biography itself. The evidence of the volume, too, that, if the will of a particular author or actor is not in it, no such will is known to exist, will be valuable. And the book cannot fail to be of high interest to every student of Shakspeare's time. We only hope that the Government will do its part in a work of such national importance, by allowing the Judge of the Probate Court the pay of an extra clerk for two or three years to catalogue the inventory rolls of the goods of deceased persons about 1550-1650 A.D., now lying useless in those twenty boxes in Doctors' Commons. The applications of the Director of the New Shakspeare Society on the point have hitherto been civilly put off.

THE first volume of Berthold Auerbach's new series of tales has appeared. He announced that, as in the former series he endeavoured to delineate the village-life of an earlier age, when the peasantry of Germany passed their days in secluded districts far removed from the rest of the world, in the present series of tales he aims at a correct representation of the German village of railway-times. By this double group of life-pictures he hopes to bring into strong relief the good that Germany has secured through the changes which the progress of time and the course of events have wrought for the Fatherland.

THE *Neue Freie Presse* announces that the Crown Prince of Germany has made his *début* as an author. Under the title *Meine Reise nach dem Morgenlande im Jahre 1869*, the Prince has described the incidents of his visit to the East, when he took part in the ceremonial opening of the Suez Canal. Unfortunately for those interested in royal authorship, the world at large will have small chance of making itself acquainted with the Prince's work, as the present edition is limited to forty copies, all of which have been bestowed by the writer on the companions of his travels. The book is in quarto, and consists of about 150 pages.

THE Danish Folkething has inaugurated its present session, which opened at the beginning of the month, by voting an annual grant of 300,000 Krone (16,800*l.*) for the increase of the pay of national-school teachers. It has also taken into favourable consideration the scheme proposed for the opening of a new "Polytechnicum," and the enlargement of the present Academy of Arts, for which objects a subsidy of 500,000 Krone (or about 28,125*l.*) will be required.

M. G. DECAUX, of Paris, will publish in a few days a book by Henri Bellenger entitled *Londres Pittoresque et la Vie Anglaise*. Among the chapters promised we may mention:—"Les Niggers," "Le Flag-painter," "Le Postman's Knock," "Les Money-lenders du West-End et le journal *World*," "Le Cat's-meat-man," "Combats de coqs," "Un Singulier Membre du Parlement," "Lord-Maire Show," "Le Baby," "Le Child," &c., which will serve to show some of the principal aspects of English life to which the author has directed his attention.

G. P. PUTNAM'S SONS announce for publication *The Plains of the Great West and their Inhabitants*, by Col. Richard Irving Dodge; and *The Gold of Chickaree*, a story by the Misses Warner, authors of *The Wide Wide World*.

G. W. CARLETON AND Co. will publish Offenbach's book on America.

THE *Autobiography of the Hon. W. H. Seward from 1801 to 1834*, edited by F. H. Seward, will be published this autumn by D. Appleton and Co. The same firm will publish Huxley's Lectures on *The Direct Evidence of Evolution*, delivered in New York.

MESSRS. HENRY S. KING AND Co. are preparing a new edition of Halleck's *International Law*, revised by Mr. G. Sherston Baker, of Lincoln's Inn.

CAPTAIN E. MOCKLER, Assistant Political Agent on the Mokran Coast, has in the press a Baloochee Grammar.

THE American edition of *Daniel Deronda*, published by Harper and Brothers, is said to have already reached sixty thousand copies.

PROF. GILDEMEISTER, of Bonn, whose *Bibliotheca Sanscrita*, published many years ago, has proved extremely useful to all Sanskrit scholars, and will, we hope, soon appear in a new edition, has just published a full descriptive Catalogue of the small collection of Sanskrit MSS. in the public library at Bonn. These MSS. come mostly from Schlegel's and Lassen's libraries, and are interesting as showing the private work of these two scholars, particularly of the latter, in branches of literature in which they have published little or nothing. We see how Lassen was hard at work on Vedic texts when younger scholars stepped in and anticipated his labours. He seems to have studied Sâyana's Commentary on the *Rig-Veda*, the *Satapatha-brâhmana*, the *Nirukta*, and to have collected MSS. for every one of these books. The most valuable MS. in this part of the collection is a fragment of Sâyana's Commentary on the *Rig-Veda*, *Ashtaka II., Adhyâya 1 and 2*. The MS., to judge from a careful collation made by Prof. Gildemeister, does not belong to any of the three families of MSS. on which the text, as published by Prof. Max Müller, is founded. What has happened sometimes to classical scholars when new MSS. were discovered after their editions had been published has happened here. The new MS. confirms in several cases the conjectural emendations of the editor ("Ac primum quidem viri doctissimi emendationes nullo tunc teste fultas confirmat"), which shows that the strict rules of diplomatic criticism which Sanskrit scholars have adopted from classical scholarship are equally applicable to Oriental literature. The new MS. contains, besides, one passage which is wanting in all the other MSS. hitherto known. The account given of the *apparatus criticus* for Schlegel's edition of the *Râmâyana* is valuable, and we copy the warning of Prof. Gildemeister, which has often been neglected by those who have lately written on the various recensions of that Indian epic:—

"Male plerique etiam in Schlegelii editione recensio-nem septentrionalium exhiberi putant. Sed iterum iterumque monendi sunt viri docti, desinant priore saltem ejus editionis volumine (aliter res so habet in altero) pro recensio-nis septentrionalis fonte uti. In illo Schlegelii non id egit, quod hodie a viro critico postulatur, ut certae codicum familiae se astringeret, sed ut, prout erat in omni judicio elegantissimus, nitidissimus quamque et aptissimam lectionem e varii generis codicibus selectam praeferret, itaque accuratam illius recensio-nis effigiem omnino non reddidit." The catalogue is published in the form of a University Programme, the title of which has rather a strong savour of a mixture of regal, imperial and mediaeval Latinity: "Sacram Memoriam Regis Serenissimi Divi Frederici Gulielmi III. pie colendum indicit Gulielmus Mangold. Bonnæ: litteris Caroli Georgii, 1876."

WE are glad to notice among Messrs. Longman's announcements a translation of Goldziher's *Mythology among the Hebrews*, an important work, which cannot fail to stimulate Biblical research, whether its conclusions meet with acceptance or the reverse. We are reserving our own review of the work till the appearance of the translation.

AMONG recent German works of which the students of religion cannot afford to be ignorant are R. A. Lipsius's treatise on *Evangelical-Protestant Dogmatics* (Braunschweig: Schwetschke), distinguished by speculative subtlety and sympathetic study of "the facts of religious experience"—worth reading even after Biedermann's more distinctly philosophical work on *Christian Dogmatics* (Zürich, 1869); and Hermann Reuter's *History of the Religious Aufklärung* (which in this first volume may be taken as equivalent to Liberalism) in the Middle Age from the End of the Eighth to the Beginning of the Fourteenth Century, vol. i. (Berlin: Hertz). To the philosopher Biedermann's brief sketch of his friend Heinrich Lang (Zürich: C. Schmidt) we have already referred. It is a fine specimen of a discriminating *Éloge*.

THE *Rivista Europea* has passed into the hands of Signor Pancrazi, editor of the *Gazzetta d'Italia* and the *Rivista Internazionale*. Prof. A. de Gubernatis, we are sorry to hear, retires from the editorship of the *Rivista Europea* at the close of the present month; but he will transfer his services to the *Nuova Antologia*, the foreign portion of which will be under his superintendence. The *Nuova Antologia* is to be warmly congratulated on the accession of such a distinguished scholar to its staff.

THE *Reliquary* for last July contains a history of Josceline, Prince of Edessa, the Crusading ancestor of the Courtenays, a family of which one branch has existed in France for 600 years and given three emperors to the east, and another has for seven centuries occupied a leading position in Devonshire. An article by the Rev. C. R. Palmer on the Friar Preachers of London, chiefly compiled from the records of the Duchy of Lancaster, will be of great value to all who are interested in the topography of London. Among the minor notes there is an epitaph from St. Mary's Church, Beverley, which affords an interesting illustration of the permanence of the system of military discipline instituted by Gustavus Adolphus. He, it will be remembered, was strongly opposed to duelling, and when two of his officers importuned him for permission to fight, at last gave it, but ordered the headsman to attend on the field to execute the survivor. The epitaph, which refers to soldiers in the service of William III., is as follows:—

"Here two Danish soldiers lye,
The one in quarrell chanc'd to die,
The other's head, by their own law
With sword was serv'd (*sic*: severed?) at one blow.
"Dec. 23, 1689."

THE *Revue Historique* for October contains an admirable article by M. Perrens on "Peter Martyr and the Heresy of the Patrenates at Florence." He traces the rise and influence of the heretics and the means by which they were put down. They had neither the courage nor the organisation to stand against persecution. They dissembled before the inquisitors, and so left morality on the side of orthodoxy. Hence the public sentiment of Florence was scandalised by them, and the Florentine writers, Dante among the rest, classify heretics and epicureans together. Yet, from this early outbreak of heresy Florence learned the need of obedience to ecclesiastical forms, and gained also a spirit of free-thinking. Hence came the peculiar attitude of the Florentines towards the Church—"également attachés aux pratiques de leur culte et détachés des dogmes de leur religion." The *Revue* is rich in materials for the history of France during the

religious wars. Besides a continuation of the letters of François Hotman, there is also a number of unpublished letters of the Cardinal Georges d'Armagnac addressed to Charles IX., Henry III., and Catherine de' Medici between the dates 1562 and 1585. M. Fustel de Coulanges contributes an article "On the Inequality of the Wergeld in the Frankish Laws." He tends towards the conclusion that the difference observed is not founded upon race but upon social conditions. There is also a notice by M. Regnald of the journal of a learned Dutchman, Gisbert Cuyper, who took part in the operations of the Anglo-Dutch army in 1706. It throws considerable light on the causes of the dissensions which hindered the success of the allies. The journal itself is in the Royal Library at the Hague.

MR. FURNIVALL'S fourth book for the *Shakspeare's England Series* of the New Shakspeare Society is the most amusing of the four. It is Part I. of *The Anatomie of Abuses: Contayning A Discoverie, or briefe Summarie, of such Notable Vices and Imperfections, as now reign in many Christian Countreyes of the Worlde: but (especiallie) in a verie famous Ilande called Ailgna: Together, with most fearefull Examples of Gods Iudgements, executed vpon the wicked for the same, aswell in Ailgna of late, as in other places elsewhere. Verie Godly, to be read of all true Christians euerie where; but most needefull, to be regarded in Eng-lande. Made dialogue-wise by Phillip Stubbes. 1. Maij. 1583, collated with the 2nd, 5th, and 6th editions. The zest with which the excellent and somewhat morose Puritan rebukes the abuses in dress and amusements of his time is refreshing to behold. He is even bitterer than Shakspeare against women's painting their faces and wearing false hair, and had evidently made up his mind that a good many of his countrywomen and countrymen were well on their way to the everlasting bonfire. Perhaps no such contemporary picture exists of the details of parts of the social life of the time as is found in Stubbes's book. It ran through six editions in his life, and the first and fifth editions have been reprinted since; but neither of their editors took the trouble to collate the other editions, and the neglect of this led the latter of the two editors, Mr. J. P. Collier, to say, "we may presume, from various circumstances, that he [Philip Stubbes] was carried off by the plague which raged in 1592," when the collation of any one page of the 1595 edition of his book with the preceding one would have shown that its author was then alive, and revised it most carefully throughout. Mr. Furnivall has not been able to find a copy of the two editions in 1584, and he is anxious to get a sight of Stubbes's *Motive to Good Works*, 1593, giving an account of his tour in England during the London plague of 1592.*

WE have received the prospectus of a proposed reprint of *The Particular Description of England, with the Portraictures of certaine of the Chiefest Cities and Townes* (1588), by William Smith, Rouge Dragon, from the unique MS. in the Library of the British Museum; with lithographic facsimiles in gold and colours of the plans of cities and coats of arms contained in it. This MS. has remained almost unknown among the MS. treasures of the British Museum. It comprises plans and views of the following places: London, Canterbury, Rochester, Winchester, Salisbury, Stonehenge, Bath, Colchester, Norwich, Cambridge, Oxford, Bristol, Coventry, Stafford, Lichfield, and Chester, beside a map of England, an illuminated title-page, and upwards of 230 coats of arms of noblemen and bishops, whose titles are taken from the various counties and towns. Some of the plans are bird's-eye views, others are profile sketches. The view of London, which is the largest of the illustrations, and fills a twice-folded page, is of much interest as one of the very earliest representations of the capital, although, in point of fact, Southwark occupies by far the largest portion of the view. Those of

Canterbury, Cambridge, Norwich, Bath, Bristol, and Stonehenge, are laid down with the utmost clearness and accuracy. On the plan of Bristol is the following note: "Measur'd and laid down in Platform by me Wm. Smith at my being at Bristow the 30 & 31 of July A^{no} Dⁿⁱ 1568," and on that of Canterbury: "W. S. A^{no} 1588 Octob. 10." We thus see that the work occupied at least twenty years of the author's life, yet he left several of the chief towns of England unrepresented. The literary part of the work consists of a full but concise account of the chief points of interest in the country, as they existed at the end of the sixteenth century, and contains lists of rivers, forests, castles, &c., and of places returning Knights of the Shire and Burgesses to Parliament. All who desire to subscribe are requested to send their names to Mr. Henry B. Wheatley, 1 Chalcot Terrace, Regent's Park Road, N.W., or to Mr. Edmund W. Ashbee, 17 Mornington Crescent, N.W. The price to subscribers will be two guineas.

NOTES OF TRAVEL.

BESIDES a description of the physical geography of Hawaii and its volcanoes by Franz Birgham, illustrated by an exquisite little map of the island, and a review of the latest discoveries in the Lake Region of Central Africa, *Petermann's Mittheilungen* for October includes a most important original paper by Prof. H. Fritz on the "Geographical Distribution of Hail." From the difficulties attending the explanation of the origin of this phenomenon and the strange partialities of its appearance, the subject of hail has generally been avoided by meteorologists, and no general examination or comparison of the records of its occurrence in all parts of the world has hitherto been attempted. Prof. Fritz has now laboriously collected and compared most of the existing data from the observing stations of all the countries of Europe, from Asia, Africa, America, Australia, and the Arctic region, and has established on good foundation, for the first time, a number of the general laws which govern the distribution of hail.

THE Augsburg *Allgemeine Zeitung* of September 2 contains the following note on the progress of the Egyptian conquest of Inner Africa, dated from Cairo, September 9:—

Colonel Mason has returned to Cairo from the Sudd in ill-health. With Purdy-Bey he has made a survey of the whole of Dar-Fur. Purdy has also completed a journey of exploration southward from Dar-Fur to the borders of Dar-Fortit, and to the famous copper-mine of Hoffarat el Nahas. From most of the provinces of Egyptian Soudan the reports of the good understanding between the natives and the Government officials are very favorable. Dar-Fur and Kordofan are politically at rest, even the negro tribes on the White Nile are gradually accommodating themselves to the new order of things. M'tesa, the ruler of the countries round the north of the Victoria Nyanza, is about to send ambassadors to Cairo, and an embassy from the Somali country reached the Egyptian Court a short time ago. Between Suez, Zeila, and Berbera, a regular postal communication by steamer has been established. We have just received the sad news of the death of the African traveller, Dr. Pfund, at Fasher in Dar-Fur, on August 21. He was a member of the scientific expedition sent to Kordofan by the Viceroy, in the beginning of last year.

THE Peruvian Government is endeavouring to attract to that republic the surplus immigration from Europe to the Rio de la Plata, and has sent agents to Montevideo and Buenos Ayres, offering free passages to Peru, and guaranteeing constant and profitable agricultural labour.

THE first part of the *Boletín de la Sociedad Geográfica de Madrid* gives evidence that the newly-formed Spanish Geographical Society will be a successful and important one. It is mainly taken up with the acts of foundation of the Society, with its division into sections which will devote them-

selves to special branches of geography, and with a long list of members; but there is also a good essay by Sr. Martin Ferreiro, discussing the possibility of introducing a uniform system of geographical orthography, of projection of maps, and of representation on these, to be used in the future publications of the Society.

FROM the Society for Promoting Christian Knowledge we have received three excellent little works descriptive of foreign countries. In the *Land and People of China*, by Mr. J. Thomson, we have a capitally-written popular description of the geography, history, religion, social life, arts, industries, and government of that country, by one who has a thorough knowledge of his subject from long residence and much travel in the Empire. The numerous portrait-illustrations of the people of many grades of society, and from many provinces, bring us face to face with the Chinese in a way that no description by writing could equal, and add very greatly to the value of the work. In the summary of the history of China we are disappointed to find the reign of Tung-chi from 1861 to 1875 described as "the most uneventful to be found in Chinese history," and the great Mohammedan rebellions which have scarcely been smothered in China proper, and which rent the whole of Eastern Turkistan away from the Empire, passed over as merely "disturbing incidents in an otherwise tranquil reign." This we cannot help thinking is a serious mistake, for unless the existence of great religious factions in the Empire is thoroughly understood, its present political relations cannot be appreciated. *Africa Unveiled*, by the Rev. Henry Rowley, formerly of the Universities Mission to Central Africa, is a thoroughly good account of the geographical features of the great continent, of the many races, religious beliefs, and customs of the Africans, of the slave trade and the history of missions in Africa from the earliest times to the present, drawn from practical experience and study. In view of the intense interest in all matters relating to Africa, this book meets exactly the requirements of the time, and can be heartily recommended as giving the maximum of information in the most condensed form. In the accounts which are daily being published of the disturbances in the Transvaal Republic the name of the Zulu chief Cetwayo, hitherto almost unknown in Europe, appears conspicuously. Writing before this outbreak, and judging from the character of this chieftain, Mr. Rowley almost predicts the rebellion which is now going on. He says:—

"Cetwayo—pronounced Ketchwayo—has lately succeeded Panda, who succeeded Dingaan, as supreme chief of the Zulus. He is a man of considerable ability and much force of character. He is proud of the military traditions of his family, and especially of the policy and deeds of his uncle Chaka. But though his own disposition is warlike, and the Zulus are impatient of peace, and desirous of some great military achievement, he is too prudent a man to provoke the hostility of Great Britain. He clearly perceives that the times are changed since Chaka was able to overcome all against whom he went: that the policy and force of Great Britain have become the more powerful. Nevertheless, it is well known that the Zulus have been arming themselves with guns, which they import through Portuguese territory; that they manufacture gunpowder; that they are angry with the Transvaal Republic; and it is not unlikely that they may venture upon a trial of strength with that rising State."

The Home of the Wolverine and Beaver; or, Fur-Hunting in the Wilds of Canada, by Charles Henry Eden, is a compilation descriptive of the scene of the capture of the animals whose skins form such an important article of commerce, and of the appearance and habits of these animals, derived chiefly from Audubon, Richardson, and Hearne. The information is tacked together by a slight story, enlivened by trapping adventures, and by an account of the first settlement of

Western America on the Columbia river, drawn mainly from Washington Irving's *Astoria*.

FROM a Batavian paper we learn that some Frenchmen are expected to arrive in Netherlands India very shortly, with the view of settling as *colons explorateurs* on the east coast of Sumatra. The enterprise is stated to be of a co-operative nature, and each party of immigrants is intended to include a farmer, an engineer, two scientific members, a doctor, a trader, and a manager. The different parties will, if the original idea be carried out, form nuclei at various points on the coast, round which French colonists may be able to rally, and thus escape that isolation which they have to encounter on emigrating to wholly foreign lands.

THE Rev. W. Wyatt Gill, the well-known authority on New Guinea, and author of *Life in the Southern Isles*, has just left this country for Rarotonga, Cook Islands, South Pacific.

WE understand that a Portuguese officer, Major M. G. Henriques, is contemplating an exploration of the Congo and other rivers of Africa, as well as the central portion of the continent generally. Major Henriques is now in this country with the view of obtaining all the preliminary information that can be got from the works of former travellers.

IN connexion with the Philadelphia Exhibition the Lovell Printing and Publishing Company, of Montreal, has just issued a volume containing a Descriptive Catalogue of the Collection of the Economic Minerals of Canada, compiled by the Geological Corps of Canada, together with Notes of a Stratigraphical Collection of Canadian Rocks, by A. R. C. Selwyn, F.R.S., F.G.S., Director of the Geological Survey of Canada.

THE unusual quiet which now reigns in the districts of Hogar and Asgar has led to the projection of two separate African expeditions for the scientific exploration of these countries. One of these expeditions, which is being carried on at the cost of the Geographical Society of Berlin, is under the direction of the German *savant* Dr. Erwin von Bary; while the other, which will be despatched in the course of a few weeks, has been organised by the French Government. Dr. von Bary, who, in the autumn of 1875, made a preliminary expedition to the provinces of Tarhona and Ghurian, has lately reached Ghât after a successful journey from Tripoli. The main object of his mission is to solve the problems of the age and geological character of the Sahara; but he proposes also to direct his attention to the flora of the Hogar Mountains.

THE committee of the "Palestine Exploration Fund" send word this quarter that they require 1,500*l.* to clear themselves from outstanding liabilities, and to have a sum in hand ready to meet the expenses of starting the Survey party again. They report that the memoirs for one sheet of the Survey Map of Palestine are complete, and in the new *Quarterly Statement* present us with another specimen of these important additions to the map. This is a study on the site of Emmaus, which is identified by Lieutenant Conder with the ruins of Khamasa, in a remote corner, difficult of description without reference to a map. At no great distance, if we are not mistaken, lies Beit 'Atab, which Lieutenant Conder and Sergeant Black identify with the rock Etam, famous in the story of Samson. An attempt is made in the same number, with the help of the Mishna, to identify the site of the hill from which the scapegoat was rolled down into the valley beneath. There is also a paper on Samaritan topography, the upshot of which is that we know much less about the topography of ancient Ephraim and half-Manasseh than about other parts of the country. Mr. Selah Merrill's letter on the Jordan valley and its neighbourhood is reprinted from the *Athenæum*. A list of the birds collected by the Survey party in Palestine, and some fresh notes from the memoir, relating to sheets sixteen

and eighteen of the Map, complete the chief contents of the number. Great credit is due to Lieutenant Conder for the extreme ingenuity which more than compensates for his undeniable want of accurate philological scholarship. One word in conclusion. Would it not be well to direct the attention of the exploring party, on their return to Palestine, to the neighbourhood of Hamath, where it is probable that a search would be rewarded by valuable discoveries of hieroglyphic inscriptions similar to those now in the museum at Constantinople. Results of this kind would be of far more importance to Biblical archaeology than any number of identifications like those of Lieutenant Conder, often problematical at best, and even if proved but slightly affecting the most important questions of Biblical study.

NEWS LETTERS, TEMP. JAMES II.

AMONG some seventeenth-century letters recently added to the collection in the British Museum are a few of considerable historical and social interest, addressed from London by one J. Fraser, "For the much honoured Sr Robert Southwell at Kings Weston near Bristol a member of Parliament." The first of them in order of date was written immediately after the death of Charles II., and gives a very graphic account of matters consequent on that event. A portion of it runs thus:—

"The Dutchess of Portsmouth has desired leave to Retire into France, and the King has consented unto providing she pay her debts before she goes, and order'd that none of her goods be Removed out of her Lodgings before a coarse be taken to effect it. Her debts are thought to amount to near 300000*l*. but her personall estate to do it withall to much more, being estimate at 1000000*l*. and better. The French amb'r is not altogether so familiar as he was heretofore, he being admitted into the bedchamber but when he has business and demands leave.

"All the alterations that as yet are made are these following. My Lord Dartmouth is made Mr. of the horse, and succeeds to the Duke of Richmond; Admiral Herbert is made Mr. of the Robes in Mr. Sydney's place, Mr. Greims privy purse in Bapt. May's place, and my Lord Peterborough is nam'd for groom of the stole in my Lord of Bath's place. My lord Rochester is the Premier Ministre now, and the discourse of his lo^r. going into Ireland is at an end. My Lord Keeper & privy seale do continue in their places and are like to do so long. My Lord Churchill is to go Ambassador into France, and Coll. Worden to have my Lord Maynard's place. The Prince [George of Denmark] they say is to be admirall, & then its probable he will be pleased to speak English, w^{ch} he has not thought fitt yet to do. The King and Queen you may easily imagine have fatigue enough, when they are to have their hands kissed by such multitudes of people of all ranks & sorts, as do dayly crowd about their Ma^{ties}, & the same compliments are repeated to the Princess. The late King's body was open'd on Saturday last, and such a quantity of extravasated blood found all over that it could not be possible for him to live longer. . . . It was a legacy that St. Alex^r. Fraser his late Physician, who knew the temperament of his body the best of any man, left his Ma^{ty} when he was a dying, that as he tender'd his life, he would let blood twice every year at least, and if he omitted or neglected the doing of it, that it would prove fatal to him. . . .

The body was carry'd last night to the painted chamber whence after 5 or 6 days more it will be remov'd to Hen. 7 chappell and there privatly interr'd, and all the white staves broke upon it. Then there will be an end of the Lord Chamberlain's, Lord Newport's, and Lord Maynard's places."

Other letters of importance contain the following passages:—

"Much honored Sr

"London Oct. 22 1685.

"The favour of yours I have two days ago, & in return can only tell you that att Court we have had some changes of late. Yesterday his Ma^{ty} declared in Council that he had reason to be dissatisfy'd with the Marquiss of Halifax, and thought fitt to continue him no longer in the place of Lord President of the Council, wherefor he ordered his name to be crossed out of the Council book. The occasion of his Ma^{ty}'s displeasur is variously conjectured. Yesterday the newes came of the Lord Chamberlain's death, who dyed at his house in the Country of the new fever. There are several candidates for the place but My Lord Mulgrave stands fairest in the opinion of most to succeed. The Prince of Orange's Court has not been exempted from changes more then others, for last week his Highness thought fitt to dismiss the Princesses chaplain and two of her bedchamber women. Mr. Tralany and Mr. Longford her two favorites. The occasion of it was certain intelligence the prince had of the chaplains holding correspondence with some persons to his disreputation; and this being confirmed by some letters his H. had intercepted wherein notice was given of every thing said or done either in privat or in publique in the familie, and seasoned with indiscreet ralleries & reflexions. These letters his H. showed the Princess, whereupon she called her chaplain and Bedchamber women together (for they were in the spying plot) and giving a Reprimand for their ungratitud, dismissed them. Their conduct is generally condemned by all persons here.

"Sheriff Cornish being tryd last week, found guilty & condemn'd for high treason, is to be executed to morrow as they say; tho' some report that he has offer'd ten thousand guineas for the ransom of his life. The prevailing report is that the Lord Gray is pardoned, but that his estate is not; he having given all but 1500*l*. per an. during life for the lease of it.

"The duke of Queensberries son has almost concluded a match with my lord Clifford's second daughter, and in few days it is believed the matrimoniall ceremonies will be celebrated.

"From France we hear nothing but lamentable stories of the hard usage of the poor Protestants in that kingdom, the Elict of Nantes on w^{ch} all their privileges and liberties were founded, being now solemnly repeal'd & the publique & privat exercise of that Religion forbid all the Kingdome over, under pain of death and forfeiture of goods & estat. On Monday last seignit Charenton was solemnly pull'd down, and all their churches in France are a pulling down as fast as they can. Monsieur Claud is retired into Holland, Mons. Alix & Menard are a coming over hither. At Amsterdam they have settled an allowance for 10 of the french ministers banisht France, & in all other Towns in Holland in proportion.

"Mr. Robert Spenser, my Lord Sunderland unckle. is made Lord Viscount Tiviot in Scotland, and marry'd an heiress last week. . . . The Lord Chancellor of Scotland is said to have fallen off from our church, to that of Rome, though without any solemn declaration as yet that I know of."

"July 19 1687.

"What prospect you gentlemen in the Country have of the meeting of a parliament I cannot tell, but here in Town & at Court we do not entertain any certain hopes at all as yet. Things do not look as if all desirable dispositions were to be found amongst those they would have to be chosen. The essentiall disposition required is to give their votes for the repealing of all the penall Laws & of the Test, w^{ch} is so reasonable a thing that his Ma^{ty} cannot but endeavour the effecting of. Dr. Burnet has the misfortune (notwithstanding of the great fortune he has had in marrying a young lady at the Hague of 15000*l*. in money) of being extremely under his Ma^{ty}'s displeasur. Three letters he has writ lately to my Lord Middleton in w^{ch} besides severall threatening indecencies of pub-

lishing to the world in his own defense a secret history of the last twenty years transactions, he has the foolishness to own that he has transferr'd his allegiance from the King to the States of Holland & is become a free Citizen of Amsterdam. Upon these letters an Indictment of high Treason is raised ag^t him in Scotland.

"If you have not yet Mr. Dreydens celebrated poem of the Hinde & the Panther wth the no less admired answer to it call'd the poem of the Panther & Hind transposed done by a young gentleman Mr. Montagu I will send them both to you."

THE ROMANS OF THE DANUBE.

PRINCE DEMETRIUS ION GHICA, of Roumania, has contributed to the *Numismatic Chronicle* (xvi. pt. 2)—a periodical not usually renowned for any startling amount of interest in its *communiqués*—an essay on the history of the Romans of the Danube, which is well worth reading by those whom recent events have awakened to a curiosity with regard to the border provinces of Turkey. Prince Ghica's essay is historical rather than numismatic, and its appearance in this publication would be anomalous if it had not as its *raison d'être* the description of a medal of Michel V., Prince of Wallachia. This medal presents the portrait of the bravest and most patriotic prince that ever ruled the provinces now known as Roumania; and on this peg is hung an exceedingly interesting historical memoir. After a brief summary of the character of the modern Romans of the Danube, people wanting in the steady progressive nature of the German nations, impulsive and enthusiast at times, and then relapsing into almost centuries of complete prostration, Prince Ghica proceeds to sketch their history, tracing it from the conquest of Dacia by Trajan, through the long years of hopeless struggles with Magyars, Poles, and Turks, and the gradual dismemberment of the principalities, to the reign of Michel V. of Wallachia, surnamed "the Brave," "Valachiea Transpinae Vaidwoda, Sacratissimae Caesariae Regis Majestatis Consiliarius Perpetuus."

"It has ever been the dream of Wallachian and Moldavian princes to shake off the foreign yoke, rescue the lost provinces from the hands of the invaders, and restore the country to its former splendour, by uniting under one sceptre the scattered members of the Latin race in the East, in order to sustain thus better their independence against the Turk, Slave, Hungarian, or Pole" (p. 164).

Four princes fought nobly to realise this dream, Mircea I. of Wallachia, "the Veteran," 1389-1449; Vlad IV., 1456-1462, and 1477-1479; Stephen of Moldavia, the scourge of the Poles, 1457-1541; and last and greatest of all, Michel V. of Wallachia. As ban of the bannat (or province) of Craiova (Little Wallachia), Michel had already acquired a considerable reputation, when he was appointed by the Turkish Sultan to succeed Alexander as Prince of Wallachia in 1593. He at once formed an alliance with Sigismund Batori and Aaron of Moldavia against the Ottoman Empire, and, after a massacre of the Turks which by no means redounds to his credit, he gained a great victory over the enemy on the ice of the frozen Danube, and seized all the Turkish forts on the banks. An Ottoman army was at once despatched to meet him. Harassed by his allies, Michel could only bring a small force of 5,000 men to oppose them; but notwithstanding this disparity of numbers, he again won a decisive victory in the battle of Nicopolis. In August, 1595, his former triumphs were eclipsed by the great fight of Calugareni near the Nijlov, which ended in the total rout of the Turks. After a series of successes, Prince Michel at last freed the country from its Muslim tyrants for the rest of his reign; and the Emperor, seeing the importance of conciliating the victorious general, "recognised the principality of Wallachia as a free State, whose throne was hereditary in Michel's family," and gave him the title of "Consiliarius

Perpetuus Sacratissimae Caesariae Regiaeque Majestatis," which is seen on his medal. Supported by the Emperor, Michel was able to frustrate the treacherous designs of Sigismund Bathori of Transylvania, and even succeeded in bringing the whole of this province under the rule of Wallachia. In the next year, 1600, he conquered Moldavia, and thus for a moment realised the dream of the Latins: Wallachia, Moldavia, and Transylvania were one united State. But reverses soon came, defeats and plots; Michel fled to the Emperor, and was assassinated by the agents of Basta, the imperial general, on August 17, 1601.

"Thus perished by treachery the bravest warrior who ever fought for the independence of Wallachia. His death was a signal of collapse for the country, which was dismembered as before. If Michel had not had to do with men like Sigismund Bathori, Andreas Bathori, and Basta, he would have raised his country to a height from whence it would perhaps never have fallen, and consolidated a powerful kingdom which would have kept in check the ambitions of the surrounding empires.

"As it is, that glorious but fruitless effort left the country in despondency. It was the last serious struggle for independence, followed by the torpor in which it is plunged to this day, through constant oppression and misfortunes, which it has silently borne. Neither the shameful cession of one of its finest provinces to Austria in 1775; nor the beheading by the Turks of the true patriot, Prince Gregory Ghica, for refusing to acquiesce in that cession; nor all the horrors undergone in the reign of the Phanariot Greek princes, who oft-times farmed the country from their palaces on the Bosphorus, have stung it into action."

CORRESPONDENCE.

THE 'HELIAND' AND THE 'GENESIS.'

Cheapinghaven, Denmark: Oct. 7, 1876.

At p. 3 of your number for July 1, you mention Prof. Sievers' strange theory that the *Genesis*—or a part of it, the Fall, &c.—is a translation of an Old-Saxon original, and is by the author of the *Heliland*. Allow me to say that I have long been convinced—and in this I do not stand alone—that the *Heliland* is merely a transcript, a "translation" if we will, of an Old-

English original. Whether this were Caedmon's or no, of course we cannot say. Most likely it was.

The *Heliland* stands alone in Teutonic literature. Neither in any German nor in any Saxon speech is there anything like it or near it. On the other hand, it is entirely English in form and spirit and poetical colour. Its word-board, its rhyme-flow, even its mechanical commonplaces, are quite English, so English and Caedmonian that it strikes everyone. It is only Saxon in virtue of a slight transdialection, just as scores of our English things are North English or South English or Midland English, or what not, according as we happen to light upon a transcript made by a northern or southern or midland scribe.

Germany was first partly evangelised by the gifted and enthusiastic Culdee and Celtic missionaries, some of them influenced by the culture and traditions of Iona, Lindisfarne, and St. Cuthbert, and therefore Kelto-Anglic. Then came the distinctively English Romanising missions under Winfrid (Boniface) and his followers, who spread their centres of influence far and wide, and rapidly Christianised or Romanised large sweeps of the Teutonic lands, which they looked upon as a base for future inroads on the outlying Scandinavian heathendom. These men took with them stores of books, and transcripts of many such in Latin were made in Germany by themselves or their German disciples. Even now great numbers of manuscripts written in England, or plainly copied from such, still exist in German libraries. Very many of them contain the English Runic Alphabet. (See my *Old Northern Runic Monuments of Scandinavia and England*, pp. 99-114, and elsewhere.)

Besides the so-called "Caedmon" poems—which may well have been written by him, however largely altered and interpolated afterwards by successive southern scribes, so that the present late south English text may often feebly represent the centuries-older original north English—and besides a body of pious lays, often of great value and beauty, the Old English Church had other things in verse. Notwithstanding wholesale destruction, we can yet show remarkable stave-rhyme creeds, prayers, and homilies, distinctly written for and used in religious instruction, often recited or chaunted in public places "when folk did meet." Some of these pieces are now found only in Early or even in Middle English, but most of these doubtless have had Old English prototypes.

As for *wær*, &c.: nothing is commoner in all lands and times than for old words to die out, as others come in or jump into wide employ. This has sometimes happened in a single generation. All our codices give proof of it. And every dialect (the Northumbrian was one of our many dialects) had words of its own. Thus every fresh-found really antique scrap gives us new long-lost words. As far as our monuments go, *wær* was little used in England, and rapidly fell away, as have so many other words. Still it kept its ground in the sense of *factum*, *fides*, and in the compounds *eal-wærlic*, "kind," *eal-wærlice*, "liberally." The Norse-Icelandic *vær*, "peaceful, tranquil," *væra*, "shelter, snugness," show yet other side-meanings. The Latin *verus* answers to the German. The root (in Old English *varian*) is common in all the Scando-Gothic tongues.

Certain it is that the Runic verses on the splendid Northumbrian Ruthwell Cross are by Caedmon, for the stone itself plainly tells us so (*Old N. Run. Monuments*, p. 419 and Plate). But these lines, in Old North-English, are only a short extract from the striking and charming *Dream of the Holy Rood*, as our great Kemble proved years ago, and as all now acknowledge. The *Dream* is therefore also by Caedmon. Yet it shows the same blending of high verse and flagging flight which we meet with in the *Genesis* and in *Heliland*. A glance at my p. 421 will show how the "transcribed and interpolated" South-English text in the tenth-century Vercelli

codex differs from the primitive Northumbrian carved on the Cross 300 years before. "One passage (line 118) is completed by the aid of the Runic monument, the codex amended by the Carved Stone" (p. 430).

Caedmon's Runic-lay is the oldest verse in our mother-tongue, dating perhaps from about 670. He died about 680. His "first song" is first found in a bookfell written about 737. See all the four copies in my *O.N.R.M.* p. 435, and observe the valuable dialectic differences between the oldest transcript and all the others.

The confused and foolish, and comparatively modern, *prose* Latin preface to *Heliland* (by a writer who, as Ernst Windisch has shown, was not even a Saxon, and who could not find out the name of the poet he writes about) agrees with (perhaps copies) the old poetical Latin preface in one thing. They both give the story of the Divine call to the bard to sing this lay in the same manner as is so well known to us in the history of Caedmon, as told by the Venerable Bede. Bede died in 735. Windisch says that the *Heliland* was written in 825-835. These things do not square. Which must give way? At all events, as the tradition attached to the version ran, its author was a "Saxon" (a term sometimes of old used for "Anglo-Saxon," or "Angle," especially by men of Celtic race or education; all non-Kelts in England, Ireland, or Scotland are still "Saxons" to the Kelts), and he was warned from heaven to write holy verse. All this quite simply points out Caedmon, as does the inherent character of the poem itself.

Very strange is the idea of a great and gifted Church enriching herself by translating a piece by a barbarian convert in one of her mission-stations abroad. What happens is the other way. Writings in the Mother-Church are translated by her missionaries, or her disciples, for the building up of her foreign converts.

Another such wanderer from England, as I shall show more at length in my third volume, is the famous Wessobrunner Prayer. This is copied by an Englishman, or an Englishman's pupil, from an English original, but in a Saxonised form, as the writer was labouring among Saxons. The proof is twofold. The almost forgotten masterly facsimile by Father Ellinger (Bragur, vol. v. Leipzig, 1797, 8vo, p. 118) shows that the MS. has four times the English sign or bind-rune for *r*, *l*, and nine times the English mark (*7*) for *and*.

GEORGE STEPHENS.

SHAKSPEARE'S POSSIBLE TROTH-FLIGHT.

Bottesford Manor, near Brigg: October 16, 1876.

I believe that there is no doubt that during the sixteenth century a valid marriage could be contracted without the religious ceremonial being used. This was, indeed, the law of Western Europe until the time of the Council of Trent.

Cranmer says, in a letter to Cromwell which is dated by the editor 1538:—"I and my doctors that are now with me are of this opinion, that this matrimony contracted *per verba de presentis* is perfect matrimony before God."—Cranmer's *Misc. Writings* (Parker Soc.) p. 360.

EDWARD PEACOCK.

"JUGGERNAUT" CALLED IN QUESTION.

Cheltenham: October 10, 1876.

An article headed as above in the *ACADEMY* of September 30 quotes from a lecture lately delivered by Mr. Moncreu Conway in which he says: "We have now learned, on the best authority, that all those pictures of Hindoos casting themselves beneath the Juggernaut car to be crushed were purely imaginary."

The writer of the letter observes that Mr. J. S. Mill was under the impression, from what he had heard in the Court of East India Proprietors, that such horrors had really taken place; and he goes on to say that it seems very desirable to ascertain the truth.

The chief mover in the debates on the subject in the East India House was the late Mr. John Poynder; and, as I happen to have a copy of some speeches of his, I may perhaps say that it is evident that he never doubted the existence of the practice in question. He published the volume which I have, in 1830, and in his preface he writes:—

"As the value of the evidence must, of course, depend entirely on its authenticity. I think it necessary thus publicly to challenge the fullest examination into its validity and accuracy; and I pledge myself to the public that I can completely verify the several extracts made by me both from MSS. and printed works."

The first testimony which I will bring forward as used by Mr. Poynder is that of the Abbé Dubois, "who is said by Mr. Mill to have spent twenty years in India in a more intimate acquaintance with the people than any other European." He describes very fully in vol. i. pp. 371 *sq.*, the self-inflicted tortures of the Hindoos, and at the head of them mentions the prostration of victims under the processional car during its progress, a sacrifice which he says is hailed by the spectators as the perfection of devotion.

The next witness is Dr. Claudius Buchanan, a chaplain of the East India Company, who on May 25, 1813, wrote:—

"It appears that in 1812, six years after the imposition of the Pilgrim-tax, Messrs. Smith and Green write from Cuttack that the worship of the idol had been more numerous attended than usual. 'You would have been astonished,' they say, 'to see the vast number of the pilgrims. You may conceive what a multitude must have been assembled at the Temple for 150, or thereabouts, to be killed in the crowd. Numbers killed themselves by falling under the wheels of the idol's car. They laid themselves flat on their backs for the very purpose of being crushed to death by it.'"

The same Dr. Buchanan writes from Juggernaut on June 18, 1806, and gives a description of the procession of the idol's car, as witnessed by himself. He says:—

"I felt a consciousness of doing wrong in witnessing it . . . After the tower had proceeded some way, a pilgrim was ready to offer himself a sacrifice to the idol. He laid himself down in the road before the tower as it was passing along, on his face, with his arms stretched forward: the multitude passed around him, leaving the space clear, and he was crushed to death by the wheels of the tower . . . He was left to view for some time, and then carried to the Golgotha, where I have just seen him."

Again, June 20:—

"The horrid solemnities still continue. Yesterday a woman devoted herself to the idol. She laid herself down in the road in an oblique direction, so that the wheels did not kill her instantly, as is generally the case; but she died in a few hours."

Again he writes from Juggernaut's Temple, near Ishera, on the Ganges, May, 1807:—

"The tower here is drawn along, like that at Juggernaut, by cables. . . . One of the victims this year was a well-made young man, of healthy appearance. . . . He danced for a while before the idol, singing in an enthusiastic strain; and then rushing suddenly to the wheels he shed his blood under the tower of obsequy. This case was fully authenticated at the time, and reported by eye-witnesses at Calcutta."

The testimonies here adduced in order to show that the immolations under the car of Juggernaut are not a myth are sufficient to justify any one interested in the subject in calling on Mr. Moncreu Conway to produce his authorities to prove a negative.

FREDERICK POYNTER.

We are extremely glad to notice the somewhat tardy recognition of Mr. R. L. Bensly's merits as a Syriac scholar, by his election to a Fellowship in Gonville and Caius College, Cambridge. His recent discovery of the missing fragment of the First Book of Ezra will be fresh in the recollection of our readers.

SCIENCE.

Field Geology. By W. Henry Penning, F.G.S. With a Section on Palaeontology. By A. J. Jukes-Brown, B.A., F.G.S. (London: Baillière, Tindall & Cox, 1876.)

AFTER the young student has thumbed over some of the standard text-books on geology, has attended a course of lectures on the science, and satisfactorily passed an examination, he finds himself but ill-prepared to enter the field as an independent observer. True, he may be familiar enough with the latest geological theories, and may have long lists of fossils at his fingers' ends: yet he may be utterly embarrassed the first time he attempts to trace the boundary-line of a formation, or even to determine approximately the age of the rock beneath his feet. And it is by no means easy to see how he is to gain the practical knowledge needful for such work. There are some scant instructions in field-geology, it is true, in Jukes and Geikie's excellent *Manual*, in Clifton Ward's *Elementary Geology*, and in some other well-known works. Nor must we forget the admirable instructions to geological observers drawn up by Mr. Darwin nearly thirty years ago, and published in the Admiralty *Manual of Scientific Enquiry*. But we fail to remember any modern work which deals fully with the important subject of practical geology. No doubt it may be said that such instruction can be got only in the field, and that no amount of book-lore can make the student anything more than a mere paper geologist. When a young man joins the staff of the Geological Survey, he needs as a rule several months' training under an experienced surveyor before he can be trusted to lay down the lines from his own observations. And yet there can be no question that a good deal of instruction may be conveyed through the medium of clear writing—instruction which will be specially valuable to the amateur who has no experienced field-geologist as guide. Mr. Penning has therefore met a long-felt need in publishing a manual of instruction in field-geology, thus giving to the student the benefit of his own experience on the staff of the National Survey.

Mr. Penning's neat little book drops naturally into four parts. The first part explains the art of geological mapping, and describes such few instruments as are used in the field. But a map showing the distribution of the several geological formations is not all that is needed to convey a complete notion of the structure of a district. The map must be supplemented by sections showing the thickness and relative positions of the component rocks; and Sections accordingly form the subject of Mr. Penning's second part. Here the author gives his new rules for finding the direction of true dip, which were recently published and criticised in the *Geological Magazine*. The third part explains the means of determining most of our common minerals and rocks; while the fourth part is devoted to practical palaeontology. The palaeontological part was contributed by Mr. Jukes-Brown, of the Geological Survey, and is excellent as far as it goes, but it is to be regretted that the

state of his health prevented him from completing this portion, and from preparing the lists of characteristic fossils. This sufficiently accounts for a few slight discrepancies in this section of the work, and for several typographical errors. There are also some slips elsewhere which it may be well to correct in a second edition; thus the table shewing the degrees of hardness of minerals is attributed to "Moll," of course a misprint for "Mohs." When Mr. Penning, speaking of microscopic petrography, says that there is "at the present time no work specially devoted to the subject," he must surely be confining himself, somewhat arbitrarily, to English literature. Zirkel, Rosenbusch, and Doelter have written works exclusively devoted to the subject, while the number of German monographs dealing with microscopic petrology is really becoming appalling.

It will be seen from the foregoing review of the contents of this treatise on Field-geology that the work takes a position entirely its own; and, however many text-books the geological student may already possess, he will do well to add this to his stock. Books without number have been written to set forth the methods of geological reasoning, but here is one exposing the methods of geological observation: others have taught us the principles of the science, but Mr. Penning, as an accomplished field-geologist, introduces us to the practice; and, while most writers treat geology as a pure science, he deals with it rather as an art.

F. W. RUDLER.

Dictionnaire franco-normand, ou recueil les mots particuliers au dialecte de Guernesey; faisant voir leurs relations romanes, celtiques et tudesques. Par George Métivier, membre de la Société Philologique de Londres. (London: Williams & Norgate, 1870.)

Few dialects offer a more fruitful, or, it may be added, a knottier study than the Norman-French of Guernesey. This genuine and ancient popular *patois* is a variety of Norman French presenting many curious elements—especially Celtic element—and many curious analogies, and retaining a power of agglutination which might well disconcert a student accustomed only to the structure of languages fastidiously formed and sifted in Court and town. The *Dictionary* of M. Métivier is not only a masterly contribution to the study of this dialect, but one of the most remarkable works of contemporary philology.

For the first half of his life (he is now eighty-six) the literary labours of M. Métivier were rather in the direction of poetry than philology. He wrote much and admirably in his native dialect. To a collection of *Rimes Guernesaises* published by him more than forty years ago was appended a glossary of words; and this glossary was the germ of the *Dictionary*, which appeared in 1870. In the interval the author, having been from early years a practical linguist of unusual range in several groups of languages, had developed himself by incessant study into a powerful and thorough philologist. His book, with the one fault, perhaps, of a tendency to

over-allusiveness in style, is a magazine of profitable and attractive reading. It reads, not like a lexicon compiled article by article, disconnectedly, but rather like an organic and well-digested treatise broken up into articles for convenience of alphabetical reference. That old art of making a dictionary good reading has been going out. Long ago, lexicographers like the diffuse but invaluable Nicod; like Veneroni with his Italian grace and geniality; like Oudry, who knows so well alike the manners and ways of speech of France and Italy; like Nathaniel Duez, who scorns no word whatsoever; like Jean Holtrop, or the authors of the French and German Dictionary printed at Berlin by order of Frederick the Great—all these knew how to give a personal character and a human attractiveness to their work. If M. Métivier also is in this an old-fashioned lexicographer, he is in science and method among the foremost of the moderns. The only work in which a popular *patois* has been investigated, not, indeed, with equal soundness, but with something like equal affection, industry, and abundance of resource, is the *Dictionnaire Rouchi-français* of M. Hécart, of which the second edition was published in 1830.

What is of most general interest, perhaps, in a work like the present, is the light which a study of M. Métivier's philological labours throws upon the literary procedure of no less a master than Victor Hugo. Imaginative writers have too often failed to bend their genius to the demands of the scientific spirit, and to reconcile the noble impatience of inspiration with the drudgery of faithful research. The scenery and accessories of a romance have too often been painted, even in works of real genius, with the touch either of Custine, who in his *Vocation de Romuald* gives a picture of the Isle of Man more slight and fanciful than the merest opera background, or else with that of Edgar Allan Poe, whose description of Paris, in pieces like *The Purloined Letter* and *The Murders in the Rue Morgue*, are minute and punctilious indeed, but perfectly imaginary. Now, I think all good fairies were present at the cradle of M. Victor Hugo—and the fairy of Science, the surest friend of all, among the rest. At least, in *Notre Dame de Paris* the scientific spirit is genuine and indisputable, and seemed almost to promise a French Goethe. But, unfortunately, in *Notre Dame de Paris* the author's faculties for exact knowledge reached their highest point, and have been notably on the decline ever since. And, as in general one evil is counterbalanced by another, and not evil by good, so, in proportion as the master has lost his power of conscientiously grasping real facts, he has acquired the passion for making a display of spurious facts. All readers are familiar with those masses of positive and precise technical detail that overload his later writings with the appearance of an erudition of which the quality is generally doubtful and sometimes absurd. Thus, after living eleven years in Guernsey, Victor Hugo published the *Travailleurs de la Mer*, a romance which might be made a masterpiece by reducing it to the proportions of a tale—for it is, indeed, a tale enlarged to the proportions of a romance by the help

of those fervid, interminable, and often almost unintelligible, technical descriptions which are introduced by turns in telling of the stars of heaven, the bolts of a steam-boiler, the waves, the rocks, and such vague gleams of thought as may cross a man's brain in dreams. In all this it seems to be an established principle with the author that the visions of Inspiration bestow a more plenary knowledge than the enquiries of Science. Without questioning the principle, the reader at any rate expects to find in a book like this a tolerably faithful reflection of the manners and language of Guernsey fifty or sixty years ago. And as to the manners, he is not disappointed; in all that concerns direct, familiar human observation, the imagination of M. Victor Hugo has retained a force, freshness, and sanity which many a so-called realist might envy him. But, as to the language, that which he gives us by way of the Norman-French of Guernsey is by no means genuine; the writer has no real command of that picturesque dialect which might have served him in such good stead. *Pour l'amour du prospect*, for instance, is not a dialect-phrase at all, but only a piece of towns-folk's Anglo-French instead of *pour le plaisir du coup d'œil*. The same may be said of *maison visionnée* for *maison hantée*. The following almost exhausts the list of real, or approximately real, Guernsey words which are to be found in the *Travailleurs de la Mer*; with the help of M. Métivier, let us briefly study them:—1. *Vere dia*: this is a form of the French *oui dâ*; *vere* (*vrai*) being employed by the Normans, both of the islands and the mainland, instead of *oui*. The people of the Pays de Caux have, indeed, invented for the people of Lower Normandy a name barbarously spelt *Houivets*—i.e., folk who say *oui vè* instead of saying either *oui* or *vè* (for *vere*) separately. 2. *Veuvier* (or, as the less educated peasants say shortly, *veuvi*): this is formed in imitation of the English *widower*, German *wittwer*. These Teutonic forms would seem to justify the explanation of the Sanskrit *vidhava* by *vi*, without, and *dhava*, husband: in primitive times the loss of a husband by the wife was more important than the loss of a wife by the husband; the primitive Aryans employed a word which described the bereft woman only; but the Latin language later applied it to the bereft of either sex indiscriminately, *viduus*, *vidua*: whence the French *veuf*, *veuve*. 3. *Elle est de charme*: there is an error here; what the Guernsey peasants say is, *elle va d'charme*—that is to say, she is very well, as if protected by a charm or spell, since spells in the popular imagination are both for good and evil. 4. *Le pil d'une cauche*: M. Victor Hugo is quite right in giving this for *le pied d'un bas*, the foot of a stocking: from the Latin *calceus* is formed the Norman-French *cauche*, equivalent to *chaussette*. 5. *Patates temprunes* is, again, good Guernsey for early potatoes; *temprun* coming from *tempus* through the late Latin *temporarius*—cf. the Old French *tempre*. 6. *Cambion* is a form of M. Victor Hugo's own for the Guernsey *cangeon*, which means, not, as he explains it, the child of a *succubus*, but a spoiled, a naughty child; because, when a child is more than its mother can manage, she consoles

herself with the belief that it is a changeling. 7. *Rang* is no genuine word; M. Victor Hugo probably means *rum*, *run*, place or room, meaning in old French the hold of a ship, and now, at Aurigny (Alderney), bearing both the senses of the English *room*; whence the verb *arrumer*, in modern French *arrimer*, to arrange.

So much for M. Victor Hugo's knowledge of the Guernsey dialect when he wrote the *Travailleurs de la Mer*. What follows is more curious. The *Travailleurs de la Mer* was written in 1866, when M. Métivier's *Dictionary* did not yet exist. That *Dictionary* appeared in 1870, when M. Victor Hugo was engaged in writing another romance—*Quatre-vingt-treize*. The scene of the new story, as all the world knows, is laid in Upper or French-speaking Brittany, in what the Breton-speaking people of Léon, Vannes, Quimper, and Tréguier call the *gallots* districts (sc. *gaulois*; see the French-Breton *Dictionary* of the Abbé A., Leyden, 1744) of the province. M. Victor Hugo having distributed a few Celtic-sounding names among his personages, such as Tellmarch, Halmal, &c., had next to consider what language he should make them talk. The real dialect of Upper Brittany was remote, and would have cost trouble. But the new Guernsey *Dictionary* of M. Métivier was at hand; and the poet, probably reflecting that between the Channel Islands and the scene of his romance the distance was but a stone's throw, calmly laid this under contribution. Let us put a few excerpts from the romance side-by-side with others from the *Dictionary*:—

Quatre-vingt-treize, vol. i. *Dict. franco-norm.*, p. 291:

p. 8: "Houiche-ba, s. m.,
"La houiche-bas, chasso chasso aux oiseaux pen-
aux oiseaux pendant la dant la nuit."

M. Victor Hugo has thought to transplant the word by altering its gender. In French the word would be *hoche-bas*; cf. the name-bird *hochequeue*; and the Norman *houiche-pote* for the French *hoche-pote*.

Quatre-vingt-treize, i. 35: *Dict. franco-norm.*, 111:

"La Claymore était d'un débris
gabarit massif et trapu." d'un vaisseau, gabarit ou
gabri. Selon Jean Hol-
trop, *Dict. franç-holl.*,
1786, gabarit est la forme
d'un vaisseau."

Here, it is the note in italics which seems to have caught M. Victor Hugo's eye.

Quatre-vingt-treize, i. 133: *Dict. franco-norm.*, 112:

"Tutrouveras bien quel-
que part un carapousse." "Carapousse, s. f., tapa-
bor, vieux chapeau."

'Oh, un tapabor, cela se trouve partout.'
The form of the word in Bas-Breton is *caraboussen*, in Norman *carapon*. M. Victor Hugo has curiously inverted parts in putting this provincialism into the mouth of his prince, and making his peasant use the real old French word *tapabor*.

Quatre-vingt-treize, i. 175. *Dict. franco-norm.*, 114.

"Cette espèce de logis
sous terre, moins rare en
Bretagne qu'on ne croit,
s'appelle en langue pay-
sanne *carnichot*. Ce nom
s'applique aussi à des
cachettes pratiquées dans
l'intérieur d'un mur." "Carnichot, s.m., cham-
brette menagée dans un
mur. Bas-breton *carnic*,
petit coin, diminutif de
carn, coin."

Here M. Victor Hugo has transferred the chamber on his own authority, for purposes

of picturesqueness, underground. Here let it be remarked in passing that the French *carne*, the outer angle of a block or table, is one of the words omitted in M. Brachet's *Etymological Dictionary*. It is connected with the English *corner*, and is of Celtic origin.

Quatre-vingt-treize, i. 177. *Dict. franco-normand*, sub voco. "Caimand ou quemand, s.m., mendiant."
"Je m'appelle Tell-march, et on m'appelle le Caimand." "Je sais; Caimand est un mot du pays—qui veut dire mendiant."

This is the way to cut up a dictionary article into dialogue. But M. Victor Hugo might have remembered that the word is not only Norman and Bas-Breton, but French. *Quemander*, "to beg," is put down by M. Brachet as one of his 650 unknown derivations. M. Métivier is inclined to connect it, through the forms *gaimenter*, *guermenter*, with the Gaelic *gairm*, Welsh *gairn*, Bas-Breton, *charm*, to utter cries.

Quatre-vingt-treize, i. 150-151: *Dict. franco-norm*, sub voco. "Imānus, s.m. et adj., homme d'une laideur extrême. Ce mot suppose une forme latine, *immanus* pour *immanis*, comme *sterilus* pour *sterilis*, forme indiquée par Lucrèce."
"D'mes daeux yers j'vis l'imānus
A la qu'inso et les bras nus
Tapaïr d'sen flais [taper de son fléau] sur notre age,
Pus dur que l'Sanné de la fage."
MS."

Now, the fact is that M. Métivier, in addition to his published *Rimes Guernesaises* and *Fantaisies Guernesaises*, has in his portfolios a quantity of unpublished verses composed by himself in his native dialect, from which he sometimes quotes to illustrate the use of a word. Such is the quotation above given; and the "ancient MS." imagined by M. Victor Hugo from reading M. Métivier's article is nothing more or less than a MS. of M. Métivier's own! For the rest, this strictly Channel Island word, which the poet has used for his grim conception of the monster Gorge-le-bruant—*alias* Brise-bleu, *alias* l'Imānus—this word is a very singular one, and I am not disposed to accept M. Métivier's conjecture as to its origin. In the original glossary to the *Rimes Guernesaises* he had simply given its signification: *imānu*, épouvantail. The Jersey form of the word *imānu*—s.f., quasi *image nue*—seems to give us the clue. In a contemporary poem, by a writer who calls himself Le St. Luorenchais, I read:—

"Oulle est morte, je l'ai perdue,
La fille que j'aimais;
Oulle est là comme une imānu,
Je ne la r'verrai jamais."

Now, we know that the images of Catholic devotion, covered up on ordinary days, were exposed on festival and ceremonial occasions. Catholicism has fallen in these islands, in Guernsey the most completely; with the change of creeds the images of Catholicism will have become things of horror instead of worship; and, according to the law that the

gods of one faith are the demons of the next, it is, I think, at least a possible hypothesis that the *image nue* of ancient religion may have passed into the *imānu* of Jersey and the *imānus* of Guernsey.

Enough has been said to show how copiously, and in some instances how carelessly, the famous poet and romance-writer has borrowed from the unknown poet and lexicographer. The question naturally arises, has M. Victor Hugo acknowledged his debt to M. Métivier? No; he has quoted all sorts of recondite authorities: Durosol for the management of guns on board ship; Errard, Sardi, Pagan, for the details of mining operations; Anguste le Prevost, the antiquarian of Bernay; but the philologist of Guernsey, never. It might, indeed, have been an awkward confession that, in order to compose conversations in the dialect of Dol and Rennes, he had taken up and ransacked a dictionary of the Guernsey dialect. But courage is not a virtue wanting to M. Victor Hugo; and it would certainly have been no blot upon his fame had he chosen to let the world know that in the island of his own exile there lived, and still lives, an aged, noble, and neglected worker named George Métivier.

JULES ANDRIEU.

SCIENCE NOTES.

ASTRONOMY.

The Supposed Intra-Mercurial Planet.—Herr Weber's observation of a round spot on the sun, supposed to be the hypothetical planet Vulcan, has called attention again to the question of the existence of one or more planets within the orbit of Mercury. Some years ago M. Le Verrier found anomalies in the motions of Mars and Mercury, which he could only explain by assuming the earth's mass to be really larger, and her distance from the sun less, than had been believed, and by supposing that there was an undiscovered planet near the sun, which disturbed Mercury. The best chance of detecting such a planet would be when it passed across the sun's disc, and, as a matter of fact, round black spots have been seen on the sun on several occasions. M. Le Verrier, in recent communications in the *Comptes Rendus*, has discussed all the recorded observations, and, after eliminating doubtful cases where an ordinary sun-spot had probably been mistaken for a planet, he finds that five remain, which might refer to a planet having a period of thirty-five days and passing through its nodes in April and October, when transits might take place. From a further consideration of the question, however, he concludes that there is no chance of such a phenomenon for several years, and that, therefore, the search to which astronomers were invited at the beginning of this month was useless. At the same time, he considers that Herr Weber must have observed a different object, and it now appears that what he saw was really a small sun-spot. On the morning of April 4, M. Ventosa, at Madrid, observed a small circular sun-spot, and two photographs taken at Greenwich show the same spot in a group of faculae, close to the place indicated by Herr Weber, who has evidently mistaken a sun-spot for a planet. How little worth there is in merely negative evidence in such a case, is shown by the fact that three observers of great experience attest the absence of spots or faculae on the morning of April 4, although the Madrid and Greenwich observations show that there was a fine group of faculae accompanying a small spot. It is evidently very easy to overlook such features on the sun, and M. Le Verrier therefore excludes all cases in which no motion of the spot was observed and

which depend on the negative evidence of the absence of ordinary sun-spots immediately before or after. M. Janssen has pointed out that it is difficult to determine whether a spot has a proper motion unless the telescope be equatorially mounted, but that the passage of the spot over the granules on the sun's surface will show at once that it is moving across the disc. He further urges the importance of using his revolver-slide to take photographs regularly at frequent intervals throughout the day, so as to make sure of detecting a planet if it exist, and of determining its path.

The Masses of Venus and Mars.—A careful series of observations of the sun were made at Dorpat from 1823 to 1839 by W. Struve and Preuss; these give a good determination of the sun's apparent motion or of the earth's real motion during that period. As the earth's motion is affected by the perturbations of the several planets which depend on their masses, a means of determining these last is thus afforded, and Dr. Powalky has thus deduced those of Venus and Mars (which produce the greatest effect on the earth) by comparing the observations with Hansen and Olufsen's tables of the sun, in which certain values for these quantities are adopted, founded on the Greenwich and Königsberg observations. The resulting mass of Venus is slightly larger than any of the values formerly found, being almost exactly 1-400,000th of that of the sun, while that of Mars would be rather more than 1-3,000,000th, which is not far from the mean of former determinations. On the whole there is a satisfactory agreement between the several values, and the masses may be considered as determined within five per cent. of their amounts. This is perhaps as much as can be expected in the case of planets, for which the masses can only be determined from perturbations amounting at most to a few seconds of arc, and in which, therefore, an error of a tenth of a second produces a considerable effect on the value of the mass found, but for planets such as Jupiter and Saturn, which have satellites, the mass can be determined to the thousandth part, with a fair degree of certainty. The differences between the values found by Dr. Powalky and those adopted in Hansen and Olufsen's tables (from another and longer series of observations) would produce an effect of only half a second at the maximum on the sun's place.

The Parallax of Mars in 1877.—Prof. Eastman, of Washington Observatory, has drawn up a plan for meridian observations of this planet at the next opposition, when it will be unusually near the earth, and therefore very favourably situated for determining its parallax, and consequently that of the sun. A year ago Sir George Airy prepared a chart of stars near the path of Mars, and urged the importance of obtaining differential observations east and west of the meridian at places near the equator, all that would be required being a firm equatorial, the rotation of the earth giving the parallactic shift, which is to be observed. Prof. Eastman's scheme requires the co-operation of northern and southern observatories provided with good transit-circles, the parallax in this case being obtained from the difference of geographical position. This plan was successfully carried out in 1861, and a good determination of the sun's distance obtained. It will be observed that it depends on the measurement of difference of declination with a graduated circle, while the equatorial observations require differences of right ascension observed with a clock. Although the transit of Venus was successfully observed in 1874, astronomers are not disposed to neglect any other means that may be available for determining the sun's distance, and of these a favourable opposition of Mars offers the best opportunity, while it has the advantage of not requiring costly expeditions to be sent to distant spots.

Sun-Spots in 1875.—Prof. Spörer, in the

Astronomische Nachrichten, gives his observations of sun-spots during last year, especial reference being made to their distance from the equator at the present time of minimum. Taking a complete period of eleven years, the average latitude of spots is about $15\frac{1}{2}^{\circ}$, but last year it was only 11° , having decreased continuously since 1868, when it was 23° . In 1863 and 1864 the average latitude was about the same as for last year, but the number of spots was far greater, while in 1866, when the spots were about as frequent as in 1875, the average latitude was only 9° . These facts, therefore, seem to point to some connexion between the frequency of the spots and their distance from the sun's equator.

The Colour of the Earth-Light on the Moon.—Most observers have described the colour of this appearance as ash-grey, though Lambert found it on one occasion to be olive-green—a circumstance which he explained as the result of reflexion from the primitive forests of South America—while Hermann Klein considers the colour to be a grey-green. Herr Possner, in a letter to the *Astronomische Nachrichten*, states that on one occasion it appeared to him to be a delicate bluish grey, more pronounced near the limb, and he claims for his eye peculiar sensitiveness to colour, as shown in the case of coloured stars. It does not appear, however, that he took any precautions to eliminate the effect of contrast from the sky, which would, if it were of an orange hue, give rise to the complementary blue on the earth-lighted portion of the moon, and in a more marked degree near the limb. The colour of the bright moon apparently changes from greenish-yellow, or even a vivid green, to bluish or reddish white, according to the hue of the adjacent sky, which is therefore an important element in the enquiry as to the real colour of any portion of the moon. And it is to be borne in mind that contrast operates most powerfully for eyes which are most sensitive to colour. Herr Possner may, however, have trained his eye to allow for this effect, though this is very difficult in the case of greys, which are nearly neutral in hue.

MICROSCOPICAL NOTES.

THE *Popular Science Review* for October contains a valuable paper by the Rev. W. H. Dallinger, explaining and exposing the errors of Dr. Bastian and others who, for want of a reasonable amount of knowledge of minute organisms, and due care, have made so many mistakes in their attempts to defend "heterogenesis," "abiogenesis," and highly improbable transformations of species imagined to be effected, not in accordance with the facts and inferences of the Darwinians, but in an abrupt way. Many of Dr. Bastian's imaginary "facts" are, as Mr. Dallinger observes, much like supposing that "a humming-bird was hatched from a snake's egg, or that a gorilla was born of a kangaroo." Mr. Dallinger has shown in his long and admirable researches that continued observation is absolutely necessary to avoid error and trace out successfully the life-history of minute objects. He gives, among other instructive instances, an account of a monad that at one stage of its existence caricatured the shape of a small rotifer, and might easily have been adduced as a case of transformation.

THE question of the limit of visibility of minute objects under the microscope with the highest powers continues to attract attention, and prompts to experiments as well as calculations. Mr. Webb, known for his skill in microscopical writing, mentions in the *Monthly Microscopical Journal* for October that Mr. F. Crisp has a diamond engraving of the Lord's Prayer, in which "the letters are smaller than the two hundred and ten millionth part of a square inch, at which size over fifty-nine Bibles would be required to cover an inch." It is not at all convenient to give the size of letters in this way. No one, without reducing the 210-millionth of a square inch to other measures, can tell of what size the letters really are. A micrometrical

measurement of the height and breadth of each letter would at once give the information required.

DR. ROYSTON PIGOTT in the same journal affords some valuable information in a paper "taken as read" before the Royal Microscopical Society, and entitled "The Present Limits of Vision." He describes experiments made with a telescope and illustrating diffraction phenomena like those which perplex the microscopist. In one instance a half-inch lens was placed in sunshine, sixty feet from a house with a white front and dark-framed windows, and viewed with a telescope. "During the sunshine nothing but the spurious disk, and companion rings of diffraction could be described . . . but in shadow very minute details of the miniature house came sharply into view." In a similar experiment, but substituting a mercurial thermometer bulb for the lens, he says, "in shadow, a very fine telescope enabled me to descry the miniature of trees, and the chimneys of the house against the sky. In sunshine, the diffraction hid all these details." Various experiments with the microscope are also mentioned, and a table given to show the proportionate resolving powers which certain mathematicians assign to objectives of various angles of aperture. "The remarkable result of this table is that if 96,000 brilliant lines can be resolved with an aperture of 150° , then 11,000 lines per inch ought to be resolved with as low an aperture as $12^{\circ} 38'$." Practically the great question is how far the diffraction effects which confuse, or destroy, proper vision can be avoided, and thus the range of the instrument increased. Dr. Pigott thinks this can be done to an important extent. His paper is full of matter deserving attentive study.

M. GIRARD (*Comptes Rendus*, September 25) states in reference to photography that a *cliché* negative, when indistinctly developed with sulphate of iron or pyrogallie acid, shows under strong magnification in the

"clear unimpressed parts uniformly dispersed crystals of reduced iodide of silver, scarcely $\frac{1}{1000}$ th of a millimetre in diameter." "The effects produced in the sensitive layer appear distinct from these superficial reductions. On examining the dark parts acted upon by the light, in a series of progressive tones, it is seen that they are formed by incrustation of a reticulated and granular texture, without appearance of crystallisation."

IN the same publication M. H. Fol has a paper "On the Intimate Phenomena of Cellular Division." Referring to his previous researches, and to those of Flemming, Bütschli, and Bobretzky, he speaks of his recent investigations of segmentation among the heteropoda, sea-urchins and sagitta. He states that:—

"Centres of attraction appear, before each division, at two opposite poles of the yet absolutely intact nucleus, and seem to consist in a local fusion of the substance of the nucleus with the vitelline protoplasm, or perhaps an irruption of the protoplasm in the more fluid interior of the nucleus. At these two little masses of sarcode soon appear rays of sarcode, some of which extend into the interior of the nucleus from one centre of attraction to the other, while others diverge in the vitellus."

The author then remarks on certain points on which he differs from M. Bütschli, and states that the medium best adapted to bring out the true aspect is picric acid followed by glycerine. Osanic acid, he says, usually causes the disappearance of the extra-nuclear filaments.

MEETINGS OF SOCIETIES.

ROYAL MICROSCOPICAL SOCIETY.—(Wednesday, October 4.)

THIS was the first meeting of the Session. H. C. Sorby, Esq., F.R.S., President, in the Chair. Mr. T. Palmer read a paper "On a New Method of Measuring and Recording the Bands of the Spectrum." It would be impossible to explain Mr. Palmer's method by any brief description, or without the illus-

trative diagrams that accompanied it. He advises careful micrometrical measurements, and supplies the means of turning them into wave-lengths which constitute a universal standard. The paper exhibited great care and knowledge of the subject, and was highly commended by the President.—"The Microscopical Structure of Amber" was the subject of a paper by Messrs. Sorby and Butler, from which it appears that amber, especially the cloudy sorts, exhibits under the microscope an enormous number of minute cavities, some round, and others more in shape like a balloon with a car attached, or sometimes detached and separated from the balloon-form by a greater or less interval. The cavities sometimes contain water and air-bubbles. They often act as lenses, and form images of other bubbles that chance to be in focus below them. The balloon and car-shaped bubbles appear to be formed by internal pressure as the amber consolidates and shrinks. Mr. Sorby exhibited some beautiful drawings showing the various sorts of cavities.—Dr. Hinds, of Birmingham, contributed a paper, read by the Secretary, "On a curious Effect in Connexion with the Cells of *Hypericum Androsaemum*." In the white spaces he noticed movements of particles, which continued even after the plant had been for some time in a vasculum.—Mr. Slack exhibited a small beach agate said to have been found on the Brighton shore, which contained a great number of round red bodies, of spongy texture and hollow. They bore considerable resemblance to the objects figured in the May number of the *Quarterly Journal of the Geological Society* by Dr. Duncan. No one present could identify them, and opinions differed as to whether they ought to be regarded as fossils or merely as mineral deposits.

ENTOMOLOGICAL SOCIETY.—(Wednesday, October 4.)

SIR SIDNEY SMITH SANDERS, C.M.G., Vice-President, in the Chair. Mr. Bond exhibited varieties of *Hepialus humuli* and *Epania luvulenta*; and also specimens of the new Tortrix, *Scricoris irriquana*, all taken near Loch Laggan by Mr. N. Cooke.—Mr. Forbes exhibited a weevil (evidently not indigenous to Britain) taken among some orchids at Hightgate. Mr. Pascoe pronounced it to be a new species of *Cholus*, for which he proposed the name of *C. Forbesii*.—Mr. W. Cole exhibited numerous bred specimens of *Ennomos angulata*, showing differences in appearance as the larvae had been fed on oak, hawthorn, lime or lilac.—Mr. Enoch exhibited microscopic slides containing some beautiful preparations of minute species of Hymenoptera.—Mr. Frederick Smith communicated "Descriptions of new species of *Cryptoceridae* belonging to the genera *Cryptocerus*, *Meranoplus*, and *Catanulacus*," accompanied by a plate containing figures of the twelve species described. The author gave some interesting particulars relative to the habits of these insects, especially of *Meranoplus intrudens*, which constructs its formicarium in the thorns of a species of *Acacia*. These thorns were some four or five inches in length, and at a distance of about half an inch from the pointed end a small round hole was made by the ants, which served for ingress and egress to and from the nest. The thorns contained a kind of spongy pith in which the channels and chambers of the nest were constructed.—A catalogue of the British Hemiptera (Heteroptera and Homoptera), compiled by Messrs. J. W. Douglas and John Scott, published by the Society, was on the table.

NEW SHAKSPEARE SOCIETY.—(Friday, October 13.)

A. J. ELLIS, Esq., Vice-President, in the Chair. The paper read was by Miss Jane Lee, on "The Second and Third Parts of *Henry VI.*, and their Originals." The four chief heads were: 1. The old plays known as the *Contention betwixt the two famous Houses of York and Lancaster*, and the *True Tragedie of Richard Duke of York* were the originals, and not imperfect transcripts of 2 and 3 *Henry VI.*; 2. No part of the *Contention* and *True Tragedy* was Shakspeare's; 3. The *Contention* and *True Tragedy* were by Marlowe and Greene, and possibly Peele; 4. It was Shakspeare, probably helped by Marlowe, who altered the *Contention* and *True Tragedy* into 2 and 3 *Henry VI.* The date of 2 and 3 *Henry VI.* the writer believed to be about 1590, and the date of the *Contention* and *True Tragedy* to be some years earlier. That the *Contention* and *True Tragedy* were the older plays was shown by pointing to the monotonous and antiquated system of their versification as compared with 2 and 3 *Henry VI.*; to the various particulars found in them which are absent from the *Henry VI.* plays; to the omissions

from them of fine passages, &c. That Shakspeare had no part in the old plays Miss Lee sought to prove by recalling the open and clamorous charges of plunder brought against him by his rivals. It was urged, too, that the *True Tragedy* was acted by Lord Pembroke's players, by whom none of Shakspeare's plays were acted; that both it and the *Contention* were in the hands of the publishers Millington and Pavier, by whom none of Shakspeare's plays were published; and that Chettle, in 1592, implied that Greene was then acknowledged to be a greater comedian than Shakspeare—whence the improbability that Shakspeare had written the Cade scenes of the *Contention*. This dissimilarity between the metre, style, and general character of Shakspeare's early works and of the *Contention* and *True Tragedy* was noticed. Marlowe's and Greene's authorship of the old plays seemed to follow from the unrefuted charge of appropriation brought against Shakspeare; from the fact that both Marlowe and Greene were writers for Lord Pembroke's company; and from the internal evidence afforded by metre, by grammatical structure, by verbal expression, and by lines reproduced in the *Contention* and *True Tragedy* from the undisputed plays of Marlowe, and of Greene. In proof of the opinion that it was Shakspeare who altered the *Contention* and *True Tragedy* into 2 and 3 *Henry VI.*, it was urged that general tradition assigned them to Shakspeare; that his intimate friends Heminge and Condell declared them to be Shakspeare's; and, moreover, that Shakspeare himself claimed the plays as his own. The writer concluded by quoting passages to show that Marlowe's peculiar style appears as distinctly in the reformed as in the unreformed plays. A summary was also given of opinions as to the authorship of the plays, and the arguments of Mr. Fleay, of Mr. Grant White, and of Mr. Ward were examined.

FINE ART.

How to Build a House. By E. Viollet-le-Duc. (London: Sampson Low & Co., 1876.)

THIS book is in form a novelette, in substance a treatise on modern domestic architecture. Its French title indicates the former, its English name the latter. Though it affects to be but the story of a house (*Histoire d'une Maison*), its purpose is really to teach how, in the present day, a house ought to be built. In most attempts to combine instruction with amusement, the one object is attained, if attained at all, only by the sacrifice of the other, and in this case, as is usual, it is amusement that fares the worse. There is really no interest in the flimsy tale which is interwoven with this architectural treatise. M. Viollet-le-Duc has shown in numerous works a clearness and vigour of style which can make the most practical essay eminently readable, and it is to be regretted that the author of the *Dictionnaire Raisonné* should abandon, in this and in other recent publications, a style in which he is so successful for one in which success is probably impossible.

The work has another drawback: it is illustrated. However excellent may be the principles enforced, the design in which they are embodied is most feeble. M. Viollet-le-Duc is distinguished as a draughtsman, a critic, and an archæologist, but not as an architect. One need go no farther than the Cathedral of Paris, restored by him, to be convinced of this. One need not go even so far as that: it is sufficient to open the *Histoire d'une Maison* to learn from the illustrations how *not* to build a house. This is really to be regretted, because the principles which Eugène, the able architect of the story, lays down are usually sound enough, and one is sorry to think how many

people may be deterred from adopting them by seeing in the illustrations a result of their application.

One may conclude from the form of the book that it is intended for popular reading. For this purpose, however, it seems much too technical; while, on the other hand, considered as a treatise on house-building, it is too slight to be of service except to a pupil of architecture in a very early stage of his studies. The problems in house-architecture which really require solution at the present day are scarcely alluded to. How to build walls strong, dry, and cheap; what form of window-fittings is the most serviceable in a given climate; how to use machine-work to the best advantage; how most cheaply to warm, and most efficiently to ventilate, a house or a room; how to satisfy the varied practical requirements of modern life to the utmost, and at the same time to give to the work, and to every detail of it, that impress of art for the absence of which no amount of mere "comfort" will make amends—such as these are the problems of house-building at the present time; and the *Histoire d'une Maison* does very little towards their solution. Its tone is good. It of course insists on real and solid construction, and it lays down truly enough that ornament should follow upon the necessities of such construction. But such generalities are of very little service. The difficulty lies in their application to particular requirements, and of this the work tells us little that is new. An exception may be made in favour of the mode of constructing floors and ceilings suggested at pp. 110–111, which is certainly novel. The usual system of flat plaster-ceilings is no doubt unreasonable. We apply to that part of our rooms in which a certain amount of vibration is inevitable a rigid coating which is fractured by the slightest movement, and we colour this coating white, so that the smallest crack is visible at once. On the other hand, such ceilings are cheap; they diffuse light and deaden sound, so that it is not easy to find a substitute which is better and not more expensive. M. Viollet-le-Duc's suggestion is ingenious, and would answer where oak is cheap. In France house-building is better understood than with us, and M. Viollet-le-Duc has little to teach his fellow countrymen, unless it be to abandon a very tolerable vernacular style, which is never vulgar, and which they thoroughly understand, for the Pointed style, into the spirit of which no Frenchman seems able really to enter. Housebuilding in England, however, is in such a degraded condition that the translation of even so slight a work as the *Histoire d'une Maison* may be welcomed here. Such a district as South Kensington (a sort of thing impossible in France) is a disgrace to us. It is amazing that English gentlemen of sense and refinement should be willing to inhabit houses which, so far as they have any character at all, express a cheap and vulgar ostentation. To this is due the use of stucco, revived upon so vast a scale in South Kensington. Stucco makes a great show at little expense, and this is just what English gentlemen, in their houses, desire, or at least acquiesce in. While the public is quite satisfied with cheapness and pretence, there

are very few architects who trouble themselves to supply anything better. M. Viollet-le-Duc deserves credit for an attempt, however unsatisfactory in some respects, to draw public attention to the important and ill-understood question—how to build a house.

G. GILBERT SCOTT, JUN.

ATTAVANTE, MINIATURIST OF FLORENCE, AND HIS PRINCIPAL WORKS.

(Second Article.)

THE Great Breviary of Charles V., as the Brussels Folio is called, is not only one of the finest examples known of Cinquecento art, but, what is of some importance to our enquiry, possesses a very clear and satisfactory pedigree. Originally executed for Matthias Corvinus, it fell by natural inheritance into the possession of Louis II., his successor, whose widow, Marie of Austria, sister of Charles V., brought it with her to Brussels when appointed Regent of the Netherlands by the Emperor, in 1531. It now forms part of the Burgundy collection in the Royal Library. From the time of the Archduke Albert and his consort, Isabella, in 1599, to that of the Archduchess Maria Christina and her husband, Albert Casimir of Saxony, in 1781, it was used as a sort of reliquary, upon which were taken the inaugural oaths of successive governors. The very first of these performances was the occasion of a serious accident to the MS. As the ceremony took place in the open air, it so happened that a shower of rain fell most inopportunistly just as the Archduke's hands were being placed upon the precious volume. Doubtless he hesitated, and laid them as lightly as his oath would permit, yet the result was most deplorable, and we have evermore to regret that Spanish or Austrian etiquette did not allow of the salutary intervention of a towel during this part of the solemnity. The two unfortunate pages, of course important ones, are pretty nearly ruined—the colouring smeared, the gold rubbed off, and the text sadly dimmed.

The volume, though entitled *Missale Romanum*, is in reality one of those private service-books properly called Breviaries, or abridgments not intended for public, ecclesiastical, or official use. The example before us was one of those kept, no doubt, in the Chapel Royal at Buda. It is a very large folio, and on the whole has been carefully preserved. It contains 215 leaves, or 430 pages, including those of the Calendar, and consists of the Order of the Mass in general, and of several particular Masses, according to the ritual of the Church of Rome at the end of the fifteenth century. Certain indications prove it to have been executed not later than 1490. For example, the feast of St. Joseph is fixed on March 19 as what is called in Church phraseology "simplex," which proves it to have been written before the year above-named, as the same festival after that date is set down as "duplex." Moreover, the Mass appointed for the "Conception of the B. V. Mary" is that approved by Sixtus IV. in 1476. At the commencement of the volume, on the "verso" of the first leaf, is a grand miniature representing David at his devotions, very similar to the one in the Vatican Breviary. He wears a blue tunic, blood-red mantle with yellow lining, and blue soft leather boots. He has the grey hair so universally to be found in all fifteenth-century miniatures, whether Italian or Netherlandish, and often, as here, painted with the most wonderful delicacy. The drapery is finely hatched with gold. The border consists of golden arabesques of Cinquecento foliage in the usual Attavante manner, including figures, medallions, and symbols. Nothing could well exceed the beauty of design or the skilfulness of execution of this ornament, the delicacy and brilliancy of the colours employed, or the extreme tenderness of the cameos and figures in the borders.

The title-page opposite has also golden arabesques of the same kind. Within the border is

placed a grand architectural design similar to those of the Vatican MS. It represents an altar-piece in marble, bearing a great arch at top, above a rich cornice. On the arch corners it is enriched with two medallions, one at either side, and there are two niches below containing statues. Just below the middle cornice is a circular disk, supported by two tall figures carrying the inscription in golden letters on a rich blue ground. Two graceful figures, one at either end, stand beside the altar-table, the front of which is adorned with exquisite bas-reliefs. The arch and cornice are painted of a very dark brown, shaded with still darker touches and finely relieved and hatched with gold. The tympanum of the arch contains a shield of arms on a blue ground, supported by two Genii or winged children in *chiaroscuro* of the deepest shade of green, like the ground of the tympanum itself, and of the same obscure depth as the brown in the rest of the design. The pillars are of dark porphyry, and produce a rich effect. Festoons of fruit, suspended from each corner of the cornice, are executed in dark brown relieved with gold. The background cornices are of a deep purple-grey, with white marble borders, and circlets of white marble around the medallions, the bas-relief heads in which are also fair white marble on black grounds. The back pillars are very dark green. The figures are clothed in fine green and blood-red, with laced Florentine bodices, after the manner of Domenico Ghirlandaio. The representation of the Almighty in the large central medallion over the inscribed tablet, surrounded by six-winged cherubs, is robed in blue and red. Rays of gold proceed from the figure, alternately straight and wavy, as usually given. The inscription on the tablet in the centre is: "INCIPIIT ORDO MISALIS (sic) SECVNDVM CONSVETVDINEM CVRTAE ROMANAE." The arms are those of Matthias Corvinus. Along the extreme base of the altar runs the legend:—

ACTAVANTES DE ACTAVANTIBVS DE FLORENTIA
HOC OPVS ILLVMINAVIT A.D. M.CCCC.LXXXV.

that is, seven years before the Vatican Breviary, and five before the death of Corvinus. No doubt much of the secondary work in both MSS. was done by pupils, even to the painting of some of the miniatures. In the border at the foot of the page are the arms of Charles V. on a scrap of parchment stuck over the original shield of Corvinus. This substitution is made several times in the course of the work.*

The medallions in the border are intended to represent white marble on black grounds. The other panels have half-lengths of beautiful women with narrow hangings of green or lilac behind them. The central portrait is that of Corvinus himself—which, by the way, authenticates another Corvinus MS. in the Collegio Romano at Rome, doubtfully said to be by Attavante, but probably the work of Gherardo di Giovanni. The portrait of Corvinus given in De Scudery's *Curia Politica* is utterly fanciful; that in *Retratti et Elogii di Capitani Illustri*, Roma, 1647, more nearly of the type here shown, but still by no means like in features. The portrait given by Attavante in this Brussels Folio is that of a round-faced, portly personage, more like a well-fed ecclesiastic than a tough and hardy warrior. It is the Corvinus of

his later years, just the sort of man that would be likely to be carried off by a fit of apoplexy, as, in fact, he was on the Palm Sunday of 1490. He appears face to face with his second wife, Beatrice of Aragon, daughter of Ferdinand I. of Naples, whom he had married in 1476. In the ornaments of the border some of the shield-like medallions have a kind of cusped form of intertwining blue and gold, very elegant, the angles or cusps being set with lustrous gems. The second border contains a golden arabesque on a dark ultramarine ground, very rich, the modelling of the scrolls being a little more sharply defined than usual. The miniature across the top of the page is David at prayers.

In the designs for the principal title-pages of this Missal the miniature is placed at top, framed in a very elaborate moulding of an architectural character with either the vine-leaf or egg-pattern along the frame, while down the centre of the page, between the text-columns, runs a border of about half-an-inch wide, edged with bright-gold bars, and containing a fine Renaissance pilaster ornament in *chiaroscuro* or colour, occasionally in gold. An oblong panel with cusped ends lies on the middle of this border, painted in a different colour, often a honey-suckle ornament in monochrome, but sometimes a group of sweetly-painted flowers on the plain white ground. No description can do justice to the exquisite beauty of these flowers—nor, indeed, to the faultless execution of the arabesques. The delicately-coloured ground of this panel usually forms a charming contrast with the remainder of the border. In the present instance the ground of this central border is a full rich green, with an ornament in paler green upon it. The cusped panel has a ground of crimson, and contains a golden-and-green ornament. The initial letters are precisely similar in dimensions and design to those of the Vatican Breviary. The one on this page is formed with golden foliage on crimson, and contains a fine miniature of David holding a harp. The stem of the letter has fine gold embroidery or filigree on a purple ground. The text in the second column is gold on purple. Labels of a rich green are placed here and there on this purple to contain the more important words or phrases. The writing is usually of faultless regularity, and the smaller capitals in pen-work of great elegance. In an ordinary page of text the floral border of the so-called Gherardesco manner is usually made to spring from some initial letter, and passes up and down the page from its upper and lower limbs, finishing with pen-work at top and bottom. This style of ornament is by no means uncommon, many books in the Riccardiana Library in Florence, some in the University Library at Bologna, and in the Bodleian at Oxford, and one or two in the British Museum have the same kind of bordering. It is the ordinary border of the Vatican Breviary also. It would be as bewildering to my reader as it is difficult for myself to attempt any description of the wonderful variety of design which occurs in the ever-varying pages of this most exquisite manuscript. At a hasty glance they appear to be pretty nearly alike, but such is not found to be the case upon closer examination. Jewels and pearls in golden settings, medallions and strings of gems, and flowers of the loveliest forms are among the rich creations of the artist's pencil.

At the commencement of the Canon of the Mass is the great miniature—filling the whole page—of the Crucifixion. The design and colouring of it are of uncommon beauty even for Attavante, and the contemplation of this page induced the curator, M. Kuelins, to observe to me that he felt confident the Vatican MS. was inferior. Along the bottom of this miniature of the Crucifixion runs a legend:—ACTVM FLORENTIAE A.D. M.CCCC.LXXXVII, marking an interval of two years between the commencement and this point. On the opposite page is placed the Last Judgment, the borders of both

containing medallion pictures of the mysteries of our Saviour's life and of that of the Magdalene. These two are the pages so hopelessly injured by the rain at the installation of Archduke Albert.

The Crucifixion is a peculiar picture. In the upper left-hand corner is an angel carrying off—in the manner of the Orcagna frescoes in the Campo Santo at Pisa, and of early Italian art elsewhere—the exhaling ghost of the penitent thief, while on the other hand a demon possesses himself of the soul of the wicked one. A stork's nest, such as we see nowadays on the chimney-tops of Strassburg, rests on the summit of the cross. The border is formed of one great volute of arabesque (I call the beautiful Renaissance foliage by this name for want of a better), winding about five elliptical miniatures, on one side; and a two-fold volute enclosing two such miniatures on the other, with Cupids here and there, or Genii, supporting them. Arms are placed at foot, under a rich crimson canopy and golden crown. The shield is supported by two angels with flowing garments, in the manner of Ghirlandaio. Some of the miniatures have double rims of bright gold, containing alternate pearls, &c., on grounds of crimson. The same style of tinting the inner margin of the pages with green on the one hand and crimson on the other is employed in this MSS., as in the Vatican Breviary and the Martianus Capella. It occurs also in the Laurentian Diurnale, being a common practice, both with the Florentine and Flemish illuminators. It is almost always enriched with a fine embroidery of gold. The initial on the Last Judgment page contains the subject of the Resurrection. The two columns of text consist of letters of gold on crimson; the central border is green, and the cusped panel lilac. The lower border is of unusual depth and divided into three compartments, like those of the Vatican Breviary. The centre is occupied, as already mentioned, with arms, &c., the other two with miniatures—a "Noli me tangere" on the left, and the Journey to Emmaus on the right. The side borders, as usual, extend the whole length of the page. Many large vignettes of saints and martyrs of the sacred calendar occupy places in the margins. The prevalent Gherardesco floriation of the ordinary pages is most elegant; indeed, I never saw it surpassed. I would prefer to call it Florentine, for though a very similar style of ornament occurs in Siennese and even Milanese and Roman borderings, there is still an appreciable peculiarity in this employed by the illuminators of the City of Flowers. Nor is it specially the invention of Gherardo, though much employed by him. Corvinus, it will be remembered, employed artists from all parts of Europe, but more especially Italians, and perhaps most especially these Florentines; and the same school that produced Gherardo produced his two brothers, Monte and Francesco di Giovanni, Attavante, Fra Eustachio, the two Boccardini, the two Torelli, the two Corbizzi, and others of inferior note. The borderings of MSS. by any of these artists are all more or less of the same type. The Siennese school, including incomers from Verona, Cremona, and other neighbouring places, never reaches the surpassing sweetness of the floral scroll in this Florentine Cinquecento.

In my next paper I shall endeavour to describe the Martianus Capella in the Library of St. Mark's at Venice.

JOHN W. BRADLEY.

CHRISTIAN ANTIQUITIES AT ROME.

Bagni di Lucca : Oct. 2, 1876.

I have to report further respecting recent works in the Roman "Catacombs," and (in this last instance) within one of those cemeteries least generally known or visited, having been long left in a condition somewhat dangerous to explorers—that, namely, called after St. Hermes, a martyr there interred, and above whose tomb was built a small basilica, now entirely subterranean, and incorporated with a section of the same hypogeum

* It may be interesting to some readers to have a rough description of the somewhat complicated shield of the Emperor Charles V.

where his remains were originally laid. This cemetery is entered by a staircase below a vineyard on the Salarian Way, not far from the Roman gate recently rebuilt after the demolition (to be regretted) of the ancient "Porta Salara." A compartment of this "S. Hermes Catacomb," never, apparently, visited either by Bosio or later explorers, not even till recently by the learned Chev. de Rossi, has been re-opened and made accessible through the convenient occurrence of a landslip in the soil which had choked up the entrance to one of the subterranean corridors leading into dim regions long untraversed by any human being. Here are seen pilasters supporting, in some places, massive arches of brick, constructions which probably belong to the earliest works for restoring and repairing these primitive cemeteries in the fourth and fifth centuries of Christianity. In this newly-opened extent of corridors and chapels there have been found no fewer than 150 epitaphs, beside the broken fragments of many others, alike inscribed on marble. The inscriptions which are still complete indicate, in phrase and orthography, a period earlier than that of Constantine, not later, as inferable, than the third century. In no instance has been found the monogram of the Holy Name (XP) in that form known as the "Constantinian," from its frequent use during and after the reign of the first Christian Emperor. Some of the more conspicuous and over-arched tombs, *arcosolia*, with deep recesses above the place of sepulture, are adorned with paintings of some interest: among others, a figure of the Good Shepherd, with a lamb laid across his shoulders, and two sheep beside him; also, in the same recess, an "Orante," standing in prayer between two doves, the expressive emblem of the believer's soul in heavenly beatitude. More observable is another decoration on the lunette-shaped space of wall at the back of the same over-arched recess, though consisting but of fragments, all now left of a large glass disk, which must have covered almost the whole of that *fondo* wall, and on which was painted a large figure, entirely enclosed within a nimbus—probably (seeing the significance of such attribute) meant for the Saviour. From the accounts extant it is perceived clearly that this figure was not (as are others on glass vessels in early and *quasi*-sacred use among the Roman Christians) either painted in a species of enamel, or enclosed between two glass *lamine* fastened together by the action of fire, but, by a less common process, executed on the back of the disk, and therefore, of course, to be reversed for the effect to the spectator seeing it on the other side of the transparent medium.

Among the epitaphs in this section of the cemetery there is one to a person named "Petrus," with the figure, incised on the same slab, of a fisherman casting his net into the waters from a boat, allusive, evidently, to the apostolic office of the Saint as a "fisher of men" whose namesake is thus distinguished among the dead. May we not also admit in this an indication of the early tendency, at least in the Roman Church, to ascribe a species of supremacy to St. Peter? In another epitaph the title "beatissimus," given to one "Silbanus" (*sic*), seems to imply the admitted character of sanctity in the deceased, perhaps either a Martyr or illustrious Confessor of the Faith; for, in the aggregate of full 12,000 ancient Christian epigraphs preserved at Rome, such designation never occurs save in the metrical eulogies composed by Pope St. Damasus in honour of Martyrs or the much-revered Confessors who suffered under heathen persecution.

The adornment of tombs with glass disks, seen in two examples in this section of the St. Hermes Catacomb, reminds us of a much later continued use of similar decorations, the disks of porphyry, green serpentine, or other coloured marbles, as well as plates of bright-tinted majolica, inserted on the brick-walls of mediæval belfry-towers, so many of which are seen in Italy, several fine examples being before us at Rome. The origin of this

usage, which was maintained in Italian church-building till the fifteenth century, may be traced to so early a period and so different a sphere as the dates and classification to which pertain the comparatively rude art-works in the underground cemeteries of the Roman Christians.

I should add a grateful tribute to the young archaeologist, Signor Mariano Armellini, of Rome, whose exertions were rewarded by the re-discovery of the buried monuments above mentioned, and who was the first to publish a report on the subject (see the *Cronichetta mensuale delle più importanti moderne scoperte*, a small monthly periodical, edited by that gentleman's father).

One might hesitate to commend, or to anticipate purely advantageous results from, the last undertaken among the many works for restoring or embellishing churches at Rome under the pontificate of Pius IX.—an ever liberal contributor to the costs of such enterprises. A considerable sum has been appropriated by the Canons of the Lateran, and, as I understand, largely added to by his Holiness, for a restoration, or rather enlargement on a new plan, of that primary basilica, which ranks, as the Cathedral of the Papacy, even higher than St. Peter's. It is proposed to give to this great church the more distinctly-defined form of a Latin Cross by lengthening the chancel with its spacious apse, and thus further distancing the high altar from the western end—the orientation of the Lateran being from west to east, the celebrant at that altar having to face the congregation. It is asserted that designs for such renovations prepared by one of the many architects who have carried out the hitherto most unsuitable and unpleasing modernisations of this cathedral, since it was almost entirely rebuilt in the fourteenth century, have been found still extant, and are to be followed out in the new works to be directed by Vespignani, an architect much engaged, and in high repute, under the present Pontiff. It is well-known that the magnificent and very complicated mosaic which covers the vault of the Lateran apse holds pre-eminent rank among Christian art-works of that class in Rome; it was executed during the last years of the thirteenth century, and has a grandly mystic character, full of profound religious meaning in its groups and symbolism. One may tremble for the risks to which this will be exposed in the course of labours which will necessitate the total demolition of the apse itself, the taking to pieces of that precious mosaic, though, of course, with intent to rebuild the mediæval structure and replace its fine decoration with the ancient material, without any alteration of the ancient artistic design. Let us hope, however, for the best under Count Vespignani's experienced guidance.

The Roman Archaeological Committee has, I am glad to learn, determined to resume the *scavi* some years ago commenced on the site of the villa of the Empress Livia at Prima Porta, a village about eight miles from the city, where the most valuable treasure-trove was the truly noble statue of Augustus, in richly decorated cuirass, and military tunic, now standing in the "Braccio Nuovo" of the Vatican. There is reason to believe that much, more or less worthy to be preserved, still remains among the buried ruins; and that a statue of Livia herself may be exhumed somewhere not far from the spot where that of her lord lay underground for so many ages.

C. I. HEMANS.

NOTES AND NEWS.

Two interesting bronze plaques have just been received from Nineveh by Mr. Rassam. They are of small size, and apparently formed a portion of the casing of some brazen gates. The figures are in *repoussé* work, and represent a procession of persons bringing "tribute to my majesty," as is indicated by a portion of an incised cuneiform inscription which accompanies the figures. The art is of a good period, and the procession is divided

into two rows by lines of rosettes. These interesting fragments will be exhibited by Mr. Rassam at the next meeting of the Society of Biblical Archaeology.

COLLECTORS do not often limit themselves to the works of a single master, nor among modern painters at least are there many who can be said to claim such exclusive worship. The experiment, however, has been tried with the best results in the case of Mr. Rickards at Manchester, where the talents of a living English painter are represented with a fullness that could scarcely be matched elsewhere. Instead of trusting himself to hold the balance of taste amid the conflicting claims of modern schools, Mr. Rickards has devoted his energies to the task of bringing together an important and very varied series of the works of Mr. Watts, R.A. Many of these works are already known by their appearance at the Royal Academy, and others have been lent from time to time to the annual exhibitions of the Manchester Institution, but the value of the collection as a connected record of Mr. Watts's career can best be appreciated by a consideration of the pictures as they are brought together under the roof of their fortunate possessor. We may even doubt whether it would be possible to find elsewhere such ample material for forming a judgment upon the artist's position; and it is certain that the public display of such a collection could not fail to serve as a revelation even to many who already entertain a very high opinion of Mr. Watts's powers. For Mr. Rickards has been fortunate in securing examples of every class of work with which the painter's talent has associated itself; and he possesses, besides, a very interesting specimen of sculpture in marble executed many years ago, during a residence at Florence. This consists of a head of Medusa, suggesting in the general motive of the composition the influence of the painting of the same subject now in the Uffizi Gallery, and attributed to Lionardo da Vinci. The head is thrown back in such a manner that the face, turned upward in full view, leaves the powerful lines of the outstretched neck as a prominent feature of the design; and here as well as in the treatment of the face the artist has successfully realised the impression of an intense agony calmed and controlled by the stronger presence of death. Such a combination of the qualities of energy and repose is eminently fitted to the resources of sculpture, and the general effect is grand and impressive, but the execution does not display either the mastery or the completeness in detail which characterised Mr. Watts's bust of Clytie exhibited some years ago in the Academy. Among the paintings there are many that we need do no more than mention as being already familiar to all students of Mr. Watts's work. Such, for instance, are the large island design of the *Deluge*, with its wide expanse of waters, a small study of the subject of *Orpheus and Eurydice*, exhibited in the Dudley Gallery, and a sketch for the large Academy picture of *Charity*, exhibited two years ago. A small picture called *Drowned*, a female figure stretched out beneath the dark arch of a bridge, has likewise been at the Dudley Gallery, as well as a foreshortened figure of brilliant execution entitled *Ariadne*, and a landscape of the Island of Cos, with visionary forms of beauty submerged in the quiet waters that wash its shores. To this list might be added a number of portraits that enrich Mr. Rickards's collection, and of which the interest seems only to increase on further acquaintance. Prominent among the number are the portraits of Joachim, of the late Earl Brownlow, of Lady Bath, of Miss Prinsep, and, last but not least, of the artist himself. In the class of portrait the collection also contains much more of equal importance that is not so familiar to the public. We may particularly mention a splendid painting of Lord Lyndhurst in his robes, a work of magnificent intellectual force and the most solid technical qualities. As a worthy pendant

to it there is also the portrait of the present Recorder of London; while as an example of a different manner may be mentioned the head of Miss Dalrymple, and a half-length of Miss Villars, of a noble severity in design and the most delicate refinement of colour. Chief among ideal compositions is an allegorical picture entitled *Time, Death, and Judgment*. Here a fine poetic invention is expressed with a simplicity and force that the painter does not always command. The figures of Time and Death—the first as a youth in the fullness of life and strength, and the second a maiden stricken with grief and pale as a shadow—advance hand in hand, while above them, mounting upwards through a cloud of golden light, is seen the figure of Judgment. The idea of the composition is sustained by an expressive scheme of colour in which the warm and cold tints are delicately contrasted, the deep flesh tones of the figure of Time and the crimson robe that he wears balancing the pallid hues of her face and the ashen grey of her ample garments, and both alike brought into harmony with the flood of yellow light that beats down from above. Besides this picture, the collection includes a very graceful study for the figure of Psyche, and a small but finished rendering of the subject of Paolo and Francesca, which was afterwards expressed upon a larger scale. There is also a considerable representation of the artist's powers in the department of landscape, and in one example, a view of some cottages at Freshwater, we have evidence of a recent study of the beauty of outward nature.

WE understand that a new *atelier* for lady artists has been opened in Paris by M. Krug, an artist of known ability. The morning class begins at eight o'clock, working on till twelve o'clock from the semi-draped figure. The afternoon class, from one till five o'clock, is occupied specially with the study of portraiture. In the evening there is another class for two hours, again working at the half-draped figure. M. Krug, besides his own assiduous instruction to the students, has secured for them also the benefit of weekly visits from three distinguished artists in Paris.

AMONG recent additions to the British Museum print-room are acquisitions of the Work of Bonington.

IN November there will be held in London, we hear, a somewhat important sale of the Work of Méryon.

M. PATZCKA, the young Hungarian painter now working in Paris, is engaged upon a large picture of the surgeon's visit at the hospital. A mother holds up to the inspection of an eminent practitioner and his pupils a suffering child, pale, wan, and stripped naked for the visit. The work is in too early a stage to speak definitely of its pictorial qualities, but it is not too early to see that the artist will use in it his rare gifts of keen and sympathetic observation. There is nothing whatever of sentimental in the work. It is, on the contrary, strongly pathetic and vigorous; and whatever faults of youth it may have, these must be put into the background by the presence of its really strong and remarkable qualities. The artist is also engaged on several smaller works more immediately agreeable.

If there is much to be desired in England in the formation of provincial museums, there is much to be desired in France in their regulation. In all except the very largest of provincial towns they are practically closed to the public. They are open, of course, to the tourist, on the reasonable condition of a fee to the *conciierge*, and the less reasonable condition that the tourist shall spend some part of his time in the *conciierge's* pet corner, where he has arranged a collection of local *faïence* or *plaques* by some living artist which he is directly interested in selling. But to the inhabitant who withholds his fee and does not care about buying the *plaque* the museum is

practically closed. At Orleans, for instance, it is open once a week, except during long vacations, which occur pretty often: at Blois it is open once a month. This difficulty of access is little creditable to anyone concerned, and it can hardly be without influence in turning aside gifts to the museum. Even the local collector thinks twice before he bestows on a museum treasures which, when once they are received, will but rarely be looked upon. Again, authoritative catalogues are greatly needed, to take the place of the pamphlets so much given to attribute to masters work which they never did. The French have little idea what treasures and what worthlessness are hidden away in the museums of their second-rate provincial towns.

THE Austrian animal-painter M. O. van Thoren has been this last summer at Trouville, and has amused himself by making many clever studies of the Parisian in the waters by the Roches Noires. From these he has worked up one or two bathing-pictures, in which aspects of the weather—wind, water, and sky—and attitudes of the motley crowd of costumed bathers are caught with very true observation: caught, visibly, *sur le vif*. M. van Thoren has already developed a special talent for these things.

M. RAJON, who is about to leave for Paris, has now in progress several very interesting and important etchings from the works of English painters. Noticeable among them is an unusually large plate after Mr. Oulless's well-known portrait of Dr. Pochin. Such a subject, with its elaborate surroundings, demands on the part of the engraver the highest manipulative skill, and affords occasion for the exercise of what may justly be termed the inventive part of his craft. For to translate the varied incidents of colour into the stricter language of black and white requires a power of selection and arrangement scarcely inferior to that originally exercised by the painter. With a new material, and under altered conditions of effect, the etcher has to refashion the painter's scheme without sacrificing his intention, and the result, when it is successful, may be compared with that achieved in the realm of language when a poem is so translated as to preserve, not merely the sense, but the music of the original. M. Rajon's work in its present stage promises well, and the plate, when finished, will form a worthy companion to that already executed after Mr. Oulless's portrait of Mr. Sale. Another large plate upon which M. Rajon is now engaged is from Mr. Tadema's picture of the *Proclamation of the Emperor Claudius*; and a comparison of the two works, with their different systems of interpretation, serves to illustrate the varied resources of the engraver and his power of entering sympathetically into the most opposite kinds of pictorial beauty. In the presence of a plate of so much delicacy and elaboration as this it is interesting to observe that M. Rajon makes but little use of the burin, depending for nearly all his effects upon pure etching and dry point. How delicate those effects can be is shown in a portrait of Mrs. Rose, taken from a drawing by Mr. Sandys, where the finest variations of tone are produced within the limits of a scheme that makes no demand upon the full strength either of light or shadow. By his portrait of Mr. Mill and Mr. Martineau, M. Rajon has already proved his peculiar fitness for the task of rendering the works of Mr. Watts, and we are glad to know that he is about to undertake other portraits by the same master. No student of Mr. Watts's work can have forgotten the splendid portrait of Herr Joachim exhibited some years ago in the Academy—a painting marked, apart from other qualities, by a peculiar beauty of light and shade. M. Rajon has, we believe, been entrusted with the task of making an etching from this work, and he has also undertaken to reproduce by etching a portrait of the Prince of Wales upon which Mr. Watts is at present engaged.

A VERY powerful committee has been formed in Paris to carry out the scheme of a Museum of the Decorative Arts proposed some time ago in the pages of *L'Art*.

THE private view of the exhibition of pictures in oil at the Dudley Gallery takes place to-day (Saturday).

A COMPETITION has been opened by the commune of Arc-sous-Cicon for a painting representing the *Martyrdom of St. Stephen*, which is intended as a decoration of the high-altar in the parish church of that town.

THE old manufactory of Sèvres has been entirely closed to the public since October 1 in consequence of the removal of the works, which is being carried on with great activity. The time for the opening of the new manufactory has not yet been fixed, but the *Chronique* predicts that in about two months the interior arrangements will be sufficiently advanced to admit the public, if not to the whole building, at all events to a considerable portion of it, and particularly to the new Ceramic Museum and the galleries of modern productions.

ON the proposition of the Mayor, the name of Eugène Fromentin is to be given to one of the streets of La Rochelle, the town in which the late distinguished artist was born. It is likewise proposed to preserve a remembrance of his name by the same mode in Paris.

THE picture of *Mohammed II.*, by M. Benjamin Constant, which attracted much admiration at the last Salon, has been presented by the French Government to the town of Toulouse to be placed in its Museum.

THE eminent Italian engraver and lithographer Michael Fanoli died recently at Milan. He was the pupil of Cicognara, and leaves to the Academy of Fine Arts at Venice a large collection of drawings and sketches.

M. EUGÈNE MUNTZ finishes in the current number of the *Chronique* the important series of articles on the "Tapestries of Raphael in the Vatican" which he has been for some time contributing to that paper, and in which he has made known the results of his researches into various inventories and books of the Vatican in which were recorded the particulars of the sums paid to Raphael and other artists for their works. M. Eugène Muntz's work will no doubt be republished in a more permanent form. It makes in many respects a useful addition to our knowledge of the art-history of a most important period.

THE third number of the magnificent Dictionary of Architecture by M. Ernest Bosc (*Dictionnaire raisonné d'architecture et des sciences et arts qui s'y rattachent*) has just been published by the firm of Firmin-Didot and Co. It gives, besides a short treatise on heraldry, an excellent history of Byzantine architecture, illustrated with a chromolithograph which gives a good idea of the splendour of the colour employed by the Byzantine mosaists and decorative artists.

THE fiftieth exhibition of the Berlin Academy is not held this year in the old Academy buildings, but in a temporary structure erected for the purpose on what is called the Museums-insel, opposite the artillery barracks. The greater part of the pictures are arranged in long parallel corridors, with side lights, a convenient arrangement for seeing them to advantage. Another convenience is that a *café* and restaurant have been opened in the new building. Of the pictures, the most noticeable is the large historical painting by Gentz, representing *The Crown Prince of Germany entering Jerusalem in 1869*. All the principal figures in this picture are portraits, but the Oriental character of the scene is nevertheless well preserved, and the grouping of various representatives of Eastern society is effective and picturesque. The gorgeous procession of Eastern dignitaries, the Jerusalem crowd, with its veiled women, and

even the artist, who has depicted himself seated on a donkey sketching the scene, are all reproduced with the utmost realistic accuracy and artistic skill. Andreas Achenbach's *Fish Market at Ostend* is another realistic painting, though of a totally different character. Here we have dashing seas painted as only Achenbach knows how to paint them, and rough seamen and fish-wives instead of grave Oriental ecclesiastics and veiled ladies. Of religious subjects the most remarkable is a *Holy Family* by the popular genre painter Knaus. This work is executed with the fervent religious spirit that marks the works of the early masters of the art, though it is by no means a copy of any particular master. It is said to have been painted for the Empress of Russia, and excites great interest and attention. The mediæval subject of *The Dance of Death* is again depicted by Gustav Spangenberg, who represents the Death-skeleton walking along a desolate plain with a long train of followers, but still ringing his bell to summon others to join in his ghastly procession. Of portraits, those by Gustav Richer stand, as usual, pre-eminent, but there are several other admirable portraits exhibited, among which may be noticed the portrait of a young lady by Oscar Begas, and his own portrait by Graef. Landscape art also occupies a high position, so that altogether, both for general excellence and several exceptional works, the Berlin Salon of this year is considered to have more than an average degree of merit.

THE catalogue of the Grenville Library in the British Museum has a mistake which does injustice to the memory of the old Elizabethan and Jacobean surveyor, John Norden. It states that his beautifully written and illustrated MS. description of Essex, No. LV. of the Grenville MSS.—a small collection little known—is the same as that edited by Sir Henry Ellis for the Camden Society from the Marquis of Salisbury's MS.: whereas it is a second and enlarged edition, with many fresh interesting details, a charming little drawing of a "watchet or pale blew" saffron flower, with a full description of it, and a superb blazon of the arms of the Earl of Essex, to whom the book is dedicated. The Essex antiquarian folk ought certainly to facsimile this manuscript. The Camden Society will, we hope, give its additions to their print of the first edition in the next number of their *Miscellany*. Norden was very poor, and had been very ill. "In the interime" of his ailings he evidently revised his "first view of this simple description of Essex," for which, no doubt, Lord Burghleigh paid him, and sent this handsome second view or edition of the book to the Earl of Essex, to get some more money from him.

THE STAGE.

TRAGEDY AT THE THÉÂTRE FRANÇAIS.

Paris: October 12, 1876.

From the death of Rachel until within the last year or two, Tragedy, as performed at the Théâtre Français, had but small chance of success. One or two uninspired writers, who had studied Corneille, wrote five acts of dignified dullness, and these were patiently represented by trained performers in the conventional way. The whole thing was a concession to the respectable traditions of the theatre. The "house of Molière" was allowed to be amusing six nights of the week on condition of being always grave and generally empty on the seventh. There is now a change. People have gone to *La Fille de Roland* a second time, and for its own sake. Pit and boxes are crowded to-day by the representation of *Rome vaincue*, and *Rome vaincue* is played at least three nights in the week. The playgoer may ask, Is the new fashion to be of long duration? And what is it owing to? It is owing to a combination of circumstances and persons which the next generation—nay, which the playgoing world of even ten years hence—is not likely to see repeated

or continued. It is owing to the defeats of 1871, to Mounet Sully, to Sarah Bernhardt, and to M. Francisque Sarcey.

But M. Francisque Sarcey will be the first to tell you that it is not. As far as he is concerned, he records and embodies the public feeling, he will say, rather than leads it. That is partially true; but what is truer is that he finds himself so placed that he can advocate a cause while at times seeming only to chronicle it. He likes French tragedy, and little would it matter whether he liked it or not if its performance had to be left to the excellent dullness of Maubant, or the measured stateliness of Mdle. Agar. But he likes French tragedy; and here is Mounet Sully, with no remarkable talent, but with a voice and presence that win audiences, and here is Sarah Bernhardt—the one actress of genius of our day—ready to play in it. Nor are these alone. Two writers at least have come to the front—and there must be others behind—who have known how to strike a note which would find an easy response. *La Fille de Roland* and *Rome vaincue* are, in a sense, tragedies, but tragedies which, like M. Emile Augier's drama of *Jean de Thomeray*, have used, not indeed the precise incidents, but the emotions and situations of the war. *La Fille de Roland*—M. Henri de Bornier's piece—is admirable work, and will live ten years very likely; more than that, its lyric about the two swords will belong to French literature. *Rome vaincue* is an elaborate exhibition of ability, but what does it contain—except an opportunity for Sarah Bernhardt—which has not been done as well by many men in many times? Where is the unmistakable personality, the first and last attribute of a writer whose work, whether received or not at the moment, is at all events to stay? You do not see it. Nor does M. Francisque Sarcey—M. Parodi's advocate—succeed in showing it to you.

But M. Francisque Sarcey is a power in Paris. Authors and actors have to reckon with him, and he affects to wonder at it. Young women, with their mothers, come to him from the Conservatoire, "as if," he says, "a few words in a journal must influence their career." But it is not "a" journal whose encouragement they want: it is the encouragement of Sarcey. Sarcey is good-natured, but confessedly incorruptible. No array of mothers and daughters greatly influences Sarcey. But the encouragement that the accepted critic withholds from an individual of doubtful capacity he bestows enthusiastically on the literary school of his choice. The actress must make her own way with the public, but the tragedy is extolled. And when M. Francisque Sarcey extols a piece, the theatre fills.

You have not to look on very far to see that there must be an end to this influence. A critic of equal ability with M. Sarcey, and with other leanings in literature, would not write for many years without gathering round him the support not only of the aggrieved and disappointed members of the two professions of Letters and the Stage with whom the potent critic of the day may happen to be embroiled, but also of a large silent public whose mouthpiece M. Sarcey has never been—who have never had adequate means of expression, since M. Sarcey has expressed so well the sentiments of those whose sentiments he shares. Some day you will have a critic who will tell you—and with all M. Sarcey's frankness and plain-speaking—that the first three acts of *Rome vaincue* are the ideal of tedious commonplace; that M. Maubant on the stage is not a man but a mask, and that traditional tragedy in Alexandrines is only supportable when an actress like Sarah Bernhardt ceases to have a single movement or gesture of tradition.

We tried to point out, a month ago, in what was the force of Sarah Bernhardt's *Phèdre*. Its force, summed up in a word, was in its modernness. It veiled or ignored the morbid passion which since Massinger has had no place in English literature or art, and which French literature

has reserved for the curious. It was an embodiment of infinite and hopeless regret—from beginning to end hardly more. In what now is the force of *Rome vaincue*? It is in the last two acts as the last two acts are acted by Mdle. Sarah Bernhardt. They are not in their acting tragedy at all, as tragedy is understood in the Rue Richelieu. They are hardly tragedy in conception, or, at least, they lose hold of the main theme and find their real interest to be in what is but an episode. You have vainly endeavoured in the first three acts to be interested in the fortunes of Rome. Hannibal—will he be defeated or not? Will the punishment of the Vestal Virgin who has dared to love suffice to turn away the vengeance of the gods? The question has been discussed by M. Parodi in laborious verse, delivered by Maubant and the rest of them—for the conscientious Maubant is but a type—with the regularity of emphasis and conventionality of gesture which would almost spoil fine things, were there fine things to spoil. And now it is the fourth act. Posthumia, the Vestal Virgin's grandmother, is informed that Opimia must perish, and by hunger, and alone. The perils of Rome are forgotten; the allusions to France, delivered with uplifted arm and pompous utterance at the footlights, are forgotten also. For there is a personal agony. Posthumia, with white hair falling round her cheeks, and with blind eyes turned up high under the eyelids, is groping about to find who there is to plead to, and where is the child she may embrace. The measured swing of the verses is all gone. The words, such as they are, are in the background, so delivered now that they seem but the accidental utterances of an immense agitation. Gesture and cry and change of voice tell the story which from this point you care about. Rome and Hannibal, and M. Parodi and his patriotism are out of sight. One real figure with a real agony is on the stage—Posthumia. And so it is through all that is left—purposelessness of the pleading, the wildness of the embrace, the gathered resolution for another end than the end which has been planned. Posthumia silently and secretly proffers a dagger to the girl. The girl understands, and it is better than the endless death of hunger in the cave. But her hands are fettered. Posthumia, without a moment's doubting, will do it herself. Is it here—"la place de ton cœur?" Opimia is dead, and the interest is with Posthumia alone while they carry the girl to the rock, and the old woman, now dazed and forgetful of the last minute's experience, feebly totters to the tomb with lifted hands, the curtain falling on her last plaintive cry:—

"Opimia, ma fille, ouvres! c'est ton sieule."

That, of course, is an extraordinary success. Nothing that was said of the acting in *Phèdre* is quite adequate to the praise of this, for the like of it has not been seen by any who have not seen Rachel. Only do not go away saying that French classical tragedy is seriously revived because M. Sarcey praises Parodi, and many women like Mounet Sully, and because Sarah Bernhardt, by giving a wrench to a play, has turned and saved it at the close, bringing on to this dead stage a human interest intense and sudden.

FREDERICK WEDMORE.

Two English Theatres, lately closed, have this week opened their doors, but neither with a programme requiring lengthened notice. The Charing Cross Theatre is occupied by Mr. Henderson and Miss Lydia Thompson and their gay and lively company, and the playhouse is henceforth to be known as the "Folly"—"a name," says Mr. Henderson very modestly, "which will sufficiently indicate the nature of the entertainment." We hear it was originally proposed to call the place "the Toothpick." That would have been still better; but "the Folly" will do.

THE Saint James's Theatre is the second play-house re-opened this week, and it puts forth as its attraction "a comedy played for the first time in England"—*Three Millions of Money*. *Three Millions of Money* is one of those pieces which generally succeed best in the original French, and in one particular Parisian theatre. The French play-going public in London is familiar already with the *Trente Millions de Gladiateur*. It has laughed at it during more seasons than one. The public that enjoys this kind of thing in English will have its laugh at the St. James's Theatre, thanks, in part, to the exertions of Mrs. John Wood and Mr. George Honey; but the piece is not one with great claims to approval. Boisterous acting is a help to it.

AN adaptation of *Martin Chuzzlewit*, to be entitled *Pecksniff*, is underlined for early production at the Folly Theatre, where it will precede the extravaganza.

THE last nights of *The Great Divorce Case* are announced at the Criterion. This piece has been one of the rare instances of successful adaptation.

Mdlle. ADELIN DUDLAY, the *débutante* at the Théâtre Français, has had an unusual history, only part of which the Paris *Figaro*, with an unwonted reticence, published a day or two since. The *Figaro's* anecdotes are amusing; but what is of interest to the playgoer is this—that the young lady comes from Brussels without any other practice whatever than that which is afforded by the Conservatoire of that city, and the special lessons of Mdlle. Tordeus, who from the first thought much of her ability. At present, Mdlle. Dudlay is wanting in mobility of facial expression, and she has a common fault of young talent—that of imitating talent that has made its way—but she has also very uncommon grace, and a voice of fine quality. She has had the good fortune to persuade some eminent members of her new profession to believe in her very much; and her success with artists is greater perhaps than her success with the public.

THE *Cog Hardy* of M. Poupert Davyl will fall far short of the success of the *Maitresse Légitime*. It was produced at the Porte Saint-Martin at the end of last week, amidst applause from the galleries which found no echo in the parts of the house most frequented by judges. M. Poupert Davyl has given us sentiment instead of laughter: drama instead of comedy. The change is not, in his case, for the better; for while the comedy contained much that was entertaining, the new drama has but little to arrest the attention. Dumaine, a quite clever actor who allows himself to exaggerate, appears in its principal character, and Dumaine has saved bad pieces from failure. The Porte Saint-Martin audience, moreover, is not sensitive as to the graces of literary style, and did not on the first night appear much moved to laughter by such a sentence as "I have managed to keep my head on my shoulders, but my heart is decapitated." But those who have an eye for literary excellence will require a good deal of brilliant scenery and costumes of the Renaissance to make them forgetful of passages such as these. The truth is, M. Poupert Davyl has followed too lightly in the steps of the elder Dumas. Dumas, at least, knew the stage, and how to conceal his literary imperfections. M. Poupert Davyl has made a mistake, and it may be doubted whether, notwithstanding all the energy and goodwill which Dumaine and Dica Petit bring to bear on the interpretation of the piece, it will have any continued success. M. Poupert Davyl must work hard; he is not without "the instinct of the theatre," and knows sometimes how to resume, as it were, a situation in a word, but then he loses himself again, and an endless unprofitable dialogue wearies an audience whose attention he might have held.

THE three-act play in verse called *Compensations* has not been able to hold its own very long

at the Gymnase, where the *Hôtel Godelot* has had to be revived pending the production of some important piece.

MADAME JUDIC has appeared at the Variétés in Mdme. Schneider's famous part, *La Belle Hélène*. Her performance is liked as much as Schneider's, but by different people. Madame Judic has always a certain *finesse* in her impudence: Schneider was saucy and gross. The piece has aged very much: all sorts of allusions to corruptions and scandals of the day when it was produced passing now unnoticed and unrecognised.

THE *Crime de Villefranche*, the last sensation drama at the Château d'Eau, would appear to owe one of its chief incidents to the murder committed by Müller, the German, in a railway carriage on the North London line. It is very realistically done.

WE understand that a comedy in three acts entitled *Flirtation*, written by Mr. George Somers Bellamy (author of *Two Wedding Rings*, *New Shakespearian Dictionary of Quotation*, &c.) and Mr. Frederick Romer, is now in the hands of Mr. Swanborough, of the Strand.

MUSIC.

MDME. ARABELLA GODDARD'S RECITALS.

AFTER an absence from England of nearly four years, Mdme. Arabella Goddard has once more reappeared in public. It was at one time stated that she had resolved never to perform again in this country. If she ever had formed such a resolution, her admirers will be grateful to her for not having kept it. She has given two Recitals at St. James's Hall, the first of which took place on Thursday week, and the second on Thursday last. The occasion will be a favourable one for offering a few remarks on the talented artist's merits, and endeavouring to show on what are founded her claims to her high position in the musical world.

Perhaps the first point that would strike a hearer of Mdme. Goddard is the remarkable beauty of her touch, and her command of *cantabile* playing. In this respect she certainly has few equals and no superiors. Even in the most elaborate and difficult passages the tone is never sacrificed. I cannot say that I ever remember to have heard her *thump*. And this beautiful tone is produced with the utmost apparent ease, and an absence of the slightest effort, the result of a mechanism developed to the highest possible pitch of perfection. There has seldom been a pianist who, with so extensive a *répertoire* as Mdme. Goddard, has played so few wrong notes in public. Whatever the class of music she is performing, whether it be a fugue by Bach, a sonata by Beethoven, or a fantasia by Thalberg, she is equally note-perfect, and impresses her audience with a feeling of her complete technical mastery of every resource of her instrument.

There is yet another respect in which Mdme. Goddard deserves the highest esteem. It must not be forgotten that no pianist in this country has done so much for the revival of undeservedly neglected works of the old masters of the piano as the lady in question. It will be sufficient to mention the names of Sebastian Bach, Friedemann Bach, Handel, Dussek, Clementi, Steibelt and Woelfl, all of which are associated with Mdme. Goddard's performances of their works at her own recitals and at the Monday Popular Concerts, to show that in this matter she has no ordinary claim to the gratitude of musicians. Many of the most beautiful compositions of the pre-Beethoven period have been, so far as the present generation is concerned, rescued from oblivion through her exertions. I believe I am correct also in saying that she was the first who ventured in this country to play Beethoven's latest and most difficult sonatas in public.

And yet, with all these excellences, with a

technique in some respects unequalled by any other player, Mdme. Goddard has always seemed to me to fall just short, and only just, of being an artist of the first rank. It is unpleasant to have to say this; but after the remarks made above, the suppression of truth, were it not said, would certainly be equivalent to the suggestion of falsehood. Her playing lacks one thing, and but one—the divine fire. To say that it is expressionless would be untrue; but the expression seems rather as if it were put in for the sake of giving variety of colour than as if it were the result of the player's own feeling of the music. This is specially noticeable in the sudden changes from *piano* to *forte*, or the reverse, in the middle of a phrase and where there is no apparent warrant for it in the text. There is real pleasure in listening to the volumes of pure and unforced tone which the player draws from her instrument, to the wonderful evenness, the exquisite "pearling" (as the Germans call it) of her scale passages and runs; but the performance seldom if ever touches the heart. One listens to it with the same feeling of delighted astonishment as would be excited by a wonderfully finished piece of machinery. Hence she is most successful in music in which the mechanical predominates over the aesthetic; Hummel and Thalberg suit her style far better than Beethoven; and she excels in Bach and Handel far more than in Chopin.

The various peculiarities which have been mentioned were fully illustrated at the first recital, last Thursday week. Mdme. Goddard appears to have lost none of her exquisite finish by her tour round the world; her power of making the piano sing is just as remarkable as it was four years ago, and her mastery of mechanical difficulties no less astounding. The programme of the recital, too, was fully worthy of the player's reputation. It was as follows:—

Grand Sonata in D, Op. 106	Hummel.
Selection, "Songs without Words"	Mendelssohn.
Nocturne in E major	
Waltz in D flat	Chopin.
Grand Sonata, Op. 53	Beethoven.
Suite de Pièces in G minor	Handel.
32 Variations in C minor	Beethoven.
La Femme du Marin	Kalkbrenner.
Widmung	Schumann-Liszt.
Grand Fantasia on <i>Masaniello</i>	Thalberg.

To such a selection as this the most captious critic could take no exception. The most entirely satisfying performances were the fantasia by Thalberg and the Suite by Handel. In both these numbers Mdme. Goddard was exactly suited. It may, indeed, be doubted whether anyone but the late composer could have played the *Masaniello* transcription so well as it was played on this occasion. One hardly knew which more to admire, the varied gradations of tone-power, or the finish and delicacy of the ornamental passages. In Handel's Suite, also (the seventh of the first set), the polyphonic writing, and the imitative passages which form so important a feature of the music, were rendered with the greatest distinctness and a true appreciation of their meaning. The variations by Beethoven, in which the composer has copied the form and style of the older masters while preserving his own individuality, were very finely played; but the sonata was, to my mind, far less satisfactory. It was mechanically as perfect as it could be; but the "reading" left much to desire. The performance of Hummel's sonata was a wonderful piece of *bravura* playing, in which the pianist was again in his element; but both the "Lieder" of Mendelssohn and the Nocturne of Chopin suffered from the arbitrary alternations of *piano* and *forte* spoken of above, while the little Waltz in D flat was taken at a tremendous pace (which surely can hardly have been intended by the composer) which robbed it of its poetry, and made it sound like a finger-exercise.

The programme of the second recital, which took place after our going to press this week, was

no less excellent than that of the first. It included Beethoven's sonata in C minor, Op. 111, Mendelssohn's Prelude and Fugue in E minor, Woelff's "Ne Plus Ultra" sonata, a "Sonate Fantaisie" by Friedemann Bach, a Suite by Handel, and shorter pieces by Bennett, Moscheles, Thalberg, Hummel, and Chopin.

Ebenezer Prout.

THE novelties at last Saturday's Crystal Palace Concert were a violin concerto by Friedrich Hegar, and Gevaert's overture to his comic opera *Le Billet de Marguerite*. The concerto, which was produced at the suggestion of Herr Wilhelm, though it had not before been played at Sydenham, had been previously heard in England, as Herr Wilhelm brought it forward at one of the concerts at the Albert Hall (on February 2, 1875), and he has, we believe, also given it at the Promenade Concerts. As the concerto was specially composed for him, his partiality for it is perhaps not unnatural; it is scarcely justified by the merits of the work itself, which, though ingenious in its construction, and very showy for the solo instrument, is excessively dry. That the work received the fullest justice from the player need scarcely be said. Later in the afternoon Herr Wilhelm performed his own transcription of Walther's "Preislied" from Wagner's *Meistersinger*, which produced far more effect than the concerto. Gevaert's overture, which is unmistakably French in style, is a most charming little piece, making not the least pretensions to greatness, but full of melodious ideas, and most ingeniously orchestrated. The other instrumental pieces of the concert were the overture to *Fingal's Cave* and Schumann's Symphony in B flat, both of which were played as Mr. Mann's band alone can play them. The vocal music was of excellent quality. The singers were Miss Catherine Penna, who is rapidly taking a high position as one of our most promising sopranos, and who gave Handel's "From mighty kings" and two songs by Rubinstein with admirable taste, and Miss Enriquez, whose fine contralto voice and good style were heard to great advantage in Handel's song "Cangio d'aspetto" from his opera *Admeto*, and in Wallace's "Sweet and low." This afternoon's programme, besides Mendelssohn's "Reformation" symphony, and the overture to *Fidelio*, includes Gade's cantata *The Evert-King's Daughter*, an Andante from an unpublished symphony by Haydn, and a "Marche Héroïque" by Saint-Saens.

MR. CARL ROSA's enterprise at the Lyceum continues to be as well supported as hitherto. Since the *Flying Dutchman*, the production of which has been already reported in our columns, no novelties have been brought forward; a detailed notice is therefore unnecessary.

DURING the present week the Bristol Musical Festival has taken place in the Colston Hall, under the direction of Mr. Charles Hallé. The principal vocalists announced were Mdlle. Titiens, Mdlle. Albani, Mmes. Edith Wynne, Patey, and Trebelli-Bettini, Messrs. Edward Lloyd, W. H. Cummings, Kearton, Maybrick, and Herr Behrens. The works to be given consisted entirely of more or less familiar pieces, and included *Elijah*, Verdi's *Requiem*, *Israel in Egypt*, Spohr's *Fall of Babylon*, Beethoven's *Engedi* (the Mount of Olives with a different text), the *Hymn of Praise*, and the *Messiah*.

A COPY of the sixth volume of Mendel's *Musikalisches Conversations-Lexicon* (Berlin: Oppenheim), which is just published, has been forwarded to us. A few months since we noticed the earlier volumes of the work in these columns; and an examination of that now issued certainly shows no falling off as compared with its predecessors. In previous publications of this kind it has too often seemed as if the editors had grown tired of their work before its completion, and the latter part of their task has been hurried over. This is to some

extent the case even with the great Dictionary of Fétis. The present work shows no signs of such undue haste. The whole of the sixth volume is occupied with the letters K and L; and on a moderate computation it contains at least 1,700 articles. Of these the most important is that by Th. Rode on "Literatur," which occupies forty-eight pages, and contains a most elaborate catalogue of the principal works on music, divided into twenty sections for convenience of reference. What adds much to the value of this catalogue is that the name of the publisher is in nearly every instance given. To many readers this article alone will be worth the price of the whole volume. Among other valuable papers are those on "Kehlkopf," "Kirchenlied," "Kirchenmusik," "Kirchentöne," "Klang," "Kunst," "Lied," and "Liedertafel," among the theoretical and historical articles; while the biographies of Franz Lachner, Orlando di Lasso, Lindpaintner, Lipinski, Carl Löwe, Lortzing, Lotti, and especially Liszt, may be named as remarkably good. The great feature of the work, however, continues to be its completeness. In this respect it is certainly unapproached by any musical lexicon.

MESSRS. CHAPPELL AND Co. have in the press and will shortly publish *Medical Hints on Production and Management of the Voice*, by Mr. Lennox Browne, Surgeon to the Royal Society of Musicians. This work will be an extension of the author's paper on "The Voice as a Musical Instrument," which was one of the most interesting of those communicated during the last session of the Musical Association.

LITERATURE.

Life of the Prince Consort. By Theodore Martin. Vol. II. (London: Smith, Elder & Co., 1876.)

JUDGING by the ordinary rules in such matters, this second volume of the *Life of the Prince Consort* must be allowed to have appeared under some disadvantages. Much of what could scarcely fail to be the most interesting part of it had already seen the light, not merely in fugitive notices in newspapers and periodicals, but in books of undoubted authority. The Queen's Journals had given her subjects a picture of her husband in the most intimate circle of their family life. Then there was the volume of his speeches and addresses, published in 1862, containing no doubt an editorial statement that no documents had been "inserted, or even alluded to, which would be required for the illustration of his life." But as his public life may be said to have blossomed in these speeches, which were delivered at all manner of gatherings, from the meeting of a Servants' Provident Society to the Royal Academy dinner, and ranged over a vast number of subjects, social, literary, scientific, and political; and as, moreover, that volume contained the well-known Memorandum and letter to the Duke of Wellington on the question of his succeeding to the post of Commander-in-Chief, the statement in question did not carry much conviction. Then his character had been analysed and discussed again and again, in books, pamphlets, and speeches, and the first volume of the present work had dealt in detail with that period of youth and early manhood which most attracts the reading public. Thus the cream had been already skimmed, and it could not be wondered at if even voracious readers should open the new volume somewhat listlessly, and turn its 570 pages with a feeling of satiety. At any rate we are bound to confess that this was our own mental attitude, and that it changed, when we had glanced at a page or two, into one of deep and lively interest. For Mr. Martin has been obliged, as he tells us in his introductory letter, "to write what will be in some measure a history of the time," and he has done it with rare tact and skill. There is scarcely a question of importance which moved men's minds between the autumn of 1847 and the spring of 1854, the period covered by the volume, which is not brought on his canvas, and so touched as to waken vividly the memories of these eventful years for those who lived through them, while pro-

viding a series of most interesting pictures for younger readers. But, although driven to give us a history of the time in order to do his work faithfully, he never lets us lose touch of his principal character, or forget that he is writing a biography, and the biography is that of a man of so commanding a character and position that the historical events seem to group themselves naturally round his figure, while a thread of playful, sunshiny domestic life runs in and out through the warp of the larger story, giving it a human and pathetic interest quite apart from the high surroundings. The task seems to us one of no small difficulty, when we think of the immense mass of interesting and most tempting material which must have been resolutely set aside, and which in less skilful hands would have overlaid the picture. As it is we close the book, after reading it at a stretch from title-page to the end, with an unsatisfied appetite, and a feeling of something more than respectful admiration for the man before whose portrait we have been sitting.

Mr. Martin tells us that his work will be completed in another volume, and has thus divided the life of the Prince Consort into three periods, of which the second is here treated. The division seems to us well chosen, for these six years stand out with singular significance for him and his adopted country. Up to 1847 the nation, so far as he was concerned, was still for the most part in that state graphically described by himself, in which it had never given itself the trouble seriously to consider what ought to be the position of the Queen's husband, or what manner of man they had got among them to fill it.

"When I first came over here," he writes to Baron Stockmar, "I was met by this want of knowledge, and unwillingness to give a thought to the position of this luckless personage. Peel cut down my income, Wellington refused me my rank, the Royal family cried out against the foreign interloper, the Whigs in office were only inclined to concede to me just as much space as I could stand upon. The Constitution is silent as to the Consort of the Queen. Even Blackstone ignores him, and yet there he was, and not to be done without" (p. 559).

For more than seven years he had remained quietly in the background, accepting his position without protest, but performing its duties faithfully as he understood them, devoting his great talents and industry to the work of lightening the Queen's burthens and studying his adopted country, appearing only at rare intervals in public, and then at such colourless gatherings as a Literary Fund or a Trinity House dinner, and never saying more than a few formal sentences. But now the time had arrived when the power which had silently grown up in the Palace could no longer be concealed. A crisis had come such as Europe had not seen since the French Revolution. Every country had been struck by the storm, and Government after Government had gone down helplessly before it. How England rode it out we all know, but the story cannot be studied too often, and the sketch of it in the present volume is full of special interest. Our great danger, like that of other countries, was the condition of the class which,

in the Prince's words, "has most of the toil and least of the enjoyments of this world" (p. 46). That they were acting wildly and foolishly all over Europe was no reason for standing aside and leaving them face to face with the soldiers. So the Prince thought; and in this belief came forward as he had never yet done. Taking the tools nearest at hand, he accepted the Presidency of the Society founded some years earlier by Lord Shaftesbury and others, for improving the condition of the working classes, and agreed to preside at a great public meeting which was to be held in London within a few weeks of April 10. Strange to say, objections were raised to this by some members of the Government of the day; but these were overcome, and the result was a speech which, while it for the first time fairly disclosed his character and abilities to the whole country, set him right at once and for ever with this portion of his countrymen. Its leading ideas on the true grounds of sympathy between classes and the methods of developing that sympathy, and on the relations of capital and labour, though now worn threadbare, were then all but new. From this day he took the position, without question, of the head in England of the great social movement of our time.

But with the other sections of English society the process was much slower, public opinion, as is its wont, swaying between the hot and cold fits of vehement applause and admiration, and silly unreasoning suspicion. The final triumph may be said to have come at the opening of Parliament in 1854, when Lord Aberdeen, as Premier, in the House of Lords, and Lord J. Russell as leader of the House of Commons, came forward to answer the attacks on the Prince which had filled the papers since Lord Palmerston's resignation of the seals of the Foreign Office in December, 1853. The speeches on this occasion of the late Lord Derby and Mr. Walpole, who had recently left office, bore equally frank and full testimony to the perfect loyalty of the Prince to the Crown and his adopted country, and of his value as the Queen's most confidential adviser.

It is with this scene that the book ends, and it is no doubt with a purpose that Mr. Martin's second volume has thus sharply fixed our attention on this precise period. The curtain rises when the sky is black with clouds, and the mutterings of the revolutionary storm of 1848 are in the air; it falls when those of the war with Russia are already gathering. But how unlike the prospect shows! The intervening years had raised the country from industrial and commercial misery, and political and social discontent bordering on revolution, to a height of prosperity and healthy vigour such as she had never yet reached, and had seen at the same time the Queen's Consort step out of the small Court circle into public life, and make himself a great power in the commonwealth, with the ultimate good will and applause of the whole nation. Whether the coincidence was merely accidental is one of the questions which this book forces again and again upon our attention, and in our judgment the answer comes out clearly enough. In the remarkable Minute by

Baron Stockmar, which is printed towards the end of the volume, there are some remarks on the paramount necessity of "moral oil for the driving wheels of the Constitutional machine."

"Let men like the late Lord Melbourne," he goes on, "exclaim as they please, 'that damned morality is sure to ruin everything.' I, on the other hand, can testify before God that the English machine works smoothly and well only when the Sovereign is upright and truthful, and that when he has been insincere, mendacious, and wicked, it has creaked and fouled, and jolted to within an ace of coming to a dead lock" (p. 550).

The moral purity of the highest family in the land—due, of course, mainly to the Prince himself—and the influence of this example on the life of the people, was one, and by no means the least, of the forces which enabled England to weather the tornado of 1848, and to make such marvellous progress in the years which followed. And it was as the representative of this force that the Prince was able to win his position, and hold his own—to overcome the deeply-rooted insular prejudices of English society, and to bring his rare and statesmanlike abilities to bear in the service of the nation. That in the struggle with these prejudices he was obliged often to keep a stiff upper lip in certain circles, and to insist on a stricter state etiquette than is now popular, may very probably be true. But the charge of pedantry and priggishness which has been coupled with it cannot, we should think, survive the overwhelming evidence now furnished of the hearty manliness and simplicity of the man's intercourse with his family, the Court officials and servants, statesmen of all sides and ranks, and men and women in all classes of society. As specimens of this frank familiarity, let readers look at the letter to Sir R. Peel (p. 217) on his "Godless Colleges," or that to Lord Granville (p. 536) on the proposal to erect a statue to himself, during his life, in Hyde Park, and consider whether a prig could have written them.

The political position which the Prince Consort thus won for himself between 1847 and 1854, and which had come to be clearly acknowledged by the leading statesmen on both sides in the latter year, may be defined as that of Secretary to the Queen, and permanent President of the Privy Council. But it was not won without a sharp struggle, the phases of which are well brought out in this volume, and are of deep interest to the student of English politics and constitutional history. For what the Prince won for himself he won for the Crown, and it is not putting it too high to say that through him the theory generally accepted thirty years ago as to the limits of the Sovereign's constitutional functions has been rudely shaken. It does not, indeed, seem clear whether he shared the views of Baron Stockmar, who claimed for the Sovereign in a Constitutional Monarchy the right to take part in "the initiation and maturing of Government measures," and "supreme authority in matters of discipline" within the Cabinet. But he did distinctly claim that the Queen should not be asked to sign any document the contents of which she had not had ample time to consider and discuss with her Minis-

ters, and established the custom on the part of the Crown of submitting for the consideration of the Cabinet formal Memoranda upon any subject which seemed to the Queen and himself of sufficient importance. Readers who will follow the story of the relations between the Foreign Office and the Crown in this volume will probably agree that for practical purposes there was little difference between the sagacious old German statesman and his royal pupil, and that the latter has at any rate made that ideal of political thinkers of last century, "the Patriot King," a possibility in the England of to-day. Had he lived to the usual age, we suspect it would have been by this time, not a possibility, but a fact; for the man who through years of conflict with so resolute and able a Minister as Lord Palmerston, not only held his own and got his own way, but at last converted his opponent into an enthusiastic admirer, could scarcely have failed to become "permanent Premier, taking rank above the temporary head of the Cabinet."

Our space will only allow us a glance at this part of our subject. The first occasion, then, of serious difference between the Crown and the Foreign Minister arose upon the question of the submission of despatches to the Queen. Lord Palmerston had dealt with 28,000 of them in 1848. Probably England was never represented by a more diligent or capable Foreign Secretary, or one more in sympathy with the enthusiasm of his countrymen for constitutional liberty, than in that memorable year. But his mode of giving advice to foreign Powers, and his habit of telling unpleasant truths in the most unpleasant manner, had resulted in the summary expulsion of the English Minister from Madrid, and in the alienation of every European Government except that of Belgium. The humiliation and pain of this state of things was deeply felt both in the Country and the Palace, but it was not a time for refusing to support a zealous servant. A gentle reminder was, however, sent through Lord John Russell, the Premier, to Lord Palmerston, that "these despatches come to you and the Queen as well as to himself" (p. 64). This reminder seems to have produced a letter from Lord Palmerston concurring in her Majesty's view, and promising amendment; so in 1849 his unsuccessful attempts at mediation between Sardinia and Austria, in concert with France, and his prompt sending of the fleet to the Dardanelles to support the refusal of the Porte to surrender Kossuth, Bem, and the other Hungarian refugees to the threats of Russia and Austria, seem to have been taken with the Queen's approval, and to have raised no question between him and the Prince. But, in the beginning of 1850 the Pacifico claims on the Greek Government were taken up, and the Piræus was blockaded, and by the middle of May, England had had to bear the "bitter, imperious, and offensive" language of Russian remonstrance—"not more bitter, imperious, and offensive, however, than the provocation" (as Lord Derby declared in the House of Lords)—and the recall of the French ambassador. Lord John Russell

announced the latter fact by letter to the Prince, who answered thus:—

"Dear Lord John,—Both the Queen and myself are exceedingly sorry at the news your letter contained. We are not surprised, however, that Lord Palmerston's mode of doing business should not be borne by the susceptible French Government with the same good humour and forbearance as by his colleagues. Ever yours truly, Albert" (p. 275).

Again and again during these events the arrangement to which Lord Palmerston had agreed in the previous year was broken, until the Prince had to write that he "had failed in his duty to the Queen, not from oversight or negligence, but upon principle, and with extraordinary pertinacity" (p. 304). This was followed by a memorandum signed by the Queen, laying down two rules to be observed by the Foreign Secretary for the future on pain of dismissal (p. 306), and by an interview between Lord Palmerston and the Prince, of which a very remarkable picture is given in the Prince's own words. Lord John's comment that this interview had done a great deal of good seems to have been premature. In September the assault on General Haynau was committed at Barclay's brewery. An apology to Austria had to be made, and Lord Palmerston sent it in a note containing expressions derogatory to the honour of the nation, as Lord John protested, and which had neither received his or the Queen's sanction. This note Lord Palmerston had to withdraw, and substitute one approved by the Premier and the Queen. In 1851 Kossuth arrived in England, and Lord Palmerston, though keeping within the letter of a promise to his colleagues that he would avoid any interview, allowed English sympathisers with Hungary to present him with, and to receive his thanks for, addresses in which the Emperors of Austria and Russia were spoken of as "odious and detestable assassins." In December, when Louis Napoleon had struck the *coup d'état*, though the Queen had written to Lord Russell, pressing the importance of strict neutrality, and the Cabinet had approved this policy, Lord Palmerston expressed to Count Walewski his entire approval of the action of the President. This last act, coupled with the "disdainful silence" with which the Foreign Secretary received his leader's remonstrances, ended in his removal from the Government. From this time the Prince was constantly assailed as the cause of the disgrace of a popular Minister, and, though the storm lulled during the short Ministry of Lord Derby, it broke out again when Lord Aberdeen came into office, and the Crimean war was threatening. The Prince, in 1853, submitted to the Cabinet a memorandum on the Eastern Question, one of the ablest he had ever produced, and urging that if war was to be waged it must not be for the maintenance of the Ottoman Empire, but unshackled by obligations to the Porte, and to obtain "arrangements more consonant with the well-understood interests of Europe, of Christianity and civilisation, than the reimposition of the ignorant, barbarian, and despotic yoke of the Mussulman over the most fertile and favoured portion of Europe" (p. 525). This view, though accepted frankly by his

colleagues, was warmly combated by Lord Palmerston, who maintained that the integrity of the Ottoman Empire was to be protected at all hazards, and his threatened resignation at this crisis—though really owing to his opposition to the contemplated Reform Bill—was attributed generally to his opposition to the Crown on the Eastern Question, and raised the renewed storm against the Prince which led to the declarations of the leaders of both sides in February, 1854, mentioned above. We do not cite these matters for the purpose of showing that the Prince was right and the Minister wrong throughout, but to enable readers to appreciate the position which the Prince claimed and won for the Crown. Whether we agree or not that the exercise by the Sovereign of the functions of a permanent Premier will be the best guarantee of Constitutional Monarchy, and will “raise it to a height of power, stability, and symmetry, which it has never yet attained,” as Baron Stockmar maintains (p. 549), we shall scarcely withhold our admiration for the tact, foresight, and firmness shown by the Prince Consort. But the highest testimony to these qualities comes from his opponent. After the return of the Queen from her visit to the Emperor of the French in 1855, Lord Palmerston bore unsolicited testimony to the “sound judgment, high intellect, and exalted qualities” of the Prince; adding, “till my present position gave me so many opportunities of seeing his Royal Highness, I had no idea of his possessing such eminent qualities, and how fortunate it has been for the country that the Queen married such a Prince” (p. 429). The loss which England sustained by his death will never be felt more keenly than at a moment like the present, when the Eastern Question is once more upon us. We have no space for further comment on the many points of interest raised in this book, but can heartily commend it to readers as a mine of interesting contemporary history. T. HUGHES.

Epochs of Modern History: The Early Plantagenets. By William Stubbs, M.A. With Two Maps. (London: Longmans, 1876.)

THE plan of this series is an excellent one, but it is a pity that the periods are not more equally divided, or at least treated upon something like a uniform scale. Between the present volume and Mr. Warburton's *Edward III.*, which in point of time immediately follows it, there is a want of proportion, from which erroneous conclusions might be drawn as to the relative importance of the two epochs. The difference in size is but a few pages; yet the one volume contains the history of a single reign only, while the other covers the whole period from the accession of Stephen to the death of Edward II., or, as Mr. Stubbs further defines it, “from the beginning of the constitutional growth of a consolidated English people to the opening of the long struggle with France.” This inequality was hardly necessitated by any difficulty in dividing the longer, and, to say the least, not less im-

portant period. One break, at the death of John, might certainly have been made, which would have given two epochs equally well defined, each supplying ample material for a separate volume. Taking the book, however, as we find it, the wonder is, where so much had to be crammed into so small a space, that the result is not far more unsatisfactory. The one fault in it is that it does not fulfil the objects which the “Epochs of History” profess to have most prominently in view. Its failure in this respect is undeniable. The narrative is remarkable for its clearness and ease, but it is too rigidly condensed, too deficient in personal interest and picturesque detail, to prove attractive to the young; and not only so, but with all its merits it certainly does *not* exhibit the life of the people as well as the policy of their rulers, still less give special attention to literature, manners, and kindred topics. At the same time, apart from the exigences of space, there is some reason for this, since to some extent the work takes its almost exclusively political and constitutional character from that of the epoch. As Mr. Stubbs observes, the age of the early Plantagenet kings is above all things an age of constitutional growth, an age also of great men, of whom it is not too much to say that “it is their history rather than the history of their peoples that furnishes the contribution of the period to the world's progress;” and, in treating it, therefore, as he has done, he may fairly claim to have reproduced its most prominent features. Accepting this view as the right one, the history he has given us is not only a triumph of lucid compression, but it is throughout in every way admirable. If there is anything more striking than the clearness and breadth of view of its political narrative, and the skill with which it traces the progress of constitutional and administrative reform, it is the singular excellence of its personal portraits. What Mr. Stubbs can do in this line is known to all who are familiar with his previous works; and, although the characters drawn in this little volume are necessarily on a smaller scale, they are not a whit less masterly. Nor is this the case with full-lengths only, such as those of the Plantagenets themselves, or of heroes of the calibre of Becket and De Montfort. In their way nothing could be more graphic and life-like than the least elaborate sketches; witness this of a notable churchman—

“Hugh de Puiset, the Bishop of Durham, was a great lord of the house of Champagne, nephew to King Stephen and cousin to the king; a rich man, an old man, the father of a fine family, one son being Chancellor to the King of France; a great captain, a great hunter, a most splendid builder; not a very clerical character, but altogether a grand figure for nearly fifty years of English history.”

As an analysis of character, however, there is nothing to compare with the portrait of Henry II. The subject is one to which, as he has already shown, Mr. Stubbs is pre-eminently qualified to do justice. The more complex a character is, the more vividly he presents it. He excels in critical dissection, in reproducing contrasts, in balancing opposite qualities; and his finest portraits, therefore, are not those of the best and greatest,

nor yet of the worst of the prominent figures of the epoch—neither of Edward, “the great lawgiver, the great politician, the great organiser of the mediæval English polity;” nor of John, “the most vicious, the most profane, the most tyrannical, the most false, the most short-sighted, the most unscrupulous”—but of those, like the first of the Plantagenets, whose characters were made up of the greatest variety of lights and shades. But, although his presentment of Henry here is as distinct and real as in the Rolls Series, the contrast between his good and evil qualities is less sharply emphasised. His moral defects are not passed over, but the colours in which they are depicted are somewhat toned down. He is still “eminently wise and brave,” but, instead of being, as in the earlier portrait, “eminently cruel, lascivious, greedy, and false,” the severest conclusions to which the analysis of his character seems to lead are that he was neither a hero of probity, nor in any sense what might be called a good man. The same lenient tendency may be thought to betray itself in the history of his quarrel with Becket—not that Becket gets less than justice, but Henry gets a little more, the whole tone of the chapter conveying an indefinable impression that the actions and motives of the reforming king are being interpreted more favourably than those of the obstructive prelate. At the same time the estimate of the archbishop will approve itself to all who are not blinded by partiality or prejudice. Severe as it is on the whole, the real elements of greatness and heroism in his character are brought out in clear relief; but the “strong, impulsive man, the strength of whose will is out of all proportion to the depth of his character, with little self-restraint, little self-knowledge, no statesmanlike insight, and yet too much love of intrigue and craft,” is a picture which no one will fail to recognise who knows the original, not from modern writers, but from his own letters and contemporary literature. The character drawn of Simon de Montfort will be equally disappointing to extreme partisans. With all his natural admiration for the great Earl, Mr. Stubbs makes no attempt to exalt him into a prodigy of superhuman virtues. That he “was a great and good man” he admits without hesitation, but with a reserve of “mixed motives and unjustifiable expedients.” Nor is this all, for he goes on:—

“Simon was not successful as an administrator; he could not maintain peace even when he had the whole kingdom at his feet. His expedient for governing was fanciful and cumbrous. His own conduct in his elevation was not quite free from the charge of rapacity. He stands out best and most grandly in comparison with the meanness with which he was surrounded—the paltry, faithless king, the selfish and unscrupulous baronage. He is relatively great; but he is not perfect. He is scarcely a patriot—a foreigner could hardly be expected to be so. He is somewhat more distinctly a hero, but he never quite rids himself of the character of the adventurer.”

Compared with the glowing panegyric of Mr. Freeman, this may appear cold, if not grudging, praise; but, in its careful discrimination, it is far more convincing. The pity is that, within the confined space at the author's command, the portrait, in common

with the rest, cannot receive sufficient illustration from the narrative history in which it is set.

G. F. WARNER.

Ἑρμηνεία εἰς τὴν Καίρην Διαθήκην, ὑπὸ Νικολάου Μ. Δάμαλα. Τόμος Α'. Περιέχων τὴν εἰσαγωγήν εἰς τὴν Ἑρμηνείαν ταύτην. (Ἐν Ἀθήναις, 1876.) [A Commentary on the New Testament. By Nicholas M. Damalas. Vol. I., containing the Introduction to the Commentary. (Athens, 1876.)]

THIS learned volume and the edition of the Epistles of St. Clement of Rome by the Metropolitan of Serres, recently noticed in this journal, are an evidence of activity in the theological schools of the Oriental Church for which Western scholars have not been prepared; an evidence the more decisive, seeing that the two works are entirely unconnected as to authorship, and, indeed, emanate from Churches which are now altogether independent, whether of each other or of any common authority recognised by them as holding a claim to the obedience of either. M. Bryennius is an archbishop of the patriarchate of Constantinople. M. Damalas is a lay member of the Church of the Kingdom of Greece. The Church of Greece, it need hardly be said, has been for nearly half a century withdrawn from the jurisdiction of the Patriarch of Constantinople. Its independence was asserted by the "organic law of Epidaurus" in 1822; its constitution, which is modelled upon that of the Holy Synod of the Russian Church, was formally settled under Capo d'Istrias in 1833; and the last remnant of the ancient relation between the Churches was definitely put aside in 1868, when a formal recognition of the independence of the Greek Church was accorded by the Patriarch, and the old patriarchal rights as to the ordination and confirmation of the metropolitan were explicitly and permanently relinquished.

The title-page of the *Ἑρμηνεία* gives no information as to the antecedents of the author or of his present position; but he is already known in England, especially to the Unionist party, as a Professor of Theology in the University of Athens, and the author of a work on Church principles,* chiefly in reference to the Articles of the Anglican Church and to the ground held by that Church in relation to Oriental Orthodoxy. He was a student in one of the German universities and afterwards spent several months at Oxford; of both which opportunities of study he appears to have made diligent use, his work, like that of M. Bryennius, exhibiting a familiarity with the theological literature of Germany, France, and England quite remarkable in a native of the East.

The subject of M. Damalas' present volume is the same that ordinarily forms the Introduction of a treatise on Hermeneutics, and is treated with more or less fullness in all the popular manuals of the subject. It is divided into three parts, the first devoted to the questions relating to the several books of the New Testament in detail; the second,

to the general canon of the New Testament; the third, to the ancient manuscripts, the translations, and the printed texts, of the New Testament. Unlike the introduction of M. Bryennius' St. Clement, it is written, not in classic Greek, but in Romaic; but the style, like that of M. Tricoupi's *History of the Revolution*, is so pure that it will be understood with the utmost ease by any practised Greek scholar. The vocabulary is almost strictly classical, making allowance for the necessarily technical words which the nature of the subject involves; the classical inflections of nouns and verbs are followed throughout, excepting some inflections of the substantive verb and that periphrastic form of the infinitive of the transitive verb which not all the efforts of the purists have succeeded in eliminating; so that, were it not for the constant recurrence of the modern negative *ὄχι*, and the abnormal government of some prepositions, it would be difficult to realise that the text is not indeed classical Greek.

I have already noticed the remarkable familiarity with the theological and Biblical literature of the schools of Germany, France and England, which the work exhibits; but it is still more interesting to learn what are its views on the great controversies on Biblical criticism and interpretation by which Western Christendom has for the last century been divided. I think, therefore, that a short account of this remarkable volume will not be unacceptable to the readers of the ACADEMY.

One of the preliminary chapters (§ i. pp. 5-39) contains a summary view of the history of Biblical Hermeneutics and Criticism from the earliest ages down to our own time. It is most comprehensive in its range, embracing every school of interpretation and of criticism, from the Fathers of the early Church down to the latest development of Rationalism; and the leading characteristics of each are discussed with much acuteness and impartiality. But it is right to say that the broad and cosmopolitan character of the author's learning does not imply any looseness or unsettled condition of his own personal opinions. His views throughout are strictly orthodox, according to the dogmatical standard of the Eastern Church. While he expresses in the preface his profound admiration of all the great Doctors of the ancient Church, and especially of those of the school of Antioch, of Chrysostom, Diodorus of Tarsus, Theodore of Mopsuestia, and Theodoret, he points out that, as the expositions of these Doctors were addressed in the main to the requirements, doctrinal and practical, of their own age, they are no longer sufficient to meet the necessities of the altered conditions of the modern times. On the other hand, while he gratefully acknowledges the signal helps to the interpretation and criticism of the sacred text which modern scholarship and science have provided, he urges that since much of this has proceeded—

"from schools of doctrine unhappily far from consonant with the conscience of Catholic antiquity, and in part from the erroneous doctrinal views of particular Churches, which have exercised a powerful influence upon the writers, and have created many prejudices against the ancient

Catholic conscience; the result has been that modern criticism, while it has embraced and applied the true grammatical and historical method, and has led the way in providing many valuable helps for the investigation of the true meaning of the text, is, nevertheless, wanting in that necessary theological and dogmatical accuracy and orthodoxy which is the fruit of the spiritual sense of the ancient Catholic fathers. Hence," he concludes, "it is an indispensable pre-requisite of modern orthodox criticism, that while it accepts as its own the doctrinal views of the ancient fathers and doctors, it shall, at the same time, turn to account the profound labours of the modern, and especially the German divines, keeping constantly in view that the work of an orthodox interpreter is to demonstrate from facts the harmony of the genuine interpretation of the common conscience of the Catholic Church with the scientific, grammatical, and historical interpretation of the New Testament."*

Notwithstanding this avowal of the preface, there is but little of the directly polemical tone in M. Damalas' introduction. Not that he ignores the doctrinal divisions of Western Christendom. He refers freely to the Lutheran, Calvinist, and Sacramentarian schools; and he alludes in numberless instances to the views of the Rationalistic commentators. To the Roman Catholic Church he refers less frequently, probably because in the great principles of authority and tradition he finds the views of Catholic interpreters substantially in agreement with his own. When he speaks of them at all it is commonly under the name of "Latins." I have only noticed the term *Ρωμαϊκή* once;† and even then it is used, not of the Roman Church, but of the Council of Trent. And in general there is no appearance on the author's part of a desire to obtrude the special points of controversy between East and West, and still less trace in his style of that acrimony by which the older disputants in that controversy, from the Council of Florence downwards, have but too commonly been distinguished. Indeed, this circumstance, as well as the author's constant references to the Biblical and theological writers of the Western Churches, renders it difficult to realise the fact that the writer is an Oriental.

His method too, as well as his tone, resembles in all respects that of the hermeneutical treatises in use in our schools. The first division of the work goes through the several books of the New Testament in order, discussing in each case successively the authenticity of the book, the personal history of the author, and the occasion, date, place, and other circumstances of its composition. On the question of authenticity, especially, his method of treatment is most careful and minute, embracing not only the arguments on both sides of the discussion, but also the history of the opinions which have prevailed regarding it, whether in ancient or in modern times. The first place in the discussion is invariably given to the testimonies of the ancients; but the author never omits to notice the modern views, even down to the most recent speculations of the German schools.

The Gospels naturally occupy a large proportion of the first part of the work (pp. 30-262), and are treated, as is now

* *Περὶ Ἀρχῶν ἐπιστημονικῶν τε καὶ ἐκκλησιαστικῶν τῆς ὀρθοδόξου θεολογίας. Ἐκδ. Νικολάου Μ. Δάμαλα. (Ἐν Λειψίᾳ, 1865.)*

† *Ἑρμηνεία, p. 611.*

commonly done, in two divisions, the former comprising the first three, or the so-called "Synoptical" Gospels, the latter that of St. John. M. Damalas discusses very minutely as well the bearing of the narratives of the first three Gospels upon each other, as the common relation of all to a possible original, which might have been used by one or more of the present Evangelists. I shall not, of course, attempt within the limited space at my disposal to give any detailed account of his review of the subject. It will be enough to say that he has fairly encountered, although with great brevity, all the difficulties of this complicated question, as well those which arise from the agreements of the three narratives and those which are founded on their divergences, as the still more formidable class which is founded upon this combination of agreement and difference, of harmony and variety; and that, while there is perhaps but little novelty or originality in his own views, there is on the other hand very little of importance in the best writers in the controversy which he has failed at least to touch in his summary. The same may be said of the discussions as to the Gospel of St. John (pp. 156-198), in which the progress of adverse criticism is traced from the crude speculations of the seventeenth century and the more cautious analysis of Bretschneider down to the mythical theory of Strauss and its modifications in the hands of Baur and the Tübingen School. The only remarkable writer upon this side of the question whom I miss from M. Damalas' pages is Renan, whose name does not appear to be even once mentioned.

A special chapter (pp. 199-224) is given to a comparison of the Gospel of St. John with the Synoptical Gospels, and another (pp. 224-262) to the "Apocryphal and uncanonical Gospels" and other spurious ancient writings connected with the Gospel narrative.

The remaining books of the New Testament are treated in the same method, both as to genuineness and authorship; and in every case in which doubts have been raised as to authenticity the question is stated with great impartiality. As regards the Epistles of St. Paul in particular, the manner of treatment is deserving of all commendation. An admirable summary of the life of St. Paul (pp. 289-359) is prefixed; and all the questions raised as to the authenticity of the various epistles—those of Bruno Bauer as to the Epistle to the Romans, of De Wette as to the Ephesians, of Mayerhof as to the Colossians, and, above all, the complicated difficulties regarding the Epistle to the Hebrews, its authorship, its language, its integrity, and its authority, are treated briefly but with much terseness and precision. On almost all these questions M. Damalas' views coincide in the main with those of our own critics. The only notable departures from the opinions common in Catholic schools regard the Epistle to the Hebrews and the Catholic Epistle of St. James. The latter merely regards the personal question as to St. James, whom, in opposition to most of the Catholic commentators, M. Damalas holds to have been the son of Joseph by a first marriage. But in

reference to the Epistle to the Hebrews, he distinctly declares against the authorship of St. Paul; and, after adverting briefly to the various conjectures—that of Grotius, who ascribes the Epistle to St. Luke; of Wieseler and Thiersch, who look upon it as the work of Barnabas; of others, who attribute it to Silas; he himself (p. 479) embraces an opinion which has had many modern supporters, from Luther downwards—as Bleek, De Wette, Tholuck, and quite recently the late Dean Alford—and which attributes the authorship to Apollos. I ought to add, however, that while M. Damalas denies the Pauline authorship of the Epistle, he regards its genuineness as a portion of the inspired Scripture (θεοπνευστου γραφης) as unquestionable (ἀναντιρρητος).

The second and third parts of the work are devoted to the questions regarding the canon of the New Testament, its formation and its history, and to the ancient texts and versions; and both these divisions of the work are characterised by the same careful treatment, and the same large and varied erudition. On the general history of the formation of the Canon of the New Testament, M. Damalas follows in the main the views of our own authorities. But, as might naturally be expected in an Oriental, he regards the declaration of the Περθέρη οἰκουμένη—the Quinisext Council—as the latest authoritative declaration of the canon of the sacred books; and I may add that it is on a point arising out of this subject that I have observed what appears to me to be the only distinct anti-Roman pronouncement in the entire volume. Having pointed out that the Περθέρη had comprehended in its confirmatory decree not alone the canon of the Council of Carthage, "but also those of Athanasius, of Gregory, of Amphilochius, of the Council of Laodicea, and of the 85th Apostolic Canon, which differ as to the Apocalypse and express doubts as to certain other books," he concludes that that Synod "did not mean, as did the Roman Council of Trent, to put forth its enumeration of the canonical books as the formal declaration of a despotic authority, but as a disciplinary ecclesiastical regulation for the common conscience of the Church, which in essential things is directed by the Holy Spirit unto all truth."

As regards his own particular view, it is not easy to discover what is the precise scope and extent of the authority which he ascribes to the canon of the New Testament as received by the Oriental Church.

There is one drawback on the value of M. Damalas' work which it is impossible not to regret in a volume otherwise so estimable. He has, for the most part, neglected to give exact references to the numerous opinions or statements which he cites from modern, and especially from German authors—an omission the more noticeable inasmuch as he is generally most exact in his references to the Fathers and early ecclesiastical writers.

C. W. RUSSELL.

M. LE DR. DE ROCHAS, of Pau, is preparing an important work entitled *Les Parias de France et d'Espagne*. M. de Rochas' conclusion is that the Gogots, &c., are not a special race, but merely the descendants of lepers and others condemned to live in isolation.

Syria and Egypt under the Last Five Sultans of Turkey: being Experiences, during Fifty Years, of Mr. Consul-General Barker. Edited by his Son, Edward B. B. Barker. In Two Volumes. (London: Samuel Tinsley, 1876.)

At a time like the present, when England is beginning to awake from her state of profound ignorance as to the real character of the Power she has so long supported, a book which would throw any true light upon the subject of the Ottoman Empire would be of especial value. As the title of Mr. E. Barker's volumes is calculated to raise high expectations, it is right to state at once that these will be grievously disappointed. The ambitious title, *Syria and Egypt under the Last Five Sultans of Turkey*, seems to promise a detailed history of these countries under Ottoman rule. The book, however, is nothing of the kind. It is simply a gossiping record of the "experiences" of a worthy and respectable Consular official at Aleppo, and afterwards at Alexandria, whose opinions and conclusions were somewhat in advance of the period in which he lived. The book is, moreover, largely padded with utterly irrelevant matter. Thus nearly a quarter of the first volume is filled with letters from Lady Hester Stanhope and others upon any and every subject, and the editor has even devoted a chapter to an account of his father's journey to England and tour in Wales, and thinks it needful to relate the "great trial" which his mother underwent at being obliged to put up at a village inn between Carmarthen and Swansea, "where they could not find anything to eat except eggs and rancid bacon"! The narrative throughout is of the most slipshod and disjointed character. Sometimes Mr. Barker sen. is permitted to tell his own story; sometimes Mr. Barker jun. tells it for him; and, worst of all, the reader is often treated to the same story told first of all by the son, and then again in the *ipsissima verba* of the father. Dates of events are frequently omitted, and such a word as *Ras-et-Tin*, the Viceroy's Palace at Alexandria, is spelt differently in different places, and both times incorrectly. Anecdotes, too, and "episodes," and these often of the most trivial character, are continually dragged into the text without regard to chronology, fitness, or relevancy. Notwithstanding these defects, however, Mr. Barker's "experiences" will be read with a certain mild interest, and their record, as may be expected from the size of the two large volumes, contains incidentally a certain moderate amount of useful information. Mr. Barker sen. appears in his son's pages as Consul-General for the Levant and East India Companies at Aleppo, and on the suppression of the former office in 1825 he was appointed British Consul at Alexandria, and afterwards, in 1829, Consul-General in Egypt. The first chapter contains a curious account of the audience granted to the English ambassador, apparently in 1805, by the then Sultan. When the ambassador was at length introduced into the Imperial presence, the Sultan

"raised his eyebrows and eyelids with half-shut eyes very slowly, and turning his head a little on

one side towards the Grand Vizier enquired who was this infidel (Ghiaour). On being told it was a slave sent by the King of England to solicit his favour (and at the same time the Grand Vizier took out of his bosom a long letter wrapped up in silk, which he had previously prepared, held it out in his hand, and said it was a letter the slave had been ordered to place at the foot of the throne), the Sultan, who appeared to be very drowsy, after a pause of a few seconds, woke up, and turning again to the Vizier, very slowly asked him if they had fed the dog, and clothed him, and on receiving a reply in the affirmative, said, 'Very well, be it so.'

The ambassador and his suite were then hurried out backwards, two colossal negroes who had been making faces and scowling at them during the whole interview crying out aloud, "Kish! Kish!"—i.e., Drive them out! Drive them out! Is it not strange and humiliating that only seventy years since the King and Government of England should have submitted to such degradation from the barbarian who occupied the Ottoman throne? The same spirit, however, still prevails in Turkey, where the masses are industriously taught that the Queen of England is the Sultan's vassal, and as such compelled at his command to send the fleets and armies of England to his aid. It is in this sense that the presence of the British fleet in Besika Bay is at this moment regarded by the Turks. Mr. Barker, who seems to have been a man of sense and candour, despite his official position and the bondage of red tape, takes a just view of Turkish character and policy, and of the tendency of successive British Governments to truckle to the Porte. Thus in 1809 he writes: "For my part I have long since adopted the resolution of *never in any case* applying to Constantinople to the ambassador for assistance in my altercations with the Turks." At page 141, Mr. Barker relates that the Turkish Pasha of Aleppo, Jelall id Deen "put to death two innocent persons, because he began to fear a popular insurrection, and thought it necessary to inspire terror by fresh examples of his cruelty and his power." And again:—

"On the first day of his arrival here he walked through the streets *incognito*, followed by an executioner, with the express deliberate design of cutting off the heads of a few wretched shopkeepers, as a thing of course, *which is always done by Pashas to show and establish their authority in a new government*. Five innocent victims were seized (not selected), on frivolous prettexts, in different quarters of the city, and murdered in cold blood before him."

This horrible description might apply to the proceedings of Turkish officials in Bosnia and Bulgaria at the present day, but the Ethiopian will change his skin and the leopard his spots before the Turk will change his cruelty and lust. At the present time it is instructive to note that after the attempt of the Greeks to take Beyrût in 1826, the houses and plantations of the Christian inhabitants generally were plundered and confiscated by Kehya Bey, who was sent by the Pasha of Acre with 500 Arnaut soldiers, and that all the Christians who could be seized were reduced to beggary, *after having been tortured for the purpose of extorting from them sums which it was impossible for them to raise by the immediate sale of all their effects* (ii., p. 38). The Consul-General

"frequently remarked that he had during his long residence in Syria met with only two Mohammedans who were really upright, honest men." It is plain that he is here speaking of the Turks, for in another place (p. 353, vol. i.) he pays a just tribute to the character of the Arabs:—

"I was extremely pleased with the Arabs; they deserve all that has been said of their hospitality, their regard to their pledged word, their perfect good sense and good breeding. I never saw a more polite people in my life. They are in every respect the exact reverse of the Turks and Turcomans."

The dictum of Haji Halef Aga, one of the leading members of the Mejliss or Council at Antioch, "We keep the people ignorant and oppressed in order to be able to govern them, for otherwise how could we govern them?" has its parallel in the celebrated saying of the Turkish despot who at present rules over Egypt, with reference to the ground-down *jellahcen* of that unhappy country, "I keep my people so poor that they have only a shirt on their back, for if they had more I could not govern them." The Turk never changes—for the better. The ideas of the Turks themselves in respect to their own existence as an empire are curious, and should be laid to heart by English Turk-lovers.

"I have been triumphantly told by a Turk," writes Mr. Barker, "that the truth of the Mohammedan religion obtained an infallible evidence from the supernatural existence of the Ottoman empire. 'I challenge you, who are a Christian and a Consul,' said he, 'to produce another example, ancient or modern, where a people long after their power of repelling aggression had ceased, has not only been suffered to continue in the list of independent nations, but whose Government is, like ours, assiduously courted and flattered by the ambassadors of all the powerful nations of Europe.'"

After describing the ravages of the plague at Aleppo in 1814, the Consul-General writes in his official report:—"The plague has carried off about 8,000 people, but I am confident the city has been depopulated of twice that number by the tyranny of the Pasha" (Jelall-id-Deen)! And (vol. i., p. 327), after dwelling on the terrors of the earthquake which overthrew the city of Aleppo in 1822, Mr. Barker writes:—

"Will not the Grand Seigneur dispense for a few years to come with the contributions of his oppressed subjects? Great as the evil is, it will be considered as nothing—nay, as a godsend, if it should be the cause of the people being released from the oppression of the Porte for two or three years only."

Turkish regard to truth is well illustrated by the following remark:—"It would seem the Porte confines its secret instructions to the Pashas to this simple injunction, 'Go, give your own and, if necessary, our Imperial *Rai* (or solemn assurance of safety) to rebels, and when they are in your power destroy them,'" and (vol. i. p. 318) the editor states that his father's fifty years' experience in Turkey "shows very clearly what little account the Turks make of Right, which in Turkey means Might, and the Turks laugh at Europeans who talk of their 'rights,' for to their understanding any one who does not avail himself of his Might is a fool." Mr. Barker's second volume is mainly occupied

with the residence of his father in Egypt, and contains some interesting particulars relating to that remarkable man Mohammed Ali, and of his quarrel and war with the Porte, but nothing particularly worthy of quotation. In 1813, Mr. Barker was superseded in his Consul-Generalship by Col. Campbell—apparently because he was not sufficiently subservient to the Viceroy—and retired to the beautiful villa and garden which he had built and planted at Soudeyeh at the mouth of the river Orontes. Mr. Barker died at this lovely spot in 1849, at the advanced age of seventy-eight, and it is certain that had his life been prolonged to the present crisis of Oriental affairs, he would never have published his old journals and letters with a misleading title. Mr. Barker was laid to rest under the walls of a church belonging to the Armenian community, to whom, in conjunction with the Greeks, his son applies the term "idolators," and this after recording with apparent approval the tolerant charity of the Greek priests who officiated at the funeral of a young English officer. Among the scraps of casual information the following is curious, if true, and at all events deserves investigation:—

"The method of composing the famous Damascus blades is lost. The only thing that is known is that they were made from *aerolites*, and lumps of this metal, showing from their form that they had been cast in moulds, which have been from time to time (and, I believe, are still) found, and from which there is not the least doubt these blades were forged."

The grammar is Mr. E. B. Barker's (vol. i. p. 218). In illustration of this assertion Dr. Birch, of the British Museum, states that the ancient Egyptian word for iron signifies "flower of heaven," implying that the first known iron was meteoric. The following not very complimentary proverb characterising the inhabitants of several towns is ascribed to Ibrahim Pasha, the son and successor of Mohammed Ali:—"Halebee, chelebee; Shamee, shoomee; Latkanee, awanee; Cupruslee, shaitanee; Mus'ree, heramee"—i.e., Aleppine, polite; Damascene, fop; Latakian, traitor; Cypriote, devil; Egyptian, thief.

GREVILLE J. CHESTER.

Rahel: Her Life and Letters. By Mrs. Vaughan Jennings. With a Portrait, engraved from a painting by Daffinger. (London: Henry S. King & Co., 1876.)

RAHEL is one of the very few instances of voluntary and total literary abstinence. A few pages of collected aphorisms are the only work of her pen published during her lifetime; and in that case she reluctantly granted her consent, to serve a friend. This shrinking from publicity is the more remarkable as she lived surrounded by literary men, and as her own nature was expansive and longing for utterance. But she felt the want of continuous thought, of intellectual stamina, sufficient to give tone and unity to a book, and patchwork she despised. "I am not unwilling," she writes to Fouqué, "to become an author. I should not be ashamed to write a work like Newton's on astronomy or mathematics, but to be able

to produce no work and yet to be in print I abhor." Self-abnegation of this kind is as beautiful as it is rare, and fully earns for Rahel the place among the "great silent ones" which Carlyle has granted her. But the silence preserved by her during life was broken when she was no more. Her grave, like Merlin's, became resonant. In 1834, hardly a year after her death, her husband, Varnhagen von Ense, published his celebrated work, *Rahel: a Book of Remembrance for Her Friends*, three stout volumes of correspondence; and since then a deluge of letters from, to, and about Rahel has been poured forth from the remains of that inexhaustible talker, and other sources—whether much to the enhancement of poor Rahel's literary reputation may seem doubtful. For, however much we may be charmed with the shrewd and witty observations, the subtle touches of sentiment, and the occasional bursts of true passion in her letters, their tone is too subjective, too microscopically self-dissecting, not to pall upon the reader before long. In immediate intercourse from month to month all this must have been delightful, but the rigidity of printed type has been fatal to Rahel's thoroughly extemporaneous utterance. There remain, however, traces of an individual charm and of a conversational power which, together with the unanimous testimony of contemporary witnesses, are quite sufficient to account for Rahel's unique position in society. Carlyle speaks of "the social phenomenon of Rahel," and Mrs. Jennings, her latest biographer, is quite justified in stating that

"Rahel attained her social position in spite of circumstances. To her were denied those advantages which surrounded the early years of Mme. de Staël and of Mme. Récamière. Rank, wealth, beauty, she had not. It was the simple force of her acute intellect, in its rare combination with an ardent emotional nature, that attracted towards her the ablest minds of her time."

Rahel Levin was born at Berlin in 1771, the eldest child of a wealthy jeweller. Her parents belonged to the large Jewish community which, although debarred from political rights, formed an influential and important component of social life in the capital of Frederick the Great. The houses of Moses Mendelssohn and Marcus Herz, at both of which Rahel was a welcome guest, were intellectual centres of the city. Rahel's youth was not happy. Her sensitive nature suffered acutely from pains, physical and mental. Delicate health kept her aloof from the enjoyments of youth. At home a latent disagreement with her mother saddened her life, and an early disappointment in love cast a lasting gloom over her mind. A letter addressed to her sister Rosa, soon after the latter's marriage, reflects the dreariness of Rahel's situation at this period (1801).

"Since your last I have felt most sad. You are gone! No Rosa will again come out to meet me with faithful step and heart, knowing my sorrow through and through. When I am ill in body or in soul, I shall be alone—alone. Your step is no longer in those evermore empty rooms. To risk a happiness! O God! I cannot even risk it. . . . Dear Rosa, what may not lie before you. But no, your name is Rosa, you have blue eyes and quite another life than I, with my star, name, and eyes. Life seems over for me. I know

it but cannot feel it. I have a red heart like others, though with a dark, hopeless, ugly fate."

But Rahel did not succumb to this fate. Her grief did not take the form of embittered egotism, it broadened her sympathy with the feelings of others. It is this genuine kindness combined with a highly-developed intellectual receptivity which alone can account for the charm exercised by Rahel over the most heterogeneous natures. Men of every age, every rank, every nationality, were among her admirers; and admiration for her was synonymous with true and lasting friendship. Friedrich Richter speaks of her as "the only woman in whom I have found humour." Goethe returned her unbounded veneration with gratitude and genuine esteem; Heine dedicated to her his *Lieder der Heimkehr*. Nay, even her own sex joined in the universal admiration. Mme. de Staël confessed to a feeling nearly akin to jealousy; but it was mixed with genuine regard and love, as far as the author of *Corinne* could love. The "psychological phenomenon of Rahel" is, indeed, quite as astonishing as the social one.

To the latter we must now devote a few remarks. At two different periods Rahel succeeded in gathering round her, and bringing into contact with each other, the literary, scientific, political, and social leaders of the Prussian capital. The first time was at her mother's house, where unceremonious meetings took place in the manner of the French *salon*, of which they were, perhaps, the only successful copy on record. Of one of these evenings in the Jägerstrasse Mrs. Jennings quotes an interesting, albeit somewhat enthusiastic, contemporary account, from which we borrow the following extracts. Count de S—, a distinguished visitor from Paris, *loquitur* :—

"Mlle. Levin was neither tall nor handsome, but delicately formed and most agreeable in appearance. An expression of suffering—she had lately recovered from an illness—lent her an additional charm; while her pure and fresh complexion, harmonising with her dark expressive eyes, gave evidence of the vigour which characterised her whole nature. . . . Upon the sofa beside the hostess was seated a lady of great beauty, a Countess Einsiedel, listening with languid interest to the pedantic talk of a gentleman spoken of as the Abbé; in the background stood Frederick Schlegel, in conversation with Ludwig Robert" [Rahel's brother, a well-known poet and dramatist of the time].

After registering the arrivals of Mme. Unzelmann, the charming actress, and other distinguished persons, the Count goes on to say :—

"The talk became very animated, ranging from one person to another, over the most varied topics. . . . They spoke of Fleck, the actor, and, regretfully, of his illness and approaching death; of Righini, whose operas were then received with great applause; of social matters; of A. W. von Schlegel's lectures which some of the ladies were also attending. I heard the boldest ideas, the acutest thoughts, the most significant criticism, and the most capricious play of fancy, all linked and suggested by the simple thread of accidental chit-chat. . . . When Frederick Schlegel expressed an opinion in his painful and awkward fashion, it was always deep and genuine; the hearer felt at once that no light coin was issued. . . . The lively caprices of Unzelmann made themselves felt throughout the evening. . . . everyone was naturally active without being

intrusive, and all seemed equally ready to talk or to listen. Most remarkable of all was Mlle. Levin herself. With what easy grace did she seem to rouse, brighten, warm everybody. Her cheerfulness was irresistible. And what did she not say? I was entirely bewildered, and could no longer distinguish among her remarkable utterances, what was wit, depth, right principle, genius, or mere eccentricity and caprice. About Goethe she said some astonishing things, such as I never heard equalled."

The evening winds up with an improvisation on the pianoforte by Prince Louis Ferdinand, whose death a few years afterwards at the battle of Saalfeld left a serious void in Rahel's circle. The wars of Napoleon ending with the liberation of Germany in 1814 interrupted for a time all social life in Berlin. This was an anxious period of Rahel's life. Readily she exchanged the *salon* for the hospital, collecting stores and money, and personally nursing the sick and wounded as far as her own weak health would permit her.

"I am ashamed," she writes to Varnhagen, October 12, 1813, "that God has sent to me the happiness of helping, and comfort myself, in my inaction while you are fighting, with the thought that I can thus heal and help. I know when I have said the right word of consolation at the right moment by the sudden smile of joy that breaks out from under the cloud on a suffering face."

The same self-sacrificing zeal Rahel showed in 1831 during the first terrible outbreak of cholera at Berlin, a fact which Mrs. Jennings ought not to have omitted.

In 1814 Rahel was married to Varnhagen von Ense, by more than twelve years her junior, and with him was present at the Congress at Vienna, in daily intercourse with the statesmen of all nations there assembled. Her letters during this period are valuable material for the personal history of that memorable gathering.

In 1819 the Varnhagens returned to Berlin, and here Rahel succeeded in adding to the nucleus of remaining friends a new circle almost as brilliant as the old. Heinrich Heine is the most remarkable member of this new society. He came to Berlin unknown and without much claim to notice. But Rahel at once recognised the future great poet in the awkward provincial. Heine never forgot her kindness. Of the second Berlin period, from 1819–1833, the year of Rahel's death, Mrs. Jennings's account is very meagre, and our own space will not allow us to enlarge upon it, interesting and easily accessible as are the materials in question. In speaking of this and other shortcomings of the present work, we ought not to forget the extreme difficulty of the author's task. In spite of Rahel's celebrity, there is extant—strange to say—not a single competent or comprehensive account of her life. A pamphlet by a second-rate German *littérateur*—a well-written essay in Camille Selden's volume, *L'Esprit des Femmes*, Mrs. Jennings does not seem to know—was her only guide in a labyrinth of names and social and literary relations, comprehensible alone to the most accomplished student of German literature. She has attempted—as was, indeed, the only way open to her—to select and group round the centre figure the most interesting of Rahel's friends.

But in this selection she has not been fortunate. Page after page is devoted to Henriette Herz, a somewhat modified counterpart of Rahel herself, and to the comparatively uninteresting Fouqués. There is, on the other hand, little or no mention of men like Heine, or like Clemens Brentano, the greatest poet, next to Novalis, of the Romantic School, and himself a psychological problem quite as interesting as Rahel. To have tamed, for moments at least, his wayward nature is one of the latter's greatest triumphs. Brentano, at the same time, was the only person among her friends courageous enough to hint at a deficiency in Rahel's nature, at which the unlimited breadth of her sympathy with the most antagonistic phases of human thought would lead one to guess *a priori*—want of depth and real enthusiasm. "How is it," he says in a letter to Rahel, "that never, even in your best moments, I have found you solemnly elevated, sacredly moved, great and beautiful, in any one word or thought?"

The difficulties of describing Rahel's life are increased by the task of giving an adequate notion of her letters in a foreign language. The intense individuality of her epistolary style has already been alluded to. It has been said of Beethoven's music that its very rests are rhythm and melody. In the same sense the italics and dashes and marks of interrogation and exclamation in Rahel's letters become so many almost imperceptible *nuances* of a meaning which it is frequently difficult enough to catch in the original. For the rendering of such *nuances* is required an intuitive entering into another's individuality, attainable to the poet alone. To make our meaning clear, we must ask the reader to compare the above-cited extract from Rahel's letter to her sister with another rendering of the same passage, which, in our opinion, displays all the qualities of highest reproductive genius:—

"Since thy last letter I am sore downcast. Gone art thou! No Rose comes stepping in to me with true foot and heart, who knows me altogether, knows all my sorrows *altogether*. When I am sick of body or soul, alone, alone, thou comest not to me any more; thy room empty, quite empty, for ever empty. Thou art away to try thy fortune. O Heaven! and to me not even *trying* is permitted."

It is perhaps hardly necessary to name the author of this second version, Mr. Carlyle ("Review of Varnhagen von Ense's *Memoirs*," *Miscellanies*, third edition, vol. iii. p. 191), to whom the present volume is appropriately dedicated. We should have refrained from a juxtaposition apparently so unfair to Mrs. Jennings if on referring to the original we had not found that the more inspired version is at the same time the more accurate of the two.

It remains to recommend cordially to the attention of our readers a book which, in spite of its shortcomings, contains by far the most sympathetic and altogether satisfactory account of Rahel's life in this or any other language.

F. HUEFFER.

NEW NOVELS.

Major Vandermere. In Three Volumes. By the Author of "Ursula's Love Story." (London: Hurst & Blackett, 1876.)

Our Next Neighbour. In Three Volumes. By Courteney Grant. (London: R. Bentley & Son, 1876.)

Theophilus and Others. In One Volume. By Mary Mapes Dodge. (London: Sampson Low & Co., 1876.)

Madeleine; or, a Noble Life in a Humble Sphere. A Huguenot Story. In Two Volumes. By the Vicomtesse Solange de Kerkadec. (London: Sampson Low & Co., 1876.)

It is sometimes an accusation against a reviewer that he merely skims a novel sufficiently to elucidate the plot, and then proceeds to criticise it on the scanty knowledge thus obtained. We defy, however, the greatest adept at this kind of work thus to dispose of *Major Vandermere*. It is as if the author had written an ordinary love-story, very pretty, very graceful, but perhaps a little dull, and afterwards, on the suggestion of a friend that it lacked sensation and excitement, the whole atmosphere had been charged with plots and counterplots, till in the result it requires the most careful reading and constant reference to fathom the mysteries of the story. These plots, too, are out of harmony with the style of the author, which has nothing in common with sensational incidents. It is pleasing and graceful, as we have said, but there are numerous traces of carelessness. For instance, the surname of the heroine is spelt "Grey" and "Gray" almost indiscriminately throughout the book. We have not space to detail the various branches of the plot, but the main story is that of a man who absents himself for seven years from the girl he loves, not because he has been refused by her, for he has never proposed to her, but on the totally insufficient grounds, as we venture to think, that he has been rejected by her uncle! Yet both are perfectly independent, and both have riches and to spare. Then there is an abduction: a lady's maid is kidnapped instead of her mistress, and after a forcible detention for some weeks in Paris returns to her place without the faintest allusion to the singularity of her absence. There is also a dead man found in an outhouse, whose history has to be interwoven with that of the other characters. But strangest of all is the episode of another couple, one Walter Brooksby and his wife: he has courted her under a feigned name and she never knows his real one until he signs it in the vestry after their marriage. This is unlucky; for her mother had taught her "to call down on herself maledictions" if she was ever "to take a kindness knowingly from a Brooksby, to call a Brooksby her friend, or marry a man who bore that name." She consequently slips away from the vestry there and then, without a word of explanation, and is seen no more by her husband for many years. In the account of their final reconciliation the author has crossed the narrow bridge between the sublime and the ridiculous:

"Just as she had spoken, and was returning to the house, there came forth from the open window of the sitting-room a few notes of music and the

voice of a man singing. Mary lifted up her head, and took the woman's part in the song which those notes preluded; she walked, keeping time to her own singing, into the room; sweet and firm, strong and true, came forth those notes and words, now mingling with his voice, who, with stooping head, was at the piano playing the accompanying chord. He never raised his head, but sang on, as she sang, walking across the room to where he sat. She laid her hand on his shoulder; they finished the last words together. As the end was approached, they were left alone, and Walter, rising, with a few words of deep thanksgiving, took his wife in his arms."

It will thus be seen that *Major Vandermere* is not wanting in incidents out of the common way, and among other peculiarities it may be mentioned that most of the characters marry at least twice: still we do not think it will ever become a very popular work.

"Our Next Neighbour" is Mr. Julius Hawkshaw, whose father has made his money in trade, and has established himself at Tunbridge Wells. He sends his son to Oxford, and at the age of twenty-five bestows on him 20,000*l.* a year, and buys for him a beautiful place called the Priory, which adjoins the seat of the Earl of Kirkcubright. The incidents consequent on such a situation may be easily imagined: the young man falls in love with one of the Earl's daughters, and the sentiment is returned. Mr. Hawkshaw senior, with his wife and daughter, comes down to the Priory, and their vulgar ways nearly spoil all. However, in the end the marriage takes place, and Julius becomes M.F.H. of the county. So far all is what might be expected; what we did not expect was that an author nowadays should arrange the first meeting between his hero and heroine thus: the young man ensconces himself among the branches of a thick-spreading elm, and the young lady seats herself by chance at the foot of the same tree. She there delivers herself of a soliloquy no less than nine pages long, in which she details her opinions as to the sort of husband she would require, as to various members of her family, and finally as to the gentleman overhead, whom she thinks it witty to designate as the "Pill Man." Eavesdropping appears to commend itself to the author, for not many pages afterwards the hero applies his ear to a hole in the wooden back of an arbour, and overhears a long conversation which acquaints him with the skeleton of the Kirkcubright closet. Notwithstanding these rather out-of-date contrivances, the book is intended to be written up to the present hour: there is a Spelling Bee, where food for amusement is furnished by Mr. Hawkshaw senior; there are frequent games of Lawn Tennis; and a most momentous conversation occurs over a game of Go-bang. It should be added that want of polish is not confined to the uneducated members of the Hawkshaw family; a peer of the realm remarks to one of the Ladies Fitz-Morris at the dinner-table:—"Goats and sheep! Goats and sheep! You should not choose the old goat on your left hand;" and Julius himself, after ascertaining that "two hopeful, expectant-looking young ladies" are the daughters of Lady Castle-tree, says, "And their name is Castle-bough, branch, twig, or what?"

THE first number of a satirical magazine entitled *The Jester: a Motley Monthly*, will appear on November 1.

There is a very considerable vein of humour running through the sketches and stories entitled *Theophilus and Others*, all of which are characteristic of American life; but there are also unmistakable traces of "padding," and the stories in particular would have been the better for revision. Of the sketches, "Shoddy" is very amusing, and, as the author says, is interesting as recording a state of things that has in some respects passed away: it was originally contributed to the *Cornhill Magazine*. "Up with the Times"—a sketch of "the mau who knows everything"—is also clever: "He is one of your thoroughly posted men, . . . yet he doesn't pretend or put on airs. He simply inhales the events of the day, and breathes them out personally." It is refreshing to read an attack on the ridiculous custom of chronicling "United Ages"—a practice which cannot be of the slightest use or interest, but has only a singular faculty for producing irritation. We suppose that the author considered the Preface to her book a happy one, so we reproduce it and leave our readers to judge.

"These tales and talks, most of which have appeared in various periodicals, are now, at the urgent solicitation of friends, &c., &c., &c.

"Their preparation has enlivened hours of &c., &c.

"If this little volume shall, &c., &c.

"In conclusion, the author, &c., &c., &c.

"M. M. D."

Madeleine is the story of a Huguenot family placed in the midst of Catholic neighbours, but at what precise epoch it is hard to make out. Her family—the Bréants—consist of a grandfather and grandmother "verging towards a hundred," and their son and daughter-in-law, Madeleine's father and mother. Whenever old Bréant appears on the scene he is wound up like a clock, and numerous anecdotes of Henry IV. and his times are the result, though they have nothing to do with the story, and are only supposed to have been related to him by his great-uncle. What is expected of Madeleine may be gathered from the opening pages:—

"I have no fear of Madeleine being spoilt (says her mother); she is so high-minded, so good, young as she is, that she would never imbibe anything but what was perfectly right." "You judge her well," replied the peasant; "and how modest she is, being so pretty withal."

Throughout the book she is made to walk according to this ideal, and finally nurses everyone else in the place when it is ravaged by cholera. The tone of the book is too unreal to be healthy. F. M. ALLEYNE.

CURRENT LITERATURE.

THE volume which appears as the fifth of M. Guizot's *Histoire de France* (Hachette), and which has been translated by Mr. Black (Sampson Low), appears to be mainly the work of M^{me}. de Witt, working with the help of notes taken at the time when the substance of the book was delivered in the form of lectures to M. Guizot's grandchildren. She had further received from him a sketch of the arrangement of the chapters (*le cadre des chapitres*), and it is satisfactory to find that M. Guizot intended to abandon for a simpler chronological arrangement the unfortunate treatment by subjects which was the ruin of the fourth volume. It is no disparagement to M^{me}. de Witt to say that the task which she has accomplished is one

which fails to reproduce the spirit of the history with which she deals. She must necessarily have been bound as far as possible to the lines which her father had laid down in his original lectures, and there is every reason to believe that M. Guizot was far less competent to treat this portion of the history of his country than any other. The very fact that he intended to bring his narrative to a close at 1789 is sufficient to condemn him. For historical purposes the French Revolution begins at the death of Louis XIV. The rottenness which preceded the great outburst and the struggling life which inspired it, lose their interest unless they are made to lead up to the scenes which follow. Nor was M. Guizot, if, as may be believed, he inspired the pages before us, capable of reproducing the life of the eighteenth century in its true colours. All its wickedness and cruelty are shaded off; its misery and wretchedness are scarcely displayed at all; while the faults of the thinkers and writers who lifted up their voice against the living death around them are dwelt upon with such severity as to throw their virtues into the background. Each touch is true as far as it goes, but the general effect is misleading. It would be unfair to forget that the translator of a book issued periodically is placed at a disadvantage. His time is limited, and he is often unable to revise his work. It must be said, however, that Mr. Black often tries the patience of his readers. It may be doubted whether the forcible feebleness of the verb or the weak feebleness of the noun is more conspicuous in the substitution of "squelch the thing" (p. 278) for the notorious *Ecrasez l'infâme*; and it is certain that a little care would have enabled the translator to avoid the curious error of making history and posterity accountable for the death of Wolfe and Montcalm—"Valour, history, and posterity assigned fellowship in death, fame, and memorial" (p. 178) is hardly a satisfactory rendering of the inscription on the monument at Quebec, "Mortem virtus communem, famam historia, monumentum posteritas dedit."

History of Arbroath to the Present Time, with Notices of the Civil and Ecclesiastical Affairs of the Neighbouring District. By George Hay, Editor of the *Arbroath Guide*. (Arbroath: Thomas Buncle.) The history of a small Scottish burgh can only be of general interest in as far as it reflects the life of the nation. But there are elements of interest in the history of Arbroath of the most vivid and enduring kind, for Scotchmen at least. The independence practically achieved at Bannockburn was finally established at Aberbrothock. The document subscribed by the Convention of the Scottish Estates assembled at Aberbrothock, and transmitted as their reply to the threatened fulminations of the Vatican, is a dignified assertion of the ancient independence of Scotland and their determination to maintain it. The early history of the district illustrates an interesting but exceedingly obscure phase of ecclesiastical history. Angus was specially rich in foundations of the "Celi Dé,"

"a title," says Dr. Reeves, "sometimes borne by hermits, sometimes by conventuals; in one situation implying the condition of celibacy, in another understood of married men; here denoting regulars, there seculars; some of the name bound by obligations of poverty, others free to accumulate property."

The most interesting of these early ecclesiastical settlements was that of St. Vigean, whose church was already ancient when it was given by King William to his newly-founded monastery. Dedicated to St. Fechin of Fobhar, in Westmeath (who died A.D. 664), it was an important place in the eighth century, if we may judge from its unparalleled assemblage of sculptured monuments in the style and with the symbols peculiar to the ecclesiastical art of ancient Alban. One of these is specially interesting, as it bears the only known fragment of a monumental inscription in the Pictish language and character. The *Book of Deer* was written in the ninth century, but this inscription is ascribed to the eighth, and believed

to commemorate a Pictish king, Drust, who fell in the Battle of Blathmig, in A.D. 729. Mr. Hay has given excellent drawings of the more important of these monuments, and these form a valuable feature of the work, which is also enriched with views of the Abbey and Burgh of Aberbrothock. The records of the Burgh commence in 1491, the earlier volumes being incomplete. The records of the incorporations of the trades and of the Kirk Session and Presbytery have been largely drawn upon for curious and interesting illustrations of the manner in which the domestic as well as the social and religious life of the community was regulated in the sixteenth and seventeenth centuries. Many of the enactments of these incorporations exhibit a zealous desire for the enforcement of morality and good conduct untempered by the notions of freedom of judgment and personal discretion which now prevail. Every master was enjoined to keep a *palm* wherewith to chastise his apprentice, and he was bound himself to go to church three times a week besides Sundays—"Monday and Saturday to the Lecture, and Wednesday to the Sermon, all in one week"—on pain of a fine of 4s. 8d. Dancing, playing, drinking, travelling or working on Sundays was punishable by a fine to be paid to the funds of the craft over and above the penalties exacted by the Church. Corporal punishment to the number of forty stripes was inflicted in presence of the deacon and mastermen of the trade on apprentices guilty of certain immoralities, among which the disregard of the seventh and fourth commandments is ranked with breach of the eighth. In the chapters relating to the municipal history of the Burgh and its trade and institutions, Mr. Hay has made judicious use of the materials at his command. The volume is highly creditable to the local press, and cannot fail to be acceptable alike to the local reader and useful as a general work of reference.

Drei Tractate aus dem Schriftencyclus des Constanzer Concils, untersucht von Dr. Max Lenz. (Marburg: Elwert.) The object of this little work is to examine as to the authorship and composition of three treatises relating to the Council of Constance, printed in Hardt's Collection—questions of some intricacy, and which have been matter of controversy before now, as students of the period are aware. Dr. Lenz goes over the whole subject with much minuteness, pointing out in the course of his examination that two of the treatises are imperfect, and that a portion of the one, as printed, really belongs to the other. He then examines the claims of various supposed authors of each treatise, disputes the hypothesis of a double authorship of the fragments, and, finally, vindicates the claim of Dietrich von Niem to be considered sole author both of them and of the one perfect treatise. The work, of course, is one for the special student only.

DEAN MERIVALE'S little book, *The Roman Triumvirates*, which forms a volume in Messrs. Longmans' series of "Epochs of Ancient History," is admirably adapted for its purpose. It contains the gist of much of the author's larger work, which gains in force by being condensed into a smaller space. The style also of this book is better, because simpler and more straightforward, than that of *The Romans under the Empire*. It escapes the tendency to sesquipedalian commonplace, which made the latter work occasionally tedious. As regards the matter of the book it is interesting to notice that Dean Merivale's views have gained in decisiveness. He is more avowedly Caesarian in his opinions than he was when he wrote his former work.

"Caesar," he writes, "was determined to make himself the interpreter of the great imperial will as opposed to the little clique which pretended to sway it from the city of the seven hills. He was convinced that the world required a despot, and would itself create a despot suited to its wants: it was his ambition to be himself the man in whom its wants and its determinations should centre."

Anyone wishing for an interesting narrative of the

period of Caesar will find it given with scholarlike accuracy in this volume. Our only regret is that, with a view to its use in schools, more reference has not been made to the original authorities. It is an admirable book for the general reader; but all schoolboys read Cicero and Caesar, and a more direct criticism of Cicero's writings in reference to his own political position would have made this volume more useful for educational purposes. In the multiplicity of historical handbooks there is still room for some which would treat ancient history, at all events, from the point of view of the authorities on whom it rests. There is no reason why a schoolboy should read Cicero only as an example of Latin prose style; he might at the same time be taught a valuable lesson of historical criticism, if the same apparatus existed for teaching the one as exists for teaching the other.

The Athenian Empire. By G. W. Cox, M.A. (Longmans.) In an earlier volume of this series Mr. Cox told the inspiring story of the repulse of Xerxes. He now passes to its mournful sequel in the destructive struggle between Athens and Sparta. The successive stages in the growth of the Athenian Empire, and the steps by which the free members of the Delian confederacy were transformed into the subject-allies of the leading city are clearly pointed out. The figures, too, of the prominent actors are carefully drawn, that of Themistocles as the founder of Athenian greatness being especially successful. The account of the Peloponnesian War, which takes up the greater portion of the book, is generally good, but Mr. Cox omits, we think, to notice an important aspect of the struggle. He makes the war turn too exclusively on the violation of the principle of autonomy implied in the Athenian Empire, and hardly lays enough emphasis on the collision between the rival interests of democracy and oligarchy. Yet it was this political antagonism which gave its peculiar bitterness to the strife, and divided, not Greece merely, but almost every Greek State into two hostile camps. Nor, in our opinion, do the internal politics of Athens receive their due share of attention. The sketch of Nicias would have been all the clearer for a fuller account of his policy and aims as a great party-leader; and in explaining the degeneracy of Athens after the death of Pericles, too much stress is laid on the personal influence of that statesman and scarcely enough on such causes as the demoralisation produced by the plague, the stimulus given to the worst side of democracy by the crowding of a poor population within the walls, and, lastly, the recklessness produced by the war. Apart from these defects, the book is admirably suited for its purpose, and possesses the merit, like Mr. Cox's previous handbooks, of constant reference to, and criticism of, the chief authorities.

Sveriges Historia från äldsta Tid till våra Dagar (Swedish History from the Oldest Period to the Present Time). I. (Stockholm.) This is the first part of an extremely well got up history of Sweden, compiled by Messrs. Montelius, Alin, Tengberg, Hildebrand, Weibull, and Hellstenius, and the engravings with which it is profusely illustrated add much to its value. The present instalment of the work deals with the heathen period, and, after a short introduction, an interesting and valuable account is given of the southern portion of the country during the Stone Age. The several sections are divided as follows: The oldest traces of populations in the north, discoverable in the kitchen-middens; their mode of life, agriculture, household arrangements, &c.; clothing and ornaments; fishing and hunting; occupations; burials and offerings; emigrations; and transition to the Bronze Age. For a popular book nothing could be better than what we have before us; the names of its authors guarantee its accuracy, and the illustrations ought to enable the most careless reader to recognise the various types of flint implements and other relics of the Stone Age.

The Germania of Tacitus, as is well known, has an importance, not only for the history of Germany, but also for that of all nations of German origin. A scholar like G. Waitz has declared with perfect justice that the study of German antiquity above all depends on a right understanding of this book, and that he would have been compelled to begin his own work on German Constitutional history at a point five hundred years later than he has done, if he had been without the aid of the *Germania*. Every attempt to make it more intelligible ought to be received with approbation. We may therefore welcome the editions which have just appeared, by Prof. Baumstark of Freiberg (Leipzig, 1875-6)—one of them principally intended for students; the other explaining with the utmost care and minuteness the first twenty-seven chapters, which are those which have a general importance. The editor has a thorough knowledge of the whole of the bulky literature of his subject. He gives an elaborate account of the views of the most eminent commentators of recent and earlier times, so as to make his book a substitute for a whole library of works on the *Germania*. Nor does he content himself with furnishing a multitude of quotations, for the most part literal, from other writers. He has his own views, which are always independently conceived, and are often very striking. It is to be regretted that Professor Baumstark accompanies his quotations from other writers with comments expressed in terms of superfluous and unnecessary acerbity. He shares the fault of many German scholars, who fancy that their arguments will appear most forcible if they are accompanied by bitter personal attacks upon their opponents. Those who use his book will have some difficulty in overcoming the unfavourable impression produced by these polemics, the virulence of which is often actually insulting. If they can succeed in this they will give due appreciation to the great excellences of the book.

THE narrative of Krone's *Handbook of the History of Austria*, which has reached a seventh edition, is carried on to the battle on the Marchfeld (August, 1278), which led to the expulsion of Ottokar of Bohemia from Austria, and the investiture of the House of Hapsburg with these grand-duchies. The work is one of great importance, and will deserve a fuller account when it has reached its completion.

THE movement which is on foot for popularising historical school-books has at last spread to books of geography. Mr. Moberly's first instalment of the *Rugby Modern Geography* (Billington), which includes the three peninsulas of the Mediterranean, does its best to give life to a study which is usually made dry and uninteresting. Instead of drawing up lists of names, Mr. Moberly takes care not to give names unless he has something interesting to tell about them, and what he has to tell is made as attractive as possible. Some people will perhaps be startled to find a prediction on the future political condition of Bosnia in a handbook of geography, but if this be a fault, it is at all events a fault on the right side.

Some Dreams of a Constitution-monger: a Paper on University and College Reforms. By Robert Laing, M.A., Fellow of Corpus Christi College, Oxford. (Parker.) It were much to be desired, at the present indecisive juncture of affairs, that University residents would take the trouble to publish to the outer world the views they are known to entertain upon the national question of academical reform. Mr. R. Laing, who is among the most eminent representatives of the flourishing history school at Oxford, has done well to issue, in a pamphlet form, an essay which he read in May last before a private society. His suggestions are professedly based upon the writings on the subject of Mr. Mark Pattison and Prof. Goldwin Smith; but by casting them in the shape of a Utopian dream, he has enabled

himself to use great boldness and to reach much precision of detail. There is something revolutionary, though but little that is paradoxical, in his proposals. He would assign absolutely certain Colleges, whose names he indicates, to special fields of study; he would remove Prize Fellowships altogether from the gift of the Colleges, and place them under the control of the University; and, by multiplying Professorial Chairs and Readerships, he would arrange for "the persistent and carefully accumulative industry of studious lives." He concludes by sketching in outline the picture of what his own college may become by the close of the present century, when it should be enjoying a net income of 20,000*l.* per annum. It may be that Mr. Laing has attached undue prominence to certain aspects of the question; but he writes with a knowledge, an earnestness, and a practical spirit, that must enforce attention. Their own future is still in the hands of the colleges.

NOTES AND NEWS.

MRS. SKENE, the wife of the English consul at Aleppo, has arrived in London with the papers left in her husband's hands by Mr. George Smith. As they comprise his notes on the cuneiform tablets found near Bagdad, as well as on the remains he discovered at Carchemish, their importance may easily be estimated. We are glad to learn that her Majesty has been pleased to grant a pension of 150*l.* a year from the civil list to Mrs. George Smith in recognition of the services rendered by her husband.

THE Society for Promoting Christian Knowledge has in the press four volumes of their series on "Non-Christian Religious Systems." These are *Hinduism*, by Prof. Monier Williams; *Islam and Its Founder*, by J. W. H. Stobart, Principal of Martinière College, Lucknow; *Buddhism*, by T. W. Rhys Davids; and *The Religious Belief of Africa*, by the Rev. H. Rowley.

THE following are among Mr. Stanford's announcements for the season:—*Studies in English Literature*, by John Dennis; *The Emigrant and Sportsman in Canada*, by J. J. Rowan; *Canoe and Camp Life in British Guiana*, by C. Barrington Brown; *The Northern Barrier of India*, by Frederic Drew, author of *The Jummoo and Kashmir Territories*; *Through Norway with Ladies*, by W. Mattieu Williams, author of *Through Norway with a Knapsack*; &c. &c.

AN article on the Eastern Question from an Eastern Christian's point of view, by a Serbian gentleman of high official position, will appear in the November number of *Macmillan's Magazine*.

ANOTHER important book has been undertaken for the New Shakspere Society, and this is a Shakspere *Holinshed*, giving in parallel columns or pages the plots of the historical plays, and the passages from Holinshed's *Chronicle* on which they are founded, with full extracts to illustrate them. The book will be much fuller than Courtenay's "Commentaries on the Historical Plays," and will enable the student to dispense with the unwieldy third volume of Holinshed's *Chronicle*. The editor of the book is Mr. Walter D. Stone, of Walditch, who helped Mr. Furnivall with his late *Tell-troth* and *Lane* volume.

CANON RAWLINSON is to contribute a volume on *St. Paul at Damascus and in Arabia* to the series of "The Great Centres visited by St. Paul," which is in course of preparation by the Society for Promoting Christian Knowledge.

THE valuable illustrative collections of Food Products, the Uses of Animal Products and of Economic Entomology, belonging to the Science and Art Department, and deposited in the Bethnal Green Museum, have lately had much attention given to them, in labelling, arranging, and amplifying them, under the direction of competent men;

and Mr. P. C. Owen, the active secretary of the Department, has had descriptive works prepared not only to serve as guides to the collection, but also works of intrinsic merit, full of valuable information and adapted for careful study. In addition to the very many cheap catalogues of the different art and other collections now sold in the building, Messrs. Chapman and Hall will publish three valuable books of reference (now nearly ready) by experienced authors—viz., *Economic Entomology*, by Mr. Andrew Murray, F.L.S.; *Economic Entomology: or, Animal Products, their Preparation and Uses*, by Mr. P. L. Simmonds, F.R.C.I.; and *Food: its Chemical Constituents and Uses*, by Prof. A. W. Church, F.C.S.

CAPTAIN BURNABY'S new work, entitled *A Ride to Khiva*, will be ready for publication by the 10th of next month. The delay in its issue has been caused by the length of time necessary for the preparation of the maps, which will furnish for the first time copies of the march routes between the Russian frontier and Asia, compiled from the best Russian military authorities.

LORD RAYLEIGH has been nominated by the Council of the London Mathematical Society to succeed Prof. H. J. S. Smith as president. This last-named gentleman and Mr. C. W. Merrifield are nominated for the new vice-presidents, and Dr. Hirst becomes an ordinary member of the council. The names struck out from the old list are those of Dr. Sylvester (he being at present Professor of Mathematics at Baltimore, U.S.) and Mr. H. M. Taylor: in their room are submitted the names of Messrs. A. B. Kempe and J. J. Walker.

THE Society for Promoting Christian Knowledge will shortly publish a series of small manuals on the subjects called "specific" in the New Code of the Committee of Council on Education. The following are in hand: *Physical Geography*, by the Rev. T. G. Bonney; *Animal Physiology*, by Charles Yule; *Mechanics*, by W. Garnett; *Mathematics and Algebra*, both by W. H. Hudson; *Domestic Economy*, by Miss Synnott.

THE MS. of the work on *Babylonia* which the late Mr. George Smith was preparing for the Society for Promoting Christian Knowledge has been left in a complete state, and is now in the printer's hands. Mr. Sayce has undertaken to see the work through the press. Two other volumes of the series of "Ancient History from the Monuments," viz., *Sinai*, by Major Palmer, and *The Greek Cities and Islands of Asia Minor*, by W. S. W. Vaux, are also in the hands of the printer.

THE second volume of the new edition of Clément Marot's works in six volumes, by Georges Guiffrey, will appear on November 1. The first volume contains a Life of the poet, with a picture of the society of the sixteenth century. Volumes ii., iii., iv., v. will comprise the Works, with about 5,000 hitherto unprinted lines collected from MSS., and from fourteen to fifteen thousand various readings from the different printed editions of Marot's poems. The text will be that of the last edition printed in the author's life, that of Etienne Dolet in 1543. The sixth volume will contain a glossary of above 6,000 words, an essay on the prosody of the sixteenth century, and a bibliography of the poet's works. All the engravings of the old editions will be reproduced from the best-known specimens.

MR. T. MILES, of Roberts Brothers, has conceived the original idea of publishing a series of American stories called the "No Name Series." The authors are among the best known of American writers, and the public are invited to discover who they are by their style. A new book by "H. H." (Helen Hunt) will be published by Roberts Brothers this autumn.

A WORK on *Ancient Society*, by Mr. H. L. Morgan, is announced by Henry Holt and Co.

SCRIBNER, ARMSTRONG, AND Co. have just issued a volume of *Every-Day Topics*, by J. G. Holland, composed chiefly of articles that appeared in *Scribner's Monthly*. Dr. Holland's *Mistress of the Manse* will be issued by this house as a gift-book, illustrated by Miss Hallock, Helena de Kay, and T. Moran.

THE lovers of chess may be glad to know that two hitherto unknown mediaeval Latin poems upon that game are printed in a volume just published at Bern (*Carmina mediæ ævi ex bibliothecis Helveticis collecta*. Ed. Hermannus Hagenus). The greater part of the manuscripts are edited for the first time. The earlier and longer of the two chess poems, "Versus de Scachis" (pp. 137-140), is found in two manuscript copies at the Abbey of Einsiedeln; one is of the tenth, the other of the early part of the eleventh century. The other poem, "Carmina Ludi Scachorum" (p. 141), is copied from a manuscript at Bern, upon which the verses are written twice over with a few variations. Dr. Hagen has published a German translation of both poems, but he has not attempted to reproduce them in rhyme, which, indeed, would have been a difficult task in the case of the later and shorter poem, which consists of nine leonine hexameters.

THE *Nuova Antologia* for October contains an interesting article by Signor A. Graf on "French Epic Poetry in the Middle Ages," in which he traces the causes which influenced the growth and later development of the "Chansons de Geste." There is an article by Signor Enrico Panzacchi on Wagner's operas at Bayreuth, which the writer condemns, while expressing admiration for Wagner's earlier works, *Lohengrin* and *Tannhäuser*. Among the new books noticed is a study of Roman History, *Clodio e Cicerone*, by Prof. Igenio Gentile (Milan). The Società Storica Lombarda has begun a "Biblioteca storica Italiana," with a volume containing various hitherto unedited chronicles; two by a Milanese, Scipione Vegio, relating to the history of Lombardy between 1515 and 1521, and between 1523 and 1526. The volume contains also two chronicles relating to the history of Cremona between 1399 and 1442, and between 1494 and 1525.

THE German Historical Commission held its great annual meeting for 1876 at Munich on October 5-7. The last year's labours of the commission have added several important works to the national literature of Germany. Among other valuable documents now first made public are the "Annals of the Emperor Otto the Great," begun by Rudolf Köpke, and completed by Ernst Dümmler; the "Chronicles of the German Cities from the Fourteenth to the Sixteenth Century," Bd. xii. xiii.; and "Contributions to the History of the Empire between 1546-1551." It is announced that the third volume of Prof. Ritter's "Letters and Acts referring to the Thirty Years' War in Germany" is nearly half printed, and will be finished before the end of the winter; when it is expected that Dr. Stiener will be ready to send to the press his introductory volume of the series of the later Bavarian State documents, beginning with the year 1591.

WE have received *The Vocabulary of Philology*, by W. Fleming, third edition, ed. H. Calderwood (Griffin); *Orcroft's Trustee's Guide*, twelfth edition (Stanford); *Manual of Dental Anatomy*, by Charles S. Tomes (Churchill); *Forging their own Chains*, by C. M. Cornwall (Ward, Lock and Tyler); *The Land of Israel*, by Canon Tristram, third edition (S.P.C.K.); *Astronomy without Mathematics*, by Sir Edmund Beckett, Bart., sixth edition (S.P.C.K.); *Proceedings of the West London Scientific Association*, Vol. I., Part 3 (Clanricarde College Class Rooms); *St. Patrick, the Apostle of Ireland*, by a Layman (Gill).

NOTES OF TRAVEL.

THE report sent home by the Rev. R. Price of his journey from the Zanzibar coast to Mpwapwa on the route towards Lake Tanganyika has newly been printed for the use of the directors of the London Missionary Society. Mr. Price's journey, undertaken as a preliminary step towards the foundation of one or more mission-stations on the line of this great highway into Central Africa, has solved a number of questions of immense importance to the task of opening up East Africa to civilisation. Choosing a route from the coast village of Saadani instead of the ordinary track inland from Bagamoyo, he has made known a way to the interior highland which is not only free from the fever-haunted swamps of the old path, but also from the great scourge of East Africa, the tsetse fly. He took four bullocks with a waggon the whole way to Mpwapwa, and left them in perfect health at Saadani on his return, an experiment the success of which will in time revolutionise the whole method of East African traffic. He says:—

"Of the comparative advantages and disadvantages of the Saadani and Bagamoyo routes I can only judge from what people say of them who know them both. In my own party there were men who had been in Arab caravans by the Bagamoyo and Usagara route, and to whom the Saadani route was new. They declared that the Saadani was by far the better route—shorter, less wooded, and the mountains far less steep and rugged. . . . I can speak favourably of the healthiness of the Saadani route. By the beginning of July the country on that route has become so far dry that one would need to go out of one's way to get one's feet wet."

IN the *Bulletin de la Société de Géographie* for September is an interesting notice on the Physical and Political Geography of Tibet, by the Abbé Desgodins. He points out that, although after the Conquest of Tibet by the Chinese in the reign of Kang-hi (about 1720), the eastern frontier between Tibet and China was greatly modified, and large areas were declared independent of Tibet and tributary to China, this territory was re-conquered by the Tibetans in 1863-64 as far as the Ya-Long Kiang, and that one need not be surprised if, in the course of a few years, thanks to the incapacity of the Government at Peking, and the venality of the Mandarins who are sent to Tibet, the territories of Bathang and Lythang also fall again under the direct government of the King of Lassa. For the moment the true limit of the kingdom of Lassa on the east lies between the villages of Pa-mou-tong and Lanten or Kincha-Kiang, and on the stream which passes the town of Kiang-Ka.

SOME brief particulars have just been received from Adelaide of Mr. Ernest Giles' overland journey from Perth, Western Australia, which, commencing early in April, was brought to a successful conclusion on August 23. Mr. Giles reports that he traced the Ashburton to its sources, and determined the whole watershed of the western rivers, which he describes as simply a mass of rangy country abutting upon the desert in longitude 120° 20'. No watercourses were found to flow eastward from the end of the watershed in that longitude. At starting into the desert Mr. Giles says that most of his camels were continually poisoned, the plant that poisoned them not being in any way allied to the poison plants of Western Australia; he succeeded in discovering it, and has brought away specimens. During the journey the longest stretch which the party had without water

was a ten days' march. They were all attacked with ophthalmia before the rains fell in May, and they experienced an excessively cold winter, the thermometer in the morning being for weeks down to 18°. Mr. Giles states that his camels behaved splendidly, and, notwithstanding all the hardships they had to undergo, he seems to have lost only one. Speaking generally, he found the country along his whole line of march desolated with drought.

WE believe that Mr. Blyden, formerly a professor in the Liberian College, whose recent papers on African subjects have attracted some attention, will shortly undertake, on behalf of a gentleman interested in trade with the west coast of Africa, a lengthened journey of exploration in the unknown regions lying beyond the Kong Mountains, West Africa. After crossing that range, Mr. Blyden will take as direct a course as possible to the east, and endeavour to reach the Niger; in the event of his succeeding, it is not improbable that he will continue his journey still further, in which case he will be absent in the interior for fully a year.

It is satisfactory to learn that letters have reached Prof. Nordenskjöld from Dr. Theel, director of the land-branch of the Siberian Expedition. Dr. Theel wrote on September 11 from Dudinskoy, where he announces that he is actively engaged in selling the wares which, according to preconceived arrangement, had been unloaded from the steamer *Ymer*, and deposited by Prof. Nordenskjöld at a convenient spot a few miles south of the mouth of the Yenisei, and at about an equal distance north of Dudinskoy. Dr. Theel reports that he and his party are well, and have been thus far successful in effecting the object of their mission.

ACCORDING to the most recent news received from Dr. Otto Lenz, who had hoped to penetrate into equatorial Africa along the Ogowe river, his health is so much affected by the climate and by his continued exposure to fatigue of every kind that he will be compelled to return to Europe with as little delay as possible. The only members of the German West African Expedition now remaining in Africa, actively engaged in following out their respective lines of research, are, therefore, Dr. Paul Pogge and Herr Eduard Mohr, who are exploring the Angola Coast, which is to serve as the starting-point of their several individual operations. It is some satisfaction to learn from Dr. Lenz's report, that although disabled for the present, he had been successful in effecting an entrance into the Oscheba lands, whose inhabitants had long resisted all overtures for a more friendly consideration of his request to be allowed to travel through their country. The result of this part of his expedition will be made known on his return home.

THE seventh and concluding General Report on the Ocean Soundings and Temperature Observations made in H.M.S. *Challenger*, which has just been issued by the Admiralty, is by far the most important of the series, containing as it does an admirable survey of the general results obtained over the whole Atlantic ocean. The facts thus summarised are of the highest interest as giving the clearest possible confirmation of the truth of the doctrine of a general oceanic circulation originated and sustained by difference of temperature, so ably insisted on by Dr. Carpenter, verifying in a most remarkable way the truth of the law which he propounded, that the depression of bottom-temperature in any part of the general oceanic basin would be found to be proportional to the freedom of communication between that part and one or other of the polar areas. The great trough of the Atlantic proves to be divided by great submarine ridges of less depth than 2,000 fathoms into three distinct basins: an eastern one, extending from opposite the coasts of France and Spain southward over the African side of the Atlantic to beyond St. Helena; a

western basin, stretching from off the Newfoundland bank to near the West Indies; and a south-western basin, occupying the sea bed off the South American coast and reaching northward to the latitude of the mouths of the Amazon. A main submarine ridge extends from a point midway between the British Isles and Newfoundland throughout the entire trough, having the Azores, St. Paul's rocks, Ascension Island, and Tristan da Cunha as its summits; and lateral branches from this to the South American coast and to the Cape of Good Hope divide the three basins. Throughout the enclosed eastern and western basins the temperature beneath a certain depth, believed to correspond exactly to that of the deepest opening into them, has been found to be perfectly uniform throughout their great areas—35° F. in the western, 35·3° F. in the eastern. The south-western basin, in contradistinction to these, has been proved by the soundings to be unenclosed on the Antarctic side, and within it the bottom temperature sinks to 31° F. The old error of a supposed expansion of water by heat in the equatorial zone, raising the level of the sea and causing a flow to the poles, which used to be connected with the theory of thermal circulation, is also for ever done away with, since it has been certainly proved that the direct heat of the sun is insufficient to influence the temperature of water in the equatorial regions beneath a shallow stratum of 100 fathoms.

NEW SCIENTIFIC REGULATIONS AT THE UNIVERSITY OF LONDON.

It is desirable that attention should be called to the "Revised Regulations relating to Degrees in Science" at the University of London, especially as they regard the department of Biology, in which the most important alterations have been made. Where the subjects are the same, the same papers have hitherto been set for the First B.Sc. examination, and the Preliminary Scientific which precedes the First M.B. The changes now to be noted refer only to the former of these; though it is said to be the intention of the Senate to apply them ultimately also to the second. Hitherto there have been separate papers set (each occupying three hours) in Zoology, and in Botany and Vegetable Physiology; and with regard at least to the latter of these two subjects, it has been generally admitted that the syllabus which held a place in the University Calendar (and still does as far as the Preliminary Scientific Examination is concerned) was altogether unsatisfactory in the present condition of science. The change introduced is radical. The two branches of Biology are united; the time allowed for answering printed questions in the two together is reduced to three hours; but this is supplemented by a twelve hours' "Practical Examination," in which the candidate is expected to examine microscopically, to dissect and to describe, plants and animals referred to in the accompanying syllabus. Unless with regard to the very short time allowed for a written paper extending over the whole area of Biology, the general scheme is one to be greatly commended. But when we turn to the syllabus which accompanies the regulations, we find one or two points which seem to call for remark. The plants and animals referred to, as specified above, are *Torula*, *Protococcus* (or some other simple unicellular plant), *Penicillium*, *Mucor* (or some other simple Fungus), *Chara*, *Nitella*, a Fern, a Flowering-plant, *Amorpha*, *Vorticella*, *Hydra*, Earthworm, Mussel, Snail, Lobster or Crayfish, and Frog. On first reading this list, it struck us that we had seen something very like it before; and on turning to Huxley and Martin's *Course of Elementary Biology*, we find that the types have been taken, with scarcely a single change, from that book. This, no doubt, wonderfully simplifies the task of both teacher and student, in preparing for the examination. But will it not be likely to have the effect of leading the student

to believe that these types represent every important and primary variety of structure in the animal and vegetable kingdoms? I cannot understand why the examiner should be precluded from bringing into the examination-room the skeleton of any animal higher in the scale than a frog, or of asking questions with regard to such important types of vegetable structure as Gymnosperms, Mosses, or any Algae of higher organisation than the unicellular. The wisdom also seems questionable of directing so large a portion of the attention of the student just commencing his biological studies to organisms with regard to which our knowledge is at present very imperfect. In none of our ordinary text-books of botany, whether larger or smaller, is such an account given of the unicellular Algae or Fungi as would be likely to satisfy the examiners; while, from the only two English works with which I am acquainted that give any adequate description of them adapted for the young student—Huxley and Martin's named above, and the *Micro-graphic Dictionary*—the reader will at once see that several most important questions with regard to the life-history of these organisms are still in debate. Practically no student will be able to present himself to the examiners with any chance of success who has not had the assistance of a private or public tutor; and the "grinding-up" of candidates will fall into the hands of some half-dozen men who will have the required types always on hand, and who will restrict their teaching within the most circumscribed limits. The scheme in its main outline is excellent, but seems to want reconsideration in some of its details.

A. W. BENNETT.

WILKIE AND HAYDON.

THE collection of original letters of Sir David Wilkie which we noticed some time ago (see *ACADEMY*, May 6, 1876) as having been sold by Messrs. Sotheby is now in the possession of the British Museum; and, an opportunity having been given us to look over the volume, we think some little account of the contents will be agreeable to many readers. For the present, however, we must limit ourselves to the little catalogue which precedes the letters, annotated in the handwriting of Haydon, of "Pictures painted by D. Wilkie, R.A., now exhibiting at 87 Pall Mall." This is dated 1812. The MS. additions include not only the prices fetched by the pictures, and the names of the purchasers, but some curious biographical revelations; we have extracted the chief of these additions for insertion below:—

- * *Village Politicians*, 30 gs. Earl Mansfield.
 - * *A Gamekeeper*, 50 gs. Sir G. Beaumont. A note to this runs: "Complained 15 was too much before it was known."
 - Blindman's Buff* (unfinished), 500 gs. Prince Regent.
 - Jew's Harp*, 50 gs. Mr. J. Annesley. "Resold at a sale at the death of first proprietor for 80 gs."
 - * *Blind Fiddler*, 50 gs. Sir G. Beaumont.
- Upon this Haydon remarks:—
- "Before he painted the large blind Fidler [*sic*] he made a small one which was placed for sale in a Print Shop, Charing Cross, and purchased by a Mr. Stewart, Harley Street. He had also painted a small 'Village Politicians' for a Scotch friend, who has it now in London. Neither however are so extensive in composition; he made additions afterwards."
- * *The Cut Finger*, 50 gs. Whitbread.
 - The Sick Lady*, 150 gs. Marquis Lansdowne.
 - The Village Holiday*, 800 gs. Angerstein.
 - * *The Rent Day*, 150 gs. Earl Mulgrave.
 - Portrait of a Lady of Quality*, 50 gs., bought by "Dowager Marchioness Lansdowne, her own Portrait."
 - Alfred Reprimanded by the Neatherd's Wife*, 150 gs. Davison.
 - * *The Card Players*, 150 gs. Duke of Gloucester.

Those marked * had been first exhibited at the Royal Academy.

Upon the back of the title-page of this Catalogue and upon the title-page itself, Haydon wrote as follows:—

"When Wilkie took a Picture round and offered it for sale, in order that he might subsist, nearly all the principal Printsellers refused it with 'We don't purchase modern Pictures, Sir.' A man at Charing Cross, I think the very one who has maps in his window at this day (I am not sure, but I believe it was him [*sic*]) as a great favour put a small blind fiddle [*sic*] in his window, it soon attracted attention, and was purchased, as related.

"I was the first who saw his name in a paper. I walked away to him instantly in great delight, and meeting an old friend of us both by the road, we came in on Wilkie, who was breakfasting. 'Wilkie,' said I, 'here's your name in the paper.' 'Where, where,' said Wilkie, ceasing to drink his tea. I then read it aloud. Wilkie stood up and huzzaed, in which we joined. We then took hands and danced round the table, and sallying forth spent the day in wandering about in a sort of extasy in the fields. We supped with Wilkie on *red herrings* and he took down his little kit and played us Scotch airs till the dreary hour of separation—these were delightful feelings! The novelty of a thing first felt, the freshness of youth, all contributed to render them intense and exciting.—This was 1806."

The other note is subscribed "Aug. 10, '17, Yarmouth, B.R.H.," and runs:—

"I shall never forget to the day of my death the expression of wild wonder in Wilkie's face, the day the exhibition opened!—he came to me staring with a delirium in his eyes, he was astonished at the enthusiasm, he knows nothing of his own power, never was any human being so unconscious of his genius as Wilkie. It amounts to a defect, it renders him timid, cautious, and nervous. I'd venture to make a bet, he could be persuaded that he has no talent at all. At the same time this unconsciousness renders him modest and unassuming. You never hear him speak of himself. You never hear him speak of his views. He has never equalled, but in one instance, viz. 'Wardrobe ransacked,' the floating richness of Teniers in touch and surface, but in simplicity and beauty of composition, in truth of character and expression, in the power to make every face contribute to the development of the story, even in the most subordinate manner, by a reference to it, so that there is no one head ever to let, Teniers and Jan Steen and all the painters of Holland must cede to him the superiority in *Time*. Jan Steen has great power but he never keeps up the feeling through every face in a Picture. The principal ones are always strong and energetic, but the inferior groups never seem to belong to the others. Cover any part of Wilkie's Pictures and you can tell almost what is going on under the part covered—his most remote figures are linked to the most prominent by an invisible ramification."

The letters of Wilkie, which are addressed to Perry Nursey, of Little Bealing, Suffolk, we must reserve for some other time.

CORRESPONDENCE.

DEIR EBÂN, THE GREAT EBEN, AND EBEN HA-EZER.

Paris: October 20, 1876.

In my last, very brief, Report (Palestine Exploration Fund, *Quarterly Statements*, No. xiii., October, 1874, p. 279) I formally proposed the identification of *Deir Ebân* with the great *Eben* on which the ark was placed on its arrival at Ekron. I had long before arrived at this result; I have repeatedly spoken of it to several persons, especially Messrs. Drake and Conder, reserving to myself the right of dealing with the question in detail, and particularly the relation of the great *Eben* to *Eben ha-ezer*. Mr. C. R. Conder having in one of the last *Statements* of the Palestine Exploration Fund (July, 1876, p. 49) proposed afresh to recognise in *Deir Ebân* the Hebrew word *Eben* (stone), and to locate *Eben ha-ezer* there, I am happy to see him partially adopt my theory, and I think I ought to seize this opportunity to set forth briefly the conclusions at which I long ago arrived on this subject.

(1) *The Great Eben*.—The Philistines, bringing back the ark on a wagon from Ekron to Beth-Chemes, reach the verge of that city, now represented by Ain Chemes (Samuel, i., 6-12); the wagon stops in the field of Joshua the Beth-Chemesite, where there was a great stone (*Eben*); the ark is rested on the "great stone," a sacrifice is offered in this place, and the cows which were drawing the ark are sacrificed (14-15). A little further on (18), in speaking of the gold offering, the narrator returns to this "great stone" on which the ark was rested, and which is pointed out to this day in the field of Joshua: it seems this time to indicate clearly the limit of the Philistine territory (to the great stone . . .), which, moreover, is confirmed by the fact that the Philistines go no farther, and that, after accompanying the ark to this point, they return to Ekron. The memory of this event is, in my opinion is correct, preserved in the name of *Deir Ebân*; as to the extraordinary importance assigned it by the book of Samuel, this is explained by the following considerations: †

* *Abel* must be corrected into *eben* in the opinion of all the commentators.

† Between *Deir Ebân* and Ain Chemes is a rocky spot called *Tantoura*, and perhaps also *es-sâfyé*. This was the scene in ancient times, according to the legend, of a great massacre of fellahs by the soldiers of the Government (*sic*). Since that time *dhabhat tantoura* has been a proverbial expression for a great massacre. It should be noted that the word *dhabha* (slaying) is precisely the Hebrew *zebah* (sacrifice). In the middle of the valley between Sar'a, Artouf, Ain Chemes, and *Deir Ebân*, there is also a low flat-topped hillock, covered with small stones, called *khirbet er-roudjoûm*; there was there a *qal'a* like a church (*sic*). The old name of *Deir Ebân*, according to the fellahs, is *Zeid el-mâl*. This word *mâl* (silver, money) is added to

(2) *Eben ha-ezer*. The Israelites on their way to attack the Philistines, who had advanced to Aphek, encamp—probably on the confines of their territory—near the stone of succour (*Eben ha-ezer*). Beaten the first time, they bring up the ark of Shiloh, and again try the fortunes of battle; they are completely defeated, and the ark, which falls into the hands of the Philistines, is transported by them from *Eben-ezer* to *Echdod*. These events occur, be it understood, *before* those which we have just related.

Is it not natural that later on the ark should have been carried back to the same point where it had been captured? On the very same spot where the sacrilege had been committed should the expiation be made. Now this spot bears precisely, as we have seen above, the name of "the great stone" (*Eben*).

There is yet another argument. It is only farther on (chapter vii.) that the narrator tells us the origin of the name of *Eben ha-ezer*, whence it results that, at the moment of the return of the ark, the place did not yet bear this name of *Eben ha-ezer*, and that the narrator only used it by anticipation when speaking of the defeat of the Israelites: as the religious outrage inflicted on the ark had been repaired on the very same spot where it had taken place, so the national outrage was to be atoned for under identical conditions. It was at *Eben ha-ezer* itself that the Israelites, beaten at *Eben ha-ezer*, were to take, under the leadership of Samuel, a signal revenge. It was then only that the battle-field, determined by the position of Maspha, Bethkar, Sen (and Aphek), was consecrated by the erection of a stone to which Samuel gave the name of *Eben ha-ezer*, "stone of succour." * It marked the point reached by the pursuit, and the Philistines never again crossed the borders of Israel.

It results, therefore, from these comparisons, which I can now only briefly indicate, waiving certain obscure points:—

(1) The place where the Israelites were beaten and where they lost the ark did not assume till a later date the name of *Eben ha-ezer*.

(2) It is to this same spot, this time called *Eben*, that the Philistines carried back the ark.

(3) The Israelites having beaten the Philistines in their turn at this same place called it *Eben ha-ezer*.

(4) This place must have been on the confines of the Philistines and the Israelites—may, perhaps, even have been one of the boundary-marks.

(5) All these data, including that of the *Onomasticon*, apply remarkably well to *Deir Ebân*.†

CH. CLERMONT-GANNEAU.

MSS. OF VIRGIL IN THE BODLEIAN.

Brasenose College, Oxford: October 24, 1876.

Some of your readers may be interested to know that six of the MSS. of Virgil now in the Bodleian Library have been identified with six which were collated by Nicholas Heinsius for his edition of Virgil (1664-71-76), but which disappeared soon after his death. Since that edition they have been quoted under the names which Heinsius gave them—viz. (with the symbols suggested for convenience of reference) "codex Mentelianus primus" (μ^1), "codex Menagianus prior" (ϵ^1), "codex Venetus" (v), "codex Rottendorphianus tertius" (ρ^3), "codex Montal-

many names of places as a kind of epithet; thus we have, between Ramleh and Jaffa, *Sarf el-mâl* (in allusion to *Sarf el-mâl*, money-changing) = *zeid el-mâl*, meaning "increase of silver."

* It results from a passage in Josephus that the stone must have borne in certain Hebrew MSS. the name of *Azaz* (strength, strong), with a final *zain* instead of a *resh*, for he translates this name by *λεχυρόν*, strong.

† The track of the wagon carrying the ark from Ekron to *Deir Ebân* must have been by the present Wady Sarar, which is certainly the Valley of Sorek, as I conclusively proved by the discovery of *Khirbet Souriq*, in 1874.

banius" (ν, reserving "o" for the Canonici MS. in the Bodleian collated by Butler, to which Ribbeck has attached that symbol), and "codex Sprothianus" (σ).

The first was one of three lent by J. J. Mentel, a physician at Paris, to Heinsius for the purpose of collation: they are all supposed to be in the National Library at Paris. The second was one of two similarly lent to Heinsius by Gilles Ménage: they are supposed to be in the possession of a Jesuit society in Paris. The third was bought by Heinsius himself at Venice. The fourth was one of three which belonged to Bernard Rottendorph, a physician at Münster. The fifth was given to Heinsius by O. Montalbani, a professor at Bologna. Of the original owner of the sixth I can find no account.

All of the above, except the fourth, came into the Bodleian Library among the Bernard MSS. in 1697. Dr. Bernard had on several occasions travelled in France and Holland, and in 1683 attended the sale of Heinsius's library.

Hevne (*Virgilius*, 4th ed., vol. iv., pp. 752-9) and Ribbeck (*Virgili Opera, Proleg.*, pp. 355-9) give a short estimate of their importance, so far as they are able to judge from the rough collations made by Heinsius.

F. MADAN.

A RECTIFICATION.

Hampstead: Oct. 24, 1876.

In his *Dreams of a Constitution-monger* on University and College reforms, just published, Mr. Laing, of Corpus College, Oxford, is pleased to attribute to me an opinion with which he says that he has "no sympathy" and, indeed, "no patience." It is this: that the "true Oxonians"—by which term, I suppose, are meant the recipients of college endowments who do the work required of them by the statutes—should become "an expatriated chosen people, choosing to expatriate itself" and "dispersed throughout the world." If this is a "Dream" of Mr. Laing's, of course I have nothing to say against it, for it represents very well that perversity and dislocation of idea which we all know to be characteristic of dreams. But if it is meant for a statement of fact, I beg to say that I never published or held any view at all like this, and that I have as little sympathy and as little patience with such a perversion of my opinions as he can have himself.

The utmost that I have ever said about the "expatriation" of persons who enjoy the endowments of learning and science is as follows. The old prescription of residence within the University annexed to the tenure of Fellowships must be taken, amid the altered conditions of study, in its spirit and not in its letter. It meant that the student should be where the original materials of his study are. At the time when our College statutes were framed, study was mainly of books and not of things; and therefore the holder of a Fellowship was rightly compelled to reside where there were first-rate libraries. Now, on the contrary, certain branches of study are of such a kind that they cannot be carried on in a library, nor in a provincial town, nor some of them in England, nor even in Europe. Our great biologists, for instance, have had to go to the other side of the world for much of their material. Would it be possible, again, to excavate Olympia except by going to Greece? or to collate the MSS. of Homer unless by going to Venice? or to reduce to writing the dialects of a living language unless by going to the areas where they are spoken? Mr. Laing's own study of history requires no less the exploration of archives—not all of them, surely, located in Oxford. To be resident, then, according to the spirit of the old statutes—this is all I have contended, and Mr. Laing may find it in the *Times* at the end of last March—is not to be in one particular place always, but to be wherever your phenomena, your materials of study, are.

Those who have gone away from the Univer-

sity to make their researches "should, at all events," pleads Mr. Laing, "wish to return and build up Zion." By all means—who ever doubted it?—let them not only wish to return, but let them return in the body, as Mr. Moseley, after his three years' voyage of discovery in the *Challenger*, has returned in the body, and is building up Zion. But we have not strength for all this original work yet. "When we have strength to spare let us send forth our missionaries." To spare from what? From the conduct of the Examination System? or from the preparation of Primers? or from the "inauguration" of the higher education at Clifton? Not from the last, it would seem; for Mr. Laing has "an inward and stubborn conviction that it is in men and not in money that assistance should be rendered by Oxford to England," though he thinks "that we should rather be paid for our advice" than, as at present, "pay that we may be permitted to advise."

Is all our strength to be thus used up in popularising the elements of knowledge? Then, indeed, we shall have but little to expend upon its increase.

If Mr. Laing can point out anything I have said more extravagant than this, I shall be glad to know where it is.

C. E. APPLETON.

APPOINTMENTS FOR NEXT WEEK.

WEDNESDAY, Nov. 1.—8 P.M. Microscopical: Papers by the Rev. W. H. Dallinger and Dr. Royston Pizott.
THURSDAY, Nov. 2.—8 P.M. Chemical: Papers by S. Lupton, M. M. P. Muir, W. R. Hodgkinson, W. R. Hodgkinson, and G. C. Marples, W. R. Hodgkinson and H. C. Sorby, and the late Dr. Anderson. Linnæan.

SCIENCE.

HEALTH AND DISEASE.

On Personal Care of Health. By E. A. Parkes, M.D., F.R.S. (Published by the Society for Promoting Christian Knowledge, 1876.)

Diseases of Modern Life. By B. W. Richardson, M.D., M.A., F.R.S. (London: Macmillan & Co., 1876.)

THE first of these two books is probably the best of its kind in any European language. The proof-sheets were revised by its gifted author only a few weeks before he died, regretted by all who had ever known him or worked with him. Tracing the life of man from puberty to old age, and only alluding in an incidental way to the bringing-up of children and the special hygiene of the female sex, he gives a short but pregnant account, in simple and attractive language, of the chief conditions tending to keep off sickness and to prolong life. Aided by a retentive and well-stored memory, a singular power of winnowing chaff from grain, and a most impartial temper, he draws a just picture of our hygienic knowledge as it is, and of our practice as it should be, without ever allowing himself to be led into exaggeration—that besetting sin of writers of popular handbooks on medical subjects.

Dr. Richardson's volume is chiefly, if not entirely, made up of essays which have been published from time to time in various periodicals. The vigorous and somewhat uncompromising style in which they are written drew public attention to them when they first appeared, and will doubtless recommend them to a still wider circle of readers now that they appear in a collected form. The name of the book is perhaps a little misleading. Many of the diseases

described are not in any sense peculiar to "modern" life, or even to an advanced stage of civilisation. Alcoholic excess, mental and bodily strain, the influence of the passions, sloth and idleness—to pick out a few of the more important headings—have furnished victims from time immemorial. The liability of the labouring population to special forms of disease varies but little, in all probability, from age to age; and what variation there is, is in the direction of improvement. Diseases belonging to the "industrial" group (saw-grinder's phthisis, painter's colic, &c.) will, of course, vary in frequency as their special causes happen to operate over a narrower or wider field; but to this group Dr. Richardson devotes only a couple of pages.

Although the ground covered by Dr. Richardson and Dr. Parkes is in many respects the same, they do not stand at exactly the same point of view. The former deals chiefly with the causes of disease, the latter with the conditions that are favourable to health. If we compare their views on such standard questions as the choice of food, the dietetic value of alcohol, and the use of tobacco, we find them agreeing in their main conclusions, though Dr. Parkes' statements are characterised by more of judicial reserve than those of Dr. Richardson.

The advocates of vegetarianism in this country are far from numerous, and their enthusiasm does not appear to be catching. The question of the superiority of a vegetable over an animal diet is, in truth, rather of economic than of hygienic importance. That the well-to-do Englishman eats too much butcher's meat, and that great muscular vigour is kept up by the inhabitants of Northern India and various African tribes on an almost exclusively vegetable diet, are statements which may be taken for granted. But they are not enough to determine us in our own choice. The curious relation that would appear to exist between vegetarianism and self-help is almost equally capable of serving as a guide for our action. We know that while vegetable food is indispensable, animal food is only one of the sources from which the nitrogen required for the building-up and renewal of our tissues may be derived. But what we want to know is, not whether animal food may be abstained from without detriment to health, but whether, other things being equal, a man who takes animal food in moderation is better fitted to survive amid the complex vitalising influences of our civilisation, able to do more work and better work with mind and body, than a man who relies almost entirely on a vegetable diet. Put in this way, the question cannot be answered from the data we possess at present. Dr. Richardson is evidently disposed to advocate a mixed diet for all classes alike; Dr. Parkes insists strongly on the unreasonable neglect of obvious resources in the way of vegetable food which is so characteristic of our labouring poor.

Believers in total abstinence will be glad to find both our authors arrayed on their side. They agree in excluding alcohol, in all its forms, from the dietary of healthy persons of either sex. They differ only in the degree of their opposition to its use.

Dr. Richardson regards alcohol as always and alike injurious, in whatever form and in whatever quantity it may be taken; Dr. Parkes is prudently content to allow that alcohol may be habitually taken in moderate quantities (the limit of moderation assigned being $1\frac{1}{2}$ ounces of absolute alcohol, or its equivalent, in twenty-four hours) without causing any appreciable damage to the system. But he denies that it is capable of furnishing material for tissue-repair, or of serving as a source of muscular, thermal, or nervous energy. In short, while the one author condemns alcohol as both useless and hurtful, the other condemns it as useless when it is not hurtful.

While the passion for alcohol burns more strongly in the savage than the civilised man, the fondness for tobacco seems to be equally shared by both. The tranquillising effects of smoking are chiefly concentrated upon the musculo-motor and the circulatory functions. It depresses, in fact, those qualities of the organism which are of least immediate importance to the student or the votary of any sedentary pursuit; and if by a vice we mean a habit which militates against the social usefulness of the individual, then smoking must be regarded as more of a vice in the savage than in the civilised man, in the hunter or warrior than in the poet or philosopher. The moderate use of tobacco is certainly less injurious than that of alcohol; unfortunately, excess in the former is less immediately productive of disagreeable or dangerous effects than excess in the latter. Hence the limits of moderation cannot be so easily assigned. Dr. Parkes allows that smoking may occasionally be of use, though never really necessary, to the healthy adult. Dr. Richardson condemns it utterly.

As regards the likelihood of the great mass of mankind ever yielding continued and willing obedience to even the simpler laws of health, Dr. Parkes is more sanguine than many writers who have considered the matter. The spread of instruction, by making the rudiments of physiological knowledge accessible to the poorest; the emulation of rival nations; the growing consciousness that a wise care for personal health rests on an altruistic rather than an egoistic basis—such are the principal forces on whose gradual operation he is disposed to rely. He asks:—

"Is this a dream of Utopia? By no means; it lies within the possibility of facts. It will take generations to do it, and there must be constant exertion. Each generation will, however, place its successors on a higher level than itself, and gradually the wonderful effects of transmission by inheritance of thoughts and modes of action will aid."

E. BUCHANAN BAXTER.

Introduction to the Study of the Chinese Characters. By J. Edkins, D.D. (London: Trübner & Co., 1876.)

In his former work, entitled *China's Place in Philology*, Dr. Edkins expressed his belief in the possibility of proving the identity of Chinese and European words, and his present volume is intended as a preliminary essay to this main object. But before the connexion between Chinese and the polysyllabic lan-

guages can possibly be proved, it is essentially necessary that Chinese should be compared with the European languages on an equal footing—that is to say, that it should be stripped of all modern forms, and should be presented to the philologist in the condition, or as nearly as possible in the condition, in which it may be supposed to have been when the people speaking it first hived off from the rest of the world. To do this is the object of the work before us.

Chinese naturally divides itself into two parts—namely, the written and the spoken languages. The Chinese characters, from their nature, are incapable of change, except such as may arise from the mistakes of scribes; and, being for the most part derived from hieroglyphics, they carry their history in their lines. As Dr. Edkins says, they are records of a distant past, and by carefully tracing out the successive forms which have been adopted to meet the wants of a settled and industrious people, it is possible to acquire a knowledge of the origin of Chinese writing, and the method pursued by the inventors of the characters. In a studiously practical way Dr. Edkins sets about this part of his investigation by beginning with the radical characters, as they are called, of the language. A very large proportion of these are hieroglyphics, and are explained by our author, who further illustrates the influence they exercise when in combination with other symbols they form compound characters. If, for a moment, we take the hieroglyphic for "a hand," we trace its meaning in many of the characters of which it forms part. For example, the symbol for "friend" is two hands; that for "to receive" is a hand held out on each side to receive something represented by certain strokes; and that for "to roll" is two hands rolling up a scroll. Being hieroglyphics, these radical characters are made up largely of objects in nature. "Heaven" was symbolised by three parallel curved lines. The sun was a circle with a stroke in the middle. The moon was a crescent. Slightly modified, it became evening. Stars were three small circles. Mountains were triangles standing side by side," and so on.

Having carefully analysed the Radicals, Dr. Edkins goes on to submit the phonetic characters to the same process. These phonetics are characters used in combination with other symbols to fix the sounds of the compound characters of which they form part, and Callery, who was the first to make a list of them, considered that there were in the language about 1,000; by subsequent writers their number has been variously estimated. Dr. Marshman gives them at 3,867, and other scholars, among whom is Dr. Edkins, have reckoned them to be from 1,100 to 1,200. The importance of arriving at the primitive sounds of these phonetics becomes at once obvious when it is remembered that they indicate the sounds which the compound characters of which they form part bore at the time they were invented, and especially when it is added that these compound phonetic characters form about one-half of the entire characters in the language. Each and all of these are carefully examined in the work before us, and in such a manner that it makes it impossible to doubt the cor-

rectness of the conclusions arrived at. The process adopted for discovering the primitive sounds of these and the other characters is by a scrutiny (1) of the rhymes of old poetry; (2) of certain characters in the classics and elsewhere which occur in senses different from those intended by the inventors of the characters, and which now, through change in sounds, do not suit them; (3) of Buddhist transcriptions of Sanskrit words; (4) of the Tonic Dictionaries; (5) of Japanese, Korean, Mongolian, and Cochinchinese transcriptions; and (6) of the dialects of modern China. From a study of these many important results are attained, the losses sustained by letter-changes and by decay, as well as all additions made through the acquisition of new elements, are made plain, and the conditions under which certain definite changes take place under similar circumstances can be laid down with a certainty which amounts almost to a law. One extremely valuable point which Dr. Edkins succeeds in establishing is the rule which governs the transfer of words from one of the eight tones into which the words of the language are divided to another. But we must refer such of our readers as desire to pursue this investigation to the work before us. It presents a comprehensive view of the origin and growth of the Chinese language, and, apart from the philological interest attaching to the subject, its pages furnish us with many an insight into the moral, physical, and intellectual conditions of the people in the progressive stages of their national life from the time when they first entered on the plains of China down to the present day.

ROBERT K. DOUGLAS.

SCIENCE NOTES.

BOTANY.

Flora of California.—The first volume of a work containing descriptions of the plants of California has appeared. It is edited by Dr. Asa Gray, and will supply a want long felt.

The Gramineae.—All botanists will learn with pleasure that General Munro has commenced a revision of the whole of this family. Probably no one living possesses so intimate a knowledge of grasses as General Munro, who has made them his special study for a great number of years; and, having been stationed successively in various distant parts of the world, he has enjoyed unusual facilities for obtaining living material. Further than this, he has examined and re-examined the vast dried collections at Kew and in other herbaria. A rough estimate of the number of distinct wild forms, to say nothing of what are termed "critical species," gives a total of nearly five thousand, belonging to between two and three hundred genera. It is to be hoped that General Munro will be able to complete the long and difficult task he has undertaken, and thus give the world the results of his almost life-long labours.

Germination of the Spores of various Moulds in different Media.—In the *Arbeiten der Pflanzen-physiologischen Versuchstation zu Proskau A.* Massink publishes the results of some investigations on the mould-diseases of hyacinth and narcissus bulbs. Finding that in cultivating diseased bulbs various fungi appeared one after the other, according as the bulb decayed more, and that the fungus which had the upper-hand gave way entirely to succeeding ones, he came to the conclusion that each kind of fungus depended upon a certain nutritious substance, in which it

flourished most luxuriantly, to the exclusion of all other kinds. To prove this, he sowed spores of several fungi in various fluids, the chemical composition of which was known. *Rosellinia*, *Pleospora*, and *Botrytis cana* germinated most rapidly in cane-sugar. In order to ascertain whether the spores germinating in the various media took up anything beside water, a blue aniline dye, soluble in water, was employed. In this the spores began to grow very well at first, but after the lapse of two or three days a visible delay was apparent. By adding cane-sugar, &c., afterwards an improvement in the growth was at once evident. From the circumstance that the mycelium had stored up the dye-substance freely from the beginning, it is clear that the spores of fungi absorb other substances beside water from the nutrient material of the plant upon which they are parasitic. Grape-sugar had a less stimulating effect on the germination of spores, though a feeble growth may be observed after two days' immersion. In a solution of 0.5 per cent. of sulphuric acid the three fungi named grew freely; but the effect was very different when the sulphuric acid was increased to 2.5 per cent., for none of them showed any signs of germination. In distilled water the spores began to vegetate, but soon ceased. The effects of vinous acid and vinous acid soda were also fatal, but in vinous acid potash the germination of *Botrytis* was observed on the margin of the object platform of the microscope. Malic acid exercised an accelerating influence on the spores of *Rosellinia*, less so on *Botrytis*, and no germination of *Pleospora* was observed in this solution. A decoction of horse-dung was so far effective that these fungi formed the beginnings of germinating tubes. Thus, says the author, we see what an intimate connexion there is between the fungus and its matrix.

The Lindley Library.—In the event, now most imminent, of the Royal Horticultural Society vacating the South Kensington establishment, the destination of this fine botanical library is somewhat problematical. It can only remain in its present quarters so long as the society remains there. Quite recently the trustees issued a circular soliciting donations of books, &c.; but now the question arises, where are the funds to come from wherewith to keep open and available for use the only free botanical library in London? This library was purchased with a portion of the surplus funds of the International Horticultural Exhibition, held at South Kensington in 1866; and it is so far public property. All botanists and horticulturists interested in keeping this library open should aid the trustees as far as lies in their power in effecting so desirable an object. We extract two or three of the paragraphs from the circular alluded to:—

"The trust-deed provides that the library shall, subject to such regulations as the trustees may make from time to time for the proper conservation of the books, be a free public library, open alike to Fellows and non-Fellows of the Royal Horticultural Society.

"Among the circumstances which tend to check the due development and utility of the library may be mentioned:—

"The little knowledge that the horticultural public has of the advantages within its reach.

"The want of a proper room, exclusively devoted to the purposes of the library.

"The impossibility, with the present limited funds at the disposal of the trustees or of the society, of providing the sufficiently constant attendance of a qualified librarian, or of issuing a printed catalogue of the books, &c.

"The scanty income of the library, amounting to only about 38*l.* per annum—a sum inadequate for the purchase of horticultural and botanical books and periodicals, and for the expenses connected with the proper maintenance of the same.

"The invested money of the trust consisted, in June, 1876, of 1,314*l.* 9*s.* 9*d.* Three per Cent. Consols, the interest on which constitutes the sole source of revenue of the trust. By a resolution of the trustees (May 1, 1872), one-third of the income of each year has hitherto been added to capital.

"The trustees have deemed it advisable to lay these facts before the horticultural public in the hope that by increasing the available funds, or by donations of books, memoirs, pamphlets, &c., the utility of the library as an independent means of promoting scientific and practical horticulture may be enhanced, and its benefits shared by a much larger number of persons than heretofore.

"Communications, books, &c., intended for the Lindley Library, should be addressed to Mr. W. B. HEMSLEY, Librarian and Secretary to the trustees, Lindley Library, Royal Horticultural Society, South Kensington."

On the Isolation of Different Forms of Bacteria.—In the *Botanische Zeitung* for September 29, Dr. C. J. Salomonsen describes a method of isolating *Bacteria* for researches in relation to the variability of these organisms. It is based upon the nature of the decay of blood. Minute quantities of calves', lambs', and other kinds of blood are drawn into glass hair-tubes, and the appearance of decay-spots, as Dr. Salomonsen terms them, carefully noted and measured from time to time, and their exact position indicated on a card-board to which the tubes are attached. So far as the experiments have been carried only one form of *Bacterium* has been found in each spot, and this seems to negative the theory that many of the different forms observed are variations of the same organism. However, the author of the article in question merely suggests this, and submits his mode of procedure to the criticism of other investigators in order to arrive at the best possible means of attaining the object in view. Meanwhile, he proposes to continue this attempt at the pure cultivation of different forms of *Bacteria*.

PHILOLOGY.

King Horn. Untersuchungen zur mittelen-gischen Sprach- und Literaturgeschichte, von Theodor Wissmann. (Strassburg: Trübner.) This short essay attempts to define accurately the position of the *King Horn* in English literature. The author first examines the relation of the three MSS., and comes to the conclusion that their deviations are due to the influence of oral tradition, each MS. representing the text of a different "gleeman." He then fully treats of the phonology of the language in the different MSS., and finally assigns the original poem to Essex. After some remarks on the metre, the author proceeds to investigate the relation of *King Horn* to the French romance of *Horn et Riemenhild*, and comes to the conclusion that the French poem is certainly an adaptation of the English one. The essay is well deserving of the study of all Middle-English scholars. English students, especially, may learn much from the author's thoroughly scientific treatment of the phonology of the poem.

THE last number of the *Rheinisches Museum* (vol. xxxi. part 3) contains several important articles. Perhaps the best are O. Ribbeck's paper on the meaning of *εἶπας*, and John's upon the candidature of Catiline for the consulship in the year 688 B.C. Heidenhain has a long essay on the different kinds of tragedy enumerated by Aristotle. Some interesting questions in literary chronology are started and discussed by J. Wackernagel ("Nicanor und Herodian"), and A. Riese on the Phoenix of Lactantius. Duncker discusses the *Passio Sanctorum iv. Coronatorum*. Götz, besides contributing some notes on the Latin Anthology to the miscellanies at the end of the volume, has a good article on Claudian's *Sixth Consulship of Honorius*. Textual criticism is represented by Barthold's remarks on the *Hippolytus* of Euripides, and Dziatzko on some

fragments of the Greek and Latin comedians. Rönisch discusses the Hebrew lemmas in the Amplonian glosses, besides contributing notes on the Latin Anthology.

FINE ART.

THE DUDLEY GALLERY.

THE tenth exhibition of cabinet pictures in oil at the Dudley Gallery will scarcely attract serious criticism. Many of the artists of distinction who have formerly contributed to these exhibitions seem, for some reason or other, to have withdrawn their support, and of those who still remain the examples are not always worthy. Mr. Watts may be taken as a case in point. It must, surely, have been out of good nature, and from no conviction of its worth, that so sincere a student was persuaded to exhibit a slight and imperfect study of the figure to which the catalogue here assigns the title of *Samson* (182). That the execution should be incomplete is nothing, for many of Mr. Watts's most beautiful designs exhibited in this gallery have shown signs of incompleteness; but the lack of vitality and the failure of intellectual force which characterise this particular figure are defects that Mr. Watts has not led us to look for. The right arm and the limbs are almost expressionless, and the lines of the face, apparently derived directly from the model, carry no sense either of power or nobility. The gallery contains only two other designs that attempt to grapple with the higher problems of art. One is *The Watchers* (298), by Mr. W. B. Richmond, a work that at least suffers from no neglect or carelessness in the matter of execution. Its failure is of a kind that lies deeper and is less curable, for, in spite of a graceful invention and much cultivated power of design, Mr. Richmond here seems to lack the directness and simplicity of vision needed most of all where the chosen theme is foreign to the ways of actual life. The second picture mentioned as coming within the category of ideal art is an interesting study of a single draped figure, by Miss Pickering. It would be rash from this one example, in which the style of Mr. Burne Jones is frankly taken for imitation, to venture a confident opinion upon Miss Pickering's powers; but that she has command of an unusual share of skill and taste there can be no question. Perhaps the only part of the picture that is distinctly unworthy both of her subject and her master is the head of the Saint, where the beauty comes too near to prettiness, and the fascination lacks something of refinement.

Among pictures of a different class, Mr. Marks's *Twins* (58) may be distinguished for the simplicity of its execution as well as for delicate power of facial expression. He has contrasted as portraits of twins the same face in different moods of expression, and the result has a genuine artistic interest. Mr. P. R. Morris contributes a graceful idyllic design, and Mr. Cotman an admirable domestic study called the *Little Bookworm*; and we may add in the class of figure-subjects M. Lhermitte's *Market-Place in Finisterre* (96); the *Washing on the River* (114), by Mr. Percy Macquoid, a work noticeable for careful arrangement of colour; *Work and Play*, by Mrs. Jopling (147), who also contributes a forcible portrait-study called *Looking Forward* (161); a small study of a bather (185), by M. Fantin; and a single figure of a peasant girl, by Mr. Herkomer. This artist also contributes a portrait of a lady reclining, with a Japanese fan in her hand, remarkable for the choice and control of brilliant colour. Landscape, though not powerfully represented, is fairly supported by the works of Mr. Somerset, Mr. Muir, Mr. Knight, Mdme. Cazin, Mr. Hemy, and Mrs. Tadema.

J. COMYNS CARR.

ITALIAN ARCHAEOLOGY.

Bagni di Lucca: October 12, 1876.

In the abundant journalism of the Italian kingdom the place now assigned to archaeological interests is duly conspicuous. When, some time before the end of the last year, the Minister of Finances, Signor Sella, was elected President of the Academy "dei Lincei" at Rome, he intimated to the then Minister of Public Instruction, Signor Bonghi, his desire to be systematically informed respecting all discoveries of ancient monuments and artistic objects, as well as all specimens of epigraphy, in whatever part of this kingdom; the former statesman expressing at the same time his wish that the "Lincei" academicians should take themes for their studies and discussions from that class of recovered antiquities. The Minister Bonghi charged the General Direction of *Scavi* throughout Italy to compile and publish a monthly report of all such precious finds; and thus was brought into existence the periodical edited by the Chev. Fiorelli, which began its career last January—*Notizie degli Scavi d'Antichità comunicate alla Reale Accademia dei Lincei*. For the benefit of the Committee of Archaeology, over which that distinguished editor presides, it has been provided that an inspector shall be established at every place in this kingdom where antique monuments exist at this day, and where works of excavation are in progress for antiquarian objects; also that all these *employés* shall keep their superior (Fiorelli) constantly informed of what is going on in the walk of archaeological undertakings, of the localities where and the exact dates when such works have been commenced, with the names of all the parties concerned in them.

Such an organ as the above-named *Notizie*, now published at Rome, was indeed greatly required; and the new periodical meets a desideratum not previously satisfied by the Italian press. The *Bullettino Archeologico*, founded at Naples by a learned editor, Signor Avellino, suspended its publication, for want of means, before the opening of the year 1861. The *Giornale degli Scavi di Pompeii* still appears at the former city, but at long intervals, and, as its title imports, with special regard to the claims (indeed of paramount interest) admissible for a single locality. The "Committee of Antiquities in Sicily," well constituted by the new Government, soon commenced its periodical Reports, but with publication not more frequent than once, or at most twice, in the year. The Chev. de Rossi's *Bullettino* of Christian Archaeology may satisfy all demands within the sphere, a restricted one (the cemeteries and general monuments of the primitive Church in Rome and its neighbourhood), to which it is confined; and the *Bullettino* of the German Archaeological Institute at Rome, aiming at a wider range, glancing at the whole aggregate of antiquarian research and discovery throughout Europe, cannot, of course, ably as it is conducted, together with its attendant and supplementary "Annali," give such space to Italian *Scavi* or their results, among the many considered in its pages, as the intrinsic interest of this national subject—the range of Italian research *alone*—must be allowed to deserve.

With respect to ancient epigraphy, the editor of the *Notizie* often requires from the several inspectors not merely exact copies, but tracings from the originals, in order that he may be enabled to determine as to dates and ethnological classification from the orthography and palaeographical peculiarities of such inscriptions. These efforts on the part of the Chev. Fiorelli are indeed laudable.

The last *fascicolo* of this periodical contemplates all that has been done and discovered throughout this kingdom in the course of last June—a rather too distant retrospect, as might be objected. Among antiques of the epigraphical class here mentioned is one in the Sabellian dialect, found at Bellante, in the province of Teramo,

and near the same place where another inscription in that idiom was dug up in 1867, the latter being edited and translated by Signor Guidobaldi in the *Gazzetta di Teramo*, May 20, 1875. This last issue of the *Notizie* informs us of works and discoveries over a wide range, in or near the cities and minor towns of Italy, at Rome, Bologna, Orvieto, Capua, Pompeii, Reggio (in Calabria), Asolo, and other places less known to fame.

Not to be forgotten, among the most valuable contributions from the periodical press here referred to, is the monthly *Bullettino del Municipio* of Rome, exclusively dedicated to the range of antiquarian undertakings and their results within that city and its environs; the most learned and active among writers for this paper are Signor Lanciani and the Chev. Visconti. Besides this, one should remember two others, though among the minor periodicals produced at the Italian capital, edited respectively by the gentlemen who write almost the whole of each *fascicolo* bearing their names, Gori and Armellini—the former dedicating his pages exclusively to archaeological, the latter to scientific, as well as antiquarian topics.

C. I. HEMANS.

NOTES AND NEWS.

MR. PRINSEP has been commissioned by the Governor-General of India to paint a large picture in commemoration of the assumption by her Majesty of the newly-created title of Empress. He will shortly proceed to India in order to be present at the formal issue of the Imperial proclamation at Delhi, which ceremony is to form the subject of the painter's composition. The picture is intended as a gift from the Governor-General to the Queen, and as a record of a very interesting event in her Majesty's reign. It is not a little remarkable, considering the importance of our Indian Empire, that English artists should have been so seldom attracted to the study of Indian life. Very few English artists of repute have attempted to render the magnificence either of Indian architecture or Indian ceremonial, and it may be that Mr. Prinsep's enterprise will prove the forerunner of further experiments in the pictorial illustration of our Indian Empire. There is certainly no sound reason why the painter's research of Oriental colour should stop at Egypt, and that English artists should be the first to extend the boundaries in this direction is both fitting and natural.

THE new bronze statuette purchased for the British Museum cannot be immediately exhibited to the public. Although complete in every respect save for the loss of one of the toes, the statue has been fractured in one or two places, and will require to be carefully set together. The figure, which represents an aged Faun, is two feet six inches in height, and it is, therefore, in respect of size a more important work in bronze than any figure now possessed by the Museum.

GENERAL CESNOLA, whose first collection of antiquities from Cyprus was transported to America several years ago, is now again in England, bringing with him the results of further research. The collection, which is particularly rich in examples of antique jewellery, has, we understand, been offered to the Trustees of the British Museum.

MR. HERKOMER is engaged upon a large picture for the Academy, the scene of which is again laid in the Bavarian Highlands.

DR. SCHLIEMANN has been officially invited by the Turkish Government to accompany the Emperor of Brazil to Ilium. He will resume his diggings at Hisarlik in March, having received ample powers from the Grand Vizier.

THE exhibition of the Ipswich Fine Art Club will open towards the end of next January, at the Lecture Hall, Ipswich. The drawings and sketches by members of the club will be sold for the benefit of the Local Blind Institution. Mr. E. Packard, jun., is the hon. sec.

THE *Euboia*, which is published at Chalkis, has recently given a detailed report of the remains which have been discovered during the present season in the district of Trypa. All the six statues that have as yet been recovered, and which are about three feet in height, represent young children in various attitudes. The heads are missing in all the statues, which are also much damaged in other respects, but, notwithstanding these mutilations, enough remains to show the graceful pose of the figures and the excellence of the workmanship. Numerous fragments of other figures, together with broken pediments and various more or less completely illegible inscriptions, have been found on the same spot.

THE unpretending catalogue of the Collection of Oriental Porcelain and Pottery exhibited by Mr. A. W. Franks at the Bethnal Green Museum is one of the most important among those published by the Committee of Council on Education. Mr. Franks's collection of Oriental ware is not limited to choice specimens, but has been selected with a view of illustrating the different varieties known. It is the first attempt that has been made to exhibit Oriental porcelain divided into classes, and to gather together in a condensed form the materials towards classification scattered through the works of previous authors. The late lamented M. Albert Jacquemart has contributed most towards a knowledge and an arrangement of Oriental ceramic productions, and though he and Mr. Franks differ on many points, yet the opinion of each must be received with respect, and it must be left to time and more extensive information to decide the disputed questions. Mr. Franks divides the Oriental products into twelve classes. In the first he places unpainted porcelain, comprising that creamy, ivory white paste, consisting mostly of cups with decorations of archaic character, formerly so prized in Europe and still held in value by the Chinese; and also the glazes of single colours, the much-appreciated sea-green *celadon*, the rare yellow, the red termed *sang de boeuf*, the *flambé* or streaked, and others. The crackle china, one of the most peculiar productions of the Chinese potter, forms the second class. The third consists of porcelain decorated with white slip. The fourth class consists of the painted porcelain, that painted in blue, the model of Delft pottery, and now so much in favour in England, and porcelain painted in colours, a numerous class, divided by M. Jacquemart into three families—the chryso-paeonian, green, and rose. Sixth is pottery or stoneware concealed by a thick glaze; of this material was formed the porcelain tower of Nankin, so ruthlessly destroyed by the rebels, and the group of brown wares or *boccaro* with ornaments in relief, imitated by Böttcher and the Elers. Japan porcelain forms the seventh, Japan pottery the eighth, and Siamese pottery the ninth class. In the tenth are grouped Oriental products with foreign designs made for Asiatic and Indian markets, and also for European, ordered by Holland, France, and England. The Oriental porcelain sent over in the white state, and decorated in Europe, in Holland, Saxony, and England, makes the eleventh division. The twelfth comprises porcelain combined with other substances, that incrustated with *cloisonné* enamels, the lacquer work, the delicate basket-work, of slips of bamboo, and the mother-of-pearls or *burgauté*. To his interesting catalogue Mr. Franks adds a most useful list of the marks found upon Oriental china, consisting of cyclical and dynastic dates, marks of establishments where made, devices and symbolic ornaments.

THE new Court Theatre in Dresden, of which the first stone was laid in 1871, is now fast approaching completion. It will be, the German papers assert, the finest edifice of the kind in all Germany, as well for its size as for the magnificence of its decorations. It is arranged to seat 2,000 spectators.

THE venerable sculptor, Ludwig von Hofer of Stuttgart, a pupil of Thorwaldsen's, has lately finished the model of a fine equestrian statue of the late King Wilhelm of Württemberg, which he intends to present to his native town, Ludwigsburg, in grateful remembrance of the favour shown him by that monarch. He has given directions that after his death the statue shall at his own cost be cast in bronze, and set up in some public place. It is said to be one of the best equestrian statues that Germany has produced for a long time. It is an admirable likeness of the old king, with whom Hofer was intimately acquainted, and the horse, a noble Arab, is full of life and movement, and has none of the heavy action that generally characterises sculptured representations of these animals. This effect of motion is chiefly gained by a deviation from the ordinary method of representing the right fore-hoof and the left hind-hoof as following one another. In the Hofer statue the right hind-hoof follows the fore-hoof on the same side, and thus gives an appearance of all three legs being in motion at one time. The effect is stated to be extremely life-like and graceful.

THERE has just been set up in the grand alley of the Tuileries, opposite the Pavillon de Marsan, a fine bronze group representing *Mercury carrying off Psyche*, the work of Jan de Vries, a Dutch sculptor of the middle of the sixteenth century. This group formerly stood in the Salle de Michelange in the Louvre, but has been removed to make room for the great gates of Stanga, which now occupy such an important position in that celebrated Salle. *L'Art* relates the various vicissitudes that this remarkable piece of northern sculpture has undergone. It was executed in 1590, by order of the Emperor Rudolph II., and was placed by him, together with a pendant at present in the Museum at Stockholm, in the court of Hradschin, at Prague. After the sack of that city by the Swedes in 1648, both groups were carried by the conquerors to Stockholm. The one still remains there, but the *Mercury and Psyche* was taken by Queen Christina, on her abdication, to France, where she bestowed it on the Marquis de Sablé, whose descendants sold it with the Castle of Meudon to Louvois. Louvois, in his turn, ceded it to Colbert, and his son, M. de Seignelay, finally presented it to Louis XIV. In 1790 it ornamented one of the *bosquets* of Marly. In 1794 it was placed in the Museum des Petits-Augustins, from whence, in 1802, it was transported into the gardens of St. Cloud. Here it remained until 1850, when it was placed in the Louvre, in the position from which it has now been dethroned and once more relegated to a site in the open air, where, however, it will probably excite more attention and interest than when placed among so many other works of greater fame in the Louvre.

THE STAGE.

THE ADAPTATION OF "CHUZZLEWIT."

THERE seems to have been a wholesome privilege in the early days of the English Theatre, by which audiences were wont to express not alone their disapproval of a piece but their wish for the immediate substitution of some other. Occasionally (narrates a writer quoted by Mr. Collier, and again by Mr. Cook) the actors were compelled to perform not at all the drama which the programme had announced, but some other such as "the major part of the company had a mind to; sometimes *Tamerclane*; sometimes *Jagurtha*; sometimes *The Jew of Malta*; and sometimes parts of all these; and, at last, none of the three taking, they were forced to undress and put off their tragic habits, and conclude the day with *The Merry Milkmaids*." And though, indeed, it may be as true now as it was in "1654" that "Men come not to study at a playhouse, but love such expressions and passages which with ease insinuate themselves into their capacities," yet that should

not, we fancy, have prevented the audience at the Folly Theatre on Monday night from dealing with the adaptation of *Chuzzlewit* after the approved old-fashioned way.

The playgoer who has gone pretty steadily to the London theatres during the last four or five years will have seen adaptations of most of the novels of our master-novelist—*Copperfield* at the Globe, *Dombey* at the same place, *Bleak House* more recently, *Nicholas Nickleby* and *No Thoroughfare* at the Adelphi, *The Old Curiosity Shop* at the Olympic—and some have been much poorer than others; but he will have seen nothing quite so unsatisfactory and inadequate as the adaptation of *Martin Chuzzlewit* now played at the Folly. Guarding himself, perhaps, against criticism which could hardly be otherwise than adverse, the adapter has explained that his work is "a dramatic rendering of so much of Dickens's novel as relates to Mr. Pecksniff, his daughters, and his daughters' lovers;" and he has called the work *Pecksniff*, and so fairly enough described what it was that he meant to do. But either the fortunes of Pecksniff and his external oddities are not enough to give interest to the three acts of which his piece is composed, or he has failed in two things—first, in consideration for the playgoer who, even in the case of an author as universally read as Dickens, does not chance to come to the playhouse with the words of the original novelist at his fingers' ends; and second, in appreciation of the fact that it is *not* Pecksniff's external eccentricities, but Pecksniff's character, that makes the interest of the personage in the novel, and must still make it in the play. The man who goes to the Folly Theatre, if he does not know Pecksniff before, will not there make his acquaintance; and if he does know Pecksniff before, he will regret that a character out of which a skilful adapter and a subtle comedian might have made much should have been made, by a somewhat clumsy adapter, the vehicle for the exhibition of the grimaces and gestures of a comic actor. What Pecksniff really was—what he did even, besides get drunk, embrace his landlady, and display an inclination to hide the teapot under the side of his waistcoat—we are, even with the efforts of the adapter and Mr. Lionel Brough, still at a loss to imagine. The play is an opportunity for the actor to give an occasion for the audience to pardon or applaud, according to their liking, one more display of the brutalities of drunkenness: that, and little besides. In the third act it is indeed sought to convey that Pecksniff's obtrusive piety was far from genuine, and his love-making not quite unmercenary. In the third act there are three or four witty things, and Mr. Brough delivers them with the seeming unconsciousness which is effective. But when the elder Chuzzlewit—both mentally and physically feeble at the Folly—discovers at the end of the piece that Mr. Pecksniff is a dissembler, we are willing to credit him with more shrewdness than we should ourselves have displayed.

Mr. Brough has stage peculiarities which a part of the public likes, and intelligence which it is possibly a pity that he does not display in better work. We cannot, save in a few exceptional moments, relish his performance here. The whole drunken scene is very offensive, and its ugliness, though cleverly assumed, appears to us exaggerated. But there is a part of our audiences with which long drunken scenes—heavy drunken scenes—have always been popular. The love of them is a characteristic of the lowest class of English playgoers, and the lowest class of English playgoers are not those to whom the least deference is paid. As to the performance of the other actors, it is necessarily but the shadow of a shade.

FREDERICK WEDMORE.

FRENCH plays have begun in a modest way at the Royalty Theatre, by the performance of *Le Panache*. The theatre is under the management of Messrs. W. S. Emden and Valnay, but the com-

pany thus far engaged does not appear to be a strong one. The enterprise, as at present conducted, may have the support of French residents in London, or of untravelling Londoners, but we doubt if this is quite the scale on which to present the French drama, if it is thought to seriously compete with the attractions of the leading London theatres, or with those of Paris, with which so many London playgoers are now familiar. But no attempt to give us, in a dull winter season, the entertainment of the French theatre should be discouraged, and we may wish all success to the effort of Messrs. Emden and Valnay.

MR. HOLLINGSHEAD has taken the Opéra Comique Theatre for a season, beginning next Monday. He is thus repeating the experiment which he made a year or so ago, when under his auspices Mr. and Mrs. Kendal appeared at this theatre in the legitimate drama. This time, however, another kind of entertainment is to be produced. There will be a farcical comedy called *Bounce*, by Mr. Alfred Maltby, and Mr. Collette's "popular but unpronounceable farce."

IF the "comedy" produced at the Folly Theatre under the new management is not the most admirable of entertainments, the house itself, since it was known but a few weeks ago as the Charing Cross, has been greatly improved. Mr. Thomas Verity, who has decorated it, is a man of artistic taste: he has brought art into a monster eating-house, and so the skilful decoration of a theatre has not been beyond his capacity. When one has admitted that the problem how to get as many seats as possible into a very limited space was thrust upon him, and that he had also to remember that the class of entertainment meant to be presented at the Folly was luxurious rather than severe, there is little fault to be found with the decorations which he has introduced into the newly-named theatre.

Clancarty, one of Mr. Tom Taylor's most effective dramas, is to be revived for a short time at the Olympic Theatre, and *No Thoroughfare* is in preparation at the same theatre. Miss Bella Pateman, an American actress, who suffers under a name most inconveniently like Miss Isabel Bateman's, will appear in *Clancarty*.

THE Court Theatre, now closed, will open very shortly, it is said, with a new piece by Mr. Coghlan.

MISS ADA CAVENDISH is in Manchester, playing her favourite part in the *New Magdalen*, with her accustomed success.

WE have received the early numbers of M. Sarcy's *Comédiens et Comédiennes*—a serial work issuing from the famous presses of M. Jouaust—and shall take our first opportunity of noticing them fully.

THE new piece, *Turgotin*, at the Palais Royal, which turns upon the unwillingness of two friends to fight—a quarrel having, so to say, been arranged for them by their seconds, who insist on its continuance—may possibly have been suggested by some passages in the *Rivals*, in which it will be remembered that Sir Lucius O'Trigger was still impressed with the glories of battle when the valiant Bob Acres, who, unlike Sir Lucius, was not to look on from behind, felt the courage "oozing out by the palms of his hands." At any rate there is something in the new little one-act piece to recall the great comedy. *Turgotin* is very well acted by Brasseur, who appears in several disguises, and by Lassouche, who is rich in grimace, and by Numa, who is becomingly simple.

THE French have just lost an old author, whose work for their theatre was done very many years since. M. Duvert, who has died at the age of eighty-two, was the author, among other things, of *L'Homme Blasé*, which is well known to the English public by Mr. Charles Mathews' performance in *Used Up*. Rather lately, this and two

other pieces by M. Duvert—*Renaudin de Caen* and *Richet d'Amour*—have been revived at theatrical *matinées*, and listened to with pleasure. Meilhac, who has a right to an opinion, said recently, "Quand je m'ennuie, quand je suis dans mes humeurs sombres, j'ouvre au hasard un vaudeville de Duvert, et je suis sûr de m'amuser une heure." But the author's pieces, though played occasionally, can hardly be played very often, and it is now proposed by one or two of his admirers and friends that a collected edition shall be published, so that at all events the good things shall not be lost. "Nearly all," writes a critic now occupied with this business, "are worth the trouble of reading, for there is not one which does not, still to-day, afford a good moment of gaiety." And he adds, "Elles n'ont pas vieilli: c'est de bon et charmant esprit français."

The Chaine, by Scribe, has been revived at the Théâtre Français, with M^{me}. Favart in the fine part of Louise, which M^{me}. Arnould used to play so splendidly. M^{lle}. Reichemberg is the *ingénue*, and she is better than usual, because it is only the typical *ingénue* that she is here expected to be.

Mademoiselle Didier—a four-act piece by M. Charles de Courcy—is the last new piece at the Théâtre du Gymnase.

OUR New York correspondent writes:—"American plays seem to be in the ascendant just now in our theatres. At the Union Square a play by Mr. Bret Harte, called *Two Men of Sandy Bar*, is having a fairly good run. This is Mr. Harte's first attempt at dramatic literature, and as such should not be criticised too severely. The plot is taken from two of his stories, *The Idyl of Red Gulch* and *Mr. Thompson's Prodigal*. The play was written for Mr. Stuart Robson, a popular local comedian, who assumes the rôle of Colonel Starbottle. As far as Mr. Robson's part is concerned, the acting is spirited, but the other parts drag for want of good playing. The play is American, and the scene is laid in Lower California, therefore the Spanish dress is worn by most of the persons on the stage. The part of Colonel Starbottle, while it is very amusing, really might be left out of the play without interfering at all with the action. There are a number of Mr. Harte's well-known characters introduced—John Oakhurst, Sandy Morton, the Duchess, and Starbottle himself are all there. Mr. Robson's interpretation of the character of Starbottle is very different from the idea one gets in reading of him in Mr. Harte's stories. One imagines a man wrapped up in his own dignity: Mr. Robson makes him a trifle. The genuine Starbottle would be too heavy an impersonation for Mr. Robson, who is an essentially light comedian. There is a great deal of Mr. Harte's peculiar power in *Two Men of Sandy Bar*, but the strength is not sustained. At Wallack's Theatre, Mr. and Mrs. W. J. Florence have just finished a long and successful engagement with *The Mighty Dollar*, an American comedy suggested by *The Gilded Age*, although it is not an imitation of that play. Mr. Raymond, it is said, will introduce his inimitable character of Colonel Sellers, in the *Gilded Age*, to a London audience at the Haymarket Theatre some time during next summer. Mr. Raymond is an American comedian who is only equalled by Mr. Jefferson. *The Mighty Dollar* has been succeeded at Wallack's by a new comedy by Mr. Boucicault, entitled *Forbidden Fruit*, which is said to be *The Great Divorce Case* in a new dress. The Park Theatre was opened some days since with an original American play, called *Clouds*. The Fifth Avenue Theatre was opened last week with a new play from the pen of its manager, Mr. Augustin Daly, called *Life*, in which Mr. Coghlan, of London, has the leading part, which was written for him. Our theatres are doing remarkably well this season, owing to the number of people from the north, east, south, and west on their way to the Centennial, who take in New York as part of the great show."

MUSIC.

CRYSTAL PALACE.

GADE's cantata, *The Erl-King's Daughter*, though performed for the first time last Saturday at one of the winter concerts, had been heard at Sydenham once before, having been produced on July 17, 1875. The audiences of the summer and winter concerts are, however, so different that the work may almost be regarded as a novelty; such, at least, it certainly was to many who were present. Among the compositions of the Danish master it has already taken a high place on the Continent; and it only needs to become better known to occupy a similar position in this country. It is not only one of Gade's most highly finished, but, as a whole, one of his most original, works. Though the influence of Mendelssohn is in parts discernible, it is less clearly to be felt than in some other of its author's compositions; there is much freshness in the ideas, and the orchestration is throughout exquisitely finished, and often highly ingenious. The Prologue (for chorus), "At eve Sir Oluf reined up his steed," is a most attractive number, very delicately accompanied; and the whole of the first part of the work is full of pleasing melody, the baritone song, "When through the meadows," being especially noteworthy. The second part, which contains the scene between Sir Oluf and the Erl-King's Daughter, is highly dramatic; the Knight's opening song, "Night, thou art silent," being remarkable for the peculiar and veiled colouring of the instrumentation. It seems a favourite device with Herr Gade to use the strings *con sordini* for depicting the supernatural; he does the same thing in the scene with Armida in *The Crusaders*. No doubt a special tone-colour is obtainable by this means; but it is one that requires to be sparingly used, as it soon palls upon the ear; and when, as in the present work, we find muted violins through the whole of the second part—for nearly sixty pages of the score—a monotony inevitably results, and we cannot help feeling that, with whatever dramatic appropriateness, the composer has from a musical point of view made an error of judgment. With this reservation, the whole of the second part, which contains some very beautiful and characteristic music, deserves high praise. The third part is not as a whole equal to the rest of the work.

The performance on Saturday was an exceedingly good one. The choral part of the work was sung by the Crystal Palace Choir in a manner that showed a decided improvement on some of their performances last season. The solo parts were given by M^{me}. Lemmens-Sherrington, Miss Bolingbroke, and Mr. Maybrick. The promising young bass singer was heard to disadvantage under circumstances which exempt him from criticism. He had been singing at the Bristol Festival all the week, and had travelled up to town on the Saturday morning to attend the concert. It was not, therefore, surprising that his voice showed signs of fatigue, nor would it be fair to judge him from his singing on this occasion. Another and more favourable opportunity will doubtless soon be afforded. Both ladies were very successful; and the accompaniments were given to perfection by Mr. Manns's band.

Particular interest attached to one of the novelties of the afternoon—an Adagio for strings from an early and unpublished symphony by Haydn. The movement, which was composed in the year 1763, is given complete in the first part of Pohl's *Life of Haydn* (pp. 405-412). It is in two parts, each of which is repeated, and is very curious from the way in which the instruments are treated. In the greater part of the movement the violas double the bass in the octave, being thus occasionally found above the first violins. As the second violins also are frequently in unison with the first, some passages are only in two-part harmony; yet, from the manner in which this is disposed,

the effect is much fuller and richer than might be imagined. Though so early a work, the Adagio has much in its style which is very characteristic of the composer, and which reminds one of his earlier quartetts and pianoforte sonatas.

Another novelty produced on Saturday was a "Marche Héroïque" by Camille Saint-Saëns, a piece which derives more of its interest from the cleverness of its treatment and the brightness of its instrumentation than from the intrinsic beauty of its ideas. It is certainly a work of talent rather than of genius. The symphony of the afternoon was Mendelssohn's in D, the so-called "Reformation Symphony." This is one of the second series of posthumous works of the composer. Many of our readers will be aware that a considerable number of pieces was published shortly after Mendelssohn's death, which were left by him presumably ready, or nearly so, for the press. Among these are some of his finest and most finished works; it will suffice to name as examples the "Lauda Sion," the music to Racine's *Athalie*, the symphony in A major, and the overture to *Ruy Blas*. But within the last few years a second series of posthumous works has been issued, among the chief of which are the "Trumpet Overture" in C, the eighth book of "Lieder ohne Worte," the "Reformation Symphony," the "Cornelius" march, and the sextett for piano and stringed instruments. These mostly come under quite a different category from the first series, being in some cases youthful works of the composer, and in others works which, during his lifetime, he withheld as unworthy of publication. His severe self-criticism has been fully justified by the result; for it is difficult to name a single work of this second series which has added to his fame. The "Reformation" symphony, for example, will not compare in value with either the "Scotch" or "Italian" symphonies; nor does closer acquaintance, derived from repeated hearings and the careful study of the score, increase our affection for it. It is, like everything its author produced, a scholarly work; but the spark of genius which illumines Mendelssohn's best productions does not shine here. It is a thoroughly respectable composition, which might have made the reputation of a smaller man; but it is not worthy of the composer of *St. Paul* and the *Hymn of Praise*.

The remainder of the concert was made up by the overture to *Fidelio*, admirably played, and songs by M^{me}. Sherrington and Miss Bolingbroke. This afternoon Raff's "Lenore" symphony is to be given, and M. Wieniawski is announced to play Beethoven's violin concerto.

EBENEZER PROUT.

WE must defer to next week the notice of the production at the Lyceum by Mr. Carl Rosa of Nicolò's *Jocunde*, which took place on Wednesday evening.

THE London Church Choir Association held its fourth annual festival in St. Paul's Cathedral on Thursday evening. The whole of the music, with the exception of the responses, and Handel's "Hallelujah" chorus, was specially composed for the occasion, and included two processional hymns by Mr. W. S. Hoyte, three double chants by Mr. E. H. Birch, a Magnificat and Nunc Dimittis in F by Mr. Ebenezer Prout, an anthem by Mr. Henry Smart, a hymn-tune by Dr. J. F. Bridge, and two recessional hymns by Mr. John Blockley, Junior. The choir, which numbered about twelve hundred voices, was under the direction of Mr. J. R. Murray, and Mr. W. S. Hoyte presided at the organ.

THE prospectus of the Monday Popular Concerts (the nineteenth season) has just been issued. The coming series will commence on Monday week, November 6, and terminate on March 26, 1877; Saturday afternoon concerts will also, as of late years, be given between November 11 and March 24. The list of performers already an-

nounced includes the names of Miss Agnes Zimmermann, Mme. Norman-Néruda, Herr Straus, Mr. Charles Hallé, Signor Piatti, Herr Louis Ries, Messrs. Zerbini, Lazarus, J. Winterbottom, Wendland, and Reynolds. Mr. Arthur Chappell also announces Mme. Schumann, Mdle. Marie Krebs, Herr Barth, Mr. Franklin Taylor, and Herr Joachim, to appear after Christmas. The accompanists, as usual, will be Sir Julius Benedict and Mr. Zerbini. We regret to miss from this list the names of Herr Rubinstein and Dr. Hans von Bülow. It was at one time expected that the former, at least, would have repeated his visit to England during the coming season. If so, we presume he comes too late for these concerts. We are more surprised not to find the name of Mme. Goddard among the performers announced. She has been associated with the Monday Popular Concerts from their very commencement; and it might have been not unreasonably expected that so old a favourite would have been re-engaged. For the first concert the instrumental works are to be Schubert's Octett in F, Mendelssohn's Prelude and Fugue in E minor for piano, Beethoven's Sonata in G minor for piano and violoncello, and a quartett by Haydn. Miss Agnes Zimmermann will be the pianist, and Herr Straus the leader.

MR. WALTER BACHE will give a pianoforte recital on Monday afternoon at St. James's Hall, with a programme of great interest. Among the special novelties to be brought forward will be three two-part songs by Peter Cornelius, and Liszt's transcription for two pianos of his "Poème Symphonique" *Mazeppa*, the latter to be played by Mrs. Beesley and the concert-giver.

MR. E. DANNREUTHER is about to give a very interesting series of performances of chamber-music at 12 Orme Square, during the months of November and December. Among the works to be brought forward are the following:—Brahms: quintett, Op. 34, for piano and strings, sonata in E minor, Op. 38, for piano and violoncello, and trio (Op. 40), for piano, violin and horn; Chopin: sonata in G minor for piano and violoncello; Grieg: sonata, Op. 13, for piano and violin; Liszt: Concert Pathétique, for two pianos; Raff: trio in C minor, Op. 102, Schumann; romances for oboe and piano; and Weber: concerto for bassoon, and trio for piano, flute, and violoncello. We have merely selected from a larger list those pieces which are least often heard; the programme includes also better-known works by Beethoven, Schumann, &c. Mr. Dannreuther will be assisted in his performances by professors of the highest eminence on their respective instruments.

THE complete list of candidates to fill the chair at the Academy rendered vacant by the death of Félicien David is given by the *Revue et Gazette Musicale* as follows—Messrs. Giulio Alary, Adolphe Blanc, Adrien Boieldieu, Ernest Boulanger, Jules Duprato, Antoine Elwart, Edmond Membré, Ernest Reyer, Théophile Semet, Adolphe Vogel. From this list the musical section of the Academy chooses not less than three, and not more than five. To this number the Academy usually adds two; and from these candidates the final selection is made.

At Hellmesberger's quartett concerts in Vienna during the coming winter two new string quartetts, one by Verdi and one by Brahms, are to be produced. A stronger contrast than that likely to be found between the two works can hardly be imagined.

At the Théâtre de la Monnaie in Brussels, a new ventilating apparatus has been, it is said, successfully tried, which, whatever the external heat may be, will maintain in the house a uniform temperature of 18°—whether Centigrade or Réaumur is not stated. If the former it will be about 64° Fahr., if the latter about 72°.

SCHUMANN's *Genoveva* is to be shortly produced at the Berlin Opera, with Frau Mallinger in the principal part.

MADAME ANNETTE ESSIOFF is to proceed to America at the end of this month, for a tour of about six months' duration.

IGNAZ BRÜLL, the composer, whose first opera, *Das Goldene Kreuz*, has been so successful on the Continent, has just completed a second, entitled *Der Landfriede*. The text is by Mosenthal, and it is founded on a well-known play by Bauernfeld.

It is stated that Offenbach's next opera will be founded on Jules Verne's tale, *Dr. Ox's Experiment*. The principal part is to be played by Madame Judic.

LITERATURE.

La Russie et la Turquie, depuis le commencement de leurs relations politiques jusqu'à nos jours. Par Dmitri de Boukharow. (Amsterdam: Jan Schuitemaker & Co., 1877.)

M. DE BOUKHAROW justly remarks in his preface that students of the political relations of Russia and Turkey find a difficulty in choosing the books which ought to direct their studies. Non-Russian works on those relations, he states, are generally hostile to Russia, while those which are due to a Russian pen are usually inimical to the Ottoman Government and the policy of foreign Cabinets. Therefore, the student finds himself bewildered, and unable to trace the historic progress of two Powers whose contiguity was constantly passing into collision, and whose successive shocks were always keeping Europe in alarm. With the view, then, of assisting all such enquirers after truth, the present work has been drawn up, claiming to be based upon historical facts, which in their turn rely upon authentic documents.

The Introduction deals with the establishment of the Turks in Europe, and their relations with Russia up to the end of the seventeenth century. For more than a century and a-half after the fall of Constantinople, says our author, the Russians were too much occupied by internal troubles, or by wars against Swedes and Poles, to behave towards Turkey otherwise than prudently, while the Turks themselves had no leisure for longingly looking northwards towards Russia. In 1621 the Sultan was about to ally himself with Russia against Poland, when a reconciliation took place which prevented the alliance from proving effective. Then came the troubles caused by the forays of the Don Cossacks along the shores of the Black Sea on the one hand, and the attacks on the South of Russia by the Crimean Tartars on the other. The Cossacks seized upon Azof, and offered it to the Tsar Alexis Mikhailovitch. But the reply of the "Boyar Council," to whom the proposal was submitted, shows that Russia was not yet strong enough to maintain a war against Turkey. The Cossacks were told to give back the stronghold of Azof; which they did, after dismantling its fortifications. In 1674 the Sultan accepted the overtures made to him by the Little-Russian Cossack malcontents, and pushed his troops forward to the right bank of the Dnieper, but without gaining the coveted land of Little Russia, or even maintaining the reputation of the Turkish

troops for being invincible. Under Peter the Great the star of Russia waxed larger and brighter, while that of Turkey waned. The Treaty of Carlowitz, says M. de Boukharow, "by depriving Turkey of its conquests in Europe, completely altered the relations of the Christian Powers with the Porte, the decadence of which became so rapid, that the interests of the European Cabinets commanded them to protect it against its assailants." In 1700 a treaty was signed by Russia and Turkey, a secret clause of which is "still supposed" to have accorded to the former "complete maritime and commercial freedom on the Black Sea." By its provisions Azof was definitely made over to Russia, and Peter the Great felt justified in dreaming of a Black Sea furrowed by the keels of Russian men-of-war. But in 1711 he nearly met with his Sedan near Fokchani, whence he retired with the remains of his army, "escorted by 12,000 Turks, who were to protect him against the Tartars." M. de Boukharow says nothing about the jewels by which Catherine I. is supposed to have saved the Tsar and his army, but he gives the articles of the Treaty of the Pruth, of July 10, 1711, which he justly styles disastrous for Russia. The next treaty which he gives in detail is that of Constantinople, November 5, 1720, by which peace seemed to be assured. The Russian advances into Persia all but broke up that peace, but their results were, to a great extent, confirmed to Russia by the partition contract of June 12, 1724. Peter's death put a stop for a time to Russia's plans against Turkey, but some years later the Empress Anne attempted to fulfil them. The result of her attempt is best illustrated by the Treaty of Belgrade, September 18, 1739, which M. de Boukharow styles "the triumph of Turkey, but an ephemeral triumph: the time of its decadence was at hand." With it ends his brief and clear introduction.

The "first chapter" of his work is devoted to the first war between Catherine II. and the Porte. "Desirous of consecrating herself to the internal reforms of her empire, the Empress was profoundly saddened by the failure of her peaceful negotiations." But her grief was dispelled by the treaty, "signed in the Russian Camp of Koutchouk Kainardji, within General Rumiantsof's tent, the 10[22] [sic] * of July, 1774." This important treaty M. de Boukharow has rendered more easily intelligible by classing its articles according to the principal stipulations they contain. He justly styles it "one of the finest pages of Russian history," and designates as "enormous" the advantages which it bestowed upon Russia. "In fact," he says, "to be master of Kertch, Yenikale, and Kinburn, and to have a fleet on the Black Sea, was more than Peter the Great had hoped for." From that time, he adds, all Europe looked unfavourably on the extension of Russia in the East; from it dates the jealousy of Russia's Eastern policy which has so often, since then, brought trouble upon Europe. To Russia's policy towards the Porte "projects were attributed

* There was in reality eleven, not twelve, days' difference between the Old and New Styles at that time. But M. de Boukharow inserts twelve in his calculations.

which Russia had perhaps never seriously conceived." With respect to this subject M. de Boukharow cites one or two documents well worthy of being studied, including the Report sent to his Government by the Austrian Ambassador at Constantinople.

The second chapter deals with "The Acquisition of the Crimea." After sketching its conquest by the Mongols, and the gradual changes which made its Khans, "under the title of vassals, nothing more in reality than faithful subjects of Turkey," he rapidly passes on to the time when, after the Treaty of Kainardji, "she [Catherine] formed the design of driving the Turks out of Europe, and carrying out the famous project which consisted in re-establishing Ancient Greece on the ruins of the Empire of the East." How she gained her end, so far as the Crimea was concerned, our author clearly explains, quoting by way of illustration the convention signed at Constantinople, December 28, 1783, skimming over the measures taken to civilise the Tartars with the remark that they were "measures which reduced them to a state of misery so opposed to the prosperity of the Crimea, &c.," and speaking of the famous inscription (which he gives as *Route de Constantinople*) on one of the gates of the "gigantic construction" of Sevastopol as no vain *forfanterie*, "for in twenty-four hours a fleet could transport the Russian army into the Bosphorus, and could seize Constantinople with less difficulty than had been offered by the seizure of the Crimea."

Chapter III. deals with the second war with Turkey. The causes which produced it—including the fact that "England, finding out somewhat late in the day the influence which the Russian flag was likely to acquire on the Black Sea, encouraged the Sultan in his projects of revindication"—are clearly described, as well as its results, the "successes, brilliant but very costly to Russia," which at last, after the fall of Otchakoff in 1788, of Bender and Akermann in 1789, and of Ismail and Brahamlof in 1790, made England "desirous of opposing herself to this triumphal march," and, in fact, all but reduced Russia to the necessity of holding out against the united forces of Europe: a necessity from which she was fortunately relieved by the progress of the French Revolution. How the war ended may be read in the articles of the Treaty of Jassy, December 29, 1791, of which M. de Boukharow quotes at length the first seven. All that had taken place, he ends by saying, served to establish the preponderance of Russia over a Power once so redoubtable that Choiseul had thought he could use it to crush Russia itself.

Chapter IV. deals with the peaceful period due to the Treaty of Jassy, followed by that in which "the feeling of the Slav peoples for Russia became more and more pronounced," and war was recommenced by the Russian occupation of the Danubian Principalities in 1806. The chapter ends with the Treaty of Bucharest, May 28, 1812, by which Russia obtained "about a third of Moldavia, the fortresses of Khotin and Bender, and all Bessarabia with Ismail and

Kilia." Chapter V. carries on the reign of Alexander I. and commences that of Nicholas. The Greek Insurrection broke out, and the Turks, by the means they adopted to crush it, did all they could to set Europe against them. "The Russian people cried aloud for vengeance, and the army burned with a desire to measure itself once more against the Turks." At the present moment the chapter which M. de Boukharow devotes to this subject has a special interest. But there is little space left for further details. It must suffice to say that our author gives a clear statement of what occurred, and confirms it by copious quotations from the Treaties of Akermann of October 7, 1826, of London of July 6, 1827, and of Adrianople of September 14, 1829.

Chapter VI. deals with "The Eastern Question," one which our author says may be briefly designated as that of "the growing power of Russia on the one hand, and the decline of the Ottoman Empire on the other," and which rests, he adds, on

"the opposition of the Catholic and Protestant, or Roman-Germanic world, to the Orthodox, or Slav world, one provoked by the fears of the Western Powers of Europe that they may see a powerful Greco-Slav nation rise, free and independent, on the ruins of the Ottoman Empire."

The idea of Panslavism, he says, became the nightmare of those Powers, who did all they could to stifle it. "Becoming the faithful guardians of the 'Sick Man' of the future, they were naturally disquieted by each fresh success of Russia on the Bosphorus," especially after the Turkish fleet was crushed at Navarino. After giving an outline of the Syrian and Egyptian complications, M. de Boukharow proceeds to quote and to comment upon the Treaty of Unkiar Skelessi of July 8, 1833, and the Conventions of London, July 16, 1840, and July 15, 1841, and of Balta Liman of April 19, 1849. The chapter ends with a reference to the ever-growing distrust of Russia's policy which disquieted the Western Powers, and gave a warning of the time when Russia would have to deal, with respect to the Bosphorus, not only with the Porte, but also with the combined forces of England, France and Austria.

Chapter VII. deals with the Crimean War and ends with the Treaty of Paris of March 30, 1856, which is given at length, with its annexes. "That treaty was received in Russia," says M. de Boukharow, "as at once a sacrifice and a boon. The campaign of 1856 had opened the eyes of the nation to the internal wounds of the empire." To internal reforms did Alexander II. devote himself, and the nation followed him with enthusiasm in the new road "which led it, fourteen years later, to the peaceful recovery of the position which was assigned to it on the Black Sea." The chapter ends with these words:—"La Russie ne boude pas," said the Chancellor of the Empire [Prince Gortchakoff]; 'la Russie se recueille.' That was profoundly true. Russia *se recueillait!*"

Chapter VIII. deals with the "Revision of the Treaty of 1856." Commencing with a rapid sketch of the extraordinary growth of Russia during the last eighty years, M. de Boukharow says that the year 1815 was "l'apothéose de la grandeur de la

Russie," when all eyes were turned to it as to the deliverer of Europe. The Treaty of Paris appeared to have tarnished its glory. But fourteen years later all was changed. "The Russia of 1856, without resources, without railways, without an articulate public opinion, holding back on the way it had to take, that Russia which Europe feared so much, no longer existed in 1870." Therefore, says M. de Boukharow, Europe could no longer be interested in pursuing the end held in view by the Treaty of Paris, so far as Russia and the Black Sea were concerned. And the Treaty itself became a dead letter in the face of the internal reforms effected in Russia, reforms in which Europe had a surer guarantee against aggression than could be possibly provided by Articles 11 and 12 of the Treaty of Paris. This statement may be taken for what it is worth. But the following one may be accepted without reserve:—

"The immense and marvellous progress which has taken place in Russia since 1856, and which is still going on, has promoted it by a century over the head of that weak and worsted Russia which yielded Sevastopol and signed the Treaty of Paris." At length, continues our author, "the *grand mot* was pronounced!" Prince Gortchakoff wrote his celebrated despatch, and the objectionable (to Russia) articles of the Treaty of Paris went into the diplomatic wastepaper basket. With the "Treaty modifying the Treaty of Paris of March 30, 1856, signed at London March 13, 1871," M. de Boukharow brings his interesting and (from at least certain points of view) valuable work to a close.

The writer of the present article has contented himself with summarising it. He may, however, say that he has taken considerable pains to discover whether it may be accepted as a genuine and trustworthy expression of Russian opinion. And he is told that it may. It is said that it appeared, a year ago, in Russian, but he has not been able to obtain the original. As a mere matter of literary criticism he may be allowed to regret that M. de Boukharow has not consulted some English friend with respect to English names. We must put up, we suppose, with "Sir Arbuthnot," "Sir Buchanan," and "Mr. le Comte de Granville," as forms absolutely required by the language in which he writes. But we may be allowed to protest against being asked to believe in the existence of a "Lord Whiteford," or a Lord Stafford Radcliffe." Surely the often-quoted historian of the Crimean War might have been mentioned under his real name instead of under that of Kingleak. Moreover, there is something odd to English eyes in the announcements that in 1822 "Lord Canning remplaça Lord Castlereagh," and that Turkey subsequently obtained from England "un emprunt de 800 mille £." But such foreign touches as these do not affect the real value of M. de Boukharow's work. W. R. S. RALSTON.

Industrial Conciliation. By Henry Crompton. (London: Henry S. King & Co., 1876.)

No man has earned a better right to speak on the labour question, generally or in

detail, than Mr. Crompton. He has taken an active part in all the great trades' disputes of the last ten years; has attended and addressed Trades' Union congresses and meetings; has assisted the Unionists in placing their views before Royal Commissions, Parliamentary Committees, and the public; has, in short, been their trusted legal and literary adviser. In this capacity he has had much to do with recent legislation, and is probably more responsible than any one outside their own ranks for the present attitude of the Unions. No one who has been the least conversant with the industrial movement in England during these years would think of doubting the genuineness of Mr. Crompton's sympathy with his clients, or the disinterestedness of his labours; but undoubtedly he had at one time gained the reputation of a vehement partisan, who was himself mastered and run away with by certain social theories, which he, like a true zealot, was bent heart and soul on instilling into the minds of our workpeople, regardless of the consequences to them or to society. Now, we are not prepared to maintain that Mr. H. Crompton never gave any ground for this feeling, or that the bitterness with which he has been regarded by one side in the great controversy has been unnatural. He has felt and written strongly upon questions which move men very deeply, seeing that their prosperity—in many cases their health, and that of their wives and children—depends upon the solution of them. And he has come into the keen strife from outside, not to preach on abstract theories, but to bandy hard knocks where the hardest knocks were going. But, whatever may have been the feeling about him in the ranks of employers of labour in past years, we are glad to think that in future he cannot be looked on by them as an enemy. For this book on *Industrial Conciliation* is not only calm and moderate in tone, but gives the employers of labour as a class the fullest credit for the forbearance and patience and fairness with which they have met their workpeople in the Courts of Conciliation and Arbitration which have sprung up in almost all trades, and in every part of the country. We are glad also to be able to add our own testimony to the same effect. In the earlier arbitrations in such industries as the coal and iron trades, where rough colliers and puddlers met their employers for the first time in equal numbers and on equal terms round a long table, to discuss burning questions, such as the rate of wages, Sunday fettering, or customary allowances, the strain was often so severe as to raise most serious doubts as to the permanence of tribunals so constituted. The representative employers had to listen to, and answer with temper and patience, the rough and exaggerated statements, and the suspicions, of men who were quite unaccustomed to choose their words or to weigh evidence, and who knew very little of the difficulties and anxieties incidental to the working of large concerns. This stage, with its accompanying dangers, has passed away, and the country owes a deep debt of gratitude to all those who have worked for this end, but especially to the employers who have sacrificed time and

money, and have braved the social prejudices of their class, to make conciliation and arbitration working realities. Mr. Crompton looks to them "to solve the industrial problem of the world," and "to urge on the final industrial and social re-organisation towards which we are now moving," adding "there never was a nobler or more sacred work to do," and we entirely agree with him both in his hopes and his estimate of the nobleness of the task.

The book contains an excellent compendium of the history of Arbitration and Conciliation in the different English industries, and of the law applicable to the subject. In all such books the temptation to diffuseness is very great. It is so easy, by inserting Acts of Parliament which have been repealed, and reports of controversies long since closed and forgotten, to swell the dimensions of your volume into importance in the eyes of that large section of the reading world who judge by size, and have been wittily called the hind-quarterly reviewers. It is no small credit to an author to have resisted the temptation, and to that credit Mr. Crompton is honestly entitled. He must have plodded through mountains of Reports to have given the results of all the most important arbitrations since the first establishment of the courts, in the space he has used. And we can safely say that for practical purposes there is little need for those interested in the question to go further than his book.

But besides the history and the law, he has dealt with the theory and principles of this movement, arriving at conclusions which are well worth careful attention, even where we may disagree with him. His cardinal position is that "increased organisation, whether of masters or men, or of both, means decreased war;" and he maintains that Courts of Conciliation and Arbitration would have been impossible but for the Trades' Unions, which have practically enabled the employed to appear by representatives, and to enter into agreements by which not only their own members, but non-unionist workmen, have been bound, and which have in almost every instance been loyally fulfilled. Such an opinion certainly runs counter to much popular prejudice, but we have no doubt that all who have had experience in the work will agree with him. They will also, we think, support his view that "the central fact, the focus of light, is the success of the Boards of Conciliation" as distinguished from the formal Court of Arbitration. It is the "long jaw," as it is quaintly called in the North, ending in a give-and-take settlement of the dispute, which is the really valuable result. When conciliation has failed, and recourse is had to arbitration and the necessary umpire from outside, it is war after all, each side striving to get the utmost they can, and the only advantage gained is that "war at the Arbitration Courts is better than strikes and lock-outs." Mr. Crompton gives his verdict strongly against the appointment of lawyers as arbitrators or umpires, and dwells on the danger of a continual succession of struggles becoming under legal guidance as formidable as the old system of strikes. He protests against arbitrations being governed by the

accumulated results of former awards, thinks that this would lead to "a voluminous library of case-law and a system of refined advocacy," and warns us that already the printed reports of these arbitrations have assumed formidable proportions. Woe unto you lawyers! We are bound to admit that Mr. Crompton has much to say for his views. They are, however, opposed to those of Mr. Rupert Kettle and Mr. Herschell, and we must refer readers anxious to consider the point to Chapter II., in which it is discussed.

We are not sure whether Mr. Crompton thinks that the ultimate solution of the labour question (when the complete independence of the working classes, which he holds to be only a question of time, has been achieved) will come through the present system of Boards of Conciliation, as distinguished from the Courts of Arbitration; or whether he agrees with other distinguished Comtists in distrusting industrial association between masters and workpeople. We suspect from the only reference to the subject in this book, in which he characterises Co-operative Production as "the only industrial scheme which really threatens the existence of employers," that he does, and in that case should entirely differ from him, but in any case we have to thank him for having contributed an excellent book to the teeming literature on the great question of our time.

T. HUGHES.

THE GERMAN OFFICIAL ACCOUNT OF SEDAN.

The Franco-German War, 1870-71. Part I., Section 8. (London: Longmans, 1876.)

THIS official account of the battle of Sedan, like the other sections of the same work, is not history in the best sense of the word. It does not rise above the ideas of the camp; it is crude, even shallow in some respects; it is so overloaded with petty details that prominent events seem lost in them; and it is rather a careful military journal than a well-ordered and harmonious narrative. It contains, however, the rude material of history in an ample measure; if attentively read it conveys a just impression of the mighty contest it seeks to portray; it is candid and honest in the highest degree; and, above all, it has the special merit of dissipating many of the illusions of writers bewildered by the glare of success. On the whole, it is, beyond comparison, the best description of Sedan extant, though this episode of the war of 1870-1, with every part of the same grand drama, is still without a real historian.

By the morning of August 31, 1870, the baffled and disheartened army of Châlons had gathered around the walls of Sedan. An attempt, utterly false in its conception, to join hands with Bazaine at Metz, by a circuitous march from Rheims to the Meuse, had been executed without vigour and skill; and it had already caused a long train of disasters.

The French columns, ill provided or hastily raised, and led by a chief who at heart disliked the enterprise on which he had weakly embarked, had been arrested by the German cavalry, as they toiled through

the Ardennes defiles; and since the 27th the advance eastward had brought on only defeat and confusion. By the 30th MacMahon had reached the Meuse, intent, it is said, still to press on to Montmédy; but the rout of De Failly, the check of Douay, and the ill-plight of his disordered forces, had induced him suddenly to fall back northwards; and by the 31st, as we have said, his army had rallied on Sedan, at a still early hour. At this moment the two great hosts which were to overwhelm him on the following day were still a march from his place of refuge; and it is tolerably certain that, had the Marshal abandoned part of his cumbrous material, and made up his mind to retreat on Mézières, he would have found the road very nearly open, and have saved a considerable portion, at least, of the last army of France in the field. The French commander, however, either from a desire to give repose to his jaded troops, or more probably because he was unaware of the * immense superiority of his foe in strength, resolved to halt for the day where he stood, and this fatal delay was one main cause of the catastrophe which was soon to ensue. During the 31st the large German masses were steadily moving upon Sedan; and by the evening the 3rd army had its outposts on the Meuse at Donchery, its main columns filling the country around to Wadelincourt, Roncourt, and Chemery, while the 4th army was upon the Chiers, between Carignan, Pourru-aux-Bois, and Donzy. The French position was already threatened on two sides; but it is evident from this work that the German leaders had not yet formed the decisive project of completely surrounding the hostile army, and endeavouring by one great stroke to destroy it. Their preparations, indeed, made this event possible; but, as they thought it likely that the French Marshal would still try to effect his escape on Mézières, their combinations sought at first only to impede, perhaps to prevent, this movement, or at most to force him against the Belgian frontier, from which he was only a few miles distant. For this purpose the 11th and 5th corps of the 3rd army were directed to cross the Meuse and to bar the road to Mézières, and the Guards and the 12th corps of the 4th army, the 4th corps acting as a reserve, were ordered to advance from the Chiers on Sedan, and to fall in force on the foe if he stood. The 1st Bavarian corps of the 3rd army was to co-operate with this movement from across the Meuse, and the 2nd Bavarian corps was to fill the space between the 3rd and the 4th armies along the southern front of Sedan, the Würtemberg division having been despatched westward, to prevent Vinoy, now at Mézières, from making an attempt to join MacMahon. By these means it was hoped that the French, compelled, so to speak, to run the gauntlet of enemies gathering on their flank and front, would be stopped in their retrograde movement, and would be, perhaps, driven from their best line of retreat, and forced to seek refuge on neutral soil.

* See the very intelligent narrative of Prince Bibesco. It is difficult, on any other supposition, to comprehend MacMahon's movements and combinations.

Long before the dawn of September 1, the German columns were in full march upon the broad semicircular front between Pourru-aux-Bois and Donchery, steadily carrying out a well-defined purpose, and gradually drawing on their imperilled foe. What had been the arrangements, in the meantime, of the French commander to avert the tempest already menacing destructive ruin? MacMahon, ignorant, it would appear, to the last* of the strength of the forces gathering against him, seems to have thought that he could make a stand in a defensive position, with a hope of success; that a victory would afford him the means of continuing the march on Montmédy and Metz; and that, in any case, he would find his line of retreat on Mézières open on September 1. Filled with these illusions—due, no doubt, to the faulty intelligence of ill-trained outposts—the unfortunate chief had lingered at Sedan; and the precious hours which ought to have been spent in making a decisive march westward had been employed in preparing to meet the onset of the German hosts on the spot. A very few words must suffice to describe the dispositions of the Marshal for the field. The French army was drawn up along the sides of the great triangle formed by the Meuse and its two affluents, the Floing and the Givonne; and its reserves covered the broken country of hills, little brooks, forest, valleys, and ravines, which, with the town of Sedan, fills the space between. MacMahon posted his best troops—those of the 1st and the 12th corps—along the east of this triangular front, from La Chapelle and Dagny to La Moncelle and Bazeilles, their rearward lines stretching to the Fond de Givonne; and this seems to indicate that, in his judgment, the principal attack he would have to meet would be that of the 4th German army advancing on the Givonne from the Chiens. The south of the triangle covered by the Meuse, and by the ramparts and guns of Sedan, was left comparatively devoid of troops, for it was rightly thought that it was not possible to make an attack on this front in force, though the fortress and the adjoining plain were exposed to the fire of modern cannon from the heights on the opposite side of the stream. The western side, stretching from Cazal and Floing to the eminence of the Calvaire d'Illy, was chiefly held by the 7th corps, the beaten 5th forming a general reserve; but, though these positions were thus occupied, the French Marshal, it appears certain, did not expect a serious attack from that quarter, as the defenders here were by no means numerous, and the hills beyond Floing of St. Menges and Fleigneux, were not guarded even by a single outpost. The entire French position, on all its fronts, independently of what nature had done, had been strengthened by artificial defences; villages had been fortified, roads broken up, and batteries raised at points of vantage; and a partial inundation of the Meuse barred the approaches to Sedan along its southern face.

This position of MacMahon was extremely

* From Prince Bibesco's narrative it seems that the Marshal estimated the 3rd German army at about 60,000 men. It must have been twice as numerous at the very least.

strong against an enemy not of superior force, or had it been assailed on one front only—that opposed to the 4th German army. But the French were not more than 119,000 men, demoralised or second-rate troops; the two German armies were not less than 190,000 strong, full of the moral power of continued success; and this single circumstance—without referring to the superiority of the Germans in guns—was enough to incline the scales of fortune. But, in addition to this, the western front of the position was only feebly defended, and if it was carried by the 3rd German army, advancing from the Meuse on that side, while the 4th once forced the eastern front, there was nothing to prevent the whole French army from being driven into Sedan and the space around, and being overwhelmed without a chance of escape by the united masses of a triumphant foe. These considerations are decisive against the dispositions of the French commander, and, though MacMahon is not a great captain, he would assuredly not have run this risk had he been aware of the true state of affairs. We can only glance at the main features of the great and eventful strife that followed. It was still dark when the 1st Bavarian corps, crossing the Meuse near Remilly, assailed Bazeilles, and before long the extended masses of the 4th German army were upon the scene between Dagny and La Moncelle, while far to the north the Prussian Guards made for the valley of the Givonne by Villers Cernay. The resistance of the French was brave and stern: in fact, they had for some hours the advantage, and it had become necessary to send the 2nd Bavarian corps and the last reserves of the 4th German army to the aid of the hard-pressed assailants before any impression was made on the strong eastern front of MacMahon's position. It was, indeed, an accident only that first gave the Germans success in this direction. MacMahon having been wounded at an early hour, Ducrot, his lieutenant, who assumed his command, had, with truer perception than his ill-starred chief, begun to draw off his columns westward,* in order to gain the roads to Mézières, and it was not until the French line on the Givonne had been weakened by this detachment, that the enemy effected a lodgment in it. By noon the Germans had become masters of Bazeilles, Dagny, and La Moncelle, and of the valley of the Givonne between; and all the exertions of their antagonists were unable to recover the ground thus lost, though Wimpffen, who had taken the command from Ducrot, and who disapproved of the retreat on Mézières, had insisted on suspending the movement of that chief, and had sent reinforcements to the eastern front. The battle, however, raged fiercely here, when events on a distant part of the theatre were gradually leading to the final issue. The 11th and 5th German corps had crossed the Meuse by daybreak, at and around Donchery, in order, as we have seen, to intercept the French supposed to be on their way to Mézières; but, when it became evident that MacMahon's army was making a decided stand at Sedan, they received orders to ad-

* We have taken this from General Ducrot's own work. It differs in this respect from the German account.

vance at once against the western front of the Marshal's battle, and, co-operating with the nearest corps from the east, to close in on their doomed opponents. Before noon the heads of the two great columns, having as yet scarcely met a Frenchman on their way, had attained the heights of St. Menges and Fleigneux; and in a short time a long line of guns was pouring a destructive fire into the hostile masses from the Calvaire d'Illy to Cazal and Floing. The French, though completely surprised, struggled energetically to repel this new attack; horsemen fell boldly on the far-advanced batteries, and infantry endeavoured to force the assailants, still small in numbers, from the positions they had won. These attempts, however, proved of no avail, as the German supports came into action; and before long the tempest of war broke from another quarter on the bewildered French. The Prussian Guards of the 4th army had by this time passed the valley of the Givonne, and, hastening to take part in a decisive movement, their dark lines were descried advancing on Illy to join their exulting comrades. The whole front of the French position from the Calvaire d'Illy to beyond Floing was now ravaged by a cross fire, perhaps unparalleled in the annals of war; and under the cover of these discharges the Germans formed for the final attack. The efforts of their foes were heroic but vain; regiment after regiment was swept away or mown down by the storm of missiles; Cazal and Floing were quickly lost; and at last the French line, receding inwards, was driven into the space around Sedan, a mere chaos of despairing fugitives. The triumph of the Germans was now all but complete; a feeble attempt to make a sortie through Bazeilles towards the Chiens was at once repulsed; and, the battle having been lost in their rear, the troops that still fought on the eastern front were speedily forced from that position, and involved in the terrible fate of their fellows. By four in the afternoon the whole French army was huddled around the walls of Sedan, a collection of shattered and useless fragments, searched by the volleys of 600 guns that converged from every point of the compass, and unable either to resist or escape. The next day saw the routed array an assemblage of helpless and disarmed prisoners.

Sedan, it has been truly said, is a striking instance of the power of the artillery of the present day. The long range of the rifled field-gun enabled the Germans to sweep the position of their enemy from St. Menges and Fleigneux, and to make it untenable at an early hour; it exposed the southern front of Sedan to a destructive fire from across the Meuse; it made the issue of the fight more rapid and complete. It is, however, a mistake to suppose that the result was, in the main, due to this or any other mechanical cause—that the end of the battle would have been very different but for the improvements effected in modern cannon. It was the attack of the 11th and 5th German corps, and the junction with them of the Prussian Guards, which really determined the great contest, by hemming the French in upon Sedan; and though, with the ordnance of sixty years ago, the battle would have been

somewhat prolonged, the capitulation would have nevertheless occurred. It is important to be convinced of this, for there is a tendency at the present time to attribute even defeats like Sadowa and Sedan to mere tactics, or to special arms, and not to assign their proper weight to those higher combinations of war which have always decided the fate of engagements entitled to fill a large place in history. We have no space to examine the other questions suggested by this great passage of arms—whether the French army could have been saved in part if, even as late as daybreak on September 1, it had been directed upon Mézières—what were the effects of the fall of MacMahon, and the unfortunate disputes between Ducrot and Wimpffen—whether the generalship of the German leaders at Sedan has a claim to rank with the grand conceptions of which the fruits were seen at Marengo and Ulm, or whether it revealed powers only of the second order—whether the catastrophe could, by any means, have been lessened even at the last moment. One remark, however, we will make in concluding: the disaster of which Sedan was the terrible close was but the consummation of a long series of military errors almost unequalled; and, notwithstanding all that detractors have said, it no more proves that the French, as a race, have lost the qualities of courage and worth than Cannae showed that the Roman legionary was a degenerate and inferior soldier.

WILLIAM O'CONNOR MORRIS.

PREJEVALSKY'S MONGOLIA AND TIBET.

Mongolia, the Tungut Country, and the Solitudes of Northern Tibet. Being a Narrative of Three Years' Travel in Eastern High Asia. By Lieutenant-Colonel N. Prejevalsky, of the Russian Staff Corps. Translated from the Russian by E. Delmar Morgan, F.R.G.S., and Annotated by Colonel Yule, C.B. (London: Sampson Low & Co., 1876.)

THE progress made of late years in the exploration of Asia has been considerable, but the very vastness of the strides serves to show how imperfect is still our knowledge of the oldest of the world's continents. Were our maps rigorously constructed so as to distinguish between accurate and recognised geographical facts and the fruit of shadowy and uncertain information, the spacious areas still meriting research would start into fuller light. At the present moment a German expedition has broken ground in the basin of the Obi; a Russo-Austrian scheme is afoot for stationing scientific observers along the margin of the Arctic shores of Siberia; while Colonel Prejevalsky, the hero of the volumes now before us, has, with the enthusiasm characteristic of the true explorer, started on a fresh mission to solve mysteries untouched in his former journey. He proposes on this occasion to explore the tracts between the Tian Shan and the Himalayas, a region which includes that vaguely-known lake, Lob-Nor, the central Kuen-Lun range, and the bleak wastes of Northern Tibet. In part of this field he will find that he has been anticipated by the adventurous journey of Pundit Nain Sing, the results of which have recently been made known, and

we may fairly congratulate ourselves that this successful feat of exploration, which has brought to light the existence of a perfectly new chain of lakes and rivers in central Tibet, besides other valuable geographical information, should be due to British foresight and encouragement, as much as to the personal intrepidity of the greatest scientific traveller that India has produced.

Colonel Prejevalsky was a traveller of considerable experience before he undertook the journey here narrated. In 1867 he had proceeded to Eastern Siberia on duty, and had occupied his leisure time in hunting, shooting, and collecting objects of natural history. This led to the publication of his *Notes on the Ussuri*, a work of much interest as regards the eastern frontier of Russia, and it also afforded him valuable experience for the prosecution of his second and more daring exploring trip into Mongolia and Northern Tibet. Besides being qualified to take scientific observations, he possessed energy and fortitude in a remarkable degree, and these attributes have enabled him to make a real contribution to our knowledge of these most inhospitable parts of Asia. But it is to Prejevalsky's tastes for natural history that the most valuable results of his journey are due, and it is no slight credit to those who selected him that these acquirements should not have been overlooked. We are tempted to dwell on this feature of the expedition, as in the organising of English expeditions, whether to the Arctic or Torrid zones, the interests of natural sciences, such as zoology, botany, and geology, have in some instances been conspicuously neglected.

But while Prejevalsky was well fitted for his task, and while in his friend Pyltseff and his two Cossacks he had brave and zealous coadjutors, the material resources of the party (a point in which the business idiosyncrasies of Englishmen would infallibly have shone) were most inadequate, and this not only forced a premature retreat on the party when within a month's journey of Lhasa, but even prevented a proper stock of instruments from being laid in at the outset. Notwithstanding these drawbacks, Prejevalsky's journey is a most remarkable feat. It comprises 3,530 miles of route survey, checked by eighteen latitude observations, numerous observations for altitude and for magnetic dip and declination, and very ample collections exemplifying the fauna, flora, and mineral features of the countries traversed.

Starting from Urga, a town which, in respect to its importance and sanctity, plays much the same part in Mongolia that Lhasa does in Tibet, Prejevalsky crossed over to Peking by one of the routes which traverse the eastern half of the great Gobi desert diagonally in a south-easterly direction. Various causes, among which the Muhammadan rebellion in Kansu may be surmised to have been the most potent, induced Prejevalsky on reaching Peking to defer for a while his main journey, and to make a preliminary excursion northward to Dalai-Nor, a lake about 240 miles from Peking, not far from the western slopes of the Khingan range, which divides the Mongolian plateau from the quasi-Alpine regions of Manchuria. It was not till May, 1871, that the final start westward for the Ordos and

Alashan countries was made. In this journey the route seems to have coincided in the main with that followed four years before by the Père Armand David, a Lazarist priest, whose interesting researches in China deserve a fuller and fitter record than the meagre abstracts which have hitherto appeared. During his passage through the Ordos country—of which the Jesuit Gerbillon in 1697, and the Fathers Huc and Gabet a century and a half later, have left us many interesting particulars—Prejevalsky noticed that opium is grown in this part of the valley of the Hoang Ho, but that, as its cultivation is forbidden by law, the somewhat ingenious process is adopted of surrounding it with thick canes and tall rushes to hide it from official scrutiny. Not that the Government officers destroy it when found; they merely make it a pretext for extorting a bribe!

Concerning Alashan, a barren province lying in the angle formed by the northward bend of the Hoang Ho, Prejevalsky is the first who has afforded us definite information. We must, of course, except that ubiquitous traveller, Marco Polo, whose discoveries (as Colonel Yule justly points out) so many modern explorers of no mean fame have but served to elucidate. In the name Alashan there is an evident connexion with *Calachan* the capital of Egrigaia, which, as the same old traveller informs us, was a district of the kingdom of Tangut. In this remote country there would appear to be an exceptionally good opportunity for trade; Colonel Prejevalsky's small stock of such articles as needles, soap, pocket-knives, looking-glasses, &c., realised 700 per cent. profit, and he considers that for woollen stuffs, cloth, hardware, and cutlery, the demand would be even greater. Were a trade route into North-Western China *via* Barkul, Hami, Suchau, and Lan-chau, eventually established, it would in all probability open important and profitable markets for Russian goods in Alashan, Kansu, and other neighbouring provinces. Baron von Richthofen, an authority of weight, has already pointed out that this route forms the most practicable and direct overland line of approach into China from the side of Europe, and the recent expedition of Colonel Sosnoffsky proves that its importance has not been overlooked by Russian statesmen.

After a fortnight's stay in the Alashan mountains, the party returned by way of Din-yuan-ing to Peking, to obtain fresh supplies, and a passport enabling them to proceed to Koko-Nor and the Tibetan highland. The stock of firearms, which, Colonel Prejevalsky pointedly remarks, are the best defence a European can have in travelling among such inhospitable folk, was specially enlarged, and, with two new Cossacks in lieu of the former ones, the expedition left Kalgan on March 17. Shortly after their arrival on June 7 at Din-yuan-ing, they managed to obtain permission to join a caravan proceeding from Peking to the monastery of Chobsen, which is five days' journey from the Koko-Nor Lake.

The description given by Colonel Prejevalsky of the Great Wall of China where he crossed it in Kansu supplies us with a possible explanation of the omission on the

part of Marco Polo of all notice of this famous structure. Instead of the important dimensions which it assumes near Peking, on the borders of Kansu, it is merely a mud wall, greatly dilapidated by time. It cannot therefore be considered strange that Ser Marco should have passed it without mention.

In the highlands to the north of Lake Koko-Nor they were fortunate enough to observe in its native condition and locality the famous rhubarb plant, which, though it has been engendered in other climes, would appear in its original and genuine form to be confined to these highlands of Kansu, where Prejevalsky and his companions are the only Europeans, except Marco Polo and the Jesuit missionaries of the eighteenth century, who have seen it.

When in the country of Tsaidam Prejevalsky appears to have been nearly on the point of deviating to the west, along a marshy depression which, according to native report, extends from Koko-Nor to Lob-Nor, and which the same authority asserts to be the home of the wild camel. The existence of this camel has been openly doubted by a high authority, but in our opinion it is impossible not to regard the mass of affirmative evidence collected by Colonel Yule (in a very full note on the subject), and corroborated by Prejevalsky's researches, as quite convincing.

The journey across the Burkhan Buddha and Shuga ranges, which would appear to combine to the westward into the great mountain chain called Kuen Lun, was one of such considerable difficulty, and so exhausted their resources, that on reaching the banks of the Murui-ussu or Upper Yang-tse-kiang, the party were quite unable to continue their much-wished-for journey to Lhasa. On January 22, 1873, Prejevalsky commenced his return homewards with feelings of disappointment at this premature termination to his further progress. He was, however, enabled to vary his return journey by an important transit of the Gobi desert from Alashan, by a route never before attempted by a European, to Urga, which town was safely reached on October 1, 1873.

We have summarised above the chief results of this adventurous journey. The personal attributes of the chief hero thereof are such as cannot fail to impress the most casual reader. It may be true, as we are told on undeniably high authority, that the traveller displayed a general inexperience of Chinese human nature; but on the other hand the decision, vigour, and promptitude he shows on numerous occasions argue a perfect acquaintance with the wider field of human nature in general. When we compare our unfortunate Yunnan expedition and the disastrous fate of Mr. Margary with the unmolested progress of these four Russians through districts peopled by semi-savage and hostile tribes, it is difficult to refrain from the conviction that a thorough familiarity with Chinese idiosyncrasies is of minor importance, and that a little less forbearance and a more consistent firmness in our national dealings with these Asiatic nations would secure for us, if not their affections, at all events a respect for our subjects' lives.

C. E. D. BLACK.

HISTORICAL BIOGRAPHIES.

Life of Simon de Montfort, Earl of Leicester. By M. Creighton, late Fellow and Tutor of Merton College, Oxford. With Maps.
Life of Edward the Black Prince. By Louise Creighton. With Maps and Plans. (London: Rivingtons, 1876.)

THESE two volumes belong to a new series, entitled "Historical Biographies," edited by Mr. Creighton, the author of the first. This series is intended, like so many others, to aid in the work of education; but the plan is altogether different from that of any of its competitors. The object is to excite interest in history through the medium of biography, setting before the young student the lives of a few great men of different epochs as a key to the character of those epochs and to the general history of the times. The idea is certainly a good one. Until the imagination is interested in history it is in vain to load the mind with facts and dates; and biography has this great advantage, that by limiting the field of view it awakens more lively sympathies than a regular history can do. At the same time, biography in able hands involves a thorough appreciation of the age to which the life in question belongs; and whatever is most interesting in the social, political, religious, and philosophical tendencies of the times can be better elucidated through the medium of biographies than by any other method.

The only question with regard to such a series is whether the right sort of biographers are to be found in sufficient abundance; for it is obvious that hack writers would be worse than useless. Each Life ought certainly to be the work of one who by elaborate study has made himself quite at home in the history of the period as well as in that of the person about whom he undertakes to write. He should tell the story with the ease of one who has all these things at his fingers' ends, and can select from an abundant store of information precisely those facts which are most interesting and important. These qualities are very rare, and it remains to be seen whether a supply will be forthcoming to meet the demand. But, after all, the lives that are capable of this sort of historical treatment are very limited in number; and we trust Mr. Creighton will find no serious difficulty in completing his programme satisfactorily.

Meanwhile, the two volumes before us are nearly everything that could be wished. Mr. Creighton himself leads the way, as an editor ought to do, and has produced a *Life of Simon de Montfort* which is evidently the result of much reading, and yet is simple and attractive in style. No work could possibly be better adapted to create in young or old a real interest in times so unlike our own. For Mr. Creighton appreciates those times himself like a genuine student of history. He is not a man who has carved out for himself a special subject and "read up" for that subject only. He is accustomed to look at history from many points of view, and has given evidence of his powers before now in treating of other periods. And though he does not profess in this work to write as an original investigator, he seems to have made a very judicious

use of whatever has been done by others to elucidate the subject or the times. It would be superfluous in a critic of much inferior reading to pronounce judgment on the accuracy even of a book like this. A book which bears evidence of conscientious study can do little harm even if there be an error here and there. The real question is whether the picture on the whole is faithful, not whether every line is absolutely correct; and as to the general truth of the picture we feel no misgivings. Not that we mean positively to guarantee even such a matter as the character the writer gives of De Montfort himself; for it is somewhat a difficult one to realise, and historians may differ about it still. But at least it is drawn with care and delicacy, and it is quite free from what Macaulay called the *lues Boswelliana*, or biographer's disease of indiscriminate admiration. De Montfort engages our sympathies throughout the story, as an able administrator, whose loyalty was very ill rewarded; a consummate general triumphant in almost every campaign; a reformer who first moulded the English Parliament; and, on the other hand, a religious man, the friend of Grosseteste, Bishop of Lincoln, Adam de Marisco, and the best and noblest spirits of the time. Yet his biographer admits that he was "not free from interested motives," that "his manner was not conciliatory, and his temper could not brook opposition;" and perhaps he would not object to our adding that as a foreigner he did not quite understand Englishmen. So long as Grosseteste and Adam de Marisco lived, their influence seems to have preserved him from indiscretions such as appeared in later times in his quarrel with the Earl of Gloucester. That the man who had so much to do with the foundation of our national institutions, and in liberating the England of that day from the government of foreigners, was a foreigner himself is a matter in which he must have stood at a great disadvantage; and it ought to be taken into account in our estimate of his moral infirmities.

On the other hand, is not Earl Simon's sagacity credited with just a trifle more than is due to it when we are told that "he had the insight to see the full meaning and importance" of summoning to Parliament representatives of the towns? No doubt this was the distinctively novel feature of his Parliament, which makes it, in some sense, notwithstanding great anomalies, the earliest of real Parliaments in our modern use of the word; but that Simon de Montfort saw as in a vision the high constitutional importance of the step he had taken, and how it would be a precedent in after ages, we beg to leave to doubt—the more so as it appears that this very Parliament, as regards the nobles, was a packed one, which seems to imply that constitutional principles, as we understand the phrase, were not very much in Simon's mind at the time.

Of Mrs. Creighton's *Life of the Black Prince* we can also say that we know no book which conveys such a vivid and accurate impression of the times; so that it is in every way a worthy companion to her husband's *Life of De Montfort*. It is illustrated with plans of the battles of Cressy and Poitiers, and a map of France showing all the great mili-

tary movements, both of French and English armies, in the different campaigns. One small error we have noticed, which, though unimportant, we may as well point out. At page 150 it is said that Richard II. was born in 1366, and in agreement with this at page 221 he is said to have been in his twelfth year when he ascended the throne. But 1366 was the date of his birth only according to the old computation of the chroniclers, which began the year on March 25. Richard was born, as Mrs. Creighton herself shows elsewhere (p. 159) on Wednesday the feast of Epiphany, 1367, and he was only in his eleventh year at his accession.

We have also one little question to ask in reference to the other book. Is Mr. Creighton right in telling us, at p. 203, that Edmund, second son of Henry III., was surnamed Crouchback "from his habit of stooping"? No doubt either this or personal deformity was attributed to him at a later date, when he was called *gibbosus*; but we were under an impression that there was no real warrant for the imputation, as the name itself only means "Crossed-back" from his having been signed with the Cross for a Crusade. Such, at least, is Gough's opinion (*Sep. Mon.* i. 69). JAMES GAIRDNER.

Lady Clarissa. By Emma Jane Worboise. (London: James Clarke & Co., 1876.)

The Adventures of Captain Mago; or, a Phœnician Expedition B.C. 1000. By Léon Cahun. (London: Sampson Low & Co., 1876.)

For *Manbury* read Glasgow, and the impression given by the title of Mr. Sime's book that its scene is laid in one of the Western States of the American Union will be at once dissipated. If it be a first venture—and the absence of any other name on the title-page makes it probable—*In Manbury City* is a book of altogether exceptional promise. There is nothing which can be exactly called a plot, as the narrative simply follows the thread of the lives of a small group of Glasgow families; but there is good natural dialogue, and a clear, vigorous power of drawing character exhibited. Three of the figures are very careful studies, and are not only well conceived, but forcibly carried out—namely, the unstable artist, Charles Browning; Emily Harrison, a girl of melancholy, strong and pietistic temperament; and Jessie Ramsay, the selfish coquette of humble life; while two or three more, though less finished, are almost as good in their way. The successful adventurer, Lushington, is the best of these subordinate sketches, but three others, which are but lightly outlined, show enough keenness of observation to prove that they might, had it so pleased

Mr. Sime, have been worked up into salient figures—namely, the Free Kirk minister, Mr. Christie; Mrs. Harrison, the shrewd, kindly, and somewhat brusque Scottish matron; and Ferguson, the openly freethinking iconoclast and secret philanthropist. There is much which may be bettered, for the story is not one of those rare books which at once place their authors high upon the roll of literature; and its chief fault is that it lacks unity of design, consisting rather too much of independent scenes, one or two of which are elaborated out of scale in respect of their importance in the plot. Nevertheless, this is a defect rather of experience than of capacity, and the study of detail exhibited gives promise that, when Mr. Sime has acquired the art of bestowing more concentrated dramatic movement on his work, it will not fail by reason of carelessness in the accessories whose finish lends so much additional pleasure to the perusal of a clever book. This one would have read better as a two-volume than as a three-volume novel, but its merit even now is such that whatever success may yet await its author, he will never have cause to be ashamed of this first effort.

Gerald Marlowe's Wife is not an improvement on the author's previous novel, *A Scotch Wooing*. It is more elaborated in some respects, but the main situation, that of a husband gradually falling in love with a wife whom he had married for money alone, has been employed too often to have any freshness, and the writer has committed the error of trying to dance in fetters, by adopting a form of composition which has never yet been successfully handled, that of telling the story in the alternate monologues of two diaries. The usual defect is very prominent here—namely, that the dictions of the two scribes, Gerald Marlowe himself and his wife's old governess, are scarcely discernible from each other in point of style; and, further, that the indirect narration does not permit vigour in drawing the central figure, which, though tolerably well conceived, is not adequately worked out, nor always consistently.

Mr. Payn is to be congratulated on having at length emancipated himself from the groove of the *Household Words* school of fiction in which he moved so long. Even *Lost Sir Massingberd*, original and clever as is the sensational incident which suggests the title, is by no means free from that curious mannerism which marks the writers of that group, whose style—quite unlike that of Dickens, though designedly modelled upon it—is so like among themselves that it may well be doubted whether, if the copy had by any chance been held over unpublished, any one of the authors could have told his own compositions from those of any of the others save through means of the handwriting. But *Fallen Fortunes* is written in a more independent key and with far greater literary success. It is a very good novel of the second rank, quite deserving much more than a *succès d'estime*, with a well-contrived plot, and a style which is always easy and sometimes sparkling. The best thing in the book is the character of Mrs. Campden, a grey mare of a very objectionable type, who is drawn with real

skill and appreciation, and fairly well contrasted with her weak and kindly husband. The humourist doctor, though pretty well done, is more trite, and there are plenty of better examples; and the same is ever more true of the scheming City speculator, who has been rather overworked of late years, especially in the matter of suicide. Some of the by-play is clever, and in particular there is a dinner-party which is vigorously sketched, and a very old story of a ruthlessly uncivil revenge for discourtesy is introduced at the close in such fashion as to seem new, no light tribute to Mr. Payn's competence as a narrator.

Mrs. Worboise holds the same position among English Nonconformists as an author of *Frauenliteratur* as Miss Yonge does with members of the Church of England. She has been before the public now as a writer of fiction during more than five-and-twenty years, and has acquired a fair measure of by no means undeserved popularity with the audience to which she appeals. Several of her books, and notably the one before us, have appeared in the *feuilleton* of the *Christian World*, a syncretist Evangelical journal, and in point of literary execution and tone are much above what might be anticipated from their surroundings. They are one and all directly religious novelettes, intended to enforce the author's views; but they are as a whole, and with a few polemical exceptions, commendably free from sectarianism, and take a cheerful and wholesome view of life and duty, being entirely free from that Pharisaic denunciation of the "world" to which we have had occasion to advert recently in noticing writings nominally belonging to the same school of opinion. Mrs. Worboise works with a somewhat broader brush and less subdued colouring than Miss Yonge, partly, it may be, from difference of temperament, but also without doubt as appealing to a somewhat less cultured body of readers; but there is a fundamental likeness—save in the particular of humour, wherein the Anglican lady has much the advantage—underlying the superficial dissimilarity. The earlier part of *Lady Clarissa*, in which the heroine's childish naughtiness and eccentricity are sketched, is much the best, and there is some really clever writing in it, as also in the character of the stepmother, a plebeian millionaire modelled on the lines of Mrs. Trollope's *Widow Barnaby*, "only more so." But the remaining personages, especially the male ones, are mere lay figures, with little that is distinctive about them, and the latter portion of the story is rather commonplace, seeming to mark fatigue on the author's part long before completion. Mrs. Worboise lays stress on the perfect acquisition of French idiom and accent by her heroine from an accomplished *émigrée* governess, but if that lady really taught her that *nomme-de-plume* and *nomme-de-crayon* (*sic*) are French, her qualifications must have been rather exaggerated and have been on a par with those of the Latin tutor from whom Mrs. Worboise has derived the phrase *Memento mori*, which cannot be laid on the printer's shoulders as a mere typographical error, for it occurs as the title of a chapter in the Table of Con-

tents, and is printed five times as a headline to the chapter itself. And though it *may* be translated "by the weight of a mulberry," that does not seem quite the force of the context, for mulberry jam is named only in a different part of the book.

The Adventures of Captain Mago is an attempt to clothe the extremely scanty dry bones of knowledge we possess as to Syria, Greece, Italy, Spain, Britain, and so forth, as they were in King David's time, with flesh and blood, and to do for them what Becker, with incomparably more abundant materials and learning, failed in doing for ancient Greece and Rome in his *Charicles* and *Gallus*. As a mere grouping together of possible voyages, combats, and the like, *Captain Mago* may serve to entertain adventurous boys, though its occasional dryness of treatment makes this sometimes doubtful; but the undoubted pains M. Cahun has taken in reading up a quantity of recent palaeological literature have not enabled him to give an air of probability, or even of erudition, to his narrative. And if he does not seem to blunder quite as grossly as M. Victor Hugo did in describing the English of James II.'s day in *L'Homme qui Rit*, that must rather be ascribed to the necessarily greater ignorance of most of his readers as to the real facts; while the anachronisms, if not altogether so obviously glaring as that which Major Whyte Melville committed in *Sarchedon*, when he made the Jewish captivity in Egypt synchronise with the reign of Ninus, are not less real, and are by no means palliated by the same ease and flow of the narrative. But if one be contented to accept it as a kind of *Sinbad the Sailor*, and not to look for instruction of any kind, it is readable enough, and M. Philippoteaux's numerous illustrations, somewhat in M. Gustave Doré's style, are cleverly grouped, whatever their resemblance to the delineated events may be. The translation is very fairly done, though here and there it would seem as if Miss Frewer were not familiar with the different phonetic value of certain letters in French and English, since she has retained an orthography which is occasionally misleading.

RICHARD F. LITLEDALE.

SCHOOL BOOKS.

MR. ARTHUR SIDGWICK'S *Vergil, Aeneid, Book XII.* (Pitt Press) is worthy of his reputation, and is distinguished by the same acuteness and accuracy of knowledge, appreciation of a boy's difficulties and ingenuity and resource in meeting them, which we have on other occasions had reason to praise in these pages. The editor's excellences are especially shown in his disentanglement of Vergil's complicated and involved expressions, but we cannot always approve of his translations. In most cases they are happy and elegant, but they are sometimes strained: "Blossom hair" is surely unpoetical. Mr. Pretor's *Anabasis of Xenophon, Book IV.* displays a union of accurate Cambridge scholarship, with experience of what is required by learners gained in examining middle-class schools. The text is large and clearly printed, and the notes explain all difficulties. The *Anabasis* needs a good editor. It is a book naturally much read in schools, and Mr. McMichael's edition, although good as far as it goes, leaves many difficulties unexplained. Mr. Pretor's notes seem

to be all that could be wished as regards grammar, geography, and other matters. Mr. Purton's *Pro Milone* is equally good, but more elaborate; indeed, it appears from the "advertisement" to be the reprint of a previous edition. If this is the case, it should surely be stated on the title-page. The editorial work is excellently done, but the book contains more than is required for University Local Examinations, and is rather suited to the higher forms of public schools. However, in a case of this kind fullness is a fault on the right side. The price, 2s. 6d., is cheap for the book, but it is more expensive than the rest of the series. *Lucan's Pharsalia, Book I.*, edited by Messrs. Heitland and Hoskin, is called by them an experiment, and can scarcely be intended for use in the Local Examinations. We are, however, very glad to see the curriculum of school books enlarged, and an English edition of Lucan has long been a desideratum. He is much better appreciated by the French, and the extracts edited by M. Demogeot form a capital introduction to the knowledge of this author. In the present case the notes are good and to the point, but they are too short and presuppose too much knowledge for the class of learners for which they are apparently intended. There surely should have been added some remarks on the peculiar diction of the poet, a fuller estimate of his relation to the rest of Roman literature, and a comparison with the style of the Augustan writers with which boys are familiar. However, we have no disposition to look a gift-horse in the mouth, and we trust that the Pitt Press will have the spirit to publish the rest of Lucan, and also portions of other authors who are less known than they ought to be.

White's Grammar School Texts. (Longmans.) According to the advertisement at the end of these volumes, Dr. White has edited a large number of little books both in Latin and Greek, the average price of which appears to be a shilling. Those before us consist of *Horace, Odes, Book III.*; *Vergil, Aeneid, IV. and V.*; *Eutropius, I.-IV.*; and a selection from *Ovid*. The books are edited on a new plan. The text is well printed without notes, and each volume has a separate vocabulary, wherein such help is given as the learner may require in preparing the lesson. We must express our thorough approval of this principle. We know that it is often said that nothing impresses the meaning of a word on the memory so much as looking it out in a dictionary. We cannot agree with this statement, and we believe that very few men of mature age beginning to learn a new language would dream of undergoing the weary and bewildering process of looking out each word in a dictionary. They would do what school boys do, either get a friend to construe to them, or procure the most literal translation they could find. The use of translations, "cribs" or "cabs," as boys call them, must at some time or other engage the serious attention of school-masters. It cannot be denied on the one hand that their use in many schools is almost universal, and on the other that a learner who has systematically depended on them, especially if he has accompanied the process of learning with "writing over" the English in his book may find at the close of his education that he knows nothing of the language which he has been learning for many years, and that he is incapable of passing the easiest examination in it. A boy rebuked by a master for using translations will reply, "Please sir, I looked out all the words in a dictionary." This shows that he entirely misconceives the ground of your objection. If translations were merely used to give the meaning of the words and to save a dictionary there would be no harm in them, but their mischief lies in the help they give in "making out the sense," thus saving the learner one of the principal and most invigorating exercises of the mind, and eluding one of the chief objects of a classical education. To meet this difficulty some school-

masters allow the use of translations; others adopt the practice of construing *unseen* passages in school; others multiply "translation papers." We imagine that the best remedy is to encourage the use of vocabularies and special dictionaries, which are almost universally used in Germany, and for this reason we hail the appearance of Dr. White's series. As far as we have examined, the vocabularies are carefully and conscientiously framed, and must have cost considerable labour. Dr. White has resisted the temptation of merely copying the articles in his own dictionary, or of repeating himself mechanically in the several books. It is of course true that Virgil and Horace cannot be properly explained without notes, but these books are obviously intended for very early beginners, and Dr. White has done his best to remedy the defect by special remarks in his vocabularies. We should also mention that considerable attention is paid to etymology, and the Greek homologies and Sanskrit roots are generally given. In our judgment rational grammar cannot be taught too early. Children of almost any age can appreciate in some degree the more scientific aspect of grammatical facts which are now familiar to us, and the widest publicity of these true views is the best guarantee we have for the final extinction of the cruel and pedantic routine which has for many generations been so deeply answerable for the woes of childhood.

We have also before us *Livy, Book XXII.*, with notes by the same editor. The notes seem to us thoroughly sound and good, a little old-fashioned, perhaps, in matters of history and archaeology, but free from serious mistakes, if regarded from a somewhat antiquated stand-point. A learner who has mastered them will have a very adequate knowledge of the text. The text is well printed in large type. It is a severe shock to our literary sense to find Livy marked off into chapters and verses as if each sentence were to be taken and digested as a separate dose, and we have the strongest objection to the custom of distinguishing adverbs with a grave accent, a practice which is entirely extinct in books intended for the large public schools. Dr. White should allow progress in orthography and etymology to go hand in hand, and we shall be glad if in the next book of Livy he edits, he has not only discarded these foolish and annoying marks, but recognised the acknowledged results of the study of Latin palaeography.

Cornelii Taciti Historiae. Edited, with English Notes and Introduction, by William Henry Simcox, Queen's College, Oxford. (Rivingtons.) These two handsomely-printed volumes belong to the excellent series of the "Catena Classicorum," one of the many sets of books with which the school literature of the present day has been enriched, a work which owes as much to the activity and enterprise of Messrs. Rivington as of any other publisher. Prolific, however, as has been the energy of the press in this department, we do not as yet seem to have made up our minds as to what manner of book the perfect school-book should be, and anyone who has had to examine much of this literature will be led to the conclusion that the editor, in many cases, might have done much better if he had realised before he began a clear conception of the object he wished to attain. We apprehend that the most perfect school-edition of a classical author is one which, while it fully explains everything that need be known about the text which it professes to illustrate, does so in a way which does not spare the labour of the learner, and at the same time, if that labour is bestowed, imparts an amount of scholarship and learning which he would not have expected to attain before he undertook the task. To this category belong Mr. Jebb's edition of Sophocles in the "Catena Classicorum," and Mr. Mayor's first edition of Juvenal, and Orelli's edition of Horace. The second class of school editions are those which give the learner every help and information which he can require, and at the same time point out to the

teacher where he may find the sources of a higher standard of exegesis. To this belong the best German editions published by Weidmann and Teubner. A third class, of a more humble character, contains those books which give the necessary help to the learner in a simple and available shape, which do not aim high, but which fulfil the end for which they were written. To this class perhaps, the bulk of good English school-books belong. The volumes before us belong to none of these categories. They are the work of a cultivated man and a good scholar; they display care, power, and elegance, but they are after all more like the jottings in the editor's own note-book than the result of a careful and laborious attempt to make the text intelligible to younger minds. The Introduction consists of three parts—the first dedicated to the life of Tacitus, the second to his opinions, the third to his style. The first and third are very useful for learners; the second is almost beyond the grasp of school-boys. We are quite alive to the extreme difficulty of editing Tacitus, and we can cordially recommend Mr. Simcox's edition in default of a better; but we believe that a satisfactory edition still remains to be written, and that when it is given to the world it will be found to be more like the admirable fragment of Dr. Smith than the more fastidious and elegant work of the present editor. Mr. Storri's edition of *Vergil, Aeneid*, XI., XII. (Livingtons) belongs to the third class. It is a thoroughly scholar-like production, text and notes are drawn from the best sources. The notes are very full and do not omit any point of real importance; their originality (so far as they are original) consists in the fact that the editor is fully alive to the beauties of his author and is able and willing to illustrate him from modern literature. The work has no other aim than that of being a useful school-book, and this it admirably fulfils. *Stories from Ovid in Elegiac Verse*, by R. W. Taylor (Livingtons), is a book of a more ambitious type, and is quite worthy to take a place in permanent school literature. It is far superior to the Eton selection, which, we imagine, is now that most commonly used. We wish Mr. Taylor had allowed himself a little more freedom in departing from the traditional *Selecta ex Ovidio*. There are many passages of Ovid (especially in the *Tristia*) which are very little known, and which in sweetness of expression, tenderness of feeling, and very often subtlety of thought, are equal to anything in Latin literature. But the work which Mr. Taylor has done he has done admirably, and we conceive from his book a very high idea of his capacity as a practical schoolmaster. Each selected piece is preceded by an argument, and every paragraph is headed by a few lines in English, showing the drift of the poetry, so that the connexion of ideas is kept constantly before the boy's mind. On the margin are marked in black figures references to the *Public School Primer*. The poetical headings to each extract show taste and judgment, and are well adapted to catch the fancy of the young. The notes are everything that could be wished, no difficulty is passed over, everything is explained in simple language suitable to the age of those who will use the book, and the historical and archaeological notices are full and interesting enough to furnish a boy with a large stock of knowledge of this kind as a stepping-stone to his more advanced studies. We have seldom met with a book which we can more thoroughly recommend to schoolmasters. Mr. Moberly's edition of Xenophon's *Memorabilia*, Book I. (Livingtons), is a very good specimen of the kind of book which by a combination of different public schools might be produced in any quantity to the benefit of good education and the confusion of "cribs." It contains just enough for one term's reading, with simple and practical notes. The two faults we have to find with it are—first, that there are no indexes; and, secondly, that the notes are too discursive. In a little more than thirty pages of notes, Mr. Moberly contrives to tell us something

about M. About, S. Columba, Lord Bacon, Moses, Milton, the Duke of Wellington and Lord Winchelsea, Arthur Clough, General de Melas, Lord Torrington, the Vicar of Wakefield, Goethe, and Rousseau. Surely there are many remarks which are admirably calculated to keep up the interest and vigour of a class that it is not worth while to print in a book.

The question as to whether or not boys should be taught Latin and Greek with the aid of grammars, and as to whether there should be one standard grammar for the whole of England, seems to have been laid at rest. We are strongly of opinion that the adoption of a uniform grammar is, to say the least, a very great convenience, and that the anarchy which has reigned in our schools since the deposition of the old Eton Latin and Greek grammars has been detrimental to the cause of scholarship. The Latin grammar in use in all Prussian and Saxon schools is that known by the name of Ellendt-Seyffert, composed originally by the first, and improved by the second of these scholars. Few *secundaries* of average attainments would be unable to give page and line for any grammatical rule which was required either in construing or in composition; and to this is due the admirable standard which is attained by German boys in their *Abiturienten-Examen*. We suspect that there are few English schools where this kind of knowledge is exacted by every master and in every form, and it is obvious that it cannot be done while we profess only an uncertain allegiance to a standard grammar. Dr. Kennedy's *Public School Latin Primer* and *Latin Grammar* hold possession of the largest portion of the field, and with all their defects of cumbersome terminology and bad taste they are superior to their rivals, although some high authorities would prefer the study of the rather antiquated work of Madvig. Roby is more suited for universities than for schools. We are therefore disposed to question the desirability of such a book as *A Grammar of the Latin Language* by Dr. Leonhard Schmitz (Collins), unless it is intended solely for the use of the northern kingdom. The book is satisfactory in itself, and is more simple than the work of Kennedy. The author is evidently acquainted with the results of comparative philology, but he does not bring them prominently forward, and clings rather to the old lines. The accidence is superior to the syntax, which is too short, and deficient in clearness. But we see no sign of independent arrangement or investigation, and it is difficult to understand why the book should have been written at all except to supply (in a very worthy manner) a gap in a publisher's series. *Rules of Latin Syntax*, by Musgrave Wilkins (Longmans), can give a better account of itself. The rules are comprised in twenty-six columns, printed on stiff paper and arranged conveniently for reference. They are compiled with full knowledge and appreciation of the work of Kennedy, and the small pamphlet which contains them is just one which may conveniently lie by the side of a young scholar when doing his Latin prose. The work is turned out with that admirable finish which we should expect from Mr. Wilkins, who appears to us to have placed himself by gradual progress in the first rank of writers of school books. *Practical Rudiments of the Latin Language*, by J. Ross (Blackwood), has a different object from most Latin Grammars. It is intended to teach Latin to girls, or to those boys who are not likely to devote themselves to a thorough training; rather with the object of explaining the meaning of French and English words derived from the Latin than of acquiring scholarship. Regarded from this point of view the book may be safely recommended. It is, indeed, a superior Latin Ollendorf, in which the more difficult inflections and characteristics of the language are left to be learnt last. The book is admirably suited, if for nothing else, for the instruction of women. *Auxilia Latina*, by M. J. B. Baddeley (Bell), is neither better nor worse than

many other exercise-books in Latin. The reasons which exist for a uniform grammar do not in any way apply to a uniform exercise-book, and we are indeed of opinion that it is well that T. Kerchever Arnold has abdicated the throne he once occupied. Of exercise-books of all grades of difficulty there cannot be too many, provided they are accurate and lively, and we think that teachers of beginners in Latin may well give Mr. Baddeley a turn with the rest. To pass from Latin grammars to Greek, our English scholars have not yet succeeded in producing a standard book corresponding to the *Public School Latin Grammar* of Prof. Kennedy. In our opinion the best elementary work of the kind is the small *Greek Grammar* drawn up in Latin by the same author, when head-master of Shrewsbury. The want, however, is less felt from the existence of an English translation of the *Grammar* of Curtius. This grammar is used in all German and Italian public schools, and it is not creditable that some English schools still prefer the very inferior productions of Parry and Wordsworth. The accidence of Curtius' *Grammar* is unsurpassed, but the syntax is less satisfactory, although it has been much improved in the last German edition, revised by Dr. Gerth. It cannot even now challenge comparison with the great work of the American scholar, Goodwin's *Syntax of the Moods and Tenses of the Greek Verb* (Macmillan), the sixth edition of which now lies before us. It is incomparably the best, the clearest, and the most complete account of the exceedingly complex construction of the Greek sentence; it is studied at Cambridge by all those who aim at the attainment of high classical honours, and it is equally fitted for the highest forms in public schools. It is not only a treatise on Greek but by implication on logic and the science of language, and it affords a far better training for advanced boys than the brilliant and attractive, but rather inaccurate work of Dr. Farrar. If the scholarship of Harvard is really built on the foundations of Dr. Goodwin we may look for great results in the future of American philology. Blomfield Jackson's *First Steps to Greek Prose Composition* (Macmillan) is a neat little Greek exercise-book, accompanied by papers on Greek grammar and a vocabulary. We are ourselves sceptical as to the advantage of Greek exercises in teaching Greek composition. It is generally held that Greek iambs and Greek prose should only be written by those already advanced in Latin composition, and we believe that the experience of both Shrewsbury and Eton would show that excellent Greek copies have been composed by those who had no previous training of the kind except in the sister language. Still they are undoubtedly useful as a means of teaching Greek writing, accentuation, and syntax. To work through Mr. Jackson's book conscientiously would be an admirable preparation for matriculation, little-go, or smalls, and as such we recommend it to aspirants who feel weak in their Greek grammar.

OSCAR BROWNING.

NOTES AND NEWS.

THE return of our Expedition has naturally drawn public attention to the Arctic regions. The appearance, therefore, of the detailed account of the Austrian Expedition of 1872-74, by Lieutenant Payer, one of its commanders, which will be published by Messrs. Macmillan and Co. in a few days, is singularly opportune. In the Introduction an attempt will be made to compare the results of these two voyages, and to show that perhaps even yet further discovery may be possible.

MESSRS. HENRY S. KING AND Co. will publish very shortly a tale by Miss M. Drummond, entitled *A Study from Life*. It is a story of the London poor, and is written in aid of the Westminster Home for Training Nurses—the memorial to the late Lady Augusta Stanley.

MRS. HAWES'S *Chaucer for Children*, which was announced by Messrs. Strahan and Co., has passed into new hands, and will now be issued immediately by Messrs. Chatto and Windus, of Piccadilly.

MR. ALFRED GREGORY, sub-editor of the *Gloucester Journal*, is collecting materials for a *Life of Robert Raikes*, co-founder with the Rev. Thomas Stock of Sunday Schools. As Raikes established the *Gloucester Journal*, in 1722, it is not altogether inappropriate that an authentic biography of the great philanthropist should a century and a half later emanate from the office of that paper. Mr. Gregory has had very valuable sources of information opened to him; and he will discuss impartially—settling, it is hoped, finally—the long-debated question as to the origin of Sunday Schools, and Mr. Raikes's claim to be considered their founder.

MISS AMELIA B. EDWARDS' book, promised nearly two years ago, *A Thousand Miles Up the Nile*, with about eighty illustrations by the author, a cover designed by the same, maps containing all the new lines and stations, and a full account of the important discoveries made by her party at Abou Simhel, is now nearly ready, and will be published by Messrs. Longmans in the course of November. The hieroglyphic inscriptions which were discovered, and which Miss Edwards copied, are translated for her by Dr. Birch.

THE Woolhope Field Club has undertaken to carry on to completion the *Pomona Herefordiensis* which Mr. Thomas Andrew Knight commenced more than fifty years ago. The new publication will embrace descriptions and illustrations of every variety of apple and pear grown in Herefordshire, with a view of encouraging the growth of the best kinds of cider-fruit, as well as of reducing their nomenclature to order. It is proposed to issue the work in annual parts, corresponding in size with the old *Pomona*, and containing not less than three coloured engravings in each part. The editorship has been accepted by Dr. Hogg, and arrangements will be made by which the public will be enabled to procure the work through the usual channels.

A NEW Natural History under the editorship of Prof. P. Martin Duncan, F.R.S., F.G.S., which has been for some years past in preparation, is now nearly ready for publication, and will be shortly issued in serial form by Messrs. Cassell, Petter and Galpin. Among the gentlemen with whom the editor has already arranged for contributions to the work are:—H. W. Bates, F.R.G.S.; W. S. Dallas, F.L.S.; W. Boyd Dawkins, M.A., F.R.S., F.G.S.; Prof. A. H. Garrod, F.R.S.; Prof. T. Rupert Jones, F.R.S., F.G.S.; R. Mac-lachlan, F.R.S.; Dr. Murie, F.L.S., F.G.S.; Prof. W. K. Parker, F.R.S., F.L.S.; Prof. Harry G. Seeley, F.G.S.; R. Bowdler Sharpe, F.L.S., F.Z.S.; Henry Woodward, F.R.S., F.G.S. The work will embody the latest scientific researches, and will be fully illustrated.

THE *Décentralisation* states that a large MS. work of St. Francis of Sales, consisting of a treatise on the Eucharist, has been purchased from "a Protestant family on the Swiss frontier" by Father Edouard, of Lyons, in whose hands it remains for the present. A valuable and hitherto unknown MS. of the *Divina Commedia*, very carefully written and containing numerous variants, has likewise been discovered, according to the *Effemeridi Siciliane*, in the library of the monastery of Monreale, near Palermo.

MISS LEBITIA MCCLINTOCK has written a story for children, entitled *Sir Spanple and the Dingy Hen*, which Messrs. Henry S. King and Co. will publish very shortly. It will contain some spirited sketches of bird-life by Mr. A. T. Elwes.

SIR EDWARD CREAMY'S new work, *A First Platform of International Law*, will be published by Mr. Van Voorst next week.

THE new edition of Lady Charlotte Guest's *Maibonogion* has just been placed in the printer's hands, and will be ready for publication by Mr. Quaritch in February next.

THE New Shakspeare Society has this week sent out its second and final issue of books for this year, consisting of *The Two Noble Kinsmen*, by William Shakspeare and John Fletcher, a revised edition from the quarto of 1634, by Harold Littledale: Part I. Text and Notes. Presented by Mr. Richard Johnson, of Fallowfield, near Manchester. And "A Letter on Shakspeare's Authorship of *The Two Noble Kinsmen*, and on the Characteristics of Shakspeare's Style, and the Secret of his Supremacy, by the late Prof. Wm. Spalding: a new edition, with the Life of the Author, by John Hill Burton, LL.D., and Forewords, by F. J. Furnivall, M.A."

THE Hebdomadal Council has chosen the Dean of Christchurch, the Vice-Chancellor and Proctors, and Prof. Henry J. S. Smith, to constitute the Board of Electors to the Chair of Celtic Language and Literature.

THE lectures this winter at the London Institution, Finsbury Circus, will be delivered by Professors Armstrong, Barrett, Bentley, Clifford, Colvin, Dewar, Ella, Huxley, Morley and Ruskin; Dr. B. W. Richardson; Messrs. F. J. Furnivall, J. Norman Lockyer, Clements R. Markham, George Meredith, Ernst Pauer, W. R. S. Ralston, Robert H. Scott, Arthur Severn, W. T. Thielton Dyer, Alfred Tylor, E. B. Tylor; and it is hoped, Sir J. Lubbock and Mr. F. W. Brearey. Prof. Huxley will open the season on December 4 with a lecture on "Some Recent Additions to our Knowledge of the Pedigree of the Horse."

IN Mr. Madan's letter last week on "MSS. of Virgil in the Bodleian," at p. 434, col. A, line 18, the words "except the fourth" should be cancelled. The error arose through an omission in the Bodleian catalogue.

MR. WILLIAM CLARKE MILLER, Vice-Principal of Huddersfield College, has been elected Registrar of the General Medical Council of Education, in the place of Dr. Erasmus Hawkins.

PROF. H. J. S. SMITH'S valedictory address to the London Mathematical Society, on the 9th inst., will touch upon various points affecting the present state and prospects of Pure Mathematics.

THE address of Mr. G. S. Lefevre, M.P., to the Economic Section of the Social Science Congress has been printed at Liverpool in a pamphlet form, but it deserves publication in such a way as to obtain a wide circulation, which the Liverpool pamphlet can hardly get, and the Social Science Association is very tardy in the publication of its annual volume of *Proceedings*. The facts which Mr. Lefevre has brought out with respect to the distribution of landed property in the United Kingdom are very important, and the address is from first to last a valuable contribution to economic literature. One proposition rather surprises us, although we will not controvert it. Mr. Lefevre undertakes to say "that no case can be brought forward of an industry having in the end really suffered from free trade." One would expect to find to some extent an unnatural division of labour resulting from protection, and consequently some artificial industries which could not live under free competition.

THE *American Library Journal*, edited by Mr. Melvil Dewey, of Boston, assisted by a staff chosen from the chief libraries of the United States, aims at supplying that want of a means of mutual communication, suggestion, and discussion, which intelligent and active librarians have long felt. The first monthly number certainly gives promise of worthily fulfilling this aim. Mr. Justus Winsor, of the Boston Public Library, in "A Word to Starters of Libraries," tells them how to obtain the necessary guidance with the least trouble to other people. Mr. Charles A. Cutter, of the Boston Athenaeum, describes the

valuable work done by "The Franklin Society of Paris" in forming popular libraries in France. The editor writes on the collection of "Public Documents," and in an article on "The Profession" shows what high qualifications modern opinion demands from the librarian and what place he should be able and willing to take as a popular educator. To the reproach of this country, we learn from him that in the United States "the number of new libraries founded has been so great that in an ordinary town we no longer ask 'Have you a library?' but 'Where is your library?' as we might ask 'Where is your school-house, or your post-office, or your church?'" Mr. E. L. Jones gives an outline from advance sheets of "The Government Library Report," a work which has never been approached in exhaustiveness, and will be indispensable to every librarian who can read English. The rest of the number is occupied with leaders, descriptive articles, bibliographical notices, queries on points of library management, news respecting libraries at home and abroad, and other matter of interest. There is no reason why the journal should not be as much read on this as on the other side of the Atlantic: to every librarian who wishes to bring his library to the most perfect method and highest degree of usefulness it bids fair to be invaluable.

AT the meeting of the Manchester Literary Club held on Monday last, Mr. Charles Madeley, the librarian of the Warrington Public Library and Museum, made a suggestion that is worth the consideration of those engaged in cataloguing. In their exact signification the terms octavo, quarto, &c., when applied to the description of books, are not indicative of size, but simply denote the number of leaves stitched in each sheet of the volume. These terms are, however, used commonly to indicate approximately the size of the book, without reference to the number of leaves between each signature. The majority of people, indeed, use them in this latter sense. Even when strictly used, the plan of counting the sheets does not afford a very scientific or satisfactory result. How, for instance, should an octavo printed in half-sheets be described? What is the value of the term octavo when applied to the leaves of the Diamond Classics, which are $4 \times 2\frac{1}{2}$ inches? Mr. Madeley proposes to adopt the popular idea, and to impart to it regularity by means of a card book-scale to be used by librarians and others. In order to determine the size of a book the top edge of the scale is laid so that it is even with that of the leaf—the division into which the bottom of the leaf falls to indicate the size of the book. If it come on the line then it should be considered to be of the larger size. Some uncertainty might arise from books that had been cut down by unconscientious binders.

THE Estonian Society in the Dorpat University, under the presidency of the well-known philologist, Prof. Leo Meyer, has lately offered Mr. John Rhys the diploma of a corresponding member.

THE German papers record the nearly simultaneous deaths at Stuttgart of the well-known literary couple, the Prussian Freiherr and Colonel von Reinsberg-Düringsfeld and his talented wife. Baroness Ida von Düringsfeld, who was born in 1815, at Miltich in Lower Silesia, began her literary career about the time of her marriage in 1845, when she published her *Gedichte von Thekla*, a work which was soon followed by other lyrical poems, and by numerous spirited translations of Slavonic, Flemish, and Italian national songs, sagas and fables. Her numerous prose writings were well received in Germany, where her tales, narratives of travel, and other compositions have enjoyed uninterrupted favour during the last thirty years. Her husband devoted himself assiduously to the study of philology and ethnography, and in these pursuits and in his numerous and extensive travels his gifted wife was his constant companion. Together they

brought out various works, some of the best known of which are their *Proverbs*; *Book of Marriage-Songs*, &c.; and *An Illustrated Almanac of the Holidays and Festivals of the Year*. Baroness von Reinsberg-Düringsfeld died on October 25, while making a tour through Germany, and her decease was followed twenty-four hours afterwards by the death of her husband.

DR. C. P. TIELE, well known to the inner circle of theological students by his *Comparative History of the Old Religions* (published in Dutch at Amsterdam 1869-72), has just brought out a small *History of Religion to the Predominance of the Universal Religions* (in Dutch, Amsterdam, 1876), which is well deserving of translation. Dr. Tiele adheres to the comparative principle, as expounded among ourselves by Mr. E. B. Tylor, and treats the existing religions of "savage" races as the best guide to the earliest stages of religion. The author does not withhold his own opinions on disputed points, but, as will be seen presently, supplies the means of testing and, if necessary, correcting them. His course is as follows: From the animistic religions of the *Naturvölker*, of the Mexicans and Peruvians, and of the Finns, he proceeds to describe successively in a clear, precise paragraph-style, the religions of the Chinese, the Egyptians, and the Semitic nations—the various characteristic variations of the latter are carefully noticed, and due account taken of recent cuneiform discoveries. Then follows an important chapter on "Religion among the Indo-Germans, excluding the Greeks and Romans," in which we would draw special attention to the careful summary of the Persian forms of religion. Brahmanism and Buddhism are also described with a proper regard to the researches which have opened up a new world to the historic imagination. A judicious estimate is given of M. Senart's recent attempt to resolve the whole of the story of the Buddha into myth. The last chapter treats of "Religion among the Indo-Germans under the influence of the Semites and the Hamites." A sound explanation is given in the concluding pages of the curious phenomenon of the adoration of the Roman emperors. At the head of each section is a carefully-selected bibliography of the subject, which will prove of great service to the reader, as not only are the good books praised, but the bad ones obelised.

PROF. DELBRÜCK, of Jena, who assisted Prof. Grassmann in his translation of the *Rig-Veda*, has just published an essay on "Tenses in Old Sanskrit" (*Altindische Tempuslehre*). It contains a translation of many intricate passages from the *Rig-Veda* and some of the *Brāhmanas*, and marks a definite advance in our knowledge of Vedic Syntax. The essay forms the second number of a series published by Delbrück and Windisch under the title *Syntaktische Forschungen*.

MR. D. MACKENZIE WALLACE, whose articles in the *Fortnightly* and *Macmillan* have lately shown him to be a trustworthy authority on Russian subjects, has in the press a work on Russia, which in the present state of public feeling is likely to be read with very great interest. It will deal with many subjects, but more particularly with the communal institutions of Russia, the mutual relations of the peasants and what we may call the landed gentry, and the actual and probable effects of the emancipation of the serfs. It will be published by Messrs. Cassell, Petter and Galpin.

At the last meeting of the Manchester Literary Club, it was announced that the MS. Remains of the late John Keble are in an advanced stage of preparation, and that the publication of them will be accompanied by an essay by Dr. Pusey, together with an elaborate criticism by Dr. Newman.

THE LATE MR. CHARLES ISIDORE HEMANS.

It is with great regret that we announce the death of Mr. Charles I. Hemans, our valued correspondent in Italy, which occurred at the Bagni di Lucca on the 26th ult. Mr. Hemans has for some time past been in failing health. After a sharp fit of sickness at Spezia at the beginning of the past summer, he retired to the Baths of Lucca, where he seemed to revive; but the chills of autumn acting on an enfeebled frame laid him low on Thursday, the 26th ult. Mr. Hemans was a son of Mrs. Hemans, the well-known poetess. He left England early in life, and after residing in various parts of Europe finally fixed his abode in Italy, chiefly in Rome, living in the most modest and retired manner with the habits of a close student. It was here that he became more generally known as a scholar of great historic and archaeological attainments. His knowledge was vast and various, and there were few nooks and corners in ancient or modern European literature with which he was not more or less conversant. In this respect he had a great advantage over many of the archaeologists of his time—that he could bring a knowledge of what had previously been said or written on the subject of the antiquities discovered, and thus throw the light of history on their elucidation. Perhaps his greatest forte lay in ecclesiastical history and Christian archaeology: here his knowledge was the most minute and extensive. He published several works on kindred subjects. One of the first was entitled *Catholic Italy*, in which much ecclesiastical art and many institutions were passed in review. This work, however, may be said to be superseded in a great measure by his later ones: *A History of Ancient Christianity and Sacred Art in Italy*, and, more recently, *A History of Mediaeval Christianity and Sacred Art in Italy*, in two volumes, embracing a period from A.D. 900 to 1500. His last work, published two years ago, *Historic and Monumental Rome*, carries the discoveries made in Rome up to recent times, and forms a treasury of knowledge for the student contained in no other work.

Although Mr. Hemans' literary works have failed in a great measure to reach the general public, the shelves of every scholar and student would be incomplete without them. Doubtless future book-makers will trade on Mr. Hemans' capital and make much of it. His works must be taken on their own merits and for the valuable material contained in them, for he borrowed little from graces of style or the meretricious ornaments of diction. Their highest value, of course, is on the spot where they were written.

Of Mr. Hemans' personal character it is almost difficult to speak. Like that of most true scholars, his bearing was quite unassuming and unostentatious. His time seemed always at the command of his numerous friends, and he was never more at home than when, surrounded by a band of enquirers, he was pouring forth his vast stores of learning in illustration or explanation of some of those antiquities which draw so many visitors to the "Eternal City."

His sensitive and amiable temperament could not allow of an enemy. He was never known to speak ill of any one. The Archaeological Society of Rome, in the interests of which he worked much in consonance with Mr. Parker, will lose in him one of its chief pillars and supports. It will also lose in him a Secretary and Librarian, of which he held the honorary posts. He had a large circle of attached friends, every one of whom will feel his death as a personal misfortune. He married late in life, and it is satisfactory to think his last moments were soothed by kind friends, though in a foreign land. He is buried in the pretty Protestant cemetery of the Bagni di Lucca, where doubtless many of his countrymen during their summer stay at that favourite place of *villégiatura* will visit his last resting-place with deep and sincere regret. WILLIAM DAVIES.

NOTES OF TRAVEL.

THE *Pall Mall Gazette* says that it is announced from Lisbon that a Portuguese Scientific Expedition is to be sent to Africa.

A TELEGRAM from Tashkend, of October 29, states that "the Chinese troops have occupied the important towns of Kumadi, Kutubi, Tashikho, and Uruliza. The town of Kumudi was taken by them after an engagement. The inhabitants of Kutubi, Tashikho, and Uruliza have fled to Taksun, where Yakoob Beg is in command of a military force. The Chinese troops have also occupied the northern fortress of Manas." In the very imperfect state of our knowledge of the geography of the region bordering on the Chinese province of Kan-su and the new kingdom of Eastern Turkistan, for which we are still dependent on the old Jesuit Surveys, it is difficult to recognise these points, or to know exactly where the Chinese forces have at length begun to recover their lost ground. Kutubi appears, however, to be the Khartube of our maps, not far west of Hami, which, with Barkul, has all throughout been held by the Chinese; and Taksun is probably Toksan of the maps, at a similar distance west of Turfan, seeming to indicate that the Chinese are advancing towards Turkistan along the main route which leads from Hami to Turfan, Karashar, and Aksu, along the southern base of the great chain of the Bogdo Ola and Thian Shan Mountains. Manas, which lies to northward of this range, has probably been advanced upon by the Chinese from Barkul, along the corresponding route which goes through Guchen along southern Zungaria.

PARTS I. and II. of the *Boletín de la Sociedad de Geografía y Estadística de la República Mexicana* for this year are occupied with a most important paper by José G. Lobato, investigating the meteorological conditions of the Valley of Mexico, chiefly in relation to the remarkable process of gradual desiccation which has been observed to be in progress in the lakes of the valley, and its effects on the climate of the capital. The historical proofs which he gives of this change since the time of the conqueror Hernán Cortés are most interesting, and the problem of how to meet the detrimental effects of its continuance in future is a serious one. Sr. Lobato concludes by recommending an extensive system of canalisation, and the immediate planting of large woods of *Eucalyptus globulus* round the sides of the valley.

THE Bremen "Verein für die Deutsche Nordpolarfahrt" has just published the first of Dr. Finsch's reports of his journey in Western Siberia, which were received from Tobolsk on October 16. The importance of his natural-history collections may be judged of from the fact that he sends home specimens of twenty different mammals, 180 birds, 100 fishes, 200 insects, besides geological samples and plants.

FROM Stockholm the news is received that Lieut. Sandeberg has returned from his ornithological journey to the White Sea well satisfied with its results. On the east coast of the White Sea, in the neighbourhood of the village of Solitzik, where Sandeberg was compelled to land in a storm, he found a great number of stone implements, arrow and lance heads, and knives, which were exposed on an ancient beach by the removal of the sand-drift in the storm.

THE columns of the *Schweizer Grenzpost* and the journal of the Jura district have lately been occupied with the project of M. Sahler of Pruntrut, for the opening of a direct and regular trade-intercourse with the interior of Africa. For some months M. Sahler has been pushing his scheme before the public by lectures and pamphlets in Belfort, Mühlhausen, Montbéliard, and other industrial centres on the borderlands of France, Switzerland, and Germany. The following are the general features of his plan: first, he wishes to collect a fund of 20,000 francs for the necessary

preparatory explorations, and then to bring about the foundation of a share-company with 800,000 francs capital for putting ships upon the enormous navigable length of the Niger, and opening a full communication with the inner rich agricultural and gold-dust districts of the Soudan. The chief articles of trade and barter will be, on the one side, gold, saltpetre, ivory, indigo, and hides; and on the other side, silk, cotton, and other stuffs, weapons, tools, and implements. Stations will be erected at intervals with offices and stores. According to M. Sahler's computations, a magnificent business is to be done, and the *Bund* believes that the project will be opened even though only a smaller capital should be forthcoming.

Our missionary societies seem all bent upon extending their operations to the interior of Central Africa. We have already alluded to Mr. Price's visit to the east coast on behalf of the London Missionary Society. The Church Missionary Society has it in contemplation to establish a mission-station at Karagwei, and a party despatched by it has recently explored the Wami and Kingani rivers, with the view of getting into East Central Africa in that way, but they have so far found themselves unable to turn them to account. The Wesleyan Missionary Society has just come to the resolution to make an attempt to enter equatorial Africa from the west, and with that object it has been determined to re-organise the mission at Macarthy's Island, and to establish a new one at Medina.

We believe that there is no foundation in fact for the statement made by the *Daily News* correspondent at Rome, that the "English Geographical Society" has contributed five thousand francs towards the expenses of the Marchese Antinori's Central African Expedition.

We hear from Paris that an expedition, under the command of a French engineer, M. Celler, but somewhat cosmopolitan in its nature, will leave Saint-Nazaire early next week for Panama, with the avowed object of surveying a route for a ship-canal across the Isthmus of Darien. M. Celler will be accompanied by other French engineers, as well as by three gentlemen from England, Austria, and Italy. The expedition is undertaken under the auspices of the Société du Canal Interocéanique, and we believe that M. Celler is fully convinced of the feasibility of carrying a navigable canal from the Gulf of San Miguel across the isthmus to a point where a junction can be effected with the river Atrato; if he can show that that can be done successfully, he and his companions will certainly be entitled to a handsome reward.

A JOURNALISTIC CURIOSITY.

THE first number of an Arabic newspaper, published in London, has just appeared. It is styled the *Mar-âtu'l Ahwâl*, or *Mirror of Events*, and is edited by Mr. R. Hassoun, a Syrian Arab, and its publishing office is at 33 Fitzroy Street, W. Its contents are written in a somewhat too literary style of Arabic to be readily understood by the common Arab people; but it is evident that the writer of the original articles possesses a remarkable fluency of diction and general command of his native tongue. His nationality is made evident by the bitter attacks he makes upon the villainy of the Turks as compared with the innate nobility of the Arabs. The leading article is a translation of one which appeared in the *Economist* of October 21, on the Eastern Question, asserting that England is not bound to support Turkey. The article headed "Egypt" attacks what it considers the folly of the Khedive's Abyssinian Expedition, and draws the gloomiest picture of his financial prospects. Various items of intelligence from the East, borrowed from English newspapers, are attended by stringent comments.

THE ARCTIC EXPEDITION.

THE Arctic Expedition has returned safely after having, in the face of the most tremendous hardships and dangers, achieved a full and complete measure of success. The difficulties speak for themselves, and no carping criticism can succeed in detracting from the heroic devotion to duty of our brave explorers. But an attempt has been made, in the daily papers, to cast a doubt upon the complete success of the expedition by dwelling on the fact that the North Pole was not reached. It is, therefore, most important that the public should be reminded of the real objects of the expedition, and should know how thoroughly and fully they have been secured.

The North Pole is a mere conventional sign on our maps, indicating a spot to which in itself no possible interest is attached by real geographers. The main object of Arctic Expeditions is to explore the vast unknown area around the Pole; and

worthy of serious discussion. But a coast-line is not only necessary as a means of progress to the threshold of work; it is also essential in order to secure the desired results of Arctic discovery, in geology, botany, zoology, and other branches of science.

The Arctic explorers, by following a coast-line from the entrance of Smith Sound, had to cross the threshold of the unknown region and place their vessels in advantageous positions for discovery—no easy undertaking in itself. They then had to achieve all the discoveries that were possible with the means at their disposal, and to secure valuable results in various branches of science. If all this has been done, the success of the Expedition is secured. It is our pleasing duty to record, not only that it has been done, but that it has been done thoroughly and completely, and in the face of such appalling sufferings and privations as enhance its value a thousand-fold.

Another attempt has been made to detract, in

if that imaginary point was referred to in the instructions, it was because by reaching it a great extent of the unknown region must be traversed. But to send an expedition merely to reach it would be childish aimless.

The object of the Arctic Expedition has been to discover and thoroughly to explore as large a portion of the unknown area as was possible with reference to the means at its disposal, and to the positions the vessels succeeded in reaching as points of departure. To attain those positions, experience has proved that it is necessary to follow a coast-line, and, as two coast-lines cross the threshold in the direction of the Smith Sound route, and in no other, it was known that the Smith Sound route was the best by which to secure the desired objects. The silly theories about open Polar basins and navigable routes caused by the Gulf Stream have long since been discarded by practical Arctic geographers, as un-

some degree, from the full merit of this wonderful success by alleging that the Arctic Expedition of 1875-76 was better fitted out than any former expedition that ever left these shores. This also is utterly untrue. The Expedition was well fitted out; but in no respect had it any advantage over its predecessors, while in some points it suffered under grave disadvantages as compared with them. To take the most recent former Arctic Expedition, that of 1852-54: the provisions were of the same kind, the clothing was similar, the sledge equipments were on the same scale. In none of these respects was there any material difference; and former expeditions had great advantages over that of 1875-76 in having their vessels better warmed, in having a far larger number of men to do the work, in having a depot ship to fall back upon, and in having annual communication with England duly provided.

The Arctic Expedition of 1875-76 was in no

respect better fitted out than those which preceded it; while it had greater dangers and difficulties to overcome, and far more scientific work of a very laborious kind was expected from it. It must be a source of pride to every Englishman to know that his gallant countrymen, with undermanned ships and inadequate means as compared with the work to be done, have, with rarely equalled fortitude and bravery, added so glorious a page to our national history. Let us now follow them in their laborious and desperate task, and learn by what heroic devotion, and through what terrible hardships, their success has been achieved.

First it was necessary to force a way through the ice-encumbered channel between Baffin's Bay and the Polar Ocean. The *Alert* and *Discovery* passed between Capes Alexander and Isabella, the portals of Smith Sound, and entered the channel leading to the Polar Ocean on July 29, 1875, and from that time until September 1, when the *Alert* crossed the threshold of the unknown region, it was one continual struggle with the ice. The rapid passage of the *Polaris* up this channel was a lucky accident. Its normal condition is a complete block of heavy floes, with occasional leads of water caused by the action of wind and tide. It was with extreme difficulty that the two vessels forced a passage, and their success was mainly due to the untiring vigilance and skill of Captain Nares himself, who literally lived in the crow's nest during this period. After many hair-breadth escapes, and unceasing labour day and night, the expedition at length reached the north shore of Lady Franklin Inlet, where an excellent harbour was found in $81^{\circ} 44'$ N. latitude. Here the *Discovery* was established in winter quarters, while the *Alert* pushed onwards to the unknown region.

It was some days before the *Alert* could make any progress; but at last a fresh gale opened a lane of water between the land and the ice, and the gallant ship dashed onwards to the goal, and crossed the threshold of the unknown, rounding Cape Union, and entering the Polar Ocean. Then, in $82^{\circ} 20'$ N., the white ensign was hoisted on board a British man-of-war in a latitude further north than any flag of any nation had ever flown before, or will ever fly again until the despatch of another British Naval Arctic Expedition. Soon afterwards the impenetrable Polar pack closed in upon the land, and on September 3, 1875, the *Alert* was fixed in her winter quarters, on the shores of the great Polar Ocean, in $82^{\circ} 27'$ N. latitude.

This was the first grand success, and it assured the ultimate completion of the work. For, thanks to the admirable seamanship of Captain Nares, and to the zeal and devotion of the officers and crews, the vessel had been forced across the threshold, and was within the unknown region. A point of departure was thus secured which rendered the achievement of complete success certain, because in whatever direction the sledge parties went valuable discoveries must be made.

The autumn travelling, when depôts are laid out for the spring work, exposed the gallant explorers to the most terrible dangers and privations; but the detailed narrative must be read before an adequate notion can be formed of the intensity of those hardships, and of the heroism of the brave men who faced them. Lieutenant May and two men suffered amputation from frost-bites.

The vessels wintered further north than any ships ever wintered before, the sun was absent for 142 days, and the cold was far greater than any previously registered. The magnetic observatory was erected, as well as a general observatory, and a vast mass of most valuable scientific observations was taken during winter quarters.

But the crowning glories of this ever-memorable campaign were achieved during the spring. The plan was for three main travelling sledge-parties to explore, while the naturalists and other officers made collections and did other valuable work

nearer the ships. Commander Markham, accompanied by Lieutenant Parr, was to strike due north into the newly-discovered Polar Ocean; Lieutenant Aldrich was to explore the coast to the westward; and Lieutenant Beaumont, the leader of the extended party from the *Discovery*, was to advance along the north coast of Greenland.

On April 3, 1876, the six sledges, with their crews of brave and heroic men, were assembled alongside the *Alert*, and started on their desperate mission. After reaching Cape Joseph Henry they parted company, Aldrich working westward, while Markham and Parr pushed due north over the stupendous masses of ice of which the Polar Ocean is composed. When the narratives of these unparalleled journeys are given to the world, some idea will be formed of the work that was done, and of the difficulties that were overcome. The men who performed these deeds have won a place in the front rank of England's chivalry. Our aim now is to speak of the grand results which have crowned their efforts with success.

Commander Markham and Lieutenant Parr reached the latitude of $83^{\circ} 20' 26''$ N. They have thus won the blue ribbon of Arctic discovery. They and their sledge-crews are the men who have been further north than any other human beings; and they succeed to the honourable post which was held by Parry for nearly half a century, but which he must now resign to his younger brother-officers. How joyfully would he have himself welcomed their success, had he been spared to hear the glorious news! How, too, would Admiral Sherard Osborn, whose persevering advocacy created the Expedition, have rejoiced at the honour thus won by two officers, both of whom he had himself selected as the men for Arctic work. In Osborn the Expedition lost its best and truest friend.

Lieutenant Aldrich pushed onwards to the westward, rounded Cape Colombia in $83^{\circ} 7'$ N., and discovered 220 miles of new coast-line, which he has accurately delineated.

Lieutenant Beaumont crossed Robeson Channel, and discovered the northern coast of Greenland for a distance of seventy miles.

In order to enable these three main parties to do their work successfully, every soul in the two ships was actively employed. The depôt and relieving parties did most arduous work, and the officers vied with each other in promoting the objects of the Expedition, while the most perfect harmony and unanimity prevailed. Captain Feilden and Mr. Hart were especially active in making natural-history collections; and Lieutenants Giffard, Archer, Rawson, Egerton, and Conybeare did admirable work in exploring and keeping open communications.

When all had come back to the ships, Captain Nares found that the sufferings had been terrible, that the work achieved was unsurpassed in the annals of discovery; but he also found that the heroic devotion of officers and men had secured for the Expedition complete success. The work was done, and he was able to decide upon returning to England.

At present our object has merely been to point generally to the great success that has been achieved, and to the value of the results, a value far in excess of the cost of the Expedition, if that cost had been ten times the paltry sum that was voted. In future numbers we shall dwell upon those rich and varied results in detail. We will now conclude by a brief general enumeration of them.

First, a great Polar Ocean has been discovered and fully described, which will revolutionise most preconceived ideas, and a knowledge of which will be most valuable to the science of hydrography. Next a coast line, stretching for 50° of longitude along the Polar Ocean, has been discovered and carefully delineated, and an exhaustive knowledge of its geology, fauna, and flora has

been obtained. The long channel, from Smith Sound to the Polar Ocean, has also been carefully delineated, and the shores on both sides have been explored and described. Most important discoveries have been made with reference to the geology of the unknown area, the value of one of which, —namely, the former existence of an evergreen forest in $82^{\circ} 44'$ N.—is alone worth all that has been expended on the Expedition. In zoology and botany the results are equally valuable, especially as regards the distribution of plants and animals. Add to this that complete series of observations, at two separate stations, have been recorded in meteorology, magnetism, tides, electricity, and spectrum analysis; besides other results not yet reported.

On the whole, then, for the richness and value of its scientific results, and for the complete success of its labours, the Arctic Expedition that has now returned to England must take a front rank in the long roll of similar enterprises. The Arctic explorers have raised the name of Englishman among the nations of the earth, and for this the sincere thanks of their countrymen are due. They have nobly earned the warm and hearty welcome which has greeted their return.

CLEMENTS R. MARKHAM.

STATISTICS OF THE GERMAN UNIVERSITIES.

ACCORDING to the latest statistical accounts, the German Universities had the following number of matriculated students and public teachers during the Summer Term, 1876:—

	Students	Teachers
1. Leipzig	2,730	155
2. Berlin	1,977	193
3. München	1,158	114
4. Breslau	1,122	108
5. Göttingen	1,059	119
6. Tübingen	1,025	86
7. Würzburg	990	66
8. Halle	902	96
9. Heidelberg	795	110
10. Bonn	785	100
11. Strassburg	700	94
12. Königsberg	611	82
13. Greifswald	507	60
14. Jena	503	77
15. Marburg	445	69
16. Erlangen	422	55
17. Münster	415	29
18. Giessen	343	50
19. Freiburg	290	54
20. Kiel	223	65
21. Rostock	141	36
	17,143	1,827

The following list shows the largest and lowest number of students belonging to each Faculty in the principal Universities:—

Protestant Theological Faculty.

Leipzig	338
Tübingen	260
Halle	190
Erlangen	196
Rostock	24
Heidelberg	9

Roman Catholic Theological Faculty.

Münster	184
Würzburg	119
Tübingen	118
Freiburg	47

Law Faculty.

Leipzig	1,002
Berlin	684
Breslau	377
Göttingen	372

CORRESPONDENCE.**THE GEOGRAPHY OF NORTHERN SYRIA ACCORDING TO THE ASSYRIAN INSCRIPTIONS.**

Oxford: Oct. 23, 1876.

I pointed out in the ACADEMY of September 16 that Mr. George Smith's identification of the site of Carchemish with the modern Jerablûs enables us to fix the site both of Pethor at the mouth of the Sajur, the 'Sagura' of the Assyrian inscriptions, and of Ptolemy's Barsampse, the Assyrian Tul-

Barsip, at some point on the eastern bank of the Euphrates opposite Jerablûs. I find from Buckingham's *Assyria and Mesopotamia*, p. 60, that the cliffs overhanging the junction of the Sajur and Euphrates are full of artificial excavations, while it seems likely that the ruins now known as Bilha, opposite Jerablûs, mark the site of Tul-Barsip. According to Shalmaneser, Akhuni, son of Adini, and king of Tul-Barsip, possessed six strongholds on the western side of the Euphrates, among them being 'Surunu, Paripa, Mabasere, and Dabigu. Near the latter was 'Sazabe, "the stronghold of 'Sangara, king of Carchemish," which I would identify with the modern Nizeeb, the Nisibin of the Romans. On the same side of the river as Tul-Barsip, and in its immediate neighbourhood were the cities of Nappig, Allig or Alig, Many and Rugulit. Allig seems to have been a place of importance. It was the nearest town to Tul-Barsip, and is clearly represented by the modern Ledjah. Northward of Carchemish came 'Sugab, and beyond that Birtu, the modern Bir—which is joined with Dabigu and called a city of the Hittites on the Black Obelisk (34)—and Bit-Zamâmi or Samosata (?). Still further to the north was Melid, Melidia or Meladdu, the classical Melite, now Melatiyeh.

It is puzzling that no place is mentioned in the Assyrian inscriptions which would occupy the position of Mabug or Bambyke, the importance of which is not only evidenced by classical and ecclesiastical writers, but also by the remains which still exist. It is too far from the Sajur to represent Pethor; on the other hand, the only city near Pethor in a south-western direction was Khahnan, which has usually been identified with Aleppo. Khahnan certainly lay between Pethor and Hamath, which would suit Aleppo admirably; but it was also at the "head of the lowground of the 'Sime'sians," a people of western Mesopotamia, who extended from the Ziuri in the south to the city of Arid in the north. As for Pethor, it probably stood where the ruins of Auz are marked on the maps.

One of the most important cities to the west of Carchemish was Khazazu or Khazzi, a stronghold of the Patinians. It must plainly be identified with the modern 'Azaz, as 'Azaz occupies exactly the position the monuments assign to Khazazu, and the two names correspond letter for letter. 'Azaz is about twenty-six miles to the north-west of Aleppo. Other towns of the Patinians were Nulia and Butannu, the latter of which may be compared with the Nahr-el-Butuyune, one of the confluent of the Orontes. On the west side of the Aprie or Ephrenus was Kunalua or Kanulua or Kinalie, the capital of the Patinians. The Patinians extended southward to the Orontes, Alizir, one of their cities, probably occupying the site of Antioch, and their neighbours on this side were the Kahuians or Kuans. On the north they bordered upon the 'Samahilians, who inhabited that part of the Amanus range which abuts on the bay of Antioch, and were the southern neighbours of the Gamgumians or Gugamians. The latter people were again to the south of Kummukh or Comagene, which in Assyrian, as in later times, was on the west and not on the east of the Euphrates.

Maundrell visited the remains of Jerablûs in 1699, and describes them as surrounded by a semicircle of walls, some 2,250 feet in circumference, and pierced by well-preserved gates. The Euphrates forms the other semi-circle of fortification, and on the north side flowed under an eminence, on the top of which was a ruined castle. Here Maundrell discovered columns, capitals, and cornices of good workmanship, and at the foot of the eminence a large stone, on which a lion with a bridge in its mouth was sculptured. Pococke also visited the place some thirty-seven years later, and states (*Travels*, ii. p. 165) that by what remains the city

"appears to have been of an oblong square figure; it is watered on the north by a small stream; the old

town is about half a mile long from north to south and a quarter of a mile broad; it has very high ramparts on every side, except towards the river. . . . There was an entrance on each side of these three sides, the two largest of which are to the west and south; I saw some remains of a basement of hewn stone on the west side, but to the south I saw only the foundation of the gateway. There is a long mound on the east side over the river, which is between forty and fifty feet high, extending southwards about two-thirds of the length of the city, and is sixty-six paces wide; the ascent to it is opposite to the west gate. This was, without doubt, a castle, and it was encompassed with a wall about eight feet thick. On the south side of the town there are foundations of a building, which are a little to the north of some considerable heaps of ruins; they lie in such a manner that it may be concluded there were great buildings in that quarter, divided from one another by short streets. These buildings probably belonged to a temple, which seems to have been to the west, though very little of the foundations could be discovered, as there is a ruined village on that spot. To the north I saw a wall with pilasters on one side of it; this wall is about a hundred and seventy paces long. I took notice of four low walls to the south, which seemed to have been the basements of four colonnades of a grand entrance or avenue; I saw also several bases and pillars which lay scattered about this place."

Pococke had little idea that he was describing the site of Carchemish. A. H. SAYCE.

"JUGGERNAUT" CALLED IN QUESTION.

Hamlet House, Hammersmith: October 23, 1876.

I regret that circumstances of a private nature should have prevented my giving prompt attention to Prof. Bain's letter to the ACADEMY of September 30, which obviously required the reply which Mr. Poynder has called for.

The single sentence quoted by Prof. Bain and Mr. Poynder from my pamphlet, *Human Sacrifices in England*, hardly represents my statement fully enough, and I must beg to add one or two more sentences of it:—

"We have now learned on the best authority that all those pictures of Hindoos casting themselves beneath the Jugernath car to be crushed were purely imaginary. . . . The crowd of the curious and the devotees is enormous, and no doubt many accidents have happened. . . . But there are no intentional sacrifices under the car of Jugernath, nor could there ever have been at any period. For Jugernath, or rather Jagarnath, means simply the 'Lord of Life.' . . . Nothing is more rigidly forbidden than to slay anything that has life in the neighbourhood of the Lord of Life."

There seems to be no doubt that the car and its image originally representing Vishnu, at present Krishna, could never have been, in association with either deity, the scene of either human or animal sacrifice except by an extreme anomaly. To offer even a faded flower to either is a sin. Were there any human sacrifices, it could only be through some Sivaites from a distance, ignorantly carrying thither their own local notions of sanctity. But on re-examining the evidence usually relied on to prove this anomaly, I was led to suspect it. Most of the missionary evidence was hearsay; but even in the case of the alleged eye-witness, the Rev. Claudius Buchanan, who was largely responsible for the popular notion, the testimony appeared to me untrustworthy. It is too "sensational." A body of men with branches becomes "a grove advancing;" the women emitted a sound "as if a serpent would speak by their organs." But above all Mr. Buchanan calls Jagarnath "the Moloch of India"! Coming with such a view, he was too much in the mental attitude to see human sacrifices to be disappointed. He was in the procession behind the tower, and could hardly have witnessed the immolation he describes of a pilgrim in front of the wheels, especially as the number of people was such as to bring to his mind "the countless multitude of the Revelations." Yet even Mr. Buchanan de-

scribes but one such death, and that little comports with the popular notion of the car. The Abbé Dubois does not profess to be an eye-witness, and, if he did, his declaration that the spectators (naturally Vishnuites) hail human sacrifices under the car "as the perfection of devotion" would convict him of something worse than ignorance of the facts. Mr. Poynder must see how insufficient is the testimony he has cited, in which there is but one instance that can possibly be regarded as directly recorded by the person who witnessed it; and even in that one case how impossible it is to be certain that he did witness it, or, if he did, that it was an act of religious self-immolation. All the probabilities are against its having been an act of devotion. The Rev. J. F. Clarke, President of the American Unitarian Association, whose work, *Ten Great Religions*, represents a thorough and impartial investigation of all such points as this, says the car is—

"drawn by hundreds of men, it being their faith that each one who pulls the rope will certainly go to the heaven of Krishna when he dies. Multitudes therefore crowd around the rope to pull, and in the excitement they sometimes fall under the wheels and are crushed. But this is accidental, for Krishna does not desire the suffering of his worshippers."

It appears to me, then, that there is no trustworthy evidence at all to justify any doubt as to the careful adjudication on the whole case by Dr. W. W. Hunter in his *Orissa* (Smith, Elder, and Co., 1872):—

"In a closely-packed eager throng of a hundred thousand men and women, many of them unaccustomed to exposure or hard labour, and all of them tugging and straining to the utmost under the blazing tropical sun, deaths must occasionally occur. There have doubtless, been instances of pilgrims throwing themselves under the wheels in a frenzy of religious excitement. But such instances have always been rare, and are now unknown. At one time several unhappy people were killed or injured every year; but they were almost invariably cases of accidental trampling. The few suicides that did occur were for the most part cases of diseased and miserable objects, who took this means to put themselves out of pain. The official returns now place this beyond doubt. Indeed, nothing could be more opposed to the spirit of Vishnu worship than self-immolation. Accidental death within the temple renders the whole place unclean. The ritual suddenly stops, and the polluted offerings are hurried away from the sight of the offended god. According to Chaitanya, the apostle of Jagannāth, the destruction of the least of God's creatures was a sin against the Creator. Self-immolation he would have regarded with horror. The copious religious literature of his sect frequently describes the Car Festival, but makes no mention of self-sacrifice, nor does it contain any passage that could be twisted into a sanction for it. Abul Fazl, the keen Mussulman observer, is equally silent, although from the context it is almost certain that, had he heard of the practice, he would have mentioned it. So far from encouraging self-immolation, the gentle doctrines of Jagannāth tended to check the once universal custom of widow-burning. Even before the Government put a stop to it, our officials observed its comparative infrequency at Puri."

Dr. Hunter refers to Stirling, *As. Res.* xv. 324; *Calcutta Rev.* x. 235; *Report of Statistical Com. to the Government of Bengal*, 1868, part ii. p. 8; *Puri Police Reports*; Lieut. Laurie's *Orissa*, 1850. An examination of the facts will, I think, prove that Dr. Hunter has conceded the utmost that can be claimed for the popular representations. The Commissioner of Orissa, writing not long after the province passed under English rule, says:—

"During four years that I have witnessed the ceremony, three cases only of this revolting species of self-immolation have occurred: one of which, I may observe, is doubtful, and should probably be ascribed to accident. In the other two instances the victims had long been suffering from excruciating complaints, and chose this method of ridding themselves of the burden of life in preference to other modes of suicide."

But self-immolation by no means describes suicide.

And all this was some seventy years ago. Dr. Hunter having gone over the MS. Archives of Orissa from the day it came under English control, confirms the general truth of the Commissioner's statement, and adds: "We complain that the Hindus do not appreciate our English institutions or accept our beliefs. Do we rightly understand theirs?"

A paragraph in the *Newcastle Chronicle* has just caught my eye which mentions that when the Prince of Wales visited St. Paul's after his recovery, several persons were crushed to death. One can imagine this phrase reaching some distant island in such a shape as to leave there a tradition that it is usual to sacrifice human victims in England on the recovery of a prince, as part of a Thanksgiving Service. Especially might this be the case if the sentence were reported and interpreted by priests anxious to place Christianity in its worst light. If we were to smile at such a notion we should only be doing what every educated Hindu probably does, so often as he finds Englishmen believing that human sacrifices were a part of the normal worship of Jagannāth, Lord of Life.

MONTE D. CONWAY.

THE ETYMOLOGY OF "WIDOW."

Victoria Park, Manchester: Oct. 30, 1876.

The derivation of widow (*vidhava*) referred to by M. Jules Andrieu in the *ACADEMY* for Oct. 21 is one which is frequently regarded as certain. But it seems worth while to point out that the great authority on Sanskrit, the Petersburg *Wörterbuch* of Böhlthring and Roth, treats it as impossible, because of the late date of the word *dhava*, husband, which is supposed to enter into it.

A. S. WILKINS.

THE MEANING OF "RESIDENCE."

Corpus Christi College, Oxford: October 30, 1876.

With most admirable good temper, beyond what many might think my deserts, Dr. Appleton has noticed his presence by name among *Some Dreams of a Constitution-monger*.

On all the main questions concerning Academic re-organisation there has always been, so far as I know, a substantial and complete agreement between Dr. Appleton and myself. I write now to add that I most cordially and unreservedly concur with his present opinions on non-residence, as those opinions are expressed in his letter to the *ACADEMY* of October 24.

It appears to me that it would be neither judicious nor becoming in me to dilate, in these pages, on any triding differences which might be discovered to have existed as to the points of departure from which we have respectively approached one particular piece of the field of general controversy; and this the more because, notwithstanding such past and partial divergence, we have at length somehow got, it would seem, to stand on the same ground and very close to one another.

Moreover, if I may once more return to the metaphorical language of my pamphlet and of Dr. Appleton's letter in last week's *ACADEMY*, this is not a time for divisions in Israel, inasmuch as—the fact is one of which, doubtless, Dr. Appleton is made somewhat aware by the hearing of the ear; it is one which I most manifestly perceive by reason both of his exceeding great stature and of the tinkle of his weapons of brass—the Philistine is still in the land.

ROBERT LAING.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, Nov. 6.—7 P.M. British Architects.

TUESDAY, Nov. 7.—8.30 P.M. Biblical Archaeology: "Mémorial of the Life and Labours of the late George Smith," by W. St. C. Bosawen; "Notes on the Hymenite Inscriptions contained in the Museum of the R. A. S. of Bombay," by Capt. W. F. Prideaux; "Further Notes on the Same," by Dr. Heinrich Müller; "On the Writings of Ephrem Syrus," by the Rev. J. M. Rodwell.

8.30 P.M. Zoological: Papers, &c., by the Secretary, Dr. Otto Finsch, Mr. E. Ramsay, Lieut.-Col. Beddome, Dr. A. Günther, Mr. W. R. Parker, and Dr. G. E. Dobson.

THURSDAY, Nov. 8.—8 P.M. London Mathematical: Papers by Messrs. W. Spottiswoode and J. W. L. Glaisher.

FRIDAY, Nov. 10.—8 P.M. New Shakespeare Society: "The Character of Hamlet not entitled to the Admiration often bestowed on it," by F. J. Furnivall.

SCIENCE.

The Physiology of Mind. Being the First Part of a Third Edition, revised, enlarged, and in great part rewritten, of "The Physiology and Pathology of Mind." By Henry Maudsley, M.D. (London: Macmillan & Co., 1876.)

In this volume Dr. Maudsley gives us in a greatly enlarged form the first part of his *Physiology and Pathology of Mind*. The author's special studies appear to point in the direction of the latter of these two divisions of the subject, and readers of his earlier works have probably felt that their main interest and value lay in the illustration and explanation of the numerous disturbances to which the mental functions are liable through various disarrangements in the bodily organism. The study of such disorders does no doubt, as Dr. Maudsley urges, greatly contribute to the understanding of the conditions of the normal processes of thought and volition. Yet the full investigation of these conditions is a very large field of research, employing distinct and intricate methods of its own, so that one can hardly expect a writer to do justice to the subject unless he has made it his one absorbing study. Dr. Maudsley in the present volume succeeds in showing how much a man may effect by an industrious reading in a department of knowledge to which his own principal activities are only indirectly contributory. He presents us with many of the latest results of physiological research, in Germany as well as in England. At the same time the omissions of the volume are numerous and striking. For example, the physiological basis of attention, as also that of the motor intuitions or representations, is discussed without any reference to Wundt's theories in his *Grundzüge der physiologischen Psychologie*, although oddly enough the author more than once quotes from this very work. The hypothesis that the source of our ideas of movement is in part a mode of feeling which accompanies the process of motor innervation has received so much attention both in England and in Germany that no discussion of motor representations should omit to take account of it. Not only does Dr. Maudsley overlook here and there new theories of a subject, he even omits all discussion of topics which rightly fall under his subject-matter. As an instance of this I would point to the meagre treatment of the sensations which contains no reference to the physiological conditions of quality in sensation and to the important question of the "specific energy" of the sensory nervous fibres.

The cause of these omissions soon betrays itself to a careful reader of Dr. Maudsley's volume. Although the work is systematic in form, passing in order from the lowest to the highest nervous processes which are connected with mental action, its ruling motive appears to be not so much the desire to supply an exhaustive exposition of the physiological data of mental science, as the wish to justify a certain fundamental conception of the relation of physiology to psychology. The author tells us in his preface that his aim is to elevate the "physio-

logical" and to depress the "psychological" study of mind. In his first chapter, which discusses the method of this study, he argues very strongly against the plan of observing mental phenomena and their laws by individual introspection, and points out numerous objections to this method. He does, indeed, in more than one place, allow in a parenthetical way that subjective reflection has some part to play in the science of mind, but he nowhere takes any pains to define its function, and in one place tells us that the union of the introspective method with the physiological as attempted by modern psychologists is impossible (p. 42). On the other hand the author distinctly maintains that the facts of conscious life are consequences of wider laws, namely, those of nervous action and organic function in general, and can only be truly explained as deductions from these principles. More particularly consciousness is much narrower than mental function. What is usually called mind includes innumerable processes which have no conscious side at all, and which can only be expressed in terms of nervous action, and even "the most important part of mental action, the essential process on which thinking depends," is carried out through an unconscious cerebral activity. More than this, consciousness accompanies mental function in all degrees of intensity, and cannot, therefore, be used as the clue to these functions. Even in the case of mental operations which are attended with full consciousness this source of knowledge tells us nothing respecting the material processes which are the real cause of these activities. To sum up, the dominant conception in Dr. Maudsley's exposition is that consciousness is a wholly accidental ingredient in mental activity, and he distinctly tells us that, as far as he can see, "a man might be as good a reasoning machine without as he is with consciousness, if we assumed his nervous system to be equally susceptible to the influences which now affect him consciously."

In so far as Dr. Maudsley seeks to illustrate throughout the several orders of the activities of the nervous system the numerous and close resemblances between conscious and unconscious operations, he seems to be quite successful, and his book may be regarded, in spite of some omissions, as an excellent summary of the evidence in favour of the doctrine that all conscious actions have nervous processes as their physiological counterpart. His endeavours, too, to define the limits of conscious activity and to check the rather hasty inferences respecting the existence of lower centres of consciousness will doubtless strike the thoughtful reader as worthy of all attention. Dr. Maudsley has no sympathy with those who would extend the region of feelings and ideas beyond the bounds of subjective consciousness, and though by a certain looseness of expression which is not perhaps altogether avoidable he persists in speaking of nervous processes unattended with consciousness as "sensations," "ideas," and so on, he reasons forcibly against the conclusion that because many other actions of the nervous system resemble those usually attended with consciousness, they must also share in this property. At

the same time Dr. Maudsley hardly defines with sufficient exactness what kinds of nervous action are attended with consciousness in its various degrees, and how these are to be marked off from the others; and here too one seems to notice an incomplete appropriation of the results of recent research.

Yet, though Dr. Maudsley may be said to have made out one main part of his case, I hardly think that he has sufficiently recognised and guarded against the objections which may be brought against his leading conception of mind. For one thing, the writer, in his eagerness to assimilate conscious actions to nervous actions in general, seems to forget that the facts of consciousness constitute a region of phenomena wholly unique, and that it is the peculiar business of psychology to give an account of these. Dr. Maudsley cannot erase the sharp and distinct line which divides a conscious feeling or thought from a purely material movement by lumping them together under the head of "mental" functions. Strictly speaking, nervous processes, wherever their seat may be and whatever their complexity, only become mental in so far as they are attended by some mode of consciousness. It strikes one that Dr. Maudsley is rather prematurely enlarging the meaning of the term psychology by making it synonymous with the science of nervous function.

Not only so, if the subject-matter of psychology is consciousness in its various forms the instrument of introspection is at least equally necessary with that of physiological observation. Supposing it to be well established that conscious operations are the product of physiological conditions, we cannot any the more on this account reach the former through the latter. Not only have single states of feeling to be known and classified by means of introspection; the numerous combinations and sequences of these, and the so-called laws of mental phenomena can in the last resort only be ascertained in precisely the same way. Every chapter, almost every page, of Dr. Maudsley's work illustrates the impossibility of talking about mental phenomena without making use of the fruits of subjective reflection, which may be supplemented, indeed, but can never be displaced by the objective study of others' mental actions. The author can hardly be wholly unaware of these rather obvious propositions in psychology, yet his extreme disparagement of the "psychological method" suggests that he has never realised their full significance.

Finally, the critical reader of Dr. Maudsley's book will probably doubt whether, after all, he has shown that conscious life is a product or effect of nervous conditions. It is curious to note how the representatives of the theory of human automatism overlook the difficulties which arise out of the very existence of such a thing as consciousness. If the incoming and outgoing currents of nervous action are self-sufficient, and consciousness only something extraneous accidentally appearing at the bend of the stream, is it not a little hazardous to talk of it as a "co-effect"? At least it is no effect that can be brought under the great

principal of the conservation of energy, since all this energy is accounted for apart from the conscious process. But, waiving this objection, one may ask whether the discovered sequences and co-existences of nervous action and conscious operation are all reducible to simple relations of cause and effect. It strikes one that Dr. Maudsley has not sufficiently thought on this matter, and the principal fault of his book lies in the hasty proposal of easy physiological interpretations of mental phenomena which are only apparent explanations. Nothing is easier than to say, for example, that memory is only one manifestation of a universal property of nerve-substance—namely, the capacity for retaining past impressions. But this kind of explanation is as deceptive as it is helpful. How do any laws of nervous action help us to account for the simple fact that in recollection a present mode of consciousness (an idea) appears as representing a past mental event? Again, Dr. Maudsley seeks, so far as I understand him, to deduce the necessity of pleasure and pain from purely physical processes. The argument is worth quoting.

"As the organic germ does, under circumstances favourable to its inherent developmental impulse, incorporate matter from without, exhibiting its gratification by its growth; and, under unfavourable conditions, does not assimilate, but manifests its suffering or passion by its decay; so likewise the ganglionic nerve-cells of the hemispheres attest by a pleasant emotion the furtherance of their development, and declare by a painful feeling of discomfort the restriction or injury which they suffer from an unfavourable stimulus."

In many similarly fanciful "explanations" Dr. Maudsley only succeeds in giving any meaning to the argument by investing purely physical processes with a *quasi*-volition—that is to say, by re-introducing into inanimate nature those very ideas of conscious representation and aim which he has in another part of his volume taken great pains to eliminate. For example, he speaks of the impulse of creative will in man as coming "from the same unfathomable source as the impulse which inspires or moves organic nature throughout nature;" and he tells us that the moral sense has its root in the instincts of propagation, the aim of which is "not appropriative but distributive, not egoistic, so to speak, but altruistic." It is not a little odd to find a writer setting out with the rigid methods of physical science and reaching conclusions which have a close resemblance to propositions in the metaphysics of Hegel and of Schopenhauer. I do not here raise the question how much physiology can contribute to the understanding of properly mental phenomena, but simply wish to guard against such empty solutions as some of those which Dr. Maudsley here gives us. Yet in doing this I would not run the risk of seeming to overlook all the interesting and valuable matter which Dr. Maudsley's volume undoubtedly contains.

JAMES SULLY.

A VOLUME of *Philosophical Discussions*, by the late Prof. Chauncy Wright, of Harvard, edited by Prof. Charles Elliot Norton, is announced by Henry Holt and Co. This firm will likewise publish a treatise *On Government*, by Mr. E. L. Godkin, editor of *The Nation*.

THE ARYAN SERIES OF PALATAL CONSONANTS IN
THE TEUTONIC LANGUAGES.

Die Palatalreihe der Indogermanischen Grundsprache im Germanischen. Von Hermann Möller. (Leipzig, 1875.)

THE brochure before me is a *Separatdruck*, but from what publication I do not know: however, it is an essay of very considerable merit, not the least important item in which is the fact that it is devoted to the discussion of a much-neglected subject. The author begins with the now well-known distinction of the *k* sounds into two sets, which he calls velar and palatal. The Aryan velar consonants were *k*, *g*, and *gh*, which I should rather regard as having been *kv*, *gv*, and *ghv* respectively, as they are the antecedents whence Teutonic *hw*, *qv*, and Welsh and Greek *p* and *b*. The palatals he writes *c*, *ç*, *çh*, and it is with them that he is concerned. These, it is also well known, have spirants corresponding to them in the Slavonic languages—namely, O. Bulgarian *s*, *z*, and Lithuanian *sz*, *ž* respectively. Mr. Möller shows that a change in the same direction has played an important part in the Teutonic languages. And this applies, he says, not only to obscure dialects, which might have escaped the glottologist's notice, but among others to a language which is known to every scholar and enjoys a world-wide importance—he alludes, it need hardly be said, to English. The palatal consonants seem to have sooner or later developed a parasitic semi-vowel *y*, which has both had an influence on the vowel following and helped to produce the spirants of such English words as *cheap* and *chide*. Now, the great Teutonic field for studying these phenomena of phonology is that group of languages consisting of English in all its stages, and the various Frisic dialects, especially those of the islands in which Mr. Möller is thoroughly at home. Having carefully surveyed this ground he is prepared to detect the fainter traces of the influence of the palatals in the other Teutonic languages. How far he has exhausted the subject, and with what success he has disposed of its details, I leave to Germanists *von Fach* to decide. In any case the attempt deserves to be brought under the notice of English scholars, especially as English is, on the whole, the last language to secure their attention.

But before closing this notice I venture to make the following incidental remarks suggested by the perusal of Herr Möller's essay. He is quite justified in finding fault with Fick's inconsistency in distinguishing two kinds of Aryan *k* (Möller's *k* and *c*), and not doing so in the case of Aryan *g* and *gh*.

He suggests that the English runes distinguished his velars and palatals: those standing for the former being called *kalk* and *gár*, and those for the latter *cén* and *gifu* respectively. Nothing could be neater, and I should very much like to see it proved.

It is not unusual to attribute the English *ch* already noticed to Norman influence, which, as some seem to think, may be made to account for anything in English history; but the change whereby English *ch* was produced extends to the entire Anglo-Frisic

group of languages, and not only that but it has been carried much further in most of the Frisic dialects than in English.

His line of reasoning leads the author to take cognisance also of the Romance languages so far as they contain Teutonic elements, and he finds the means of answering the hitherto unanswered question why Italian *giardino* begins with our *j* sound instead of having taken the form *gardino*, in the fact that Teutonic *gard-*, represented in English by *yard*, is one of those words which began with a palatal *g*. He further thinks that such Latin loan-words as Early English *cealc* and *ceaster*, now *chalk* and *Chester*, with their palatal *ce*, must have reached the Teutons through the Celts. This opens up a question which he has not exhausted—namely, why has French everywhere made the *c* of Latin *ca-* into *ch*? Diez has failed to give a satisfactory answer, and in fact he acknowledges as much. The Latin velar *c* was changed into a palatal *c*, but by whom? There is no reason to ascribe it to the Teutonic invaders of Gaul, for they were in the habit of distinguishing the two *k* sounds in their own language; and had they been tempted to change the Gaulish pronunciation of the Latin *ca-* they would have had every reason to substitute a velar *c* for a palatal one before *a*, and not *vice versé*. So I cannot help concluding that the palatal pronunciation of Latin *ca-* must have been the Gaulish pronunciation, which the Teutonic settlers did not disturb. If so, French *ch*, as in *chambre*, for Latin *c* followed by *a* as in *camera*, may perhaps be rightly regarded as one of the greatest Gaulish facts in the French language. It is easily explained on Celtic grounds, as all the Celts seem to have kept the velar and palatal mutes perfectly distinct; for when first we read of the Gauls their velar *c* had become *p*, so that probably all the other *c*'s in their language were at one time palatal, which led the way to their palatalising also the Latin syllable *ca*. Sooner or later, however, the palatal seems to have given way to the velar when the vowel following was *u*, and such a form as *Sequana* was probably a contraction of some such a longer one as *Secvina*, after the change from *qu* into *p* had become an obsolete process in the language. The case of French *j* for the *g* of the Latin syllable *ga* is so nearly parallel that it needs no special mention.

Herr Möller shows evident dissatisfaction with the usual classification of the Teutons into Low Germans, High Germans, and Scandinavians; but his own classification is not clearly enough indicated to be understood by an outsider, and I should be glad if he would devote a future paper to this important subject. He would also be doing a very good work if he would undertake to examine the velar series as carefully as he has done the palatals. It would be interesting not only to students of the Teutonic languages, but also to Celtists and classical scholars. An instance will make this clearer:—Irish *nocht*, Welsh *noeth*, Latin *nūlus*, are represented in English by *naked*; now, I do not recollect having ever seen a satisfactory account of the long *u* in the Latin word, but on consulting Ulfilas one finds that the Gothic form was *naqvaþ-s*

with the *v* retained, which shows unmistakeably that *nūlus* is a contraction of *no(g)vidus*. JOHN RHYB.

SCIENCE NOTES.

METEOROLOGY.

The Distribution of Temperature according to Height.—Dr. Hamberg, who has lately been working on the subject of night frosts in Sweden, has recently given to the Royal Society of Science of Upsala a paper on the Distribution of Temperature and Humidity with reference to height above the ground. The paper is in French, and is, therefore, more easily readable than that on night frosts, which was in Swedish. The investigation is based on observations taken during the summer of 1875. The enquiry was twofold: one series of observations referring simply to the vertical heights of 0, 4, 10, 16, and 22 feet, while the other had relation to the changes of temperature at the same elevation, according to the nature of the contour and the covering of the soil. The readings were made by students at the University, and the nightly period extended from a few hours before sunset to a similar interval after sunrise. The following are the principal results attained:—In calm weather the temperature of the air at the surface of the ground is lower than above it for at least two or three hours before sunset and after sunrise. Consequently the rise of temperature in the morning is not caused by heating of the soil. The reduction of temperature in the afternoon before sunset is greater on the ground than above it. During the night, whether there be dew or not, the relative reduction of temperature depends on the nature of the ground and the conditions of radiation. The latent heat set free in the deposition of dew retards the reduction of temperature, but not so much as might be anticipated. When there is dew the temperature near the ground may fall even below 32°, but as soon as hoar frost appears the temperature on the ground rises to 32°, although it may remain lower than that point at a slight distance above the ground. The isothermal surfaces of the air by night are not strictly parallel to each other, but follow the contour of the ground the more closely the nearer they are to it. The tension of vapour, on nights when there is no dew, as well as by day, is highest close to the ground and decreases upwards. If there be dew this relation is reversed, at least up to the height of twenty-two feet. The relative humidity on all nights sinks till towards morning, and then rises. The cause of the reduction of relative humidity in the evening is not the formation of dew, for that can only influence it indirectly through lowering the vapour tension. The diurnal march of relative humidity in clear weather is different at different heights. As regards hoar frosts, Dr. Hamberg gives the following useful hints:—Other things being equal, these frosts are well known to occur on ground which is covered with herbage, irregular, and lies low, or is surrounded by hills or woods. They are less frequent on ground which is open, or sloping, or else elevated and exposed to the action of wind. As they are aggravated by the presence of herbage, especially if it be long, they are tempered or entirely stopped by bare earth, as well as by trees, and in autumn by the courses of streams.

The Causes of Ocean Currents.—Prof. Ekman, who has long been engaged in the study of the physical condition of the sea on the coast of Scandinavia, has published in a paper read before the Royal Society of Science of Upsala his views on this much-debated problem, which merits the more attention as the coast of Sweden affords numerous opportunities for the examination of currents produced in very different ways. The paper is in English—an extra recommendation to our readers. The best idea we can give of

its general gist is contained in the following summary:—

"If we take a general view of the effects produced upon the ocean by the different forces which originally set its water in motion, we find, singularly enough, that each of these forces produces both of the kinds of stream—viz., a surface-stream caused by a limited, and a deep-stream by an unlimited disturbance of the equilibrium. Heat produces a surface-stream by warming the water, and a deep-stream by evaporating it. Cold can produce an under-current by the contraction and still more by the concentration of the water, but it then leaves at the surface a tendency to disturbance of equilibrium, which shows itself in the form of a surface-stream on the melting of ice. Rainfall causes a deep-stream as its immediate consequence, and a surface-current of lighter water as a secondary effect. Winds occasion directly surface-currents, and deep-streams by changing the level. Rivers, and similar constant outpourings of lighter water, give immediately rise only to surface-streams, but produce under-currents by mechanical reaction: streams of this kind often accompany even the above-mentioned. The specific gravity of the water plays in all these cases a very varied part, but always one which is in some respect or other important. It usually determines the level of the water-strata, but not always."

Irregularities of Pressure in India and their Connexion with Rainfall.—The *Journal* of the Asiatic Society of Bengal contains Mr. Blanford's paper on this subject, which was originally read at the Belfast Meeting of the British Association, but is now printed in full. He shows that an examination of the monthly and yearly barometrical means shows certain anomalies either in the way of excess or defect, prevailing over different districts, and exhibiting a marked persistency; these differences being "in certain cases maintained throughout those great revolutions of atmospheric density, composition, and movement, which accompany the alternations of the monsoons." Several instances of this are given in the paper. As regards the rainfall, Mr. Blanford shows that generally the heaviest fall is on the northern side of a district of negative anomaly—e.g., the excessively heavy rainfall in the district of which the town of Hooghly is the centre, when an intense barometrical depression lay at Saugur, about 100 miles to the southward, off the mouth of the Hooghly river. He shows, however, that the rule is not always followed, so that we must beware of being too hasty in drawing our conclusions.

The Effects of the Wind on the Surface of the Earth.—*Petermann's Mittheilungen, Ergänzung's Heft*, No. 48, consists of a treatise on this subject from the pen of Dr. F. Czerny of Vienna. The subject has more to do with physical geography than with meteorology, but the paper deserves notice in connexion with the latter science, and it is accompanied by a good wind-chart. The successive heads of the reasoning are: I. The climatic action of the wind. II. Its mechanical action: A. on the land; B. on the sea. III. Its indirect effects in connexion with volcanic eruptions and with terrestrial magnetism. We may perhaps be allowed to remark that the existence of any relation between earthquakes, &c., and atmospherical phenomena is doubted by the best authorities on seismology.

The Windroses of Southern Norway.—M. C. de Seue, formerly assistant at the Meteorological Institute of Christiania, has drawn up a most important prize-essay on this subject, for which he has received the Royal gold medal. The paper has been published as the programme for the University for 1876. Some idea of the labour bestowed on this work may be gathered from the fact that nearly 400,000 observations have been dealt with in it, and the results given numerically as well as graphically show for the five stations of Christiansund, Aalesund, Skudesnaes, Mandal, and Sandösund, windroses for pressure, temperature, vapour tension, relative humidity, and wind direction and force; and for Christiania similar data, except

as regards vapour. The corrections which have been employed to eliminate the influence of the daily period are given in special tables. Bessel's Formula is not employed, and the author states clearly his objections to that mode of treatment of the materials for the purpose he has in view. The results for the several stations are then discussed at some length, and finally tables are given showing the frequent and the rare winds at each station and in each season. The consideration of these tables leads to the remark that the difference in meteorological conditions between the sea outside the coast and the land enclosed by the coast of Norway cannot be very great. In every season we find two groups of frequent winds, one bearing the character of land winds, and the other that of sea winds, and, furthermore, we have in each season two groups of winds of rarer occurrence, marked by a similar contrast of character. We cannot speak too highly of the patience and care bestowed on such monotonous calculations, and express our sincere regret that M. de Seue has deserted meteorology for another occupation.

The Development of a Barometrical Depression.—Dr. H. Hamberg has printed, in the *Proceedings* of the Swedish Academy, a paper on the "Generation of a Barometrical Depression over Sweden in July, 1872." He shows clearly that the disturbance in question did not advance to Sweden, but was formed there, and also that it could not possibly have owed its origin to the condensation of vapour, for the rainfall in connexion with it was not great, and was essentially sporadic, being connected with thunderstorms which were very prevalent at the time. These thunderstorms succeeded the fall of the barometer, and were most violent where that fall had been greatest. Dr. Hamberg is disposed to attribute the rarefaction at the centre of the depression to the unusually high temperature prevailing in the interior of the country, and this view is supported by the fact that the isobars follow the line of the coast.

Charles Sainte-Claire Deville.—We regret to have to record the death of this well-known meteorologist and chemist, which occurred at Paris on the 10th ult. He had a narrow escape of being a Danish subject by birth, the West Indian island, St. Thomas, in which he was born in 1814, having changed masters soon after the birth of him and his brother Henri. It is to him that Paris is indebted for the Observatory of Montsouris, for by his indomitable perseverance he obtained in 1869 from the Government of the time being the Moorish palace of Montsouris, built originally for the reception of some of the Emperor's African visitors. He then for some years maintained the Observatory mainly at his own expense. On the return of Le Verrier to the Observatory of Paris, the idea of Montsouris as the Central Meteorological Station for France was given up, M. Marié Davy was placed at its head, and M. Deville was appointed Inspector-General of Meteorological Stations in France. He filled that post with remarkable energy up to the time of his death, travelling through the various departments and through Algeria organising the different stations. Although we may not agree with some of his views, no one can deny to him the character of an ardent enthusiast in meteorology and of a most loveable man.

Carl Jelinek.—The preceding notice had scarcely gone to press when the news of the death of another prominent meteorologist has arrived. Dr. C. Jelinek was born at Brünn in 1822, and for the last thirteen years he has been director of the K. K. Central Anstalt für Meteorologie und Erdmagnetismus at Vienna. His high mathematical attainments and his long official experience will render his post very hard to fill. He had long been in delicate health, and he at last passed away on the 19th ult., to the sincere regret of all who had ever been in close relations with him.

GEOLOGY.

SOME interesting and important papers were read before the Geological Section of the British Association during the meeting which was held this year at Glasgow. The president of the section, Prof. J. Young, pointed out in his opening address the anomalous position in which this science stands in its want of a special terminology. This want has, among other things, led to the unwarrantable belief that homotaxial beds are synchronous; while the work of the Geological Survey has shown that unlike groups in different parts of Britain may be contemporaneous. Thus in the case of the Cretaceous series, the Lower Greensand is contemporaneous with part of the Chalk, of the Wealden, and, perhaps, even with portions of the Purbecks. A considerable reduction might thus be made in the estimated age of the earth's crust; but any conclusion founded on mean thickness of sedimentary strata is considered by Prof. Young to be of no value whatever.—"The Physical Structure of the Highlands, in Connexion with their Geological History," formed the subject of an important paper read by the Duke of Argyll, who maintained that the great general lines of strike were determined during Silurian times, and that all the principal physical features of the country were formed prior to the Glacial Epoch. The central Highlands were probably never completely submerged during the long ages that elapsed between these two periods.—A new division of the seven stages into which the coal-measure is divided was proposed by Prof. Hull. The Middle Carboniferous is to be extended and made to comprise all the strata between the Gannister beds and the Yoredale rocks.—"The most recent Researches into the Structure and Affinities of the Plants of the Coal-measures" have led Prof. W. C. Williamson to believe that the flora of that period will become the battlefield on which the question of evolution with regard to the origin of species will be fought out. A perfect specimen of a *Calamites* recently obtained by Prof. Williamson exhibits the following structure:—A nucleal cellular pith, surrounded by canals running lengthwise down the stem; outside of these canals, wedges of true vascular structure; and, lastly, a cellular bark. The specimens which usually pass as *Calamites* are merely the casts in mud or sand of the pith of the plant. From the examination of a large number of specimens of *Lepidodendron* and *Sigillaria*, both young and old, Prof. Williamson has come to the conclusion that the difference between them is not generic, but merely one of species or of the age of individual plants.

An article on "The Climate Controversy," by Mr. Seales V. Wood, jun., will be found in the September and October numbers of the *Geological Magazine*, in which the author discusses the seven different causes that have been put forward at various times to account for the climate of the Glacial period. "A variation in the amount of heat radiated by the sun" is, he considers, the most probable of those suggested.

In the same periodical Dr. Günther describes some fish remains from the Tertiary deposits of Sumatra. The specimens were collected by Herr R. D. M. Verbeek, from the marl slates and carbonaceous shales of the island, and with one exception all belong to existing genera. The new genus (*Hexasephus*, Günth.) is represented by some sets of conical teeth, ranging up to the size of a large pea, and one or two pharyngeal bones, showing it to be a Cyprinoid fish.

The remains of a predaceous fish obtained some years back by the Earl of Enniskillen from the Lias of Lyme Regis is now described by Sir Philip Grey-Egerton under the name of *Harpactes velox*. It is a true Notochordal Ganoid, about three feet long, with a depth of barely five inches; but, unfortunately, in common with several other Liasic genera, is represented by only a single specimen. A full description of it will be found in the periodical above cited.

In *The Great Ice-Age* Mr. James Geikie boldly expressed his opinion that all our palaeolithic implements are of interglacial or even preglacial age; and this view will be materially strengthened if the preliminary announcement of Mr. Skertchly's discovery in East Anglia be confirmed. From his letter in *Nature* it appears that this observer has found some palaeolithic implements embedded in patches of brick-earth that underlie the chalky boulder-clay near Brandon, in Suffolk. The implements are of the oval type, boldly chipped, and are associated with quantities of broken bones and a few fresh-water shells.

M. BARROIS, who has already worked out the zones in the Chalk of the Isle of Wight, now extends his investigations to that of England and Ireland (*Recherches sur le terrain crétacé supérieur de l'Angleterre et de l'Irlande*, par Ch. Barrois, Lille). He shows that our Chalk is divisible into the same zones as those into which M. Hébert has divided the Chalk of Northern France; and gives a table correlating the local sections of our country with the French beds, though unfortunately some of them have been placed in the wrong columns. M. Barrois considers that the cretaceous sea was neither so widespread nor so uniform as generally believed; and maintains that the different cretaceous basins of England were gulfs opening into the North Sea.

THE first part of the *Handbuch der Palaeontologie* by Profs. Schimper and Zittel, which appeared a short time since, commences with some introductory chapters treating of the subject generally, and then deals with the Protozoa. It is plentifully illustrated with woodcuts, and the work when completed will, judging from this sample, form a most valuable manual.

MR. J. F. WHITEAVES has been appointed Palaeontologist to the Government Geological Survey of Canada in place of Mr. E. Billings, F.G.S., whose loss Science has recently had to regret. The present period of the Survey, however, expires next June, unless a further grant be obtained from the Government, which, seeing the importance of the work, it is earnestly to be hoped may be the case.

THE Government has at last become alive to the defective state of the water-supply at Gibraltar, and a short time ago commissioned Prof. Ramsay and Mr. James Geikie to survey the locality and report on the probability of obtaining a proper supply of good water for the garrison by means of a deep boring. This has been done, and the geologists have just returned to England.

MEETINGS OF SOCIETIES.

NUMISMATIC SOCIETY.—(Thursday, October 19.)

MR. JOHN EVANS, F.R.S., President, in the Chair. Interesting coins were exhibited by Mr. T. Jones and Dr. Aquila Smith, and by Mr. Vize a die of a coin of Michael, Prince of Wallachia, 1593–1601.—Mr. Percy Gardner read a paper on the coinage struck on the western shore of the Euxine Sea during the period of Roman dominion. Mr. Gardner established the existence of a monetary league between Tomi, Olbia, Marcianopolis, Odessus, and other cities, which issued coins on a uniform standard, the basis of which was a light as of about 40–45 English grains weight.—Dr. Aquila Smith read a paper on the Irish coins of Henry VIII., and exhibited drawings of all the varieties.—A paper was also communicated by Mr. Cochran-Patrick, of Beith, the first of a series which are to give a complete account of the Scottish medals.

FINE ART.

ART BOOKS.

Handbook of Fairford Church and its Stained Windows. By J. P. (Fairford: Powell.) The Fairford glass has often been described, but never, so far as we remember, by any one who has had a sufficient knowledge of mediæval lore to enter

fully into all the nooks and corners of their quaint symbolism. The present handbook will be found useful by persons who have but little knowledge of the subject, as it points out clearly the more obvious meaning of each picture. Nothing further is attempted. The author seems to be of opinion that the designs were furnished by Albrecht Dürer. In this matter we have little doubt that he is mistaken. The windows at Fairford have long been celebrated, but those who formerly noticed them, commonly did so, not on account of their beauty, but for their grotesqueness only. The men of the seventeenth and eighteenth centuries were for the most part unable to enter into the beautiful side of the older work, and consequently it was only the fun in such things that attracted them. “‘Jane,’ said she, with a fiercer look than any of the tan-coloured devils which are painted upon the church windows of Fairford, in Gloucestershire” (James Parry, *The True Anti-Pamela*, 1741, 204), is a fair index of the way in which the art of the Middle Ages affected our great-grandfathers. Fairford is now justly celebrated. There is probably no other such series of late glass-pictures preserved in England, but at the time when they were made, though beautiful, they could not have been extraordinary. We have the best reason for believing that before the misguided zeal of Protestants and the neglect of the parish authorities had deprived us of them, nearly every village church throughout the land was as rich in stained glass as this Gloucestershire village has by a series of happy accidents continued to be to the present day.

Explanation of the Famous and Renowned Glass-work, or Painted Windows, in the Fine and Beautiful Church at Gouda. For the Use and Commodity of both Inhabitants and Foreigners who come to see this Work of Art. (Gouda: Bentum and Son.) The Netherlands have few remains of stained glass left in the churches, and therefore the Gouda windows, which are of the sixteenth century, and mostly poor in colour and feeble in drawing, have attained considerable local celebrity. This is not entirely undeserved, for, although they are not very valuable as works of art, many of them are of considerable historical interest. The pair representing the siege of Damietta and the relief of Leyden, though among the very latest in the series, are extremely curious. The window given by Philip II. and his consort, Mary of England, is one of the best; unfortunately the upper part, which once contained the Consecration of Solomon's Temple, was long since destroyed by a storm. The portion that remains represents the Last Supper, with the king and queen in front kneeling on cushions, with their arms beneath them. The Dutch are noted for the facility with which they acquire foreign tongues. This little book is, however, not a specimen by which they ought to be judged. We have rarely seen forty pages of more un-English-looking English. It is a pity that the publisher did not submit the proofs to some one who was well versed in the language. Notwithstanding, however, all defects of form it is a useful little book, chronicling many facts which the ordinary guide-books omit. Something ought to have been said as to its authorship, or at least as to the date of its first publication. The copy before us, though it has no date on the title-page, is evidently quite new; yet the text is almost identical with a book having a similar title published in 1718, a copy of which is in the library of the Society of Antiquaries. We have not collated every word on every page, but as far as we have compared them we can find no variations whatever except in spelling—wherein, by the by, the older text is commonly the more accurate—and in now and then altering what has been thought an inelegant or old-fashioned word. The effect in these cases has usually not been to improve the English.

THE ALTERATIONS IN WESTMINSTER ABBEY.

FOR some time works have been going on in the north transept and the adjoining chapels of Westminster Abbey which, though not very extensive in themselves, will greatly modify both the appearance and the history of the building. Many of the monuments which we inherit from the Georgian era had their obstructiveness and obtrusiveness increased by high backgrounds of plain walling. The removal of some of these, besides much improving the appearance of the transept, has brought to light several objects of great archaeological interest. Built up in one wall has been found the screen which formed the western enclosure of the chapel of St. John the Evangelist. It is of stone, of ordinary fifteenth-century design, and was probably erected by Abbot Estney, when he fitted up and adorned this chapel as a memorial to himself. The place of the entrance is filled up with a piece of similar screenwork which has possibly formed part of the north or south side of the chapel. The chapel of St. Andrew, at the other end of the transept, was fitted up by Abbot Kirton, and so late as the beginning of the last century its western screen was famous for its display of heraldry. Unfortunately, no vestige of it remains now. It must have been entirely removed on the erection of Gibbs's monument to the Duke of Newcastle in 1723. The screen is also gone from the intervening chapel of St. Michael, but the removal of the background of the Somerset monument has revealed three niches of a fine fifteenth-century reredos. The reredos appears to have extended all across the chapel and to have been made up of seven niches, the missing four of which were cut away to make room for Roubiliac's grotesque monument to Mrs. Nightingale. The work is delicate, and has, of course, suffered much, and no figures remain, but it is the most important addition to the known antiquities of the Abbey since the discovery of the foundations of the Confessor's Church a few years ago.

Behind Mrs. Kendal's monument in the chapel of St. John Baptist enough has been found to prove that most of the exterior of the little chapel, which Islip erected for the temporary accommodation of the altar of St. Erasmus, still remains, and there is some talk of opening it out by removing the monument. It is also proposed to draw out the tomb of Sir Thomas Vaughan and that attributed to Hugh de Bohun from the walls in which they are partly embedded. The latter was no doubt placed where it is to make way either for the Hunsdon or the Exeter monument. The history of the Vaughan tomb is obscure. It has certainly been moved, for part of the inscription is buried in the wall. The debased arch under which it stands might pass for a very early effort of the “Gothic revival,” but it must be as old as the seventeenth century.

The removal of some brickwork from behind Sir John Puckering's monument in St. Paul's Chapel has exposed a spandril of the thirteenth century wall-arcade, containing a most perfect figure, probably intended for St. Anne. The decayed state of the exposed portions of this arcade makes the new find—which is as good as when it was first cut—particularly valuable, apart from its own interest as an un mutilated and undecayed example of the sculpture of its period. Traces of colour have at different times been found on this arcade, which have led some to suppose that the whole of the lower story of the chapels was decorated with painting, but the recently exposed portion does not confirm this.

We cannot conclude our notice of these interesting discoveries without a warning as to the dangerous character of the works which have led to them. We do not know that any harm has really been done yet, though we miss a few monuments which we hope to see again when the work is finished. But we know how liable work of this sort is to extend itself, and how quickly the desire for fresh discoveries, if it be not properly regu-

lated, grows into a sort of passion, which makes men careless of what they destroy in order to reach them. The growth of such a passion at Westminster would be most disastrous. Westminster Abbey belongs, not to the Middle Ages only, but to all time since its foundation. The monuments, even the worst of them, are part of the history of the building. We wonder how our grandfathers could admire the extraordinary erections which their notions of "high art" led them to set up in the church, but it is certainly true that they did admire them, and if we destroy them our grandchildren may be equally astonished at us, that when possessing such a perfect record of the tastes of past times we failed to value and preserve it. The character of many of the monuments is such that their removal is very desirable, and in some cases almost necessary, but this cannot justify their destruction or alteration. The mere removal of a cenotaph cannot do much harm, but to alter it is to take from it its reality. The objection to removal is the present want of a fitting place to receive the removed monuments. The triforium might, indeed, be used for tablets and small objects, but it is not these which are generally the most offensive; indeed, many at Westminster are really very good in their way. The difficulty is with the large monuments, and we fear that there will be a great temptation to reduce the sizes of some by the removal of architectural settings, or other essential parts of them. To do this would, we contend, be wrong. And if the as yet undiscovered relics of the early state of the church cannot be exposed without such destruction of the later work, they had better remain hidden until a place is provided to which the unsuitable monuments can be removed uncurtailed and unaltered. Such a place ought to be built.

J. T. MICKLETHWAITE.

THE UNIVERSAL EXHIBITION OF 1878.

THE plans of the palace, or rather of the monumental constructions which are to adorn and to crown the slopes of the Trocadero in 1878, were entrusted to M. Davioud. These plans are now finished, and are only subject to receive from the Higher Commission modifications in detail, which will not alter the general scheme. M. Davioud is a skilful architect with exquisite taste in details. He has found means to combine lightness of proportion with constructive force. His starting-point is Arabesque architecture, without any servile copying. The building is to be of stone and brick. It will probably be built so solidly that the city of Paris will be able after the exhibition to buy it and turn it to some account. It will be faced with enamelled pottery. This is the first time in France that complete use has been made of enamelled terra-cotta on the outside of public buildings, and our experience on this occasion, therefore, promises to be highly interesting. It will be satisfactory, if we may judge from the perfection reached by decorative earthenware within the last few years, which the exhibition of the Union Centrale brings before us in all its details.

The palace is flanked by two extensive lateral galleries, intended for the horticultural and agricultural exhibitions. It will contain an official hall for receptions and great occasions, capable of holding at least eight thousand persons, and circumscribed by a portico of two storeys in the Hispano-Moorish ogival style. These galleries will be divided into lesser halls, in which conferences may be held. The great hall will naturally serve also for concerts, official balls, &c. It is lighted in the daytime by nine arcades seven *mètres* wide. The sides are flanked by two light-houses, seventy-five *mètres* high, the lanterns of which will be visible from a great part of the most distant points in Paris. They will be used for experiments, scientific and practical, on the electric-light and the various international modes of lighting. They terminate in gilded chambers,

which will glisten in the sunlight like buildings in Russia.

The slopes of the Trocadero, from the summit to the quays along the Seine, are decorated with gardens belonging to the different nations, and with a cascade, which will probably have a marvellous effect. It will spring from the very base of the palace, from the pedestal of a group of large decorative figures in stone and bronze. A grotto nestles behind the curve described by this cascade, which will have a fall of nine *mètres*. Through this sheet of crystal the spectator will see confusedly the whole extent of the Universal Exhibition, with its buildings and its gardens stretching away over the Champ de Mars as far as to the Ecole Militaire, then, beyond and in all directions, the great basin of Paris, drained and intersected by the Seine and bordered on the horizon by picturesque hills.

PH. BURTY.

NOTES AND NEWS.

TO-DAY (Saturday) there will be a private view of a collection of oil-paintings by British artists at Mr. Deschamps' gallery in Bond Street. Hitherto this gallery has been principally devoted to examples of the Modern French School, and the exhibition now announced has, therefore, the interest that belongs to a new experiment.

THE twenty-fourth Winter Exhibition of Cabinet Pictures in Oil by British and Foreign Artists, at the French Gallery in Pall Mall, will be opened on Monday. The private view takes place to-day.

WE have also received intimation of an exhibition of works in water-colours, to be opened at the gallery of the Fine Art Society in Bond Street. The contributions are all from artists who are not members of either of the two water-colour societies.

FROM Mr. Soden Smith's Report upon the National Art Library at South Kensington we learn of some interesting additions in the way of original drawings made during the past year. The list of such additions amounts to 2,513 examples. Included in this is the valuable bequest of the late Mr. J. B. Waring, consisting of 2,400 original drawings of architectural ornament. A selection from this series will be exhibited whenever the required space, "so often demanded and so much needed, shall have been provided;" and, as Mr. Waring's researches extended over Spain, Italy, and France, the result of his labours cannot fail to be interesting to architectural students. We also notice among the drawings a design by the late Alfred Stevens for the bronze doors of the Geological Museum in Jermyn Street. This design, which has never been worked out, bears further witness to the genius of the sculptor of the Wellington monument. It is divided into panels, representing, in a noble style of invention, the different crafts by which the hidden treasures of the earth are made serviceable to man. We believe that Mr. Stevens went so far as to model some of the groups, but it may be doubted whether enough of his work remains to permit of the present execution of his design. It may be interesting to the admirers of that artist to know that a large number of his designs for ornamental work in bronze, and in painted tiles, have been carried out by Messrs. Benham, of Wigmore Street.

THE Conversazioni of the Graphic Society have been fixed for November 8, December 13, January 10, February 14, and April 11. The new members elected during the present year are Messrs. Long, A.R.A., J. Acton Adams, Ernest George, E. Hanson, and Aston Webb.

A NEW School of Art has been opened at Winchester.

THE Shanghai community has been much divided in opinion as to what form the Margary memorial should take. At a public meeting which

has just been held at that port, several propositions were placed before the subscribers, who, rejecting the idea of a clock-tower and spire to the cathedral, a clock-tower on the Bund, an Eleanor's cross on one of the public jetties, a statue on the Bund, and a gold medal for adventurous geographical exploration, have finally determined to have a monumental cross.

THE annual competition of the sketch clubs in connexion with the various metropolitan Schools of Art took place at the South Kensington Museum on the 26th ult. In 1874, when the challenge was issued by the Gilbert Club (St. Martin's School of Art), Lambeth Club only responded; while this year two additional clubs accepted—viz., South Kensington (Female) and West London. 177 sketches were exhibited, and Messrs. Alma Tadema, H. S. Marks, and E. J. Poynter officiated as judges. Prizes of the value of 3*l.* each were awarded as follows:—Figures: subject, *Waiting*, Mr. H. Schäfer (Gilbert), and an extra prize given by the judges, Mr. H. Glindoni (Gilbert); Landscape: subject, *Far from the Busy Haunts of Men*, Mr. J. Seymour Lucas (Gilbert); Animals: subject, *A Chase*, Mr. W. K. Stevens (Lambeth); and Sculpture: subject, *Waiting*, Miss Henrietta Montalba (South Kensington). The award of honour for the best aggregate of work fell to the Gilbert Club.

MESSRS. PILGERAM AND LEFÈVRE have just issued two good-sized prints from the paintings of Mr. L. Alma Tadema. These form a pair, this seeming to be the usual plan of publication with the successors of Mr. Gambart. There is, however, a novelty in the present case that distinguishes these prints, which are called *The First Whisper of Love* and *In Confidence*, from all others; they are pure etchings, although of a size for framing, and in that way carried out with delicacy and refinement by Mr. L. Lowenstam.

A MONUMENT to the celebrated Danish physicist Oersted, who, in 1819, discovered electro-magnetism, was inaugurated last month at Copenhagen in presence of the King of Denmark and numerous notabilities. The monument consists of a statue of Oersted, who is represented holding the wire of an electric battery over a magnetic needle, and three female figures, symbolical of the Past, the Present, and the Future, grouped round an hexagonal pedestal. It is erected on a terrace of the old fortifications of the city.

AN important discovery of Roman coins has been made on the estate of Mr. John Clayton at Newcastle-on-Tyne. Mr. Clayton, whose property lies upon and round about the old Roman Wall, was recently employing some workmen on his farm at Corraborough, four miles west of Chatterford on the north Tyne, when, during their digging operations, they came upon a Roman treasure-chamber, wherein were found many altars and thousands of Roman coins. It is supposed that a military chest containing this treasure must have been dropped into a bath as the soldiers retreated from the Roman station of Procolitea before the enemy. The *Times*, which records this discovery, says that "it appears to be the greatest find of Roman treasure which has occurred in the North of England for some time." Mr. Clayton will give the full particulars of it at the first winter meeting of the Newcastle Antiquarian Society.

ON the occasion of the two hundred and third anniversary of the death of Salvator Rosa, a banquet was held in Naples in honour of that gloomy, but poetic, painter, and a marble slab inserted over the doorway of the house at Arenella, near Naples, where he was born. The slab was simply inscribed "In questa casa nacque Salvator Rosa nel 1615, di 20 di Giugno." The original manuscript of a satirical poem by Rosa, lent by Count Borromeo of Milan, was an object of great interest at the banquet, and printed copies of it were distributed to all the guests, who consisted chiefly of Italian artists.

A SPECIAL school has been opened in Paris by the "Chambre Syndicale du Meuble Sculpté" for the teaching of art as applied to cabinet-making and furniture in general. Truly Art in the Household is receiving some attention at the present day.

THE Gobelins manufactory is at present at work on several large tapestries destined to figure at the general exhibition of 1878. The *Chronique* enumerates:—1. An ornamental subject for the decoration of the Palace at Fontainebleau, of a size of eighty-six square mètres, and distinguished by great richness and variety of colour; 2. Two large compositions by Lebrun representing Earth and Water; 3. "The Conqueror," designed by M. Ehrmann; 4. A tapestry designed from M. Machard's picture *Séléné*; 5. Two interesting panels styled respectively *Tornatura* and *Pictura*, symbolical of the ceramic art, destined for the new manufactory at Sévres. These were designed by M. le Chevalier Cheygnard, and are already finished.

AMONG the improvements that are still being carried on in Paris may be mentioned the proposed removal of the magnificent fountain of the Rue de Grenelle from its present obscure and inconvenient position to a more suitable site at the corner of the Rue du Bac and the Boulevard Saint-Germain. This fountain, the work of the celebrated sculptor Edme Bouchardon in 1739, is really one of the finest works of its kind in Paris, but owing to the confined situation in which it was placed it has been generally overlooked. Its new position will, it is said, permit of its artistic merits being fully appreciated.

THE undertaking of the French Government, begun in 1874, of making a complete inventory of all the treasures of art in France, is still being carried on with great vigour. The Minister of Public Instruction and Fine Arts has recently addressed a circular letter to the Préfets of Departments asking for particulars concerning the various academies, fine-art and learned societies, that exist in their departments, in order that communications may be established between them and the Administration of the Fine Arts, with a view of furthering the great work in hand, by gaining the collaboration of all societies and persons having particular knowledge that might be useful in the preparation of the inventory of their department. It is further stated that monographs thus contributed to the general inventory will be published with the names of their authors. A letter has likewise been addressed to the Bishops of France, asking for their assistance in making the inventory of religious monuments and other treasures in their churches as complete as possible. The first part of the first volume of this great national catalogue has already made its appearance. It contains 144 pages, but only enumerates the monuments and other works of art in twelve of the churches of Paris. By this one may judge of the gigantic scale on which this important work is being carried out.

A COMPETITION has been opened in Germany for designs for the monuments to the great brothers Wilhelm and Alexander von Humboldt, which it is intended shall be set up in front of the University at Berlin. On the occasion of the celebration of the centenary of Alexander von Humboldt in 1869 a committee was formed for the purpose of collecting funds for raising a national monument to his memory. Their endeavours have been so successful that at present a sum of 100,000 marks has been contributed, but the original idea of a statue to Humboldt has now been increased to statues of both brothers, to occupy parallel positions outside the University. The Senate, indeed, have refused their consent to the erection of the one statue without the other. The statue to Wilhelm, however, is to be a State gift, and not a matter of national subscription like that of Alexander. The competition is open to all German artists of whatever nationality.

THE *Zeitschrift für bildende Kunst* begins its twelfth volume this month, for, unlike most other publications, it does not follow the course of the year, but with confusing perversity ends its yearly volume in September. The current number opens with a long argumentative article by Anton Springer on the "Meister W." one of those perplexing masters of early German engraving whose identity has not yet been satisfactorily resolved. This master is, indeed, more than usually perplexing, owing to the strange difference in style in the plates signed with his initial—a difference which has led to the supposition that not one, but two, or even more masters are included under this signature. It has also been affirmed that the "Meister W." was none other than Michael Wolgemut, Dürer's master, and that the difference in the style of his plates arose from the influence of his great pupil over his art in his later days. It is this latter hypothesis that Herr Anton Springer sets himself especially to disprove; but there was little need of such an elaborate argument in disfavour of Wolgemut's claims, for it seemed tolerably certain already that all the prints marked with the simple W could not have been executed by Wolgemut, if, indeed, any of them were. The theory Herr Springer brings forward with respect to them is that they were the work of Jacopo de' Barbari, who, he considers, although he signed with the Caduceus in Italy, adopted the signature of W, bearing reference to his cognomen of Walch, in Germany. It is far easier, however, to prove who the "Meister W." was *not* than who he was, and we must wait for the conclusion which Herr Springer promises in another number before deciding on the value of his theory. Another interesting contribution to art-history in the *Zeitschrift* is a detailed description of Titian's lovely *Madonna of the Pesaro family*, in the Church of the Frari at Venice, and of its present condition. This is given by the painter August Wolf, whom we have mentioned before as having been for some years engaged in copying the masterworks in the Venetian churches and galleries for the Schack Gallery in Munich. A good etching by Unger of this celebrated picture is given.

MR. ROGET is, we understand, engaged upon a life of the late John Pye, the engraver. The materials for such a work are ample, and its completion will be expected with interest, not merely for the record it will contain of Pye's own labours, but for the new light it will probably throw upon the engraver's relations with Turner. The book, we believe, will supply a considerable amount of information upon the history of the *Liber Studiorum*, and the author in the prosecution of his labours has had free access to the papers left by Pye at his death. It is, however, true that many documents which would undoubtedly have possessed a strong artistic interest were destroyed by the deceased from a feeling of reluctance to allow the record of his career to be associated with matters of controversy that might by any possibility give pain to others. We may add, what no doubt will be made clear in the forthcoming biography, that the late John Pye was a vigorous supporter of the public claims of art as well as an accomplished professor of engraving. His little book on the "Patronage of British Art," though little known, contains the best and most trustworthy account of the various attempts and failures in art administration that exists; and as there is but little chance of such a book being republished, we may venture to hope that Mr. Roget will embody some of its conclusions in his biography. Pye himself was apt in his lifetime to be rather severe in his criticism upon the efforts of contemporary biography. He was himself a sufferer from the blunders that are sometimes made in this kind of work, for in the supplement to the *Dictionary of Engravers* he is described as the son of an artist with whom he had no sort of relationship.

THE STAGE.

THE REVIVAL OF "CLANCARTY."

Clancarty, when you have got over its dull first act, which prepares you with perhaps superfluous display of labour for the events that are to follow, settles down into one of the best of the semi-historical plays our stage has recently seen. The author, touching history but not adhering to it, is freer than in *Twist Axe and Crown* and in *Anne Boleyn*, of which one owed some of its success to the beauty of Mrs. Rousby, and the other to the beauty and talent of Miss Neilson. And in *Clancarty* Mr. Taylor has used his freedom very well. He has built up an intrigue such as the historical truth which is "stranger than fiction" could never have surpassed; and in drawing his leading characters he has done something more than "trace the outlines of rôles for the stage," as M. Legouvé said of Scribe.

And yet a purely literary criticism would pronounce *Clancarty* to be a piece of no great literary value. In the main it is a popular success, and the talent of it is shown not so much in strength of dialogue, not so much in individuality of character, as in generally adroit adaptation of the means to the end—the end being presumably to interest an every-day London audience during four acts in a closely woven story, and in personages who are so near History that they catch a little of its dignity, and so near to our common life that they catch a little of its homeliness. Putting conventional tragedy apart, on the one hand, and vapid burlesque, on the other—purely literary criticism might tell us—stage work may be divided into two classes only: the class which relies on the interest of the story: the class which relies on the keenness of the observation. The semi-historical drama, the long drama of domestic life, the play that tends to melodrama—all that the French call *drame*, and place so in the second rank intellectually—belong to one class. Comedy alone belongs to the other, whether it is that higher comedy which crystallises, so to say, on its pages the characters that our commonplace observation of the world can only hold in solution; or that comedy, of more frequent creation, which deals with types already selected and used, and relies mainly on smartnesses of dialogue, isolated but numerous. The first large class sometimes stretches a little into the second, but never without losing a little of its own ground. The interest in the plot wanes, though not necessarily much, if the author is preoccupied with the accurate presentation of a type or the delivery of witticisms. The quality of the dialogue suffers, the sharpness of the type of character is marred, if the author concerns himself at all considerably with the retention of interest by insistence on intrigue.

Clancarty belongs, of course, to the second class, and a second hearing of it—two years and more having passed since the first—modifies somewhat one's judgment of it. One is inclined to see in its faults just the necessary losses of the class of play to which it belongs. Plot-interest has not been sacrificed; brilliancy of dialogue has not been sought. The types presented are not the result of social discoveries, but of observation common to all of us. And *Clancarty* comes to be ranked as a very vigorous and creditable specimen of the kind of drama the author desired to write: a kind of drama of which even purely literary criticism is at least bound to be tolerant, since as long as the stage lasts it will fill theatres.

The acting is not, on the whole, better than it was two years ago; but then, in London, *Clancarty* has never been badly acted. Mr. Henry Neville now, as when the piece was originally produced, fills the character of the hero, and the hero in his valour and chivalry is one of those characters which Mr. Neville can fill the best. His performance, never aiming at subtlety, rarely fails in naturalness. It is impetuous and spirited, and not unjustly finds favour with the public. One or

two other actors resume their original parts, but these are mostly quite subordinate ones. Lord Woodstock is an exception. The lover of Lady Betty Noel can hardly be called secondary. He has scenes which an actor, say with the grace of Mr. Conway, might make effective and interesting. The part is performed at the Olympic, as two years since, by a gentleman fuller of good intentions than of capacities to play it. He has often done better elsewhere. William the Third, a carefully sketched personage in the hands of the author—a sketch at all points mindful both of Lord Macaulay and of some who differ from him—was elaborated in 1874 by Mr. Charles Neville into a finished little picture: about the best thing Mr. Charles Neville has done. This part now falls to the lot of Mr. Flockton, who is also careful and not obtrusive. But he does not, to our thinking, make quite the mark of his predecessor. "Scum Goodman," the conspirator—played originally by Mr. G. W. Anson with almost loathsome display of degradation—is not very much less forcible, nor very much more pleasant, in the hands of the actor who follows him—Mr. Pateman. Lady Betty was played first by Miss Emily Fowler, then by Miss Marion Terry. Neither failed to be agreeably saucy. Nor does Miss Camille Dubois, the new Lady Betty, fail in sauciness. But she is lacking in distinction.

The chief change in the performance is in the character of the heroine, which was played originally by Miss Ada Cavendish, and is now performed by Miss Bella Pateman. Miss Bella Pateman is not precisely the "star" one or two of the papers have described her to be. Her performance in *Clancarty* gives one no reason to think that her name must some day be added to those of the few actresses who have any serious claim to be considered artists. There are four or five of them, and she does not, at all events at present, make a sixth. She is intelligent; she is painstaking; and she has learned her business. But "creative criticism" must have been somewhat busily at work to discover in the acting of this lady all the subtleties that a stage character may exhibit. Take one scene which affords a pretty sure test of what imaginative hold the character has over the actress. Young Lady Betty Noel has suspected an intrigue between Lady Clancarty and her own lover, Lord Woodstock. She has listened and has been reassured. Then coming out into view again, bright with her own happiness and relief, she is hand in hand with both of them; and Lady Clancarty, on the Olympic stage, is a sharer in the merriment, like the rest of them. But, in reality, it is a critical time for her. Her husband is even then in danger, and the actress whose first thought was of the mental situation, and not the momentary need of the stage part, would give, behind the momentary merriment, the air of pre-occupation. Not to do so may not be a serious fault, as the stage goes, but it is the kind of failing which at least betokens no penetrating dramatic genius. No, no; Miss Pateman, so far as the excellent part of Lady Clancarty allows us to see, is a useful rather than a notable addition to our London stage. She enables *Clancarty* to be performed without serious drawback; but she is not an actress who will draw the town to see *Clancarty*.

FREDERICK WEDMORE.

THE programme of French pieces at the Royalty Theatre has not long remained unchanged—*Les Vieux Garçons*, by Sardou, having taken the place of the *Panache*. M. Sardou's comedy, when adequately presented, is a piece worth seeing.

THE Opéra Comique has opened its doors with an entertainment called *Bounce*, of which dignity is hardly the characteristic. Mr. Maltby, an author at present not much known to fame, is the author of a piece described as a farcical comedy; but *Bounce* does not bear much resemblance to what we have been accustomed to consider comedy, and the jokes and contrivances to produce laughter may indeed be farcical, but are

not all very new. However, it would be a mistake to judge by any strict rule a piece and a performance which claim to be extravagant. The piece was probably written for Mr. Collette, who plays in it. He is a gentleman of varied gifts. Hesingspatter songs glibly, imitates and caricatures cleverly, and has the more serious accomplishment of an acquaintance with several languages—an accomplishment which a miscellaneous audience is always delighted to recognise. Mr. Collette is quite successful in Mr. Maltby's light piece; and Mr. Hollingshead, the originator of the entertainment, bids fair to win the blue ribbon of the stage—if that be given to the manager who puts forth the lightest programme.

TO-NIGHT the regular Court company, strengthened by the addition of Miss Ellen Terry, returns to the little theatre in Sloane Square.

It is said that Signor Rossi meditates undertaking another season in Paris. He was successful there last season, among the fashionable world and among some of the critics, though certain of the more notable were cool and reticent. It remains to be seen whether even the attraction offered by the combination of a certain amount of talent with a language you don't really understand will suffice to bring any large part of the Parisian public again to the feet of this tragedian. The Parisian public is a mixed one, and especially that which can afford to pay high prices. Only a half of it is French.

THE "troisième Théâtre Français" has at last, after a month's delay, opened its doors. A prologue in verse and a comedy were presented last Saturday night. The prologue was entitled *L'Ombre de Déjazet*, after the famous actress in whose old theatre the audience was gathered. *L'Ombre de Déjazet* was written by M. Delair, a young poet who has thoughts, though obscure ones. His admirers predict for him a literary if hardly a popular success, and *L'Ombre de Déjazet*—notwithstanding the idea "*avec force développements*," as a correspondent writes—was listened to sympathetically. The comedy was much less fortunate—"less fortunate," we say, expressly. For its chance had soon to give way to the need which came over the audience to laugh much and at everything. No one can have been much at a theatre without observing, on some critical occasion or other, that the fate of a piece often hangs on a thread; and it may even sometimes be that thread is nothing in the piece itself, but something in the mood of the audience. Perhaps M. Ballande's scheme had been somewhat pretentious. Perhaps the letters of gold "Troisième Théâtre Français" outside, and the plaster busts of geniuses within, had an air of incongruity. At all events the comedy failed, despite one or two scenes of close observation of *bourgeois* life and manners. It was called the *Pupille*; it could never have taken definite rank in stage literature; and it will now shortly be forgotten. Against the actors nothing is to be said. The gentleman who was so unfortunate as to have one of his buttons fly off under unusual physical exertion was, probably, not responsible for sewing it on. A *jeune premier* named Lambert and another young actor named Reynold were remarked as competent or promising. One or two intelligent young women are also in the company. Mdlle. Cassoth and Mdlle. Rose Lion will have a better chance very soon, for the portfolios in which the conscientious M. Ballande has stored away the comedies he is to seriously consider must surely contain something destined for better fortune than the *Pupille* which inaugurated his enterprise on Saturday night.

THE story of the *Comtesse de Lérins* is not a savoury one, and it is doubtful whether even the art of Mme. Fargueil will give the play a long run at the Théâtre Lyrique. Messrs. D'Ennery and Davyl are the joint authors of the play, which has three principal characters—M. de Lérins, a

sailor about to be Admiral, Mme. de Lérins, and one Chantenay, who possesses himself of the gallant sailor's wife, having first on the plea of intended suicide induced her to come to his house, "où se trouve une chambre dont les émanations capiteuses endorment la volonté et brisent toute résistance." Still in the husband's absence a child is born of this outrage; the child is hidden away; then discovered; then hidden again, until the interest turns no longer on the outrage upon the woman or her husband's suspicions, but upon the search for the child. At last there is a great scene in which the husband, bringing back the child, tells the mother that it is hers, and that she has betrayed him, the mother having now at last the true story to tell. This scene is played by Mme. Fargueil with so much power that the horrible "motive" of the piece is almost forgotten:—"Mme. Fargueil," writes the *Temps*, "le joue en éminente comédienne." When the husband of Mme. de Lérins accuses her she has "une superbe révolte d'indignation," and one of those cries or calls which she is famous for. Her "Non, non"—four times repeated here—is equal to the "*Assassin!*" of *Rose Michel*. But in both cases it is to be regretted that such emotional power should be applied to subjects so unworthy.

MUSIC.

LYCEUM THEATRE.—NICOLÒ'S "JOCONDE."

ALTHOUGH the name of Nicolò is familiar to all students of musical history, his works have hitherto remained unknown in this country, except to collectors of old music. We believe we are correct in saying that until the production by Mr. Carl Rosa of *Joconde* at the Lyceum last Wednesday week none of the composer's operas had been heard on an English stage. Before we proceed to speak either of the music or the performance, a few words as to Nicolò himself may be acceptable.

The real name of the composer was Nicolò Isouard, but he is more commonly known merely under the name of Nicolò. He was the son of a Frenchman, but was himself born at Malta, in 1775. He received a good education in Paris, and was destined for the sea, but the breaking out of the French Revolution caused him to return to Malta in 1790. At the wish of his father, he then entered a commercial house; but his inclination for the pursuit of music proved, as in so many similar cases, too strong to be overcome, and he ultimately threw up his situation, and, taking with him the score of an opera, went to Florence to seek his fortune. Here his first dramatic work, an Italian opera, *Avviso ai maritati*, was produced with success in 1794, his second opera, *Artaserse*, given at Leghorn the following year, being even more favourably received. M. De Rohan, Grand-Master of the Order of Malta, thereupon invited young Isouard to return to his native land, decorated him with the Maltese cross, and appointed him organist, and subsequently director of the music, to the church of St. John of Jerusalem. For the theatre at Valetta he wrote several operas. After the capitulation of Malta in 1799, Isouard was taken by General Vaubois, as private secretary, to Paris. Here he made the acquaintance of Rudolph Kreutzer, and of the poet Etienne, who furnished him with the libretti of several of his operas. The first works which he produced in France met with no great success; it was not until 1802 that, with his *Michel Ange*, he established a reputation in that country. In the fourteen years which intervened between this time and his premature death in 1816, Nicolò (by this name alone he was known in Paris) produced twenty-eight operas, the most successful of which were *Cendrillon*, *Joconde*, and *Jeannot et Colin*.

Joconde, the second title of which is "*Les Coureurs d'Aventures*," was first produced at the Théâtre Feydeau on February 28, 1814; it is, therefore, one of its composer's later works, being, in fact, the thirty-fourth out of his thirty-

nine pieces written for the stage. The text is by Etienne. The plot of the opera is a tolerably simple one, and deals with the adventures of a certain Count Robert and his squire, Joconde, who, in trying to deceive their mistresses, are themselves outwitted, and beaten with their own weapons. The English adaptation has been skilfully made by Mr. Santley.

The chief impression produced by the music is that of melodic charm. Nowhere is there a trace of profundity; the harmonies are in general of the simplest description, and the orchestration may almost be described as primitive. There are no trombones, nor even drums, in the score; and the wind instruments are employed more as we find them in the scores of Grétry or Sacchini than in the more modern works founded upon the school of Mozart. It is true that to a certain extent the influence of the composer of *Figaro* may be traced in Nicolo's music; but this is much more the case as regards the form than the colouring. The strong point of *Joconde* is undoubtedly its tunefulness. It contains some numbers, certainly, which must be called weak, but none which can be described as dry; and, though the opera as a whole is hardly strong enough to be ever likely to establish itself as a great favourite, it will yet be heard with pleasure by all whose tastes have not been vitiated by too great an indulgence in musical stimulants. Those who can enjoy nothing short of Liszt and Wagner had decidedly better stop away from *Joconde*; they will not find it to their liking; but those who appreciate the charming works of the old masters, and who do not despise composers of the second rank because they are not all Beethovens, will be well repaid by a visit to the theatre when the opera is repeated.

Among the best numbers of the work must be named Joconde's song, "I have travelled the wide world over," and the very charming duet, "By the pangs of love tormented," in the first act; Jeannette's song, "Grandam oft was wont to say," her couplets, "Among the girls of the village here," and the extremely pretty quartett, "Nothing more irritating," in the second act; and Joconde's song, "Blinded by jealous madness," in the third act. The original words of the refrain of this song,

"Et l'on revient toujours
A ses premiers amours,"

have passed into a proverb, though it is more than probable that not one person in a hundred who have quoted the lines knows whence they are taken.

The performance of the opera was of that uniform excellence which we are accustomed to expect from Mr. Rosa. The part of Joconde was sustained by Mr. Santley, whose singing left little to desire; though the part lies almost too high for his voice, and traces of fatigue were occasionally perceptible. The Count Robert of Mr. Henry Nordblom and the Lucas of Mr. J. W. Turner were both extremely good, and the smaller parts of Lysandre and the Bailli were well filled by Mr. A. Stevens and Mr. Aynsley Cook, the latter of whom at a very short notice replaced Mr. Charles Lyall, who was unwell. Among the ladies special praise should be given to Miss Julia Gaylord, whose singing and acting as the village maiden, Jeannette, were perfect. Miss Gaylord is making very rapid progress in her profession, and may already be reckoned one of our best operatic singers. The parts of the two Court ladies, Edile and Mathilde, were excellently given by Mdle. Ida Corani and Miss Josephine Yorke; and the band and chorus could not have been better. The work was favourably received, though hardly with enthusiasm; the music, indeed, is scarcely of a character to arouse that feeling.

Fidelio, with spoken dialogue, as originally written, instead of with the recitatives customarily given in this country, was announced for last Thursday. Of this we must speak next week.

EBENEZER PROUT.

LAST Saturday's concert at the Crystal Palace, though containing no absolute novelties, was full of interesting items. The symphony was Raff's "Lenore," first heard at Sydenham on November 14, 1874, and repeated in compliance with a very generally expressed desire. As the work was noticed in detail on the occasion of its first production, it will suffice to say now that its performance on Saturday was extremely fine, and that it produced no less effect than before. The other orchestral pieces at this concert were Schubert's overture to *Alphonso and Estrella*, a most charming and genial work, though but seldom heard in public, and Sullivan's sparkling "Overture di Ballo," composed for the Birmingham Festival of 1870. M. Wieniawski gave an excellent performance of Beethoven's violin concerto, which he played last season at the Philharmonic concerts; his style, however, is somewhat lacking in the breadth which the work so imperatively demands. The vocalists were Miss Mary Davies, whose fresh voice and unassuming style created a most favourable impression, and Mr. Barton McGucken, a young tenor who appeared, if we are not mistaken, some time ago at these concerts. Since then he has been studying in Italy, and has made considerable progress. In our present comparative dearth of tenors, Mr. McGucken ought to take a good position. This afternoon Mdme. Arabella Goddard is to play Mendelssohn's concerto in G minor, and a very interesting novelty is to be brought forward in Tschaiakowsky's overture to *Romeo and Juliet*.

MR. WALTER BACHE'S Recital took place, at St. James's Hall, as announced in our columns last week, on Monday afternoon. We have often spoken of Mr. Bache as one of our most genuine artists. In spite of a constitutional nervousness, which seems at times to prevent his doing himself full justice, his playing is always interesting, from the excellent taste it displays, and his evident enthusiasm, and appreciation of the true spirit of the music he performs. At his recital he played Liszt's transcription of Bach's Prelude and Fugue in B minor, Beethoven's sonata, Op. 110, and smaller pieces by Chopin, Liszt, and Henselt. The special feature of the afternoon was Liszt's transcription for two pianos of his "Poème Symphonique" *Mazepa*, which was very finely played by Mrs. Beesley and Mr. Bache. It is difficult to pronounce a decided opinion upon an orchestral work from a transcription, even though made, as in the present instance, by the composer himself. Mr. Bache promises *Mazepa* in its original form at his next concert, early in the coming year; we shall, therefore, defer our notice of the music till that occasion.

At the Langham Hall on Tuesday evening, Herr Hermann Franke gave the first of four very excellent concerts of chamber-music. The programme included Kiel's pianoforte quartett in A minor, Op. 43, Rubinstein's sonata in D, Op. 18, for piano and violoncello, and Raff's octett for strings, besides violin solos and songs. The works by Kiel and Rubinstein have been previously heard in England, the former having been produced by Mr. Hallé at his recitals, and the latter brought forward by Dr. Bülow at the Monday Popular Concerts. Raff's octett, a most interesting work, was, we believe, new in this country. It was reviewed in the ACADEMY some time since (August 8, 1874), and it is needless to repeat what was then said.

THE sixth season of the Royal Albert Hall Choral Society commenced on Thursday last, when *Israel in Egypt* was performed, under the direction of Mr. Joseph Barnby. Unfortunately the production of *Fidelio* by Mr. Carl Rosa on the same evening prevented our attendance at the Albert Hall; we can therefore only say that the vocalists announced were Mdme. Sinico, Miss Katherine Poyntz, Miss Julia Elton, Mr. W. H. Cummings, and Mr. Sims Reeves. The duet "The Lord is a man of war" was advertised to be sung by all the male voices—a most unjusti-

fiable and inartistic practice, to which we are much surprised that so excellent a musician as Mr. Barnby should have been a party. The second concert is to be given on the 23rd inst.

MR. HENRY HOLMES' Chamber Music Concerts will be resumed in Mr. Holiday's Studio at Hampstead on Wednesday, November 29 at 8 p.m. Mdle. Krebs and Mr. Dannreuther will play the pianoforte.

MDLLE. MARIMON has been singing at the Opéra Nationale Lyrique, Paris, in *Giralda* with great success.

M. PASDELOUP's Concerts Populaires were resumed for the season last Sunday week. At the second concert, last Sunday, a disgraceful riot occurred. Among the pieces in the programme was Wagner's Funeral March from *Götterdämmerung*. The political hatred of the audience to the German musician was such that they absolutely refused to hear it, and by whistling and hissing completely drowned the music. Such brutality needs no comment.

WE regret to announce the death, under very painful circumstances, of Mdle. Priola, an operatic singer whom some of our readers will remember to have heard with the French company at the Gaiety Theatre last year. The young lady had undertaken an engagement at the Marseilles theatre, and on the night of her first appearance was extremely unwell. Though her state of suffering was apparent to all, the audience showed no indulgence, but gave such unmistakable tokens of dissatisfaction that Mdle. Priola threw up her engagement, and, her illness being aggravated by the unworthy treatment to which she had been exposed, took to her bed and died.

J. S. SVENDSEN has lately completed a second symphony, which has been performed in Christiania. The work will be looked for with interest.

FROST, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 44, 46, 48, 50, 52, 54, 56, 58, 60, 62, 64, 66, 68, 70, 72, 74, 76, 78, 80, 82, 84, 86, 88, 90, 92, 94, 96, 98, 100, 102, 104, 106, 108, 110, 112, 114, 116, 118, 120, 122, 124, 126, 128, 130, 132, 134, 136, 138, 140, 142, 144, 146, 148, 150, 152, 154, 156, 158, 160, 162, 164, 166, 168, 170, 172, 174, 176, 178, 180, 182, 184, 186, 188, 190, 192, 194, 196, 198, 200, 202, 204, 206, 208, 210, 212, 214, 216, 218, 220, 222, 224, 226, 228, 230, 232, 234, 236, 238, 240, 242, 244, 246, 248, 250, 252, 254, 256, 258, 260, 262, 264, 266, 268, 270, 272, 274, 276, 278, 280, 282, 284, 286, 288, 290, 292, 294, 296, 298, 300, 302, 304, 306, 308, 310, 312, 314, 316, 318, 320, 322, 324, 326, 328, 330, 332, 334, 336, 338, 340, 342, 344, 346, 348, 350, 352, 354, 356, 358, 360, 362, 364, 366, 368, 370, 372, 374, 376, 378, 380, 382, 384, 386, 388, 390, 392, 394, 396, 398, 400, 402, 404, 406, 408, 410, 412, 414, 416, 418, 420, 422, 424, 426, 428, 430, 432, 434, 436, 438, 440, 442, 444, 446, 448, 450, 452, 454, 456, 458, 460, 462, 464, 466, 468, 470, 472, 474, 476, 478, 480, 482, 484, 486, 488, 490, 492, 494, 496, 498, 500, 502, 504, 506, 508, 510, 512, 514, 516, 518, 520, 522, 524, 526, 528, 530, 532, 534, 536, 538, 540, 542, 544, 546, 548, 550, 552, 554, 556, 558, 560, 562, 564, 566, 568, 570, 572, 574, 576, 578, 580, 582, 584, 586, 588, 590, 592, 594, 596, 598, 600, 602, 604, 606, 608, 610, 612, 614, 616, 618, 620, 622, 624, 626, 628, 630, 632, 634, 636, 638, 640, 642, 644, 646, 648, 650, 652, 654, 656, 658, 660, 662, 664, 666, 668, 670, 672, 674, 676, 678, 680, 682, 684, 686, 688, 690, 692, 694, 696, 698, 700, 702, 704, 706, 708, 710, 712, 714, 716, 718, 720, 722, 724, 726, 728, 730, 732, 734, 736, 738, 740, 742, 744, 746, 748, 750, 752, 754, 756, 758, 760, 762, 764, 766, 768, 770, 772, 774, 776, 778, 780, 782, 784, 786, 788, 790, 792, 794, 796, 798, 800, 802, 804, 806, 808, 810, 812, 814, 816, 818, 820, 822, 824, 826, 828, 830, 832, 834, 836, 838, 840, 842, 844, 846, 848, 850, 852, 854, 856, 858, 860, 862, 864, 866, 868, 870, 872, 874, 876, 878, 880, 882, 884, 886, 888, 890, 892, 894, 896, 898, 900, 902, 904, 906, 908, 910, 912, 914, 916, 918, 920, 922, 924, 926, 928, 930, 932, 934, 936, 938, 940, 942, 944, 946, 948, 950, 952, 954, 956, 958, 960, 962, 964, 966, 968, 970, 972, 974, 976, 978, 980, 982, 984, 986, 988, 990, 992, 994, 996, 998, 1000.

CHAPMAN & HALL'S PUBLICATIONS.

THE FORTNIGHTLY REVIEW for NOVEMBER.

CONTENTS:—

- Fermentation, and its bearings on Disease. By Prof. TYNDALL.
 Lord Althorpe and the Reform Act of 1832. By WALTER BAGEHOT.
 Daniel Deronda. By SIDNEY COLVIN.
 The Future of Political Economy. By W. STANLEY JEVONS.
 On Popular Culture: an Address. By the EDITOR.
 The Eastern Situation. By RALPH EARLE.
 The Rodies. By BERTHAM F. HARTSHORNE.
 Home and Foreign Affairs.

UNIFORM WITH ROUSSELET'S INDIA.

ITALY; from the Alps to Mount Etna. Magnificently illustrated. Containing about 70 Full-page and 500 smaller illustrations. Edited by THOMAS ADOLPHUS TROLLOPE. Super-royal 4to, 31. 3s.

ART in ORNAMENT and DRESS.

Translated from the French of CHARLES BLANC, Member of the Institute, and formerly Director of Fine Arts. With illustrations. Demy 8vo. [Nearly ready.]

The PAPAL CONCLAVES, as they Were and as they Are. By T. ADOLPHUS TROLLOPE. Demy 8vo, 16s. [This day.]

SHOOTING and FISHING TRIPS in ENGLAND, FRANCE, ALSACE, BELGIUM, HOLLAND, and BAVARIA. By "WILDFOWLER," "SNAPSHOT." Two vols. large crown 8vo, 21s.

IMAGINATION, and other Poems. By the Right Hon. WILLIAM JAMES RICHMOND COTTON, M.P., Lord Mayor. Crown 8vo, 5s.

"It will be seen that the scope of the poem is comprehensive enough, and many of the scenes that are conjured up before the eye are made very gracefully suggestive. The shorter pieces are pretty and melodious, and the pictures of the beauties of the country and natural objects are the reflection of vivid images the author has carried away with him."—*Times*, October 25.

THE EASTERN QUESTION.

The AUSTRO-HUNGARIAN EMPIRE: a Political Sketch of Men and Events since 1866. By Baron HENRY DE WORMS. Second Edition, revised and corrected, with an additional Chapter on the Present Crisis in the East. With Maps, demy 8vo, cloth, 9s.

"A clear account of the difficulties which beset Austria after the close of the war with Prussia, and of the policy of Count Beust in overcoming them, will be found in 'The Austro-Hungarian Empire and the Policy of Count Beust.'—*The Quarterly Review*, October, 1876.

The above Work has been translated into the French and German languages.

The DARDANELLES for ENGLAND. The True Solution of the Eastern Question. Demy 8vo, paper wrapper, 6d.

TWO CHANCELLORS; Prince Gortchakof and Prince Bismarck. By M. JULIAN KLACZKO. Translated by Mrs. TAIT. Demy 8vo, 16s.

"This is a most interesting and valuable book. The object is to trace out the working and the results of a ten years' partnership between the two famous Chancellors of Russia and Germany, Prince Gortchakof and Prince Bismarck, and these are delineated with considerable artistic power, and in a manner which betokens considerable political insight, and an intimate acquaintance with the diplomatic world."—*Blackwood's Magazine* for October.

NEW NOVELS.

NEW NOVEL by Lady WOOD.

THROUGH FIRE and WATER. By Lady WOOD. 2 vols. [Now ready.]

NEW NOVEL by MASSINGBERD HOME.

CARSTAIRS. By MASSINGBERD HOME, Author of "Shadows Cast Before." 3 vols. [Now ready.]

PHILIPS' FAMILY ATLAS

OF

PHYSICAL, GENERAL, & CLASSICAL GEOGRAPHY.

A Series of Fifty-seven imperial 4to Maps, with an Introductory Essay on Physical Geography, and a copious Consulting Index.

By THE LATE PROF. W. HUGHES, F.R.G.S.

New and Cheaper Edition, Revised to date.

Lately issued, crown folio, half-bound morocco, gilt edges, 11. 11s. 6d.

PHILIPS' HANDY GENERAL ATLAS OF THE WORLD.

BY

JOHN BARTHOLOMEW, F.R.G.S.

New and Revised Edition.

"We can heartily recommend the 'Handy General Atlas.' The maps are clear and easy of reference, while we have found, by constant use, that the selection of names is most judicious."—*Athenaeum*.

Lately issued, crown folio, half-bound morocco, gilt edges, 21. 2s.

PHILIPS' ATLAS OF THE COUNTIES OF ENGLAND.

A Series of Maps, reduced from the Ordnance Survey, and embodying an amount of detail and accurate delineation not to be obtained in any similar work. New Edition, with a valuable Consulting Index.

By JOHN BARTHOLOMEW, F.R.G.S.

London: GEORGE PHILIP & SON, 32 Fleet Street.
 Liverpool: 49 and 51 South Castle Street.

SATURDAY, NOVEMBER 11, 1876.

No. 236, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

THE SOUTHERN ISLES.

Life in the Southern Isles; or, Scenes and Incidents in the South Pacific and New Guinea. By the Rev. William Wyatt Gill, B.A. (London: Religious Tract Society, 1876.)

Adventures in New Guinea. The Narrative of Louis Trégarce, a French Sailor. Edited, and with an Introduction, by the Rev. Henry Crocker. (London: Sampson Low & Co., 1876.)

MR. GILL, who has worked long as a missionary in the Hervey Islands, one of the most advanced of all the Pacific groups, has published various good papers at different times on subjects connected with those regions. In his collection of *The Myths and Songs of the South Pacific*, which deservedly met with favourable notice in these columns and elsewhere, he has shown an enlightened sense of the value of such materials for the "proper study of mankind," and he has now condensed into a single volume the scattered notes of more than twenty years' experience. It would, perhaps, be unfair to complain of the arrangement, which is somewhat disjointed and fragmentary, for there is no literary pretension about the work—indeed, to judge by the style, it has been rather "adapted to young persons" than to the general reader. But the latter personage will also find much interesting matter in the volume, for although the author writes primarily, as is natural enough, from a missionary point of view, he is by no means a man of one idea, and has evidently abundance of material at his command. He gives much attention to natural history, and his stories on this head, if sometimes verging on the marvellous, contain some curious information. He is also a diligent collector of traditions bearing on the previous history of the people, and he infers from these that the islands of the Hervey group were peopled by immigrants from the Samoan Islands only about 500 years ago. In accordance with tradition, and the opinion of most authorities, he traces the origin of the Polynesian race to the far west; and he quotes instances within his own knowledge of canoes having drifted vast distances from the westward—in one case upwards of 1,200 miles—as proof that the race might easily have come from the continent of Asia. He is entirely opposed to Mr. Wallace's theory that they may have originated on a now submerged Pacific continent.

It is strange that a people so many degrees removed from barbarism, and so amenable to

civilisation, should possess no trace of any written or—with a very few doubtful exceptions—graven records of the past. These could hardly have failed to exist in the times of that higher culture of which their present elaborate social and religious organisation is only the shadow and caricature, and their absence seems to imply long ages of isolation, under unfavourable conditions. The colossal statues of Easter Island, and the massive stone structures of the Caroline Islands (some of them far below the present sea-level), attest mechanical powers now extinct; but the extent of dry land, and with it the elements of material civilisation, may have greatly decreased within comparatively recent times.

Mr. Gill contrasts, with pardonable pride, the condition of Polynesia before and after the introduction of Christianity. It is true that, in some of the islands, the mere presence of Europeans and the example of a superior race were sufficient to terminate the grosser abominations prevalent, such as cannibalism, and human sacrifices; and in other places, as in Hawaii, a strange interregnum of apathy and total disbelief preceded the acceptance of the new faith. Still, as a general rule, the orderly, peaceable, and civilised condition of the majority of the population in nearly all the principal island groups must in fairness be ascribed to missionary teaching, which, in fact, opportunely, if but partially, supplied the moral stimulus which the national existence then urgently required. It was, perhaps, unavoidable, but it is matter for regret, that the civilisation thus introduced had not a more spontaneous national development. The type would have been more interesting and less prosaic, and, what is more important, an outlet would have been found for the natural energies and capacities of the people, too often fatally cramped and paralysed by a narrow and uncongenial system. But it would have been wonderful indeed if all the early missionaries, besides being preachers, had also been statesmen and philosophers; and nothing less would have sufficed for the solution of the difficult problems which the case presented.

The stories of the vicissitudes in the early lives of some of our author's converts, and their comparisons of the former with the latter days, are not only curious, but valuable as records of a state of society which is rapidly disappearing. Such expressions as "May your head"—or, more delicately, "your ear—be cooked for my wife's supper," will soon have lost their significance. Mr. Gill publishes the "lament," by no means devoid of pathos, of a wife whose beauty had inspired her husband with a sudden determination to eat her; but the subject is too ghastly, according to our canons, for legitimate art. It is difficult, indeed, to realise that the eminently respectable, if somewhat insipid, communities of to-day still contain some who were witnesses and partakers of such deeds. We fancy ourselves separated by a vast gulf—both of time and of feeling—from the slayers of Polyxena, or of the daughter of Jephthah, but these would have recoiled in disgust from the hero of the above story.

Mr. Gill's account of the southern coasts

of New Guinea has all the interest and distinction belonging to early discovery. The object of the expedition was to establish native Polynesian teachers as missionaries; but the results were unfortunate, for those who were placed on the western side of the Gulf of Papua, among the fierce black Papuan race, were very soon killed and eaten, while of those placed among the milder people to the eastward, a large proportion have died from disease. Captain Moresby relates that he rescued some of these unfortunates, who were dying of starvation. Mr. Gill warmly repudiates the implied charge of neglect, but, admitting that all possible precautions were taken, it remains doubtful how far these natives were capable of appreciating the dangers of their position, or were fitted to encounter them. Our author's description of the race which inhabits the eastern peninsula of New Guinea is the more valuable from his being so well able to compare them with the Polynesians of the Pacific. The change in the physical character of the country on the eastern side of the Gulf of Papua, at the point where the hilly regions of the eastern peninsula with its protecting coral reef give place to the flat, half-drowned mangrove swamps which extend thence to the westward, coincides with a marked change in the character of the people; those to the westward belong to the dark Papuan or Melanesian race (which also forms the bulk of the population of all the islands immediately to the eastward), while the entire coast region, at least, of the eastern peninsula is inhabited by a people whom Mr. Gill considers identical with the fair-skinned Polynesians. This opinion is shared by the Rev. W. Lawes, who is settled among them, and for whose interesting letters our columns have been indebted to Professor Rolleston. Not only their appearance and character, but also their language is, he tells us, distinctly of the Polynesian, as opposed to the Papuan type. But the more the Papuan type, at all events in New Guinea, is studied, the more confused and uncertain it becomes, and the more difficult to define. Some ethnologists doubt whether the difference between these two races is nearly so great as is usually supposed. In the New Hebrides and Solomon groups, where they exist side by side, various intermediate types are found, and among the fairer race there, and notably in New Guinea, many characteristic Polynesian customs are absent, while some which are peculiarly Papuan are observed. On the other hand, there is almost everywhere a strong mutual antipathy, and in New Guinea the singular isolation of these apparent Polynesians lends force to the belief that they are a distinct, if not an immigrant, race.

The demand for solid information on the subject of New Guinea seems to be producing a crop of fiction of a by no means legitimate kind. Suggested, perhaps, by the example of Captain Lawson's *Wanderings in New Guinea*, we have a volume of *Adventures* there, purporting to be edited by "The Rev. Henry Crocker, Incumbent of St. Anne's, Wërëmai, N. Z.," who appears to vouch for its authenticity. In a grave and matter-of-fact Introduction he relates his intercourse with the author, the mate

of a French vessel, who spent ten years in the interior of New Guinea. The Introduction, however, ends with these words:—"As the true character of the book is evident to the careful reader, it is unnecessary that more should be said by way of Introduction to it." This, perhaps, is entered as a saving clause, and a sufficient hint to the intelligent reader that the whole story is a fable; but this is hardly fair, for we are thus left to decide whether the reverend editor is perpetrating a somewhat heavy joke, or was himself the victim of a clumsy hoax. The narrative contains statements which, being absurd in fact, should have been avoided also in fiction; and the improbabilities and inaccuracies, while numerous, have not the audacity which half redeems those of Captain Lawson. The description of the course taken, and of the winds encountered by the vessel after leaving Moreton Bay in Australia, makes it impossible that she should have been wrecked, as we are told she was, on the northern coast of New Guinea. Herds of wild animals, cattle, bisons, tigers, and ponies are mentioned. Now, besides that there are strong *a priori* reasons for disbelieving in such a fauna, none of these animals, indeed no mammalia larger than the pig, have ever been seen by any traveller, and natives who have come on board European ships have shown the greatest terror at the sight of sheep and cattle.

Again, we know that even on the coast the population is subdivided into many tribes, holding usually no communication with each other, and deriving their little civilisation chiefly from intercourse with the outer world. The tribes farther inland, as far as we know them, are thus in a very inferior condition. We find a difficulty, therefore, in accepting the accounts of a central civilised kingdom, hundreds of miles in extent, with an elaborate government, good roads and posting houses, regiments of cavalry, and large cities where no house of less than three storeys may be built.

The narrator was taken from the wreck, with four companions, by the natives. After being carefully fed for some days, they are brought, naked, before an assembly seated round a huge fire, with evident preparations for cooking. A "very fat sailor named Blewitt" is slaughtered first, and the others follow, but when the author's turn came he felt his hand grasped by the officiating priest, and was conscious of receiving the "first Masonic grip," which he immediately answered, and was, of course, saved. He was unable to ascertain whence the priest had derived his knowledge of Masonry; this evident connexion with cannibalism, however, seems to justify the recent Papal strictures on the Order. Being now received into favour, and, having recovered from the plunder of the wreck his Bible, an illustrated *Pilgrim's Progress*, and a quantity of paper and pencils, he proceeded to convert the natives to Christianity; though by his own showing he was generally worsted in argument. But we should, perhaps, apologise for a serious refutation of the genuineness of this narrative. We hope we are not impervious to a joke, but viewed as a *jeu d'esprit*, its merits are very slight, and the

joke is a dull one and hardly legitimate. There is only one other solution of the matter. We have strong doubts whether "the Rev. Henry Crocker" has any more substantial existence than the French sailor. This makes the joke still more ponderous, and, as it seems to us, the morality and good taste of the publication, in its present form, somewhat questionable. COUTTS TROTTER.

The Episcopal Succession in England, Scotland and Ireland, A.D. 1400 to 1875: with Appointments to Monasteries and Extracts from Consistorial Acts taken from MSS. in Public and Private Libraries in Rome, Florence, Bologna, Ravenna and Paris. By W. Maziere Brady. (Rome: Tipografia della Pace, 1876.)

WE are somewhat at a loss to understand on what principle Mr. Maziere Brady has classed together so much documentary evidence and so many facts relating to English, Scottish, and Irish ecclesiastical affairs. The collecting of such an amount of information must have been a laborious process, and the compilation of these volumes suggests the idea that the editor was unwilling that any of the knowledge he himself picked up in the course of his investigations should be lost to the world. And so, though we admit that we have been disappointed with the form in which the mass of matter he has collected appears, we nevertheless have to thank its editor for a very important contribution to the history of the Catholic Church in Ireland from the commencement of the fifteenth century to the present time. But we can scarcely understand why he should have wasted 120 pages of his first volume by the insertion of documents relating to the English Episcopal Succession, which is perfectly well known, and may be found in Le Neve, Stubbs, and other writers, unless, indeed, he was anxious to exhibit the fact of the termination of the line of bishops consecrated according to the ancient Ordinal; and we observe he never omits to chronicle the last bishop of Henry's or Mary's reign as being the last Catholic bishop of the see. English Churchmen have, of course, no right to complain of this, which is a view necessarily taken by one who has submitted to the Roman obedience; neither need we have mentioned it at all here were it not that it illustrates the general character of the book with which, from a literary point of view, we are disposed to find fault. The work, indeed, is partly documentary and partly historical, this latter portion having been extracted or made up from a variety of sources.

It is full of facts, but there is nothing to connect those facts together, no apparent unity of purpose in publishing such a collection. Occasionally a good deal of information is conveyed as to the lives of ecclesiastics, especially those deprived of their offices by Edward or Elizabeth. In other parts, where the documentary evidence is imperfect or scarcely intelligible, we have no explanations or additional information supplied. And this is the more to be regretted as the text has been taken, not from

original documents, but from copies which are evidently in many cases extremely imperfect; and when it is added to this that the volumes are full of misprints, not only in the English, where a Roman printer might naturally be at fault, but also in the Latin, it will be seen that this seriously detracts from the value of Mr. Maziere Brady's collection.

His work is at once most valuable and most defective in the extracts from the *Acta Consistorialia*, which appear in the last half of the second volume. The author gives us this account of himself, that

"his object was to trace from Roman Archives the succession of archbishops and bishops in the sees in England, Scotland, and Ireland; and to collect from authentic sources documentary illustrations of the period when England broke off relations with Rome and ceased to be a Catholic nation. The chief records to be examined for such a purpose are the Acts of the Pope's Consistory" (p. vi.).

Unfortunately the editor has transcribed most of these Acts from the volumes in the possession of Prince Barberini, and they are full of mistakes, some of which may be classed as mere misprints, though the greater part have been in all probability accurately given according to the MS., without any attention being called, for the most part, to the errors of copying. We confess that we like to see an autograph document produced in type exactly as it was written, but nothing is gained by perpetuating such mistakes as *destitutae* for *destitulae*, and the like, made by a mere scribe in copying from an original, when no one can doubt what the original reading was. In many of these instances it is quite doubtful whether the blame lies with the earlier scribe, or the modern compositor, or the editor himself. The request to make *Bellomene de Casalibus* a Cardinal (vol. ii. p. 270) might puzzle any ordinary reader, especially after the mistake made by the editor of the State Papers (vol. vii. p. 231), who makes the king ask for the Cardinalate for Sir Gregory da Casale. The real person meant is John da Casale, Bishop of Belluno, who is generally spoken of as the protopnotary in the correspondence of the period. Besides this, there are several obscure points upon which, with the help of these documents, the editor might have thrown considerable light. Several refer to the transactions about the Divorce from 1531 to 1533; and here the editor has missed a great opportunity of illustrating the obscure point of the debates concerning the admission of Sir Edward Carne as Excusator. In the whole history of the Divorce, no point is so obscure as the proceedings connected with the mission of Carne. Herbert speaks of his having been sent about February, 1532, and says that on November 14 of the same year he protested against the citation of the King to Rome because it had not yet been decided whether he was to be admitted to show cause why the King ought not to be summoned. Even Dr. Lingard, who is usually so accurate, speaks only in general terms of Carne having been sent with verbal instructions. In fact, till the *Records of the Reformation* was published at Oxford in 1870, nothing was known

of Carne's embassy except from a few letters printed in the State Papers of the reign of Henry VIII. The editor of those volumes expresses his wonder that there is no trace of Carne's appointment to so important a station. The *Acta Consistorialia* of February 12, 1531, solve the whole difficulty, as they state that on that day an unknown Englishman had appeared *tanquam unum de populo*, to excuse the King's appearance, when, as might be expected, the opinion of the assembled Cardinals was that no such private Excusator could be admitted. In another entry, of Dec. 4, he is present and expects to be heard. He is present again on January 8, 1532, when he alleged that the Pope had assigned him a certain time within which to bring up certain learned men from different parts of Italy, and petitioned that as he had not had time to convene them the discussion of the matter might be delayed. The petition was rejected in the consistory held a week later, January 15. On February 7 Mussetola, the Emperor's ambassador, requested the Pope to proceed in the matter, and Carne, entering his protest against the proceedings, nevertheless consented to appear on Friday, February 15, to discuss the merits of the case; but the Imperial ambassador and the Queen's advocate wanted to show that no person ought to appear at all in the capacity which Carne held as Excusator. Both points appear to have been argued on February 28 and March 6, and on the 13th and 15th the matter was discussed without the presence of the Excusator, and the same was continued on April 3, 10, and 17, after which we have only notices of the consistory of June 19 and 22, beyond which time the *Acta Consistorialia* unfortunately give us no information. From the State Papers we learn that Carne presented the King's letter appointing him Excusator on June 12, and that on July 9 it was agreed in consistory that the Pope should write to the King to persuade him to send a proxy to represent him in the case, which should be delayed till November. And this volume gives us no further information on the point, except that on January 8, 1534, it was determined to decide the case as quickly as possible, the decision itself being given on March 23, and printed at length in this volume, though it has appeared so often in Foxe and other books.

Among other interesting documents in this part of the work are the Pope's decree for the deposition and excommunication of Cranmer, dated December 4, 1555 (vol. ii. p. 318), the appointment of Cardinal Pole as his successor (p. 321), and the conferring of the legatine power on Peto after it had been withdrawn from Pole, upon the representation by the Queen and prelates of the disasters likely to fall on the realm by the revocation of Pole. There is also an account of a paper in the Vatican collections apparently intended to give the Pope information how to fill the sees of the bishops deprived by Elizabeth, and another document from which it appears that Cardinal Morone was appointed to consider the matter and to recommend a plan for filling up the vacancies. And there is one extract which seems absurd enough when read in

the light of history. It is a message from England stating that on June 8, 1565, the Queen was beginning to treat Catholics with more kindness, and that there was yet hope, if she should marry a Catholic husband, of the return of the kingdom to the obedience of the Church.

All these appear under the head of "*Acta Consistorialia*," and as such, or, at least, as having some relation to the main object of the work, we welcome them as supplying new information on ecclesiastical matters in England. But, as if to complete the incongruity of the contents of the collection, this volume ends with extracts from letters of the Venetian ambassador and others, which the editor speaks of as relating to consistories. In some of them the relation is not very visible, especially in one in which Paul Thiepoli, the Venetian ambassador, describes the quality and the quantity of everything that Pope Pius V. eat and drank at his frugal supper on August 24, 1566.

NICHOLAS POCKOCK.

PICTURES FROM "HALF-ASIA."

Aus Halb-Asien; Culturbilder aus Galizien, der Bukowina, Südrussland und Rumänien.
Von K. E. Franzos. (Leipzig: Duncker und Humblot, 1876.)

THIS is a book calculated to cause a conscientious critic some searchings of heart. For all who concern themselves with the fortunes of the Austro-Hungarian Monarchy it is both an interesting and an instructive, but at the same time an eminently painful, book. Hatred is the passion which forms the theme of by far the greater number of the sketches that make up the two volumes before us. And, as the author is in some sort an actor in the great drama of which these sketches form a few detached scenes, he also hates and is hated. Not that M. Franzos would exactly acquiesce in this way of stating the case. He would say that what he feels is righteous indignation. And, indeed, it is difficult not to feel righteous indignation against the monsters whose crimes are here recorded, until the blackness of the pictures displayed before us suggests the suspicion that the artist has been laying on his colours too thick; by which time righteous indignation is apt to behave like the elephants in ancient warfare, that turned on those that had brought them into the field. Nor is the painful character of the book diminished by the tone in which the author has thought proper to compose his Preface and Introduction. Even if M. Franzos had not told us as much in so many words, the internal evidence furnished by his book would have warned us that he is a young author. A little more experience will show him that to pose as the St. Sebastian of German culture, exposed to the amenities of the journalism of Lemberg and Bucharest, is not the best way to win the confidence of readers in lands remote from the struggle he depicts. It is, however, by no means clear that our author cares for such confidence. He seems to share the opinion of M. Franz von Löher that all Germany's neighbours, western as well as eastern, regard her with envy and hatred, and that Germans ought

to be proud of the fact. "Viel Feind viel Ehr." In like manner M. Franzos writes:—

"To-day we know that we Germans have on the earth's surface no other friend but ourselves. Let us be glad that that is sufficient for us. To-day we know that from all the nations, whom we are educating to an existence worthy of human beings, we have to expect no other return than envy and hatred, which, to be sure, is not the fault of our own national character, but of that of our scholars. . . . We had tears for the sufferings of all sorts of oppressed nationalities (*Schmerzenkinder*) around us; for our suffering had no one any sympathy, and, since we have fully made up our minds to be an oppressed nationality no longer, we have become the best-hated nation in Europe, and such we shall remain. At the same time we shall remain what we have hitherto been—calm unselfish champions of civilisation and humanity."

This extract from his "Introduction" is sufficient to show that our author's philosophy of history is not very profound, nor his "Objectivität" so completely above suspicion, as he with somewhat ill-judged vehemence asserts it to be. But his indifference to what Frenchmen or Englishmen think of his subject, or have already written about it, perhaps adds to the interest of his book though not to the value of his conclusions. The twenty-three sketches here collected first appeared as *feuilletons* in the *Neue Freie Presse* and other German newspapers, and were afterwards, as M. Franzos tells us with legitimate satisfaction, "*massenhaft nachgedruckt*," "The Insurrection of Wolowce" being copied in thirty-two, and "The Dead Souls" in forty other journals. The sketches are of very unequal merit, and are very unequally distributed among the countries enumerated in the alternative title. South Russia comes in for only three, none of them particularly full of information. Those devoted to the Bukovina and Roumania deal for the most part in generalities, giving us, so to say, merely a bird's-eye view of those countries. But Galicia, or, rather, a particular portion of Galicia—Austrian Podolia—has eight sketches specially devoted to it, besides its fair share of those which cannot be assigned to any one province of "Half-Asia." This is explained by the fact that the author was born and bred in an obscure Podolian town which figures in these pages under the assumed name of "Barnow." From several incidental remarks the reader discovers that the author is a Jew. It is to some extent characteristic of the school to which the writers in the *Neue Freie Presse* mostly belong that he nowhere tells us so in so many words, and that, in opposition to Mr. Daniel Deronda and his friend Merdecai, he considers it a misfortune for the Jews of the East of Europe that they form a separate nationality, as compared with their more fortunate brethren "the Frenchmen or Germans of the Jewish confession," who do not. The chief interest of the book consists in the portraits it presents of the different nationalities of "Half-Asia," though these portraits are of very various degrees of excellence. The Russians can hardly be said to be portrayed at all. One or two ugly stories are told of them, but it is somewhat vaguely hinted that they are very superior to the Poles and Roumans. The portraits of these

two nationalities might perhaps have been more effective if the artist had not chosen to dwell exclusively on the bad sides of their characters. The Roumans, indeed, fare extremely ill. They are said to be inferior to the Poles, which from the pen of M. Franzos is the severest condemnation. In his sketch entitled "Dead Souls," where he treats of the traffic in false certificates of death flourishing in Roumania, he observes:—

"But no Rouman Gogol has as yet appeared to lash this novel traffic. The poets of this unhappy nation—more unhappy than anyone in the West imagines, unspeakably miserable!—the Alexandris, Rosettis, Sions, *e tutti quanti*, have something else to do. They have to translate every piece of French nastiness, the more eagerly, the more obscene it is. They have to urge on their people to mad dreams of a great Dacian State. They have to corrupt the folksong, the one pure and beautiful flower that this diseased population has produced, by composing 'edited' collections. In such company no Gogol can be found. Only where a people still sound in its innermost core wrestles with disease can so great, so austere a man appear as physician. But to a nation sick unto death even the Cassandra-cry of the poet is denied."

But the greater part of the book is taken up with the three nationalities of Austrian Podolia—the Poles, the Ruthenes, and the Jews. Of the last-named we have several interesting vignette portraits, especially in "Schiller in Barnow," whose theme is that "Schiller is not dead but liveth, being born anew day by day in thousands on thousands of hearts, which are by him enlightened, and he becomes to them a very Saviour and Redeemer (*Heiland und Erlöser*)."

One of these hearts is that of Schlome Barrascher, the two-and-twenty year old scholar in the second "gymnasial class," who never rose into the third, because his son died in the holidays. In spite, however, of his soft heart and dreamy sentimentalism we find him deciding a contested election in favour of a Jewish lawyer against a Polish count. But no Jewish character is portrayed in such detail, and consequently none makes such an impression on the reader as the Ruthene village-judge, Ywon Megega. His sterling honesty, his manly courage, his simple modesty, not incompatible with a certain vein of extravagant romancing, and withal his habitual drunkenness, are somehow so given by our author as to enable us to form a very vivid image of the population of which he is a type. As for the Poles, they are all depicted from a Rutheno-Jewish point of view, as prodigals, debauchees and tyrants, without conscience and without compassion. The descriptions given by M. Franzos of the bitter feuds between the Poles and Ruthenes, remind us of the more artistic compositions of his compatriot, Sacher-Masoch. This feud supplies the motive of the two longest and most successful sketches—"The Insurrection of Wolowee," and "The Village-Judge of Biala." Both of them excite a good deal of that uncomfortable feeling called righteous indignation, but that does not diminish our interest in the stories, or our admiration of the skill with which they are told. As much cannot be said for our author's third longest effort, "Wladislaw and Wladislawa." This is not only as vulgar a story of obtaining money on false pretences as could be picked out of the columns of a London penny

weekly, but is withal told in a painfully vulgar tone, with a tasteless dwelling upon dirty details which is unfortunately but too common in Austrian newspapers. However, it serves the author's polemical purpose, by showing that when Poles are not hateful they are despicable; that when not addicted to murder and rape they are distinguished by dirt and snobbishness; that in Polish human nature the fool begins where the villain leaves off. There is absolutely not a single redeeming feature in any one of his Polish *dramatis personae*, with the sole exception of the Dominican monk, one of those in whose hearts Schiller has been born anew, who found in the *Gedichte* that assurance of faith which Catholicism and St. Augustine had ceased to afford him. Yet M. Franzos tells us that he is no enemy of the Poles, and never will become one, that no German writer has depicted with greater warmth the bright side of the Polish character, or has more zealously commended to his German fellow-countrymen the great poets that adorn the rich literature of Poland. Of all this, however, the two volumes before us contain nothing.

One word more in conclusion. Our author adopts the theory, which, of course, he does not claim to have originated, that there is a civilised Western Europe of Teutons and Latins, and a half-civilised Eastern Europe of Slavs, Roumans, and Jews. Is the contrast so marked as it is here represented? Most, if not all, the marks of barbarism which he recounts as distinguishing "Half-Asia" might be found in Latin Italy or in Latin Spain, and we might match in countries still nearer to London his story of the Rouman peasant-woman who held that the wonder-working image of the Mother of God in Dragomirna was very well for curing the ailments of cattle, or for recovering stolen property, but that to heal her sick child she must make a pilgrimage to the wonder-working image of the Mother of God in Putna. Indeed, the "People of the True Faith," who reject medical aid to the sick, would find congenial religionists in Essex. But, setting a too systematic theory aside, we have to thank M. Franzos for some very vivid pictures of what is, perhaps, the least-known portion of Europe, and would express a hope that, when time has somewhat mellowed the flavour of his "*saeva indignatio*," he will give us another set of pictures, more cheerful in tone, which, according to a suggestion contained in his "Introduction," may be entitled "Half-Europe."

ARTHUR J. PATTERSON.

Early Rome. By W. Ihne, Ph.D. (London: Longmans & Co., 1876.)

"We can hardly," says Dr. Ihne, "speak of a history of this time except in so far as we attach to the word 'history' the original meaning which it bore in the Greek language, and which is synonymous with 'investigation.'" Bearing this truth in mind, he has discarded all thoughts of a straightforward narrative, and has given us instead an able summary of the chief points which recent historical criticism has been able to establish. More than this, he has wisely attempted to

give the ordinary reader some idea of the methods by which this rough skeleton has been pieced together out of those fossils and fragments of the original which have come down to us. We get in consequence an outline of the political, religious and social system of primitive Rome, and of the most decisive crises in the early history of her citizens; but on the other hand there are only one or two dates, a very few names, and but a meagre list of events.

From an educational point of view especially, this period seems peculiarly unmanageable. The few certainly established facts are almost lost in the multitude of theories and conjectures which have sprung up around them. The plan which Dr. Ihne has adopted, though only possible for one thoroughly conversant with his subject, is probably the best. In most cases, after a careful statement of the problem, he gives the solution he prefers, with the reasons for his preference. No doubt he thus runs a risk of appearing one-sided, but what else he could have done in so limited a space it is difficult to see.

Enough has been said to show our high opinion of Dr. Ihne's book, and, without attempting to follow him closely throughout it, we shall confine ourselves to noticing one or two points. In the second chapter the sources of the history are discussed: in other words, the materials available, and the methods of using them, are clearly exhibited to the reader before he approaches the fabric itself. After narrating and carefully examining the traditional story of the Seven Kings, our author proceeds to sum up the positive results obtained. Between the earlier and later Roman monarchy there was, he considers, this important difference. The former was priestly, the latter military in character. Now, that the early Roman monarch was priest as well as king is certain, and it is possible that before the final dissolution of the monarchy these priestly functions had most of them passed to a separate officer, the Pontifex Maximus; lastly, the military prerogatives of the kings are sufficiently proved by what we know of the powers of their direct heirs, the consuls. Still we venture to think that Dr. Ihne has a little exaggerated the sacerdotal character of the first monarchs, and we cannot accept his suggestion that they regularly left their military duties to deputies, as inconsistent with their priestly office. The erection of the high-priesthood into a separate office seems in the same way to connect itself, not with any scheme for secularising the monarchy, but rather with the traditional aristocratic policy of breaking up the supreme magisterial authority.

Dr. Ihne so clearly realises the military aspects of Roman monarchy that it is surprising, when we come to his account of the Senate, to find that he ignores the traces of such a rule which that institution seems to bear. It is probable that the Senate was originally, as its name implies, a council of elders, and it is possible the various heads of families formed, in right of their position, a council with powers and prerogatives of its own. But by the commencement of the Republic it is clear that this state of things, if it ever existed, had passed away. The

Senate then consisted only of such citizens as the king chose to summon—a council of war, to advise, but to do nothing more. The explanation of this change is probably to be found in those military necessities which in Rome as in mediæval Europe strengthened the central authority at the expense of the aristocracy.

Few political institutions are from first to last so difficult for a modern reader to understand as the Roman tribunate. That it was not a constitutional (*legitima*), but a semi-sacred authority (*sacrosancta*), is clear; but on what this sanctity rested it is not so easy to say. Was there, as Dr. Ihne thinks, a solemn covenant originally made between patricians and plebeians guaranteeing the inviolability of the tribunes; or did this rest at first merely on an oath sworn to by plebeians alone, and only legally ratified as a “*lex sacra*” on the restoration of the tribunate after the Decemvirate? The latter is the view we prefer ourselves, and it is that supported by Prof. Mommsen in the second volume of his *Römisches Staatsrecht*.

The difficulties of the traditional account of the fall of the Decemvirs and the legislation which followed have long been recognised. Dr. Ihne's explanation of them is clear and satisfactory. He maintains that the Decemvirs were overthrown, not by the plebeians, but by the patricians, who hoped to restore the former *régime* unencumbered by the tribunate, and that the plebeians in turn successfully insisted upon the restoration of their chief safeguard.

Our limited space precludes more than a bare notice of those parts of the book which deal with the foreign history of Rome. Everywhere the traditional accounts are literally given and critically weighed, and the true bearing of such evidence as we possess clearly shown. In conclusion, we have only to say that no one is likely to read the book carefully without gaining, not only an accurate idea of what Early Rome was, but also a valuable lesson in the true methods of historical criticism. H. F. PELHAM.

NEW NOVELS.

Madcap Violet. By William Black. (London: Macmillan & Co., 1876.)

Bessie Lang. By Alice Corkran. (Edinburgh: W. Blackwood & Son, 1876.)

The Owl's Nest in the City. By Edward Lovel. (London: Henry S. King & Co., 1876.)

It would be disagreeable to have to say that *Madcap Violet* gives less pleasure than *The Princess of Thule*, and *A Daughter of Heth*, if the story did not raise a question in art which no second-rate novel is likely to suggest. Everyone has heard of Mr. Thackeray's defence of Lady Castlewood's second marriage: “they would do it,” he said; “how could I prevent them?” Now, the characters in *Madcap Violet* do a number of things which we would rather they had left undone, and by this means they bring down Fate, and give to the heroine's pet-name a cruel fitness. The question is, could they, having once been clearly conceived in the author's imagination, and having taken possession of his fancy—could

they have done otherwise? Is necessity only to sway the conduct of the ephemeral race of men, and are the more enduring people of fiction to enjoy the exercise of free will? We fancy that the more nearly they attain to actual life, the more sternly are they compelled to put up with the lot that the Norns weave for each soul that comes into the world. Looking at *Madcap Violet* from this point of view, and asking what the laws of life and of conduct would have made of her existence, and not considering what change in her fortunes the taste of the novel-reading public might demand, we must grant that her destiny, in all its changes, is natural, and perhaps necessary. A frank and kindly heart, too highly strung, without guidance in childhood, and without any law but impulse, carries her hither and thither in a fashion which we may not admire, but which is certainly not improbable. Again, the little turn out of the course where her happiness lay, or seemed to lie, is contrived with great skill, as we think, and though matters might have been, probably would have been, explained in real life, still affairs would no longer have gone smoothly between the two strange lovers. As for Drummond, who is, next to Violet, the chief character, Mr. Black has again displayed a stern realism in making him a humourist of the melancholy Scotch sort. The odds are always about five to two that among Drummond's flow of good things will be some blank failures, and what seems to his restless fancy a happy quaintness, or incongruity, will fall flat on his hearers. Thus he differs from such humourists as the wise youth in *Richard Feverel*, and from the author of *The Pilgrim's Scrip*, in the same work, both of whom are certain to hit the mark. He has the Caledonian pedantry, which runs on the humorous side of grave or learned matters that no one else would think of, when on the moors, or when sailing up the Sound of Mull. If there is one not very natural point in the conception of Drummond, it is the strength of the love of this rather senior sentimentalist. One would naturally have suspected him, rather than Violet, of trying to escape to “the land, distant and unnamed,” of men and of matters that desire to be forgotten. As to the Scottish scenery in which much of the action of the tale is made to happen, it is described with Mr. Black's usual skill, unsurpassed in the English literature of the day. Indeed, the gray mornings, and broken lights, the Highland rain, and the clear shining after rain, are brought so vividly before us that we are fain to omit some passages in the reading for the reason for which Goethe at one time refused to look at pictures of Italy. In parting with the book, which shows Mr. Black's powers in a new and unexpected form, it is necessary to express a hope that when next Mr. George Miller visits the neighbourhood of Loch Aline, he will shoot no herons there. He is not an amiable character at best, and few people would have been sorry if he, rather than a promising young minor poet of the decorative school, had perished ignominiously by a fall out of the back seat of a dog-cart.

“Dans l'Angleterre la séduction est très-restreinte,” says a French novelist, speaking of this country. No one would gather such a favourable impression from English romances, and, indeed, foreigners are hardly to blame if, judging from our fiction, they have a low opinion of our morals. The story of Bessie Lang, who “brought dishonour on her race,” is told so well, with so much feeling for the beauty and peace of life in a remote Cumbrian village, and Bessie herself is a character so bright and touching, that one cannot but regret the melancholy conclusion of her romance. Among the quaint scenes of the hamlet of Carbeck, such as the Rush Sunday, the challenge to wrestle, conveyed by ringing the town bell, one may be permitted to quote a dispute in church:—

“Mr. Orville began to read the Psalm for the twelfth day. ‘You're wrong, sir,’ shouted Mr. Horton from under the pulpit. ‘It is the eleventh day, not the twelfth.’”

“‘Nay, nay,’ answered Mr. Orville stoutly, looking down where the clerk stood, ‘it's the twelfth. I had my sheep sheared on Wednesday—that was the seventh of the month, I marked it down.’”

“‘It's the eleventh, sheep or no sheep,’ cried the clerk.’”

“I knew he was getting angry, for his wooden-leg was thumping against the floor, as it did when any one contradicted him. He was accustomed to have his way with the children, and he was dictatorial, was Mr. Horton. ‘Is not the fair held to-morrow, and is it not always held on the twelfth?’”

“‘Why, man!’ cried Mr. Orville, laughing, ‘according to your showing the twelfth of June could never fall on a Sunday, as 'tis against the law the fair should be held on the Sabbath. Cannot the fair come off on the thirteenth, once in a while, to make way for the Lord's day? Nay, nay, my mark is better than yours.’”

The priest and clerk are set right by Bill Troughton, the village lad of genius, who is later betrothed to Bessie, and deserted by her for the all-accomplished amateur artist of fiction. All this is natural enough, though we fancy Bessie's father would not have been so blind to facts as the story makes him. The author, when she ruins poor Bessie, deserves the reproach of those who have willfully chosen sadness.

The author of *The Owl's Nest in the City* has some powers of observation, and can write in a quiet and assured style. It is the greater pity that he has chosen to invent a plot of too complicated and repulsive tragedy. Squire Earle has a son, Stephen, and a daughter, Mary. Stephen, who fears to be disinherited in favour of Mary, deliberately throws her, as we understand the story, in the way of having private meetings with a young nobleman, Lord M. Now seduction among people in this rank of life is really too rare to be introduced as a natural event in a novel. Mary, however, is obliged to conceal her shame by marriage with one Prescott, a solicitor's clerk. She bears a son, the Dick of the story, to Lord M., and another son to her husband, and runs away just before the birth of a daughter. This daughter is brought to Prescott's house, on her mother's death, and after a love-affair with her half-brother, Dick, who is unaware of the relationship, she too is seduced by a son of the Lord M. who ruined her mother. The following sentence gives the main idea of the story:—“Would you have Dick fight

his own brother, and for his sister, too? Oh! it is too horrible." Certainly the mere suggestion is much too horrible.

A. LANG.

CURRENT LITERATURE.

Three Centuries of English Poetry; being Selections from Chaucer to Herrick; with Introductions and Notes by Rosaline O. Masson. (Macmillan.) Mrs. Masson's selections from English poetry have been made with a literary, not a philological, purpose. The passages are, as a rule, well chosen, the texts in general accurate, and the brief introductions correct in their statement of facts. Why Herrick should close the volume seems inexplicable. It is like making a cowslip the goal of a race. The year of Milton's death, 1674, might well have been chosen as a landmark, and thus the noble poetry of Marvell, too little known, might have been represented. We are surprised to find that Mrs. Masson, acquainted as no doubt she is with the evidence against the traditional opinion, and with the decision of the competent authorities, should have given extracts from "The Flower and the Leaf," and from "The Court of Love," under the head of "Chaucer." The modernisation of Chaucer and of Langland, though far from carelessly executed, is not carried out on steady and unvarying principles, and the metre is in some instances spoiled by an unceremonious treatment of the final *e*. It is, however, so great a gain to possess a volume of popular selections which introduces the reader to Chaucer's minor poems, and to that great epic of the social conscience, *The Vision of Piers Plowman*, that we condone these offences. It is harder to excuse the neglect of certain writers whose names ought to be dear to all lovers of poetry; Giles and Phineas Fletcher appear, but where are George Herbert, Vaughan, and that poet of passionate mystical aspiration, Crashaw? The selections from Spenser are very happily made, and ought to tempt readers into that world of loveliness, *The Faery Queene*. Upon the whole the work deserves decided commendation, and it will be of real use as an introduction to our elder poetry.

Plato and the Older Academy. Translated with the Author's Sanction from the German of Dr. E. Zeller, by Sarah Frances Alleyne and Alfred Goodwin, M.A., Fellow and Lecturer of Balliol College, Oxford. (Longmans.) This is the third detachment of Zeller's work on the Greek Philosophy which within the last few years has been made accessible to the somewhat numerous body of students for whom German is an unknown or unfamiliar tongue. The compliment of translation is well deserved by the patient erudition and masterly arrangement of the original, which, though it may err by seeking a system where system can only be patchwork, is still an indispensable aid to the readers of one or two selected treatises of Plato and Aristotle. To any one therefore who takes up the irksome part of translator gratitude is eminently due. Of the present version it can be said that in all essential respects it may be relied on as an equivalent of Zeller's book. The text is the special work of Miss Alleyne, as the notes are that of Mr. Goodwin. In the former there is an occasional uncertainty as to the force of an idiom: nor are there wanting slips, such as in p. 489, where "justifiable in themselves" has taken in *sich* from its verb *aufnehmen* and given it to *berechtigte*; "something opposite" scarcely expresses *ein Jenseitiges*, and "essentially individual aims" misses the meaning of *den wesentlichen individuellen Zwecken*. Less stress need be laid on a want of precision and uniformity in rendering the special jargon of philosophy; for *autant de professions, autant d'argots*, and the reader will probably find out the right term for himself. The notes so far as our inspection has gone are correctly done: but surely there is a mistake in p. 322, note 83, where "each of these is added as

Platonic to the disputed determinations of the Platonists" has been put by an oversight for the true rendering of *Jede von diesen unter den Platonikern streitigen Bestimmungen schliesst sich an Platonisches an*. These slight lapses, however, need not interfere with the utility and general excellence of Miss Alleyne and Mr. Goodwin's performance.

It would hardly be possible to give a more succinct account of 270 years of English history than that which is contained within the limits of ninety-four pages in Mr. Rowley's *Rise of the People and Growth of Parliament*, 1215-1485, "Epochs of English History" Series (Longmans). No really important fact is omitted, and there is no superfluous detail; yet there is detail enough to make the sequence of events intelligible, and the true proportions of the facts are admirably preserved throughout. Social and constitutional history are not neglected; indeed, they are made an important feature of the book, as the title itself pretty sufficiently indicates. The work, in fact, is divided into five books, each treating of a leading subject in the history of the period which the author himself sets forth as follows:—

"1. How Parliament grew into its present shape.

"2. How Wales was joined to England; and how an attempt was made to join Scotland also, but without success.

"3. How some English kings strove to win the Kingdom of France; and how the English people were thus drawn into a war which lasted for more than a hundred years.

"4. How great changes came over the people in social matters; how Parliament grew stronger, and some men tried to reform the Church.

"5. How the barons, towards the end of this period divided into two parties, and fought for different kings; and how the land was filled with disorder and bloodshed."

The full treatment of these five subjects would almost make an exhaustive History of England for the period; and the condensed treatment of them by Mr. Rowley makes a very complete History considering the dimensions of the book. Altogether, it is an admirable handbook; and what adds very much to its value is a brief chronological table of events at the end, together with indexes of names and places. There are also four woodcut maps. In short the student is here furnished with every possible means of referring to the main events of the period and studying their bearings on each other.

The Boudoir Shakespeare. Carefully Prepared for Reading Aloud. Edited by Henry Cundell. No. 1 and No. 2. (Sampson Low and Co.) This is, upon the whole, a praiseworthy attempt to supply single plays of Shakspeare in an expurgated form. *Cymbeline* and *The Merchant of Venice* have been published. We cannot approve of the pains which the editor has taken to conceal his omissions by running lines together with a slightly altered text, so as to avoid metrical breaks. The statement that words substituted for those of the original are invariably printed within inverted commas is not strictly true. It would have been better to let the gaps and variations in the text remain frankly apparent. That Mr. Cundell should have reasons for believing himself descended from the editor of the First Folio of 1623 cannot but be a "most grateful circumstance" to himself, but, as he is aware, his ancestor's reputation as an editor—the errors of the First Folio being estimated at 20,000—is not a guarantee for careful superintendence of the text. The aims of the elder Mr. Cundell and the younger are essentially different—the one being to present Shakspeare's plays "perfect of their limbs" and "absolute in their numbers;" the other "to strip the text of all that might wound a feminine sense of delicacy." It must be confessed that our own Mr. Cundell has fulfilled his promises more faithfully than did Shakspeare's fellow-player. The type is excellent. On the cover appears a bust of the poet (after that of Stratford), looking as bland

and mindless as if he had specially adapted his features to the boudoir. In spite, however, of the silly and insipid title *Boudoir Shakespeare*, the adult and masculine poet remains within the covers of these volumes—as he ought to be—unchanged at heart.

King Lear. Edited by William Aldis Wright, M.A. (Clarendon Press.) This addition to the Clarendon Press Series is no less remarkable than the plays that preceded it for full and accurate scholarship. In all that concerns the text and verbal criticism it is eminently satisfactory. Mr. Wright in the preface takes occasion to defend the editions of Shakspeare's plays in this series from the objection that they do not deal with aesthetic criticism. Such criticism "turns the commentator into a showman;" Mr. Wright has no sympathy with "such sign-post criticisms." But surely the illustration of Shakspeare's ideas and imagery by other passages from his own writings and those of his contemporaries is no less legitimate than the illustration of the verbal peculiarities of the writer and of his age; nor would the comparison be less instructive. It is thus we approach the one mind which expresses itself in each and all of the works of an artist. Nor is the value of the so-called "sign-post" criticism to be finally determined by a contemptuous epithet. To say "This is beautiful!" "This is sublime!" is indeed ridiculous, because for such broad sign-post directions there can be no need. But accurately to touch the secret of some less obvious artistic effect is sometimes possible, and is full of educational value. Lady Macbeth says:—

"If he do bleed,
I'll gild the faces of the grooms withal,
For it must seem their guilt."

Either Mr. Wright or Mr. Clark was guilty, in the Clarendon Press edition of *Macbeth*, of the following note:—

"By making Lady Macbeth jest, the author doubtless intended to enhance the horror of the scene. A play of fancy here is like a gleam of ghastly sunshine striking across a stormy landscape, as in some pictures of Ruysdael. Compare for the pun, 2 *Hen. IV.*, iv. 5, 129."

We submit that this sign-post note is as instructive as any array of bad textual emendations from Warburton, from Zachary Jackson, and the old Corrector.

King Lear, with Notes, &c. By Dr. W. B. Kemshhead. (Collins.) A school edition of the play, inferior, in a marked degree, in scholarship to the Clarendon Press edition; but to some readers it may be an advantage to have only twenty or twenty-five pages of notes instead of a hundred. The introduction contains passages of criticism from Coleridge, Schlegel, Lamb, and others.

Notes on Shakespeare, and Memorials of the Urban Club. By John Jeremiah. (Clayton.) The Urban Club, which holds its meetings at St. John's Gate, Clerkenwell (where may be seen the chair called *Dr. Johnson's*), was started, in 1858, by Mr. Hain Friswell. It is still, therefore, an infant, but apparently so precocious an infant that its honorary secretary, Mr. Jeremiah, finds material to write its history. One needs to be within the circle of genial *Schwärmerei* which an At-Home-giving and dinner-giving society begets to enter with zeal into the story of its songs and toasts. Special honour is paid by the Urban Club to "the immortal memory of Shakspeare," and its secretary now re-issues his *Notes on Shakespeare*, previously presented to the members. They consist of a little gathering of familiar facts about Shakspeare's life, the quartos and folios, &c., &c. The appendix contains the programmes and circulars of dinners and meetings issued by the club, which are works of literature or of art, each toast being accompanied with suitable mottoes from Shakspeare. We commend to the notice of Mr. Jeremiah the Bill of Fare of the Philadelphia Shakspeare Society's Annual Dinner, 1869, in which *King Lear*—the play in the study of which the members of the society

had been last engaged—is constrained to furnish a joke in connexion with each item of a modern dinner à la Russe. We quote for his benefit from this unique *carte*:—

Oysters.—"Art not asham'd to looke upon this Beard?"

Snipe.—"Bring up the browne Billes."

Punch.—"I tax you not, you Elements, with unkindness."

Filet de Boeuf with Tomato Sauce.—"I am asham'd That thou hast power to shake my manhood thus."

Cigars.—"Looke heere comes a walking fire."

We fear the bouquet of after-dinner jokes must be enjoyed upon the spot, or not at all.

Words; their Use and Abuse. By William Mathews, LL.D. (Triibner.) A book about words intended for popular reading, and containing an abundance of miscellaneous information, gossip, moralising, platitudes, anecdotes, and quotations. We have a deep sense of the value of all these, and especially of platitudes, but we can be content with those of home manufacture, and consider it, indeed, a patriotic duty to consume the home product before importing a similar article from the great pork-packing centre of Illinois. Nevertheless, a popular lecturer in a small country town which was understood to have literary tastes might find in this volume material for some intellectual treats suitable to the parish school-room or town-hall.

MR. TREVELYAN'S *Selections from the Writings of Lord Macaulay* (Longmans) will perhaps serve as an inducement to some people to read the books from which they are taken. As Mr. Trevelyan truly says in his preface, Macaulay's writing lends itself more than that of most men to the work of the selector. Mr. Trevelyan gracefully avoids criticism by closing his remarks with a statement that his author's pen "never sinned against honour, liberty, or virtue;" and even those who dislike Macaulay's writings most may be content to admit that the praise is justified.

Manual of Political Economy. By Henry Fawcett, M.P. Fifth Edition. (Macmillan.) The author of one of the most celebrated philosophical works published in this country in the last five-and-twenty years, one which has passed through many editions, has been heard to say that it has suffered from insufficient criticism. We believe Mr. Fawcett might in like manner ascribe some of the defects discoverable in the fifth edition which his *Manual of Political Economy* has now reached to the reluctance of the reviewers of earlier editions to find fault with the works of so popular and eminent a politician. If we notice one or two blemishes, it is in the hope of preventing their reappearance in a sixth edition. Mr. Fawcett's manual follows in its chief lines Mr. Mill's *Principles of Political Economy*, and we shall not attempt to discuss the objections which may be taken to the method followed by both. For instance, Mr. Fawcett at the outset warns his readers that Political Economy only affirms tendencies in the absence of counter-acting causes, and that the results deduced from its principles do not come into immediate operation. Yet he subsequently reasons in not a few cases as though the deductions were immediately and certainly true as a matter of fact. Thus, in treating of the incidence of taxes, he sometimes argues as though they fell with mathematical certainty and exactness on individuals so as to preserve a nice equilibrium of profits. In fact, producers, instead of recovering with a fair profit all advances in special taxes, have not unfrequently been ruined by them. But Mr. Mill's treatment of this subject is open to similar criticism, and Mr. Fawcett has only followed the steps of his great predecessor. He makes, however, an unfortunate departure from Mr. Mill's path in defining Political Economy as treating of "the principles which regulate the production, the distribution, and the exchange of wealth." It would scarcely be logical to define Zoology as the science which treats of animals,

plants, and vegetables. Exchange is only a branch or mode of distribution. At the beginning of his third book on Exchange, Mr. Fawcett says that "the distribution of wealth of course implies the exchange of wealth," adding as a reason for the arrangement he adopts that "the laws of the production and distribution of wealth have been discussed (in Books i. and ii.), without anticipating any of the laws of exchange." There appears to be a twofold confusion here. Distribution, as Mr. Mill has carefully pointed out, by no means necessarily involves exchange. One of the most important modes of distribution is, for instance, by the law of succession. Again, in Book ii., Mr. Fawcett discusses wages, profits, and rent, which involve exchanges between labourers, employers, landowners, and consumers, so that the laws of distribution have not been discussed by him "without anticipating any of the laws of exchange." Another correction which we may suggest relates to the occasional phenomenon of a rise or fall of the foreign exchanges beyond "specie point," which is not satisfactorily explained or exemplified in Mr. Fawcett's book. He instances the sudden rise of the premium on foreign bills to 10 per cent. on the news of Napoleon's escape from Elba, and cites Mr. Mill as referring so extraordinary a rise to the anticipated difficulty of procuring gold for transmission. But Mr. Fawcett omits the chief part of Mr. Mill's explanation—namely, that the rise took place during a suspension of cash payments, and that in a convertible state of the currency no such thing could have occurred until the bank stopped payment. Mr. Fawcett would, moreover, have done well to illustrate the subject by the aid of Mr. Goschen's treatise on the foreign exchanges, in which a striking example is given of a fall of the discount on foreign bills in the United States below specie point on the outbreak of the Civil War, in consequence of an urgent desire to realise immediately.

A Mad World. By J. Chambers. (Sampson Low and Co.) "Nothing that the public deserves to know can be effectually barred against the Press any more, neither Central Africa, nor a Russian march on Khiva, nor the judgment of a German Kammergericht, nor the secrets of our United States' Senate Chamber." So says Mr. Julius Chambers, who, in his character of Felix Summerley, a newspaper reporter, managed to get himself locked up in a New York private lunatic asylum, and exposed the secrets of that Inferno in some New York journal. The public certainly deserves to know how asylums are managed, and Mr. Chambers has done good work in the same cause as Mr. Charles Reade. The reprint of his articles called *A Mad World* shows him to have plenty of courage, a style that runs too much to what is called "graphic," a great deal of observation, some humour, and an innocent and unaffected belief in the daily Press. No one who begins the *Mad World* is likely to leave it unfinished, but perhaps the work would have had more practical worth if the manner had been less the manner of the special reporter.

Annales de la Typographie Néerlandaise au XVe siècle. Par M. F. A. G. Campbell; xvi. and 630 pages 8vo. (La Haye: M. Nijhoff.) A carefully got up and well-arranged volume, containing titles and bibliographical descriptions of 1,794 works, forming a pretty complete catalogue of all the known productions of the Low Country presses of the fifteenth century, which may be considered as the first part of a general Netherlandish bibliography. The notices may be divided into two classes: those which relate to works in the Library at the Hague, 815 in number, which are complete; and the remainder, which are in part not the result of the author's personal inspection of the works described.

In his preface M. Campbell enumerates the few facts relating to early Netherlandish printers that have been ascertained since 1868, most of which have been made known to English biblio-

graphers by Mr. H. Bradshaw in his "List of the founts of type and woodcut devices used by printers in Holland in the fifteenth century." At page viii., M. Campbell remarks that as the wood-blocks of the *Speculum humane salutis* are proved to have been in the possession of John Veldener in 1481 at Utrecht, it is probable that the earlier editions of this work, as also the *Tractatus de amore* of Pius II., and several other treatises which have a sort of family likeness, were printed in that town. To this we may add that some curious documents which Mr. Weale discovered ten or twelve years ago in the archives of Bruges, and which he is now engaged in printing, show that as early as 1426 prints and rolls and books of prints were imported in large quantities into Flanders from Utrecht. In that year, however, the magistrates of Bruges issued a decree forbidding the importation of separate prints as injurious to the interests of the illuminators and painters of the town, but authorising that of rolls and volumes of prints.

It may be well to mention one omission, namely, that of the *Breviarium ecclesie leodiensis sancti Lamberti*, printed at Brussels in 1484, a copy of the *pars hyemalis* of which is preserved in the Duke of Arenberg's library at Brussels, and a fragment of the *pars estivalis* mentioned in the catalogue of the Van de Velde library. The description of the Carmelite Breviary, no. 364, is not quite correct, but probably this rare volume has not come under the author's personal notice.

M. Campbell has rendered a great service to bibliographers by the publication of this volume, which, with Holtrop's *Monuments typographiques*, will render the classification of Low Country *incunabula* an easy task to any intelligent person.

A Protest against the Extension of Railways in the Lake District is a composite work. There is a preface by Mr. Ruskin, a chapter by Mr. Somervell, an article from the *Daily News*, somewhat out of the *Saturday Review*, a poem from *Punch*, and clippings from *Fors Clavigera*. All the authorities agree that a new railway in Cumberland would be a superfluous nuisance, though the *Daily News* and, we think, the *Saturday Review* admit that "it would be inevitable on the discovery of rich mines in the threatened district." Mr. Somervell contends that it is "idle to urge the development of 'material prosperity' as in itself a sufficient reason for turning, if it were possible, this Lake Country into a mining region." We heartily wish that it were idle; but where the copper is, there will the Philistines be gathered together. Mr. Ruskin says, however, that there is no copper, or at most, as the man said of the water in the Styx, "only enough to swear by," and that the opposite statement is "a wicked fiction." As to the other pretext of making the scenery accessible to the public, it is accessible already to every one but consumptive paupers, whose needs may be disregarded. People who cannot walk fifteen miles, and who cannot pay a pound for a dog-cart, may be interesting creatures at home, but it is scarcely worth while to build a railway for the purpose of taking them to Helvellyn. We wish Mr. Somervell every success, and a keener appreciation of the figure of irony than he seems to show in his controversy with a paper of world-wide circulation.

NOTES AND NEWS.

MR. J. A. SYMONDS has finished the second section of his work on *Renaissance in Italy*. This includes the "Revival of Learning" and the "Fine Arts," which he intends to publish in two separate volumes next spring. In the "Revival of Learning" he traces the re-discovery of classic literature, and the history of Italian scholarship from Petrarch to the middle of the sixteenth century. In the "Fine Arts" he reviews Architecture, Sculpture, and Painting from Arnolfo, Niccolò Pisano, and Giotto, down to the same

date. It has been his aim to treat both subjects with special reference to the general culture of the Italian people.

SIGNORA VILLARI, wife of the distinguished author of *The Life of Savonarola*, and herself author of a fairy story, *In the Golden Shell*, which attracted some attention a few years ago, has in the press a novel called *In Change Unchanged*. The scene is laid in Italy and the Italian Tyrol, partly also in England. Messrs. Macmillan and Co. are to be the publishers.

THE fourth and last volume of the Appendix to the *Black-Book of the Admiralty*, edited by Sir Travers Twiss, Q.C., and published by the authority of the Lords of the Treasury, under the direction of the Master of the Rolls, will shortly appear. It contains a collection of important mediæval Sea-Laws, supplemental to the Judgments of Oleron and the Customs of the Sea, which have been published in the previous volumes. Among them will be found the Amalphantan Table from the MS. recently discovered in the Imperial Library in Vienna; the Gotland Sea-Laws, otherwise the Maritime Law of Wisby, from the oldest MS. in the Royal Library in Copenhagen; the most ancient Flemish version of the Rolls of Oleron, from the MS. in the Purple-Book in the Archives of the city of Bruges; the Maritime Laws of the Teutonic Order in Livonia, from a MS. in the Library of the University of Göttingen; the Flanders Sea-Laws and the Maritime Ordinances of Amsterdam, from an early MS. preserved in the Archives of Dantzic; the Wisby Town Law on Shipping, from the original MS. preserved in the Royal Library at Stockholm; the earliest Code of Maritime Procedure, from the Catalan MS. in the National Library in Paris; the Maritime Laws of King Amauri I., of Jerusalem, from the Munich MS.; and the Maritime Ordinances of Trani, from the text preserved in the Library of the city of Fermo, in Italy. An English translation accompanies each body of Sea-Laws, and photographic facsimiles of the earliest MS. of the Judgments of Oleron, from the *Liber Memorandum* in the Guildhall of the City of London, and of Selden's MS. *De Rebus Admiraltatis*, in the Bodleian Library at Oxford, which was for some time erroneously supposed to be the Black-Book of the Admiralty, are prefixed to the volume. A very full account of the various Sea-Laws, and of the MSS. collated by the editor, is contained in the Introduction.

DR. EMIL WOHLEWILL is about to publish a paper on the question "Whether Galileo was Tortured by the Inquisition."

THE Delegates have in preparation volumes ii. and iii. of Mr. Kitchin's *History of France*, treating of the period between 1453 and 1789—that is, down to the commencement of the Revolution. The same publishers have also in press a volume of selections from the Wellesley Indian Despatches.

MESSRS. ABEL HEYWOOD AND SON will publish early in December a *List of Lancashire Authors*, with brief biographical and bibliographical notes, edited for the Manchester Literary Club by C. W. Sutton. This work, which has been for many months in preparation, contains the names of over 1,300 writers, and includes not only authors born in the county, but those long resident in or closely associated with it.

MR. GARDNER, of Paisley, is about to publish by subscription the *Register of the Monastery of Paisley*, the first reprint of which, from the MS. preserved in the Library of Advocates, was published in 1832 by the late Prof. Cosmo Innes, and presented to the members of the Maitland Club by the Earl of Glasgow. It has now become exceedingly scarce.

AN association of young physicians, under the direction of the Professors of the Medical Faculty of the University of Cracow, was founded two years ago with the purpose of publishing medical books in the Polish language. They have

already in hand some original works, and they are now anxious to get translations of the best foreign medical treatises. One of the first English books that will be translated is Dr. Richardson's *Diseases of Modern Life*, recently published by Messrs. Macmillan and Co.

THE serial in *Good Words* for the coming year will be by the author of *Patty*. The scene of the story is laid in Yorkshire, and the illustrations will be by Percy Macquoid, the son of the author.

MR. C. B. PITMAN is engaged upon a translation of the fourth volume of Paul Lacroix's series on the Middle Ages. The subject is *Sciences and Literature*, and this volume will be published, like the three first, by Messrs. Chapman and Hall.

THE Bishop of Gloucester and Bristol's Charge on "The Present Aspect of Infidelity," which has been delivered in sections at different places in his Diocese, is about to be published by the Society for Promoting Christian Knowledge. It is distributed under the following heads:—"The Prevalence of Unbelief;" "The Cause of Unbelief;" "The Characteristics of Current Unbelief, and the Leading Arguments Against it;" "The Leading Arguments in Favour of Christianity;" "The Best Practical Method of Dealing with Unbelief." The Society will also publish Canon Barry's recent "Boyle Lectures," on "The Cumulative Argument derived from Comparison of the Various Branches of National Theology."

AT the conclusion of the proceedings of the Oriental Congress at St. Petersburg Florence was fixed on as the seat of the next or fourth Congress. Prof. and Senator Michele Amari was appointed president, and Signori G. I. Ascoli, G. Gorresio, A. Severini, F. Lasinio, and A. de Gubernatis were chosen as members of the organisation committee, and it was left to the President, in consultation with committee, to fix the date for the meeting of the Congress. From information received from Florence we understand that it has been decided that the session of the next Congress shall be held in 1878, and probably towards the end of September in that year, by which time it is considered that the great heat of the Italian climate will be over.

PROF. RESKIN will not be able to deliver his proposed lectures at the London Institution in December, his present work obliging him to remain in Italy during the winter.

BY the combined efforts of the National Health Society and the Council of the Trades' Guild of Learning, a movement has been set on foot for establishing in London a course of popular instruction on the laws of health. The lectures will be open to working people on payment of a nominal fee. The first course will be delivered by Prof. Corfield in the Large Room of the Society of Arts, John Street, Adelphi, and is advertised to commence on November 11. An experiment of the same kind has already been tried at Birmingham for three consecutive years, and the results are said to be very gratifying. The lectures were well attended, and the examination held at the termination of the course proved that they had been listened to intelligently by a certain proportion, at any rate, of the audience. The remarkable ignorance that prevails, not only among our working-classes, but among people far above them in the social scale, concerning the rudimentary facts of bodily structure and function, and the simpler rules of personal hygiene, renders any organised attempt to dissipate it worthy of cordial encouragement.

MESSRS. LONGMANS announce: *The Life and Times of Simon de Montfort*, by G. W. Prothero; *The Puzzle of Life, and How it has been Put Together*, by A. Nicols; *Our New Judicial System*, by W. F. Finlason; *The Tiber and its Tributaries*, by Strother A. Smith; *The Tudors and the Reformation*, in the "Epochs of English History" series, by the Rev. M. Creighton; and *The Roman Empire of the Second Century*, by the Rev. W. W.

Capes, in the "Epochs of Ancient History" series.

THE valuable collection of MSS. formed in India by the late Prof. Martin Haug, of Munich, is offered for sale, and a detailed catalogue has been published by Theodor Ackermann and Co., of München. The MSS. in Zand, Pahlavi, Persian, &c., have been catalogued and described by Dr. West, and the Sanskrit MSS. by some of Prof. Haug's students. It is proposed, if possible, to keep the whole collection together, and offers or enquiries may be made up to the end of this year, the names of the persons to whom they should be addressed being given in the catalogue. There will be much competition for the possession of these collections, which in some respects are quite unrivalled; and it would be matter for grave regret if they were finally consigned to some provincial library out of the way of those who are most likely to make use of them.

WE take the following from the New York Nation of October 19:—

"The Whole Book of Psalmes" was sold by auction in Boston last week, Mr. Rider, a bookseller of Providence, R. I., becoming its purchaser at a cost of \$1,025. The modest printer, Stephen Daye, had not put his name upon the title-page of the volume, but the evidence is unquestioned that it was the work of his hand and the first book printed in this country. Among antiquaries it is known as the Bay Psalm Book, and was printed 'at our Cambridge' in the year 1640. This particular copy had once belonged to Richard Mather, one of its translators from the Hebrew into the English metre; from the Mather family it went into the possession of Thomas Prince, the founder of the New England Library; Prince bequeathed it to the Old South Church, and in the steeple-chamber of that meeting-house it rested for nearly one hundred years; the deacons of the Old South gave it to the late Dr. Shurtleff; and now (after a law-suit instituted to settle the question of ownership) it has passed from the auctioneer into the hands of the highest bidder. Except the Eliot Bible—which at the Bruce sale brought \$1,130, and at the Rice sale \$1,050—we remember no instance of an American printed book fetching at public sale so high a price as this Bay Psalm Book."

MESSRS. SMITH, ELDER AND CO. have issued a translation by Mr. Robert Harrison of Herr von Reumont's *Lorenzo de' Medici*, the high merits of which were freely acknowledged in our columns (ACADEMY, September 5, 1874). From the prefatory admission "that it has been no easy task to interpret for English readers the admirable biography of Lorenzo," it is to be gathered that Mr. Harrison is fully alive to the want of artistic finish in his author's work.

IT is unnecessary to do more than to announce that Messrs. Macmillan have reissued, in six volumes of a convenient form, a book so well-known as Mr. Bancroft's *History of the United States of America*. Mr. Bancroft has, as he tells us in his preface, devoted "a solid year of close and undivided application" to the work of a thorough revision, with the help of information forwarded to him by friends in the course of more than forty years.

THE publications of the English Dialect Society for 1876 are nearly ready for issue. They are four in number:—*The Whitby Glossary*, by Mr. F. K. Robinson, of which the first part was issued last year; *A Glossary of Words Pertaining to the Mid-Yorkshire Dialect, with others Peculiar to Lower Nidderdale*, by Mr. C. Clough Robinson, to which an outline of the Mid-Yorkshire dialect is prefixed; Dr. Richard Morris on *The Survival of Old English Words in our Present Dialects*, being a reprint of a portion of his annual address to the Philological Society; and a collection of smaller Glossaries edited by Mr. Skeat, and including some additions to the Rev. J. C. Atkinson's *Cleveland Glossary*, Pegge's *Kentishisms*, *Surrey Provincialisms* by Mr. Granville Leveson Gower, a set of *Warwickshire words* by Mrs. Francis, and some Oxford-

shire words by Mrs. Parker. Mr. Skeat's Introduction to this volume will be found to contain an interesting and lucid account of the Society's scheme of work, and the plan upon which it is being carried out.

WE regret that our account last week of the Board of Electors for the Celtic Chair at Oxford was not only incomplete but also inaccurate. The Board consists of five members, of whom two are official, the Vice-Chancellor and the Principal of Jesus; of the three others the Dean of Christ Church has been elected in the capacity of Member of Convocation by the Hebdomadal Council; Prof. Henry Smith by the Vice-Chancellor and Proctors in the capacity of Professor or Public Reader; and, lastly, Mr. Sayce by Jesus College, "on account of proficiency in the study of languages and philology."

THERE is a great deal of Eastern Question in the Magazines this month:—In *Fraser* Dr. Kilian gives a very instructive account of the Bulgarians, partly based upon Djirezek. He inclines to believe that the Christian Bulgarians are almost all pure Slavs, and that any remains of Turanian blood are to be sought among the aristocracy who embraced Islam; and dates the oppression of the Christians from the victories of Prince Eugène, which weakened the central Government, and threw power into the hands of Pashas leaning on the Court aristocracy. Mr. Blyden proves that Koran Islam ought to be quite as tolerant as Bible Christianity, and opines that Turkish intolerance is a matter, not of Islam, but of Race. In *Macmillan* a distinguished Serbian politician, who prefers to remain anonymous, begins an exposition of what the South Slavs want. In *Temple Bar* there is a paper on Servia, mostly extracts from ballads carelessly printed—who is Tzar Sazar?—and one on "Koumanian," containing some fair specimens of the *chronique scandaleuse* and diplomatic *on dits* of Bucharest. In the *Fortnightly* R. A. Earle supplicates Germany to order Austria to govern and regenerate European Turkey. In the *Contemporary* Mr. Malcolm MacColl and Mr. Gladstone prove respectively that the Rayahs in Turkey are as badly off as the French peasants before 1789; that the irregulars of a Turkish army have all the faults of the camp-followers of the Crusades except drunkenness; that the calculating ferocity of General Kaufmann to the Yomuds was as exceptional an episode of the Russian conquest of Turkistan as the panic-stricken ferocity of the local authorities last May was of recent Turkish administration in Bulgaria; and that Mr. McGahan's evidence does not bear out that of Mr. Schuyler's informant as to the full extent of the Russian atrocities.

In the *Fortnightly*, Prof. Tyndall gives an account of Pasteur's discoveries in fermentation, in connexion with those of Drs. Sanderson and Koch on splenic fever. Mr. Bagehot preaches from Lord Althorpe and the Reform Act that the effects of Parliamentary Government in an old society where the temper of men is what it is in England tend increasingly to give dull men too much power. Prof. Colvin states with penetrating grace and precision, and almost too deprecatory courtesy, the general view of *Daniel Deronda*. Prof. Jevons thinks the future of Political Economy lies largely in investigating the most profitable division of labour between the State and individual enterprise. There are two points in the Editor's admirable address on popular culture at the Midland Institute which may provoke discussion. He assumes that Macaulay's knowledge of the classics was more than superficial, and he proposes that short courses of lectures on general and English history should form one of the foundations of education. B. F. Hartshorne describes the Rodiyas and Kinnaras, two outcast races of Ceylon, whose degraded position contrasts curiously with their fine physical and cerebral development.

In the *Contemporary Review* Mr. Matthew Arnold draws a psychological parallel between the views of Sir Matthew Hale and John Smith, a Cambridge Platonist, on witchcraft, and St. Paul's views on the Resurrection, and recommends that we should continue to use the Apostles' and Nicene Creeds as the Founder of Christianity used the books of Daniel and Enoch. Here is one of the most spirited stanzas of Mr. Hallam Tennyson's spirited version of the "Song of Brunanburh." "No need had he to vaunt of the carnage of axes, that white-haired Baron, that aged Nestor; nor had he, any more had Anlaf, with the ruin of their armies, aught of reason for laughter, as though they were better in the works of war, in the struggle of standards on the battleground, in the meeting of men at the gathering of spears, in the wrestling of weapons, wherewithal they had played on the field of slaughter against the sons of Edward." W. R. Greg replies to Mr. Hutton's paper on the "Prophetic Element in the Gospels." He inclines to think that Christ did not die on the Cross, and that the predictions on which Mr. Hutton relies are hardly a sufficient base for argument. He does not appear to have read Sir R. Hanson's convincing criticism of Renan's assumption that the ministry of the Twelve was barren. Cardinal Manning gives a vigorous *précis* of Mr. Kirkman's *Philosophy without Assumptions*, which he welcomes as a vindication of the traditional framework of thought, though he thinks on common-sense grounds that the author carries pure dynamism too far. Dr. Appleton's "Plea for Metaphysic" is an endeavour to disengage a metaphysical element in Mr. Matthew Arnold's critical thought. The writer finds in Mr. Arnold, whom he considers to be "quite the most important constructive intellect in the domain of politics and religion that we have had in Europe since Strauss," a certain dim perception of metaphysical ideas, also an ingredient of humour, which Mr. Arnold himself calls the mind's gift "of getting itself unfixed from its over-certainty, of smiling at its over-tenacity." Yet, though having these qualifications of a metaphysician, he lacks sureness of touch in handling metaphysical ideas. The chief aim of the article is to illustrate the presence of metaphysical elements in Mr. Arnold's negative criticism of current ideas in politics and religion. Their influence on his positive construction, as well as on his discussion of the philosophic ideas of Descartes and others, is to be the subject of a subsequent enquiry. The nature of metaphysical ideas, which are ideas or principles of this common consciousness, or *Zeitgeist*, "or better self," is then expounded as respects their dimensions, their structure, and their genesis. We cannot say we feel sure that the writer has quite made out his case. One's state of mind on reading the article a good deal resembles that of a well-known personage in French comedy when he discovered that he had been talking prose all his life without knowing it. No doubt Mr. Arnold's poetical abstractions look very much like certain metaphysical ideas, as Dr. Appleton's ingenious essay shows; but this resemblance may arise much more from the presence of a poetical element in the Hegelian metaphysic than from that of a metaphysical element in Mr. Arnold's highly poetic conceptions.

In *Macmillan* H. Nettleship questions the "plastic" theory of Attic oratory set up by the late Public Orator of Cambridge. W. H. Pater explains the temporary circumstances under which Romanticism arose so fully that one is surprised to find him carefully fixing its sense as a permanent addition to the vocabulary of criticism. C. H. Hawkins discusses the Bayreuth festival as the euthanasia of Wagnerism.

MR. PROCTOR has a paper in *Fraser* on the recent evidence for the theory that Saturn's rings are made up of satellites, and one in *Belgravia* on astrology, which is noticeable for a confusion between Bacon's idea of a reformed astrology and recent speculations on the terrestrial effects of solar

spots. In *Fraser*, Newton Crosland suggests that the Astronomy of the Future will resolve gravitation into some combination of electricity and magnetism, and show that the sun is a cold dark machine, like a galvanic battery, producing light and heat at a distance where wanted.

In the *Gentleman's Magazine* "Calbot's Rival," by Julian Hawthorne, is admirably eerie, but too careless of local colour. The "Vers de Société" in *Belgravia* are exceptionally good. In the *Sunday at Home* there is an account of Mothers' Meetings, from which one-half of the world may learn something of how the other half lives. In *Blackwood* there is a most interesting instalment of the "Run through Kathiawar," containing a picturesque description of the Holy Mountain of Jirnes and the crazy and sometimes cannibal ascetics who haunt it, and of the sweating statue of one of the twenty-four Tisthankaras, which is kept in an underground temple, hitherto inaccessible to Europeans, where the moisture of the air and of the breath of worshippers condenses on the cold marble. The article includes a clear though popular account of Jainism, and a narrative of an unsuccessful attempt to ascend the peak of Kalika.

OBITUARY.

HEUGLIN, Theodor von, at Stuttgart, November 5, aged fifty-two. [Author of *Travels in the North-East of Africa*, and *General System of the Birds of the North of Africa*.]
PERRAUD, J. J., at Paris, November 2, aged fifty-five. [Pupil of Ramey and Dumont; "grand prix de Rome," 1847; executed a great number of busts, and also *Le Drame Lyrique*, one of the groups on the façade of the New Opera House; Member of the Institute, 1865.]

NOTES OF TRAVEL.

THE *Cosmos* for October continues the publication of Sr. Odoardo Beccari's interesting description of his voyages on the coast of New Guinea, taking up specially the district round Humboldt Bay, of which there is an original map, and the return voyage thence to Ternate. A point of importance is Sr. Beccari's discovery of the probable continuation of the volcanic belt of the Moluccas through New Guinea. Having left Humboldt Bay on December 21, 1875, the following morning the vessel passed into a beautiful inlet called Sadipi Dorei by the Mafors, at the bottom of which Mount Cyclops (Monte Ciclope) rises in the form of a grand cone. The rocks at the base of this cone had all the appearance of being of volcanic origin; at Batanta volcanic rocks were also found; Mount Disceras, near the Island of Amsterdam, has all the appearance of a volcanic cone, and native boatmen assured Beccari that there are active volcanoes beyond Humboldt Bay.

In a paper on the Dutch Geographical Society the *Cosmos* gives some particulars of the expedition which has left for the exploration of Sumatra. The expedition, which sailed direct for Padang, consists of Lieutenant Schouw Santvoort, who has already served in the Archipelago; of Dr. Veth, son of Prof. Veth, who was recently employed as engineer in the St. Gothard Railway; and of the naturalist, Herr Snelleman. At Padang the expedition will be joined by Herr Harmsen, Professor in the Normal School at Padang, who is perfectly acquainted with the dialects of Sumatra. The portion of the island which the expedition is intended to explore is that situated between Padang, Benkoelen, Palembang, Indragiri, and the sea, forming the sultanate of Giambi. This work may require two years.

In the tenth part of the *Russische Revue* for this year, M. Veniukov contributes a paper on the latest Russian journeys in Central Asia. One of the most important of these was Herr Rheinthal's mission from Wjernaja to Kashgar, carrying presents to the ruler of Eastern Turkistan or Djety-schar in exchange for gifts sent to the Russian Government, which was accomplished in spring and summer of 1875. Rheinthal says that the

native Kashgarians are not fond of Yakub-beg, who for his part places no confidence in them. Yakub-beg never allows himself to be alone, and sleeps only for three hours, during which time he is surrounded by "Duwanes" or mendicant-friars whose business is to chant verses from the Koran. Another journey from which some interesting particulars are drawn by M. Veniukov, is that of M. Nitikin, a Russian trader, from Uscha in Khokan to Djetysschar. The "Terek" pass route, M. Nitikin says, is only traversable when the mountain torrents are covered with ice, or from the second half of February till April 15; for the rest of the year the more circuitous Alai route must be taken.

BESIDE a brief account of the results attained by the Arctic Expedition, the *Geographical Magazine* for this month has a most interesting and graphic narrative of a journey by Lieut. Rae Crooke, of H.M.S. *Audacious*, on foot through Central Japan, along the Nakasenda, a road leading through the mountain districts of Central Japan, a line hitherto almost untravelled by foreigners. The account of M. Chekanovski's important journey of exploration to the Lena and Olonek in the summer of 1875 is translated from the Russian Geographical Society's *Journal*. During it M. Chekanovski made a route survey of the river Lena from Yakutsk to Ayakit, and thence through the Tundra to the Olonek, collecting materials also for a geological map and description of the country. He has brought back about 1,500 palaeontological specimens, and a large botanical collection; while M. Venglovski, his companion, has made an entomological collection including not less than 7,000 specimens, many of them from the Northern Tundra.

Two papers read by Capt. J. S. Hay, the first in June last, before the Geographical Society, and the second before the British Association at Glasgow, on the district of Akim in West Africa, attracted considerable attention and discussion in scientific circles owing to a statement they contained respecting a peculiar conformation of the cheek-bones, among a portion of the male population, resembling horns. This statement, while it awakened much interest, was met generally with incredulity at the time. We hear that Capt. Hay, who has recently returned to the Gold Coast, has just sent two photographs to England of one of these "horned men," and the original is now on his way to this country. The photographs have been pronounced by the highest scientific authorities to be "most curious and interesting." It is probable that a third paper, entering more fully into this remarkable peculiarity, will shortly be read on Capt. Hay's behalf before the Anthropological Society.

THE ARCTIC EXPEDITION.—II.

Report of Proceedings by Captain Nares.

THE Report of Proceedings, by Captain Nares, furnishes a very lucid narrative of the Arctic Expedition for immediate use; but its perusal only serves to increase the desire for further and more detailed particulars respecting the most important and most successful geographical enterprise of our time.

The first great object, as we pointed out in our last number, was to cross the threshold of the unknown region, and to place the vessels in such positions as would ensure the exploration of new ground by the sledging parties. If this could be done success was certain; but, by the Smith Sound route, it was no easy task. The portals of that long and tortuous navigation were no sooner passed than ice was sighted fifteen miles north of Cape Isabella, at eight in the evening of July 29, 1875. It consisted of floes ten or twelve feet thick, and the two vessels were detained for three days in a harbour, named after Lieutenant Payer, to the south of Cape

Sabine. At last the main pack, though remaining perfectly close and impenetrable to the northward, moved off a little from the land, and enabled the ships to double Cape Sabine and proceed up the south side of Hayes Sound to a good harbour about twenty miles from the entrance. On August 5 Captain Nares ran the two ships into the pack under steam, in hopes of forcing a way through, but before midnight both were hopelessly beset, and drifted rapidly towards an iceberg. This danger was skilfully avoided, but they ran great risks almost hourly until August 8, when some open water was reached off Cape Victoria. Captain Nares very properly animadverted on the alterations made by Kane and Hayes in names of headlands given by Admiral Inglefield, the first discoverer. These changes are the more unjustifiable as the charts of this coast published by the Americans are very incorrect and misleading.

It was not until August 16 that Cape Frazer was approached, and here the character of the

between them being filled with broken-up ice of all sizes. It now became clear that the sea to the northward was covered with ice of a totally different formation from what is found in Baffin's Bay and Barrow Strait, ice such as had only previously been met with by M'Clure off the west coast of Bank's Island, and by Collinson off the coast of America. The only hope of pushing northward was by keeping close to the shore. The wind freshened from the south-west, blowing off shore, and driving the ice away so as to form a lane of open water. On September 1 the *Alert* ran up this lane at the rate of ten knots, and by noon she was in $82^{\circ} 24' N.$, a higher latitude than any vessel had ever before attained. Cape Union was rounded, and the *Alert* entered the Polar Ocean. On emerging from Robeson Channel the land trends to the west of north, the coast-line loses its steep character, and the heavy ice is stranded at a short distance from the shore, forming a fringe of detached pieces, from

pack changed considerably. The floes consisted of old ice from twelve to twenty feet in thickness, and of great age. For two days the laborious work of watching the ice and taking every opportunity of pushing onward continued; but on August 18, Cape Frazer was successfully rounded, and the Expedition entered Kennedy Channel. Cape Frazer is placed by the Americans twenty miles too far north. On the 24th the *Alert* and *Discovery* crossed the channel and entered Lady Franklin Sound, discovering a good harbour inside an island off the northern shore. Here the second ship was left to winter, while the *Alert* proceeded onward, in order to reach the necessary position whence the exploring work could be commenced.

Beyond Lady Franklin Sound the difficulties in making progress materially increased, and on August 30 the *Alert* was hopelessly beset in a very heavy pack consisting of old floes eighty feet in thickness, and one to four miles across, the intervals

twenty to sixty feet in height, and aground in from eight to twelve fathoms. The ship was secured inside this protecting barrier of ice, about a mile south of Cape Sheridan. Thus a tolerably good position was obtained for winter quarters.

No Arctic Expedition has ever encountered such difficulties in reaching its winter quarters, except Captain M'Clure's when he passed between similar massive ice and the west coast of Banks' Island. There are very few navigators who would have ventured to contend, day after day, with ice of this description, and still fewer who would have succeeded, by dint of incessant watchfulness, and prompt action, in escaping from its embraces and reaching such a latitude. It was abundantly clear that the ocean itself was never navigable, and that no progress was possible away from the land.

The most trying work, in the course of Arctic service, is the autumn sledge-travelling, when

dépôts of provisions are laid out at a distance from the ships, for the use of the spring parties. This work was first attempted by Capt. Austin's expedition in 1850, when three parties were away for about a week with the temperature three degrees below zero. In the succeeding expedition of 1852, under Capt. Kellett, the officers of the *Resolute* made longer journeys. McClintock was away for forty days in two trips, when the thermometer fell to — 21; Nares was absent twenty-three days, Meham twenty-two, Pim seventeen, Hamilton sixteen, but the temperature was never below zero. The *Alert* eclipsed all former expeditions as regards her autumn travelling. Capt. Markham and Lieuts. Parr and May were away twenty-four days with the temperature as low as — 25, and Lieut. Aldrich was away nineteen days. After very severe labour, dragging the sledges overland and lowering them down steep declivities, Capt. Markham succeeded in establishing a dépôt in 82°44' N. Seven men and one officer returned to the ship severely frost-bitten, three of whom suffered amputation. On four occasions the sledges, with their cargoes, broke through the ice, and heavy snow fell on twelve consecutive days, so that the men had to wade through drift often up to their middles. "Nothing," says Captain Nares, "could exceed the determined perseverance with which each obstacle to the advance of the party was overcome."

During the winter the prevailing wind was from the westward, but no movement whatever occurred in the ice except the formation of a tidal crack, and the weather was remarkably calm. This was accompanied by the severest cold ever experienced in the Arctic regions. In March the *Alert* registered a minimum of 73°·7 below zero; and 70°·31 below zero during twenty-four hours. For thirteen consecutive days the *Alert* experienced a mean temperature of 58°·9 below zero, and for five days 66°·29 below zero. During this period of unparalleled cold Captain Markham and Lieutenant Giffard took a series of magnetic observations, Lieutenant Aldrich observed with Sir Charles Wheatstone's polariscope, and Lieutenant Parr obtained a series of astronomical observations, and also observed with the spectroscope, and with Sir William Thomson's portable electrometer.

Up to this time the great discovery made in physical geography was that a frozen ocean, containing ice of stupendous thickness, extends along the northern shores of the lands hitherto known only on their western or eastern sides; and that the other end of the channel leading from Smith Sound is very narrow and opens upon this frozen ocean. The tides, coming from south and north, meet at Cape Frazer, and here practically all animal life ends, so far as the sea is concerned. There is no clearer proof of the absence of land and of open water to the north. It is true that one seal was shot near the winter quarters, but scarcely any more were seen, and not a single bear. All the usual Arctic land animals and birds were found up to the furthest northern point, but in very small numbers as compared with the quantity met with at Melville Island. Falcons were never seen, as they prey on dwellers in the sea, but owls, feeding on lemmings, were not uncommon. The game list was, however, very meagre in the *Alert* after reaching winter quarters, consisting only of six musk oxen, twenty hares, seventy geese, twenty-six ducks, ten ptarmigan, and three foxes.

Next to the autumn travelling the most trying work in Arctic Expeditions has been during short trips in the very early spring. When it was necessary to inform Captain McClure, in the Bay of Mercy, that H.M.S. *Resolute* was at Melville Island, Lieutenant Pim and Dr. Domville were sent with a party across the strait. They started on March 10, 1853, and at that time this was the earliest date on which any sledge had left its ship in the Arctic regions. But the thermometer was never lower than 14° below zero; and Pim's trip was mere child's play compared with what was

done afterwards. Commander Richards and Mr. Herbert left H.M.S. *Assistance* to communicate with the *North Star* on February 22, and endured a cold of 40° below zero; and in 1859 McClintock and Allen Young started on February 17 with the thermometer 48° below zero. The Expedition of 1875-76 has surpassed all these exploits. On March 12, 1876, Lieutenants Rawson and Egerton set out to communicate with the *Discovery* when the thermometer was 35° below zero, but during their absence it went as low as 50° below zero, and the Danish dog-driver, Petersen, was severely frost-bitten. Captain Nares says:—"During this journey Lieutenants Egerton and Rawson behaved most heroically, and, although frequently very severely frost-bitten themselves, they succeeded in keeping life in the invalid until they arrived on board." The poor man died from exhaustion after having both feet cut off; and, on the whole, for the intensity of the cold, and the perilous nature of the service, this journey is the most remarkable that has ever been performed in the whole range of naval Arctic travelling.

But it is in its spring travelling, and in the work of its extended sledge-parties, that the Expedition of 1875-76 takes so high a rank, when a comparison is made with its predecessors; and the best of the old Arctic officers have been foremost in generously acknowledging that their younger successors have worthily upheld the fame of the navy.

The time for starting on the extended spring-journeys has usually been early in April. The sledges of Captain Austin's expedition started on April 15, 1851, when the temperature was + 14, those of the *Resolute*, under Captain Kellett, on April 4, 1853, when the temperature was + 3°; while McClintock and the officers of the *Fox*, on April 3, 1859, faced a cold of — 30°. But the Expedition of 1875-76 eclipsed all its predecessors as regards the intensity of the cold, and the consequent hardships that its sledge parties gallantly faced. Captain Markham, with six sledges, commanded respectively by himself, Lieutenants Aldrich, Parr, and Giffard, Dr. Moss and Mr. White, left the *Alert* on April 3, when the temperature was — 33°, and a few days afterwards it fell to 45° below zero. In former expeditions, after the first few days, the weather became warmer. But with the *Alert's* the intense cold was continuous: the thermometer was never above zero until April 28, and the minimum inside the tents during that month was 25° below zero.

As regards the length of the sledge journeys, the officers of the *Alert* and *Discovery* are almost foremost in the first rank of naval Arctic travellers. The distance made good from the ship is of course no test of work, because it depends entirely on the character of the ice. The true test is the number of working days of absence from the ship. In this respect McClintock and Meham alone surpass them, having been absent 105 and 97 days respectively. But, on the other hand, McClintock and Meham experienced warmer weather, and obtained plenty of musk oxen and other game, yielding to the former 1,629 lbs., and to the latter 1,460 lbs. of fresh meat. Captain Markham and Lieutenant Parr were away seventy-two days, Lieutenant Aldrich eighty-four days, they obtained no fresh meat, and endured more intense cold.

On the whole, the Arctic travelling of the Expedition of 1875-6 ranks as the most arduous on record. Captain Markham and Lieutenant Parr, under circumstances of terrible privation and suffering, which must be described in detail in order to be at all understood and appreciated, advanced the British flag over a continuous succession of ice ridges, to the most northern point ever reached by man. Lieutenant Aldrich explored 220 miles of newly-discovered coast-line, and Lieutenant Beaumont added materially to our knowledge of the north side of Greenland. Captain Nares testifies, as regards the northern division led by Captain Markham, that, under the circum-

stances, the distance attained was truly marvellous. He continues:—

"The excellent conduct of the crews and the spirit displayed by them, combined with the work performed, indicated in a striking manner the sense of confidence in their leaders, and points unmistakably to the watchful care taken of themselves, and to the general good guidance of the party. No two officers could have conducted this arduous journey with greater ability or courage than Commander Albert H. Markham and his very able second in command, Lieutenant Parr."

Only second in importance to the work of the extended parties, was that of the officers and men employed on the severe service of bringing relief, laying out dépôts, and pioneering. Lieutenant May, although he had suffered amputation from frost-bite in the autumn, was indefatigable during the spring, in command of the dog-sledge. He crossed Robeson Channel to pioneer a route, went out twice to explore and survey, and relieved the northern and western divisions when in extreme distress. Lieutenants Rawson and Egerton also rendered most important service of the same kind; while Captain Feilden, the naturalist, passed many days in sledge travelling nearer the ship, and his indefatigable labours will be productive of most valuable results.

The outbreak of scurvy added a hundred-fold to the sufferings of the sledge travellers, as well as to the severity of the work entailed on officers and men. It became necessary to drag the invalids as well as the provisions, and it is very certain that no officers in any previous expedition ever performed a tithe of the actual hard labour at the drag-ropes that was cheerfully gone through to save their men by some of the officers of the *Alert* and *Discovery*. The causes which produced the outbreak of scurvy in a very severe form will, no doubt, be thoroughly investigated, and we must for the present suspend our judgment on this point. But meanwhile we must express our admiration of the ability and watchful care of the medical staff of the expedition, and especially of Fleet-Surgeon Colan. Many of the men undoubtedly owe their lives, not to the skill alone, but also in a high degree to the untiring watchfulness, the tender nursing, and constant care of Dr. Colan.

Such was the kind of work performed in order to obtain those results of which we are about to reap the benefit. It is beyond all praise. It is, in the strictest sense of the word, heroic. We trust that it will be the commencement of a series of such enterprises, through which the sum of human knowledge will be indefinitely increased, and England will resume her proud old place as the foremost in the work of maritime exploration and discovery. CLEMENTS R. MARKHAM.

Zoology, Botany, and Geology.

WE are indebted to the courtesy of Captain H. W. Feilden, the naturalist of H.M.S. *Alert*, for the substance of the following brief notes on the general results obtained by the Arctic Expedition in zoology, botany, and geology. We have ourselves seen sufficient examples of the collections made to be able to testify to the great value of the work done by Capt. Feilden and his colleague, Mr. Hart, naturalist of H.M.S. *Discovery*—work performed, it must be remembered, under the greatest natural difficulties and amid the most severe hardships and privations. It would have been impossible for these gentlemen to attain such success had it not been for the hearty support of Capt. Nares and Stephenson, and the cordial co-operation of all their brother-officers, none of whom seem to have allowed an opportunity to escape of rendering them assistance.

Of mammals the species found furthest north were the Arctic fox, wolf, ermine, Polar hare, lemming and musk ox, all of which were observed on the shores of the great Polar Basin or "Sea of Ancient Ice." No cetaceans were seen

north of Payer Harbour, near Cape Sabine (a fact of serious importance in view of the advancing extermination of the right-whale in more southern latitudes); and the little "floc-rat" or ringed seal (*Phoca hispida*) was the only one of its family which went north of Cape Union (82° 15' N. lat.). Bird life was present as far as the land extended, the outlying species being the snowy owl, snow bunting, and ptarmigan. Full collections and observations were made of all the birds found in Smith Sound, and the long-sought-for breeding haunts of the knott and sanderling were discovered—the young in down of the former, and both eggs and young of the latter, being obtained. Of fishes few marine species were procured, but an interesting small salmonoid was found in fresh-water lakes up to about 82° 35' N. lat. Every opportunity was embraced for dredging and trawling, and a fine collection of marine invertebrates is the result. Many of the minute pelagic forms which it is so difficult to preserve are the subjects of beautiful drawings by Dr. Moss, and a complete series of soundings illustrates the character of the sea-bottom from Baffin's Bay up to 83° 19' N. lat. Insect life was more abundant than could have been expected, and a good number of species were obtained.

Botany has received full attention. Our explorers were rewarded by the discovery of between twenty and thirty species of phanerogamic plants between the parallels of 82° and 83°—a much greater number than was anticipated—and Mr. Hart's collections at lower latitudes are both rich and interesting. The cryptogamic flora was of course much more varied and abundant.

The geological observations are probably among the most important of the scientific results obtained by the Expedition. The whole west coast of Smith Sound, from Cape Isabella to Cape Union, has been fully surveyed and mapped, and large collections made both of fossils and rock-specimens, while the sledge-parties which explored the shores of the Polar Basin both to east and west brought back sufficient material to determine the geological character of the country. Silurian Limestones, richly fossiliferous, were the prevailing rocks along Smith's Sound. Miocene deposits, including a twenty-foot seam of coal, were found as far north as latitude 81° 44'. From the shales and sandstones of this formation a beautiful series of leaf-impressions were collected, illustrating the characteristic flora of the epoch, and presenting a remarkable demonstration of the existence of a temperate climate within five hundred miles of the present Pole at a comparatively recent geological time. Not less important are the indications of great recent changes in the elevation of the land afforded by the discovery of thick post-Pliocene deposits, lying at a considerable elevation above the sea-level, and containing fossils similar to the existing marine fauna. Lastly, very interesting and suggestive observations have been made on glaciation and on ice-action in general. EDWARD R. ALSTON.

PARIS LETTER.

Paris: Nov. 4, 1876.

Decidedly literature lives no longer except through the dead, and in the matter of novelties we have only posthumous works. After Michelet, Odilon Barrot, Ste.-Beuve, Doudan, Proudhon, here are Philarète Chasles and Balzac.

The publication of the complete works of Philarète Chasles has been undertaken, but, notwithstanding all the erudition, talent and imagination contained in the articles collected under the titles of *L'Antiquité*, *Le Moyen-Age*, *L'Angleterre littéraire*, *La Psychologie Sociale des nouveaux peuples*, there is too little connexion in the ideas, too much disorder in the composition, not to make it more wearisome than instructive to read. It is not so with the *Mémoires*, the first volume of which has just appeared (Charpentier). The disorderly, fantastic manner which is displeasing elsewhere has in this volume, on the contrary, a

certain charm, and helps to make us acquainted with the writer's originality. The digressions, instead of making us impatient, amuse us, because they are always connected with personal recollections and sentiments. It is only when the author discusses generalities and abstractions, as in the last chapter, entitled "La Morale," that he again becomes wearisome and fatiguing. Son of a regicide of the Convention, an enthusiastic disciple of Rousseau, a Latinist, and a passionate, irrational and sincere Jacobin, and of a gentle, serious, and delicate mother; imprisoned at the age of fifteen by the ridiculous police of the Bourbons, on suspicion of conspiracy, Philarète Chasles was sent from sixteen to nineteen to England, where he conceived a sympathy for the people of the North, which is one of the most honourable features of his character. On his return to Paris he was launched into the literary and political world, and was liberal and romantic, but without ranging himself in the ranks of either party, as much from independence of mind as from an unhappy disposition to jealousy and detraction. The first volume of *Mémoires* brings us down to the morrow of the Revolution of 1830. During his early youth we see him receiving irregular instruction and an austere education in the Hôtel Flavencourt, whither his father had retired after the Revolution, and where he knew some of the strange characters still remaining from that terrible time, such as Vadier the Voltairian, and Amar the Swedenborgian. After the very amusing and touching narrative of his imprisonment at the Conciergerie, we see him in England, and this is the most interesting part of his *Mémoires*. His sojourn at Harwich in a Puritan family, his relations with Ugo Foscolo, Coleridge and Bentham, the portraits he sketches of these writers, and of some of the most original types of English society in 1818, are charming pieces of life and colour. He knew England well, and loved all that was noblest and best in it. When he returned to Paris he was quite a stranger: all seemed to him superficial, false and corrupt; and here personal dislikes come in and disturb the equity of his judgments. There is, however, much that is true in the harsh picture he traces of the literary and political world of the Restoration, and historians might borrow more than one feature from the piquant passages devoted to M. de Jouy, Béranger, Benjamin Constant, Guizot, and Delacroix.

The value of these *Mémoires* is diminished by the character of the man who has written them. During his life he was held in no esteem or consideration; he wrote his *Mémoires* as an apology for his conduct, and pretends that envy alone was the cause of the bad reputation which always followed him. It is hard to admit this explanation, and we cannot help thinking that for a man really virtuous he dwells a little too persistently on his virtue, his chastity, his austerity, and honesty. He carries his *naïveté* so far as to boast of having accompanied a young girl from London to Amiens without her virtue having suffered by it! There is often a want of sincerity in the tone of the *Mémoires*: a pose, an after-arrangement is felt in them, and there are some inaccuracies a little too flagrant, as when he speaks of conspiracies against the Bourbons in the April and May of 1815.

Notwithstanding this criticism, this volume of Philarète Chasles is most instructive as regards the literary and moral history of contemporary France. It forms a useful preface to Ste.-Beuve's *Chroniques Parisiennes*, and shows the causes of the bankruptcy of Romanticism, the crash of which comes in the last-mentioned work.

One of the most remarkable chapters in the *Mémoires* of Philarète Chasles is that devoted to Balzac. No one has ever better described all that was so powerful, and at the same time incomplete, in the author of the *Comédie Humaine*.

"It was all that could be conceived of coarseness in subtlety, of refinement in materialism. It was

Rabelais in Marivaux. His basis of doctrine was pantheism, and his expression of pantheism was his thought—that is to say, himself and his genius. He had much genius and of the most vigorous kind; he was truly creative. . . . There was magic in this man of hallucinations. Like his works, he was *blagueur* and positive, believing in chimaeras and not believing in anything, with strong intuitions and an incomparable faculty of deceiving and deceiving himself. . . . There was something of the woman and of the child in this big monk, bloated and corpulent. . . . This extraordinary genius, aspiring to enjoy every pleasure, desiring every kind of power, is really the greatest agent and the true exponent of that French epoch which he precipitated, listening to it and absorbing it through his career of gigantic abortions."

If one would be convinced of the justice of this appreciation, one need only read the two volumes of the *Correspondance de Balzac*, which have just been offered for sale (Lévy). There is nothing more interesting than to surprise this strange man, who was perhaps the greatest worker of the century, in his more private life, and as it were *en déshabillé*. No one ever lived a more intense life, either of the mind, heart or senses. "To great labours," he says, "correspond great excesses;" and he, indeed, threw himself with great violence into pleasure and work, but particularly into work. As soon as he arrived in Paris in 1819, at twenty years of age, to try his fortune in literature, he declared that he wished for three things: to be celebrated, to be loved, and to be rich. Twenty-five years later he wrote, with that *naïve* pride of his that life had only increased: "There have been three great men in this century, Napoleon, Cuvier, O'Connell; I wish to be the fourth." His correspondence paints him to the life, with his vulgar, commercial-traveler's amusements, and his exquisite feminine sensibilities, wanting in taste and often in moral delicacy, but full of affection, always preoccupied by the books he was writing or the speculation he was projecting, gaining enormous sums and always in debt. He used to work in the oddest manner, passing the night in composing and the day in correcting proofs. This correction of proofs, besides, was a real work of composition. He re-wrote his romances on the proof-sheets. A work which had 100 pages in manuscript would have 400 when it appeared. He wrote the *Médecin de Campagne* in three days and nights, and took eight months to re-write it on the proof-sheets, so that the expenses of correction amounted to 4,000 fr. for a book for which he was paid 3,000. He was continually engaged in lawsuits with his printers and publishers. It is something unparalleled to see what projects he conceived of books never executed, from his drama of *Cromwell*, the ridiculous plan of which he sent to his sister, down to that *Bataille d'Austerlitz* at which he worked ten years without finishing it. And besides all this he goes to Sardinia to work the *scoriae* of the silver mines of the Romans; into Poland to undertake the transportation of entire forests into France; he speculates about the soil, constructs houses, &c. Notwithstanding this feverish desire for money, and in spite of the brutal and sensual side of his Cyclopaean nature, he still shows himself essentially good, noble and devoted. His literary judgment is severe but pure; he admires with charming enthusiasm Stendhal's *Chartreuse de Parme*, and he despises Dumas' *Trois Mousquetaires*. We see his character elevating and purifying itself as he advances in life. The vulgarities, the subtle and coarse nonsense, which fill his first letters disappear by degrees, and the correspondence with Mme. Hanska, which occupied him almost exclusively the last years, shows him in a most sympathetic light. It was a touching romance, that love which lasted sixteen years, always increasing in spite of separation, business, fame, and which only resulted in the realisation of Balzac's wishes at the moment when, exhausted by his ardent life, his health was failing. Married on March 14, 1850, he died on August 30 of the same year. Better

service could not be rendered to his fame than by publishing that correspondence, which shows in him, by the side of the man of genius always in the fervour of creation, the warm-hearted man, most worthy to be loved, the most tender son and brother, the most devoted lover and friend.

But let us return to more modern times. Romanticism, Balzac, the Restoration, all this, too, is far away from us—farther, perhaps, than Ronsard and Molière. The literary movement is dying out in France as it is in the rest of Europe; the scientific movement is taking its place. This is, perhaps, the moment—the moment when the scholastic year is re-opening—to recall in a few words what the principal organs are which represent this scientific movement in the domain of letters. Secondary teaching, properly speaking, has but one organ, and that but very mediocre, *L'Instruction Publique*. It is a weekly Review, written, for the most part, by young men scarcely out of the Lycée, and which aims above all at success with those engaged in clerical education. The university is without any organ at all of its own, since the *Revue de l'Instruction Publique* of Hachette came to an end. It is outside the university world properly so-called that activity and life are to be found at the present time, or at least in a part of the university world which ardently pursues the reform of education and of the old routines. Two Reviews have given an impulse to things in this respect. The first, published in 1864, is the *Revue Politique et Littéraire*, formerly the *Revue des Cours Littéraires* (Germer-Baillière), directed by M. Yung. First intended to reproduce the most remarkable of the courses in the various Faculties, little by little it has become a kind of weekly *Revue des Deux Mondes*, with more variety and more life, and, thanks to its union with the teaching body, a more instructive character. (By the side of this the *Revue Scientifique*, directed by M. Alglave, has a similar end in view in the domain of positive science—that of making science common without debasing it.) Founded in 1866 by MM. Meyer, Paris, Morel and Zotenberg, the *Revue Critique* (Leroux), instead of addressing itself to the public at large like the *Revue Politique et Littéraire*, is destined specially for the learned. Confined to a small number of readers, but edited with conscientious care, and an impartiality often carried to rudeness, it has not only acquired a merited influence, but has become the centre of a group of young savants which it has trained and encouraged, and has, so to speak, created around it other Reviews more special in their aim, but addressing perhaps a more extensive public. In this way we have seen successively the births of the *Revue Celtique* of M. Gaidoz (Vieweg); the *Romania* of MM. Paris and Meyer (Vieweg); the *Revue Historique* of MM. Monod and Fagniez (Germer-Baillière). Next January three new Reviews will appear—a *Revue Géographique*, directed by M. Drapeyron (Thorin); a *Revue de Philologie Ancienne*, directed by MM. Tournier and Havet (Klinksiek); and a *Revue de Mythologie Comparée*, entitled *Mélinus*, and directed by MM. Gaidoz and Rolland. The Ecole des Hautes Etudes, created in 1868 by M. Duruy, has powerfully seconded this youthful scientific movement. The greater number of the directors and contributors of these various Reviews are connected with it more or less closely, but we must give to the first founders of the *Revue Critique* the honour of having been the first to initiate this movement at a time when they were quite isolated, and when everyone predicted for them a lamentable failure.

By the side of this erudite movement—in which we have not spoken of older Reviews, such as the *Revue Archéologique*, the *Bibliothèque de l'Ecole des Chartes*, the *Revue de Numismatique*, the *Revue de Droit Français et Etranger*, or of the Catholic Reviews mentioned in a former letter, or of the various Fine Art journals—the purely literary Reviews do not make a great figure, except-

ing the powerful and venerable *Revue des Deux Mondes*. The *Revue de France*, in spite of its interest and variety, has not attained the notoriety it deserves; the *Vie Littéraire* of M. Collignon, the *République des Lettres* of M. Mendès, give the impression of wrecks of another age, although the latter attempts to make a scandalous success by publishing the most impure pages which have yet appeared from the pen of M. Zola. The *Courrier Littéraire*, directed by M. Colani (Fischbacher), deserves separate notice. It is a modest and serious Review of bibliography, which we hope will be one day for the lay and enlightened public what the *Polybiblion* is for the Catholic public. In any case the intellectual movement which is manifested by all these new creations is very full of life, and will, we hope, produce great fruit.

CORRESPONDENCE.

MANDEVILLE'S TRAVELS.

London Institution: Nov. 6, 1876.

In the received text of the Prologue of these Travels the author is made to say that he wrote his book first in Latin, that from Latin he put it into French, and from French into English. This statement, the sole authority for which is MS. Cotton. Tit. C. xvi., has been often repeated, and so far as I know has not been questioned by any English writer. It is, however, quite certain that Mandeville wrote his work only in French, and that the Latin and French versions are due to unknown translators.

In studying this most curious book with the view of re-editing it, I was long since struck with the fact that several of the readings of the Latin version, given as foot-notes to the received text, seemed to be corrupted from the readings of the French version, and not vice versa. I afterwards found that a German, Schönborn, in a pamphlet published at Breslau in 1840 (*Bibliographische Untersuchungen über die Reisebeschreibung des Sir John Maundeville*), had shown from the strongest internal evidence that the Latin was another man's abridged and corrupt translation of Mandeville's French. This conclusion is confirmed, were confirmation needed, by the fact that many MSS. of the French version contain a passage in the Prologue in which the writer says that he would have put his book in Latin but that Romance was more generally understood.

The statement of the Cottonian MS. being, therefore, a forgery, there remains no evidence that Mandeville wrote the English version. I go farther, and say we have proof positive that he did

not write it. The reader of the received text will find *Adrianople*, *Acre*, and *Archis* under the forms *Dandrenoble* (p. 8), *Dacoun* (p. 31) and *Dacres* (p. 128), and *Darke* (p. 124), which prove that the translator mistook the preposition *d'* (*la cité d'Andrenoble*, &c.) for the initial letter of the name: this of course the author could not have done. Similarly, as Maetznor long ago observed, "the Cercle of Swannes of Hevene" (p. 86) is due to the translator having mistaken *signes* for *cignes*, or having translated from a MS. which had the latter reading. I might multiply such items of evidence, but I pass on to another almost decisive proof. A year or two ago I discovered in the British Museum a wholly independent English version, free from many of the blunders of the received text. Now, if so popular a work had been rendered into English by the author himself, the fact would surely have been known; and in that case no one would have undertaken a second translation. The MS. which contains the new-found version is Egerton 1982.

To make assurance doubly sure, I sent this summer to various libraries a circular asking certain questions respecting MSS. of Mandeville. The result of the answers was wholly in favour of my conclusions. The two French MSS. in the Bodleian confirm the French origin of the Travels, and I cannot hear of any English MS. which supports the interpolation in the Cottonian MS. Nor can I find that there exists any undoubted fourteenth-century copy of either English version (all those in the British Museum being now known to be later), though the Librarian of Trinity College, Cambridge, tells me that their single MS. (which may turn out to be a specimen of the new version) "may possibly be referred to the end of the fourteenth century."

Other work has forced me to lay this aside for a time, but I shall be able to resume it shortly. As, however, the collation of the text and annotation of the subject-matter must not be hurried over, I do not like to keep secret for an indefinite time results which students of our earlier literature will, I hope, think not altogether unimportant.

EDWARD B. NICHOLSON.

SEMITIC ARCHAEOLOGY.—AN ELDER BROTHER OF THE MOABITE POTTERY.

Paris: November 4, 1876.

The unfortunate history of the Moabite pottery teaches us to be doubly careful in the future with regard to Semitic antiquities, to let none go free without being quite sure that they are genuine. Might it not even be well now, after what has happened, to turn a sceptical eye on the past, and ascertain whether by chance some fraudulent pieces have not crept in among antiquities whose claims to admission have hitherto never been disputed?

The following fact goes to prove the need of such retrospective enquiry. The Imperial and Royal Cabinet of Vienna has for years had in its possession a Phœnician monument which succeeded in imposing on the good faith of one of the first Hebraists of Europe, was introduced by him into the domain of science, and has held its ground there to this very hour—that is, for nearly twenty years—undisturbed. This forerunner of the Moabite pottery is a seal with a Semitic inscription, published by Dr. M. A. Levy, of Breslau, at the end of the second book of his *Phönizische Studien* (pp. 111-112). This engraved stone, according to the learned Hebraist's description, represents a male figure (a king with a crown) walking, one hand leaning on a stick, the other holding a bird; beside it are four letters. M. Levy takes pains to decipher these four Phœnician letters, which, strange to say, are cut face upwards on the seal, and tells us that they stand for a proper name, 𐤊𐤍 or 𐤊𐤍 preceded by the possessive *lamed*; As a Semitic name this name is an absolutely improbable one; moreover, the last character, which M. Levy pretends to take for a *samech*, and which

is wonderfully like a *sigma* reversed, has a most suspicious look.

All these peculiarities filled me with the liveliest mistrust. What is more, the contour as well as the cutting of the figure struck me as feeble and bad in quality, and to me the consummate art (*ganz vorzüglich*) which, according to M. Levy, the execution of this monument shows looks more like the relative skill of a modern hand. Tormented by these doubts, I had recourse to a little private examination on my own account, and the results fully confirmed my first impression.

The Vienna intaglio is only the copy of an intaglio in Florence (a sardonix), published by the Duc de Luynes in his *Essai sur la Numismatique des Satrapies*. It is all the more strange that M. Levy should not have discovered the fraud, seeing that he himself drew attention to a remarkable analogy existing between the two monuments. With a little care he might easily have satisfied himself that the analogy went much further than he fancied it did, and that the four Phœnician characters of the Vienna gem are a servile, though unskilful, reproduction of the four first characters of the Florence stone: Le Abi-baal!

I can prove that this base imitation was made neither from the Florence original nor from the excellent reproduction of the same which we owe to the Duc de Luynes, but from an engraving published in the last century by the celebrated Gori in his *Museum Florentinum* (T. ii. p. xvii., pl. xxiii. and p. 56). This engraving, singularly unfaithful, is quite in the manner of the time; the stiff dry little figure, in the Egyptian style, of the original, has become an elegant personage of quite modern aspect. All the details have been interpreted with the most impertinent freedom; among others, the artist has placed on the right wrist of the figure a bird which never existed save in his imagination: this bird has been religiously reproduced by our forger. In Gori's drawing the Phœnician characters appear face upwards, in their normal order; the forger has cut them in the same manner on his stone, so that this would-be seal furnishes impressions of an inscription inverted! Lastly, the fourth character, which presents the very singular form of a *sigma*, and which M. Levy took for a *samech*, is neither more nor less than the *yod*, already interpreted as such or very nearly so by Gori's engraver.

Doubt is no longer to be admitted, and we have no misgiving in formally proposing that the Vienna Phœnician intaglio be rejected, and all the theories which may have been founded upon it since 1857 erased from science.

I have just written to M. E. Bar. de Sacken, director of the Cabinet of Vienna, on the subject, and his answer positively confirms my own conclusions: having at my request carefully examined the original—or, to describe it more correctly, the pseudo-original—he acknowledges that he recognises in it rather the character of a work of the end of the last century than of antiquity. The proper place for this would-be Phœnician monument would, therefore, be the cases of the Moabite collection in Berlin. CH. CLERMONT-GANNEAU.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, Nov. 11.—3 P.M. Crystal Palace Concert (*Acis and Galatea*).
3 P.M. First Saturday Popular Concert.
MONDAY, Nov. 13.—8 P.M. Monday Popular Concert.
8.30 P.M. Geographical: Opening Address, by the President; "On the Buried Cities of the Gobi Desert, Eastern Turkistan," by Sir F. Douglas Forsyth.
TUESDAY, Nov. 14.—8 P.M. Colonial Institute: "The Benefits to the Colonies of being Members of the British Empire," by J. D. Wood.
8 P.M. Civil Engineers.
8 P.M. Herr Franke's Third Concert, Langham Hall.

SCIENCE.

THE VEDA AND ITS INFLUENCE IN INDIA.

Vedârthayatra; or, an Attempt to Interpret the Vedas. (Bombay, 1876.)

(First Notice.)

THE *Veda*, or more correctly, the *Rig-Veda Samhitâ*, the ancient collection of the sacred hymns of the Brahmans, is more and more attracting to itself the interest and the work of the best Sanskrit scholars in Europe. As in the newly-discovered ruins of an ancient city, students are everywhere busily engaged in digging and bringing to light what can still be found of the ancient monuments, in clearing away the dust and rubbish of theological and grammatical commentaries that have been accumulating for centuries, and in placing before our eyes the thoughts, the feelings, the very life of the earliest poets of the Aryan race.

The work has now been going on for half a century. It has been slow, but, with few exceptions, it has followed the right direction. The first duty was to collect all the materials that had been preserved in manuscripts. The task of editing the text, or the two texts, of the *Rig-Veda* was not so difficult as people at first imagined. There are excellent MSS. in existence which have been used for several generations in the schools of the Brahmans, and have been carefully corrected while they were being consulted by native students. Various readings, in our sense of the word—i.e., mistakes arising from careless copying—can hardly be said to exist in the best MSS., and when they do occur in one or the other copy, they are at once corrected by the unanimous testimony of the other MSS. There is little doubt that we possess the text of the *Rig-Veda* as it was settled at the time of the Prâtisâkhyas, 400 B.C., nay, we may go still further, as it existed before the Brâhmanas were composed. At that time there were already different schools, each of which was in possession of its own collection of hymns; but those collections differed little from each other, and, what is still more important, their differences were noted, were considered even at that early time as of the utmost importance, and were in some cases the ground on which one school separated from another. These recognised variations in the sacred texts cannot be called various readings such as Greek and Latin scholars have to deal with; but even if we take them into account, we may still say that we possess the text of the *Rig-Veda* in that accredited form in which it was known and quoted by the authors of the most ancient Brâhmanas, about 800 B.C. What was necessary, therefore, in editing the text of the *Rig-Veda* was not conjectural criticism, but simply patience and mechanical accuracy in copying and collating the best MSS., and again in reading the proof-sheets. I believe that my last edition of the text of the *Rig-Veda*, which has been stereotyped and carefully examined by some of our best Vedic scholars in Europe and India, will gradually acquire that perfect accuracy which it ought to possess, and which the Brahmans in India claim for their best MSS. It is curious, however, that in India, whenever there is a

doubt as to the exact reading of a passage, no appeal is made to the best MSS., but to the best Shrotriya—to the Brahmans who know the *Veda* by heart, who have learnt it from the mouth of their teacher, and who hand it down again to their pupils. Such a Shrotriya, so I was informed by eye-witnesses, would in reading my edition of the *Rig-Veda* point out from memory any misprint, not only in a letter, but even in an accent. If it is considered that the *Rig-Veda* consists of 1,028 hymns, each on an average of ten verses, some idea of the power and of the accuracy of oral tradition may be formed, at least when, as in India, it is regulated by the strict discipline of a school, and where a priest spends his whole youth in learning, his manhood and old age in repeating and teaching, certain portions of his sacred literature.

Thanks to the researches of Sanskrit scholars in India, some Sanskrit MSS. have lately been brought to light of much greater antiquity than the ordinary run of Indian MSS., and in localities from which hitherto but few MSS. had been sent to Europe. Among them there are also MSS. of the *Rig-Veda*, and it is possible, when they come to be more carefully collated, that they may supply independent readings in the hymns. Dr. Bühler, however, to whose persevering efforts these discoveries are mainly due, does not hold out much hope in that respect. After collating a MS. of the *Rig-Veda* which he brought from Kashmir, with my edition, he states that the MS. begins with some portions of the *Yagurveda* necessary for the Sandhyâ ceremonies. Then follows the text of the *Rig-Veda Samhitâ* according to the Sâkalasâkhâ, divided into Mandalar and Ashtakas, the Adhyâyas being numbered from one to sixty-four. At the end there is a long Khilakânda, consisting of five Adhyâyas. The text of these Khilas, or spurious hymns, differs considerably from the text as printed in the notes to my edition. This is what might be expected, for the text of these Khilas is hardly ever the same, as may be seen from the extensive, though on the whole very unimportant, *varietas lectionis* which I have given in my edition for some of these fragments. Next follows the *Âranyaka-upanishad*, which is counted as part of the *Samhitâ*. Its text differs from the printed text, but agrees frequently with the text presupposed in Sâyana's Commentary. It has one Adhyâya more.

The peculiarities of this important MS. seem to me, so far as I can judge at present, to be entirely of a graphic character. The accents, for instance, are marked in a different manner, the acute being indicated by a horizontal line above, the grave (*gâtya*) by a hook. This is a mere matter of convenience or local custom, for it is well-known that neither the Prâtisâkhyas nor Pânini give any rules about writing either letters or accents. I know of several MSS. in which the accents are marked differently from the usual system, but as the intention is always the same, these are matters concerning Kâyasthas rather than Vaiyakarnas. Again, the fact that *d* between two vowels is not written *l*, does not prove that *l* was not meant to be pronounced as *l*. The Prâtisâkhyas teaches that *d* between

two vowels becomes *l*; every Shrottriya knows this, and if he follows the *Sākala-sākhā*, he would pronounce accordingly. This is a view which we must keep in mind in several cases where the *Prātisākhya* prescribes a change or a doubling of letters, which the MSS. do not attempt to carry out graphically. Dr. Bühler remarks that the nasalised (anunāsika) vowel, in passages such as *i*, 8, 5, *mahān indra*, is written with a dot, not with a half-moon. Other MSS. adopt the same writing, but there can be no doubt that the dot can only be meant to express what the half-moon would have expressed, the nasalisation of the final vowel. If, as Dr. Bühler remarks, the Kashmir MS. does not insert a *t* between a final *n* and an initial *s*, it should be remarked that, on this point, other MSS. also vary, and that the *Prātisākhya* also (sūtra 236) ascribes that phonetic change to certain teachers only. Again, the fact observed by Dr. Bühler, that the Kashmir MS. doubles initial *v* and *y* after *Anusvāra*, shows only that the writer tried to carry out the rule 226 of the *Prātisākhya*, according to which final *m* before initial *y*, *l*, *v*, becomes itself *y*, *l*, *v*, but nasalised. Thus *i*, 5, 8, *tvām vvardhantu* is always meant for *tvāv vārdhantu*, whichever system of writing we adopt. Lastly, if the nasal before *r*, *h*, and sibilants is written by a half-moon, placed topsy-turvy above the line, this is curious for the history of writing in different parts of India, but leaves the nature of the sound so represented entirely unaffected.

Though it will be very interesting, therefore, to have a complete collation of this ancient MS., yet, from the nature of the case, I doubt whether the traditional text of the *Rig-Veda*, as I have published it, will ever be encumbered with a *varietas lectionis*, though there will be ample room for conjectural emendations, when we come to restore the original as distinct from the traditional text of those ancient hymns.

After the text, the most essential work that had to be done was an edition of *Sāyana's* Commentary. That Commentary represents the traditional interpretation of the *Veda*, beginning with the *Brāhmaṇas*, continued by the *Nirukta-kāras*, recorded by a succession of later commentators, and finally collected in the fourteenth century by *Sāyana*. It is not for me to dwell on the difficulties of an edition of this work. Suffice it to say, that thirty years ago its publication was considered a debt of honour on the part of European scholarship, and that all Sanskrit scholars agreed that it was the most important work that had to be edited. Some, no doubt, entertained an exaggerated opinion of the value of the traditional interpretation as handed down in India for more than two thousand years; but true scholars knew that, at all events, it was a fortress that had to be taken, before it was safe to besiege the capital itself.

During the twenty-five years that I was engaged at Oxford on my edition of *Sāyana*, another most important work was carried on at St. Petersburg. The Imperial Academy, which had at first intended to undertake the edition of *Sāyana*, entrusted Prof. Boehtlingk with the publication of a new Sanskrit Dictionary, in which the Vedic Sanskrit

was to occupy for the first time its proper place as representing the earliest period of the language. This part of the work has been carried out most laboriously and conscientiously by Prof. Roth, and the whole work, reflecting the highest credit on all contributors, was finished about the same time as my edition of *Sāyana*. In the meantime Prof. Grassmann elaborated a new Dictionary to the *Rig-Veda*, which, coming after the Petersburg Dictionary, reached of course a still higher degree of perfection. My own *Index Verborum* also facilitated, I believe, the work of independent scholars, and soon there came numerous contributions from young and old, all intended to throw light on the ruins of the Vedic period. Foremost among them stands Prof. Benfey, whose articles in the *Göttinger Gelehrte Anzeigen* and in the *Abhandlungen der königlichen Gesellschaft zu Göttingen* are full of learning and original research. His long-promised *Vedic Grammar* will open a new era in the interpretation of the *Veda*. Aufrecht, Ludwig, Delbrück, Hillebrandt, Hang, Myriantheus, Bréal, Bergaigne, Barth, Darmesteter, and many others contributed valuable essays. The *Rig-Veda* became, in fact, a new California to all students of Sanskrit. No one doubts any longer that the *Rig-Veda* is the *Veda par excellence*, the only historical *Veda*, and that it alone can give us a real insight into the deepest foundations of the Aryan mind. Hence the attraction it exercises on all thoughtful scholars; hence the ardour with which every verse, every word in it has been and is studied.

F. MAX MÜLLER.

SCIENCE NOTES.

PHYSIOLOGY.

On the Effects produced upon the Kidneys by Cutaneous Irritation.—Between the skin and the kidneys there undoubtedly exist relations of a peculiar kind, altogether independent of the vicarious or compensatory offices they are able to perform for each other. Wolkenstein has recently published the results of a long series of experiments designed to throw light on some aspects of this obscure subject (*Centralblatt für die mediz. Wiss.*, 1876, No. 31). The experiments were all performed on healthy rabbits. A superficial area of twenty-five square centimetres having been shaved, various irritants, such as oil of mustard, tincture of iodine, mercurial ointment, croton oil, solution of tartarated antimony, &c., were applied to the skin. The urine was collected and examined at frequent intervals. The application of the milder irritants was followed by slight and transient albuminuria, without any evidence of structural change in the renal tissues. When the skin was more severely irritated, the urine contained a larger proportion of albumen, together with renal epithelia and casts. Death not unfrequently occurred, preceded by convulsions, probably of uræmic origin. Microscopic examination of the kidneys showed the appearances characteristic of acute parenchymatous inflammation. This artificial nephritis was attended by a considerable elevation of temperature and increased frequency of the cardiac and respiratory movements. The urine was diminished in quantity; it contained more urea and less chlorine than in health. Of the various chemical irritants employed, one only—viz., mercurial ointment—produced no obvious change in the composition of the urine. Wolkenstein ascribes the renal disorder to two different sets of causes. The irritant may be absorbed into the blood and exert a selective action on the

epithelial elements of the kidney or on the walls of the renal capillaries (as, e.g., cantharides); or the fever induced by the inflammatory process in the skin may give rise to constitutional effects, of which the nephritis may be one. Neither of these hypotheses is adequate, however, to explain the results observed after faradisation of the skin. This does not give rise to permanent changes at its point of application, and cannot, of course, exert any specific action on the renal tissues. Yet it is always followed by effects like those described above. Immediately after the electric brush has been applied, for a few minutes only, to the shaved patch of skin, the temperature rises, the urine is increased in quantity, and contains a trace of albumen, an excess of urea, and a lessened proportion of chlorides. These morbid phenomena subside in a few hours. When the faradisation was continued for a longer period, the albuminuria was more severe, and lasted for thirty-six hours; though no fresh application of electricity was made during this time. The kidneys were found to be in a state of passive congestion; the ears and paws cold and cyanotic. To explain these curious results, the author has recourse to an unlikely hypothesis. He supposes that the irritation conveyed along the afferent nerves excites the vaso-motor centre in the medulla oblongata, and thus causes spasm of the arterioles all over the body; the systemic blood-pressure is raised, and the increase of tension in the renal capillaries is so great as to cause transudation of albumen through their walls. The persistence of albuminuria for many hours after the irritation has subsided is explained by supposing that the capillary walls undergo a structural change during the temporary stagnation of blood in their interior—a change which deprives them for some little time of their normal power of resisting the transudation of albumen.

The Relation of the Vagi to the Unstripped Muscular Tissue in the Lungs.—Many distinguished physiologists, from Prochaska to Donders, have made experiments to ascertain whether the smaller bronchi are or are not contractile. The question may now be regarded as decided in an affirmative sense. But the relation of the unstripped fibre in the bronchial walls to the nervous system is still unsettled. Rügenberg, for instance, admits that when the trachea is connected with a pressure-gauge, and the peripheral end of the divided vagus stimulated by an induction-current, the column of water in the gauge invariably rises. But he attributes this, not to contraction of the bronchi or of the pulmonary tissue, but to pressure exerted on the lungs by the movements simultaneously excited in the oesophagus and stomach, whose muscular walls are also under the control of the vagi. Bert repeated Rügenberg's experiments, but arrived at a different conclusion. He found that the pressure in the trachea rose even after the oesophagus and stomach had been removed. Gerlach now attempts to settle the question by experiments made, not on lungs taken out of the body and subjected to abnormal conditions of temperature, &c., but on lungs remaining *in situ* (*Ifflinger's Archiv*, xiii. 10, 11). He finds that stimulation of the distal end of one vagus is always followed by a decided, though very trifling, rise of pressure, measured by a manometer in communication with the wind-pipe. The rise is greater when both vagi are simultaneously excited. By means of special contrivances the possible influence of the oesophagus and stomach may be eliminated. It is shown, moreover, that the rise of pressure cannot be due to contraction of the muscular tissue forming the posterior wall of the trachea, but must be attributed to an active diminution in the calibre of the smaller and smallest bronchial tubes. Gerlach does not believe that the fibres of the vagus stand in the same relation to the unstripped muscle of the bronchioles as that in which an ordinary motor nerve stands towards the muscle it supplies. He thinks

that the calibre of the bronchi, or "pulmonary tonus," is under the immediate control of local ganglionic centres, analogous to those in the walls of the gastro-intestinal tube. It is influenced by the vagi indirectly—through the ganglia. Some such theory accords best with the comparatively trifling increase of pressure that results from the stimulation even of both vagi together. Spasm of all the unstriated muscular tissue in the lungs would produce a much greater effect on the manometric column; whereas waves of contraction, analogous to the peristaltic movements of the bowel, would cause the very sort of effect that is observed. Reflex contraction of the bronchioles may be produced by stimulating the central end of the superior laryngeal nerve, or of one vagus, while the continuity of the other is unbroken. Stimulation of the recurrent nerves, on the other hand, is not followed by any appreciable effect.

The Functions of the Brain.—A fresh instalment of Nothnagel's researches on this subject appears in *Virchow's Archiv* for October 9, 1876. He gives an account of his experiments on the cerebellum of rabbits. The injection of minute quantities of chromic acid into different parts of the organ was not found to answer as well as might have been expected from the analogy of the greater brain. Accordingly, mechanical stimulation with a fine needle, and cauterisation of small areas of the cerebellar substance, were resorted to instead. The following are the principal results arrived at: confessedly inadequate, they suffice at any rate to carry us beyond the zero-point alluded to by Schiff, when he declared that about the functions of the cerebellum proper we knew nothing at all. 1. The cerebellum is intimately connected, though in a peculiar way, with the performance of certain muscular movements. 2. There is a close functional, as well as structural, connexion between its two halves. 3. The complete extirpation of those parts of the organ whose irritation gives rise to definite motor disturbances is not followed by any lasting paralysis. 4. The destruction of one or both hemispheres by themselves, or of the vermiform process by itself, is not followed by any demonstrable impairment of co-ordinating power. But if the hemispheres and vermiform process are injured simultaneously, the usual disturbance of co-ordination is manifested at once.

The Action of Amyl Nitrite.—Mayer and Friedrich confirm the results obtained by Brunton and others, and add something to our knowledge on one or two points (*Centralblatt für die med. Wiss.*, No. 38, 1876). The increased rapidity of the pulse after inhalation of amyl nitrite was attributed by Filehne to a depressant action of the vapour on the centres of the vagi nerves. Mayer and Friedrich have contrived a new experiment to prove that Filehne's explanation is the correct one. When artificial respiration is stopped in a dog under the influence of curare, the heart beats more slowly owing to stimulation of the vagus centres by the excess of carbonic acid in the blood; if a little amyl nitrite be now injected into the jugular vein, the heart begins to beat more rapidly, just as it does when the vagi are cut. The alteration caused by amyl nitrite in the depth and rate of the respiratory movements is shown to be due to a direct action of the vapour on the respiratory centre, and to be independent of the circulatory disturbance. So too, the convulsions must not be attributed to the disordered state of the breathing and circulation, but to a direct irritation of certain parts of the brain by the nitrite.

CHEMISTRY AND MINERALOGY.

Conversion of Cane-Sugar into Cellulose.—Durin has studied the characters and mode of formation of certain hard white lumps which he had frequently observed in the expressed juice of the beet-root (*Annales agronomiques*, 2 Juillet, 1876, ii. 199). At first he considered that they did not owe their origin to the sugar itself, but were a protoplasmic conglutium from the beet. On one occasion, however, a large bulk of a neutral

solution of molasses was run into a wooden vat, used for the storage of beet-juice, the sides of which were lined with a thin layer of organic deposit. Twelve hours later it was found that the entire contents of the vat were converted into a compact gelatinous mass, consisting of insoluble lumps suspended in a thick ropy liquid. When some of these lumps were transferred to fresh solution of molasses, it underwent a similar change in the space of twelve hours. Durin next set himself to determine the nature of the products of this change. The lumps resembled certain pectin compounds at first sight, but they were insoluble in boiling water which had been rendered strongly alkaline with soda; and they exhibited all the properties of cellulose; by long boiling with dilute sulphuric acid the substance is converted into dextrin, and then into glucose; with nitric acid it forms oxalic acid; it is insoluble in nitric acid (monohydrate) and it forms pyroxyline; and, lastly, it is soluble in Schweizer's Liquid. The thick fluid in which the lumps were suspended, when mixed with alcohol, deposited a large quantity of a white amorphous substance, which after being dried resembled in all its chemical characters the material forming the lumps. In the mother-liquor, which originally contained cane-sugar only, the presence of considerable quantities of laevulose was recognised. This cellulose fermentation differs in a most marked manner from ropy fermentation: the latter may occur in any variety of sugar, the former only takes place in the case of cane-sugar. Ropy fermentation produces no lump-like masses, and viscosity is only an occasional phenomenon attendant on cellulose fermentation; in some cases no indication of such a change is noticed. If into a solution of pure sugar well-washed lumps of the kind above described be introduced, others are formed at the expense of the sugar, as well as an equivalent amount of laevulose. No gas is evolved unless the liquid become acid, in which case carbonic acid is given off and acetic acid is produced. When lime carbonate is added to the mixture the reaction is a simple one, and the amount of products obtained leads to the assumption that the sugar splits up into cellulose and laevulose only, in accordance with the equation:—

The development of the lumps proceeds more rapidly in the light than in the dark. The ferment appears to be a form of diastase. In one experiment, where cane-sugar (ten parts) was treated with lime carbonate and the diastase at 30° C., and the process of fermentation stopped before the change was complete, the following products were obtained: crystallisable sugar 5.10, laevulose 2.44, and cellulose 2.226. The bearing of these results on the question of plant-life is manifest. Plants in the earlier stages of their development contain sugar, which decreases in amount as the growth proceeds, and finally vanishes altogether. Analyses have shown that the existence of cane-sugar in plants is transitory, and that perfectly ripe fruit contains none whatever. As these changes must be due to the presence of such a ferment in plants themselves, Durin selected certain of them as ferments for cane-sugar, and in several cases he has succeeded in inducing cellulose fermentation. So soon as further researches, on which the author is engaged, as well as some which he is desirous other workers should undertake, are completed, and the full and perfect application of such important results as those enumerated has been established by confirmation, a valuable addition will have been made to this branch of organic chemistry.

The Absolute Weight of Atoms.—For the purpose of demonstrating the divisibility of matter and the exceeding minuteness of the atoms, Annaheim (*Ber. Deut. Chem. Gesell. Berlin.*, ix. 1151) proposes the following experiment:—A granule of fuchsine, about 0.5 mm. in diameter, and weighing 0.0007 gramme, is dissolved in alcohol and

diluted till the liquid measures 1000 c.c. In one drop of this solution, about thirty-five of which measure 1 c.c., the colour can be recognised; the eye, in short, can detect the presence of 0.00000002 gramme of fuchsine. If this drop contained only one molecule of the dye—and less cannot be present—the absolute weight of an atom of hydrogen cannot be more than—

0.000000000059 gramme.

Again, if 0.001 gramme of cyanine be dissolved in a litre of alcohol, a solution is obtained in one drop of which the colour is apparent; the amount of cyanine present is estimated to weigh 0.0000000255 gramme. This would make the weight of an atom of hydrogen not more than—

0.000000000054 gramme.

Fermentation of Glycerin.—The changes which glycerin undergoes during fermentation have been studied by A. Fitz (*Ber. Deut. Chem. Gesell. Berlin.*, ix. 1348). He finds that in the presence of a ferment and carbonate of lime decomposition takes place at a temperature of 40° C. The chief products, in addition to carbonic acid and hydrogen, are normal butylic alcohol and normal butyric acid. The presence of small quantities of ethylic alcohol and of a fatty acid, high in the series, and probably caproic acid, was also recognised.

A Base Homologous with Caffeine.—By the action of methyl iodide on the silver compound of theobromine, Strecker converted the latter body into caffeine. By the employment of ethyl iodide, in place of the methyl compound, L. Philips (*Ber. Deut. Chem. Gesell. Berlin.*, ix. 1308) has succeeded in forming ethylated theobromine:—

The new base sublimes without decomposition, and melts at a rather higher temperature than 270° C. It is soluble in acids, and can be thrown down for solutions by ammonia. It resembles caffeine in turning brown when evaporated with chlorine water, and becoming rose-coloured when moistened with ammonia.

Gmelinite.—In the *Amer. Jour. Sc.*, 1876, xii., 270, A. B. Howe describes specimens of this comparatively rare mineral from Five Islands and Two Islands, Nova Scotia. The variety from the last-mentioned locality has the rhombohedral planes *R* and -1 very nearly equally developed, and the colour of the crystals is a pale flesh-red or a cream-white. Those from Five Islands differ from the above in that the basal plane *O* is wholly wanting and the plane -1 , in most cases, is extremely minute. One of the most characteristic planes is that truncating the edge between *R* and -1 . The variety of this mineral from Bergen Hill stands, in point of composition, intermediate between those mentioned above. In the specimen from Five Islands, where the protoxide bases almost wholly consist of soda, the crystal is decidedly rhombohedral in character. The Bergen Hill specimens have not so decided a rhombohedral appearance, although *R* and -1 are very unequally developed. In the Two Islands specimens the percentage of lime nearly equals that of the soda, and the planes *R* and -1 are very nearly equal in size, and the basal plane *O* makes its appearance. The author considers that the question respecting the change in the crystalline habit, which a further increase in the percentage of lime would produce, is an interesting one.

The Silicium of Plants.—Attention was directed a few months since by this journal (*ACADEMY*, July 8, 1876) and the *Journal of Botany* to a most astonishing paper, written by Prof. Wilson, of the Medical Department of Washington University, Baltimore, and published in the *American Journal of Science*, May, 1876, wherein it was boldly stated that silica can only enter a plant in a free state—as silica, that is to say—and that wheat, grown in diatomaceous earth, actually takes up such diatoms as can pass through the root-capillaries. We now learn that two English

scientific serials—the *Journal of Science*, and the *Monthly Microscopical Journal*—have published drawings of the forms which, according to Prof. Wilson, occur in the ash of straw after it has been treated with nitric acid. The *American Journal of Microscopy* for August, 1876, examines in detail these organisms, and finds *Bacillaria* figured as it exists only in the living condition—the frontules being joined together in the peculiar manner which has given to this form the specific name of *paradoxa*. “For this diatom to have passed through a bath of nitric acid and come out in the condition figured, would have been almost as great a miracle as the passage of Shadrach, Meshach, and Abednego through the burning fiery furnace of Nebuchadnezzar.” Moreover, there is a sketch of a calcareous foraminifer which has passed through the same trying ordeal by acid; and only one of the forms belongs to the Virginia deposit with which the field where the wheat was grown was fertilised, if such a term be allowable. The *Journal* states in conclusion:

“We may look with complacency on the Moon Hoax, of Locke, and the extravaganza of Dr. Neulenz and his discoveries, effected by means of an objective of $195\frac{1}{10}^\circ$ of angular aperture, for these *jeux d’esprit* were harmless, and tended only to create a little amusement. But such a fabrication as the present is of a more serious character, since the hard-earned dollars of the farmer are paid out on the strength of these so-called scientific investigations, and so obviously and demonstrably erroneous are they, that it must bring a blush to the cheek of every scientific man in the country, when he reflects that Silliman’s *American Journal of Science*—a journal which claims to be the foremost scientific authority in America—should have lent its aid to the propagation of such nonsense.”

Synthesis of Allantoin.—The synthesis of allantoin, $C_4H_6N_4O_3$, has been effected by E. Grimeaux (*Comptes Rendus*, 1876, lxxxiii., 62), by the action of glyoxylic acid on urea at $100^\circ C$. The product exhibits the same reactions and the same degree of solubility as allantoin, and the measurements of the crystals accord with the earlier determinations of Dauber, who found it to belong to the monoclinic system.

Crystals of Ultramarine.—Grünzweig and Hoffmann (*Ber. Deut. Chem. Gesell. Berlin*, ix. 864) publish a statement respecting some specimens of ultramarine described by them some time since as possessing crystalline structure, which, however, had more recently been referred by other observers to the presence of quartz and other foreign substances. Later investigations by Vogelsang, and others, of the ultramarine prepared by the authors have shown that the greater part of it is formed of crystals of so minute a size that no goniometric measurements of them could be accomplished. The fact, however, has been established that they do not doubly refract light, and other characters likewise point to the probability of their belonging to the cubic system.

MR. F. FIELD adds a new mineral to the somewhat extended list of native phosphates and arseniates found in Cornwall (*The Chemical News*, xxxiv., 147). The crystals of the new species, which appear to be rhombic, are transparent, brilliant, and of a clear green colour, with a hardness about 3.5. The mineral dissolves in hydrochloric acid, forming a nearly colourless solution, and begins to lose water a little over $100^\circ C$.; at a low red heat it becomes brilliantly black. Analysis showed the presence of phosphoric acid, iron protoxide, and water, in the proportions which indicate the formula

as that of the mineral. In point of composition the new species resembles vivianite in so far as the ratio of iron protoxide to phosphoric acid is that of the orthophosphate, while it accords with scorodite, on the other hand, as regards the ratio of anhydrous salt (ferrous phosphate in place of ferric arseniate) to water of crystallisation.

IN the third part of his *Populäre wissenschaftliche Vorträge*, which has recently been issued (Braunschweig: Vieweg und Sohn), Helmholtz replies—in a supplement to a lecture *Ueber die Entstehung des Planetensystems*, delivered at Heidelberg and Cologne, in 1871—to a criticism, by Zöllner, of the view, propounded by Sir William Thomson in his presidential address to the British Association of the same year, that the germs of life may have reached our globe “through moss-grown fragments from the ruins of another world.” Helmholtz states that he gave expression to the theory at a somewhat earlier date (sogar noch etwas früher) than Sir William Thomson, and, if it be an error, “muss sich als Mitirrender melden.” Helmholtz directed attention to the controversy in 1874, in the preface to his translation of Thomson and Tait’s *Handbuch der theoretischen Physik*, Band i.; in the *Vorträge*, however, Zöllner’s criticism and Helmholtz’s reply are unfortunately both given as quotations, in sequence, and the meaning is thereby rendered somewhat obscure.

DR. COHEN, of Heidelberg, has examined the “specks” which are to be found in many of the crystals of diamonds from the Cape. He thought at first that they were particles of another modification of carbon. In a large diamond, weighing eighty carats, however, he discovered a crystal of specular iron, the larger faces of which lie parallel to the octahedral face of the diamond. Lustre, colour, and form (rhombohedral) all combine to identify it with specular iron, and the crystal in its habit closely resembles those occurring at St. Gothard. His paper, which was communicated to the *Versammlung des Oberrheinischen geologischen Vereins*, 1876, and is printed in the *Jahrbuch für Mineralogie*, 1876, contains some interesting observations on the connexion existing between the flawed character and the colour of Cape diamonds.

A CHEMICAL Society has been founded in the City of New York, and Part I. of its *Proceedings* has already been issued. Dr. John W. Draper is the president.

DR. CARRINGTON BOLTON, of the School of Mines, Columbia College, New York, has published a very complete *Index to the Literature of Manganese* (Salem, 1876) which, like his earlier historical notices of the metal uranium, cannot fail to be of great value to the student of the history of mineral chemistry.

MR. PETER TOWNSEND AUSTEN has compiled a *Kurze allgemeine Einleitung zu den aromatischen Nitroverbindungen* (Leipzig: Winter), in which a vast amount of scattered literature of great importance to those pursuing this branch of organic chemistry has, as far as abstracts and references go, been carefully orientated.

THE Chemical Society of London have recently given consideration to the expediency of adopting some means for exercising control over such Fellows of the Society as devote themselves to industrial pursuits; and the question of the formation of an Institute of Professional Chemists is at present under consideration.

A GERMAN translation of the *Handbook to the Special Loan Collection of Scientific Apparatus*, *South Kensington Museum* (Chapman and Hall), has just been issued.

MEETINGS OF SOCIETIES.

CHEMICAL SOCIETY.—(Thursday, November 2.)

PROF. ABEL, F.R.S., President, in the Chair. The President announced that the Goldsmiths’ Company had contributed 1,000*l.* to the recently-established research fund of the Society. Mr. Lupton then read a paper on “The Oxides of Potassium;” after which communications were read “On certain Bismuth Compounds, Part III.” by M. M. P. Muir; “On Phospho- and Arseno-Cyanogen,” by W. R. Hodgkinson; “A Secondary Oxidised Product formed during

the Reduction of Stannic Ethide to Stannous Ethide,” by W. R. Hodgkinson and G. C. Matthews; and a preliminary notice on “Pigmentum Nigrum, the black colouring matter contained in Hair and Feathers,” by W. R. Hodgkinson and H. C. Sorby. This black colouring matter is left on digesting the cleansed hair or feathers with dilute sulphuric acid, but is present only in very small quantity.

PHILOLOGICAL SOCIETY.—(Friday, November 3.)

HENRY SWEET, Esq., President, in the Chair. Messrs. Brandreth and Cust, who represented the Society at the Congress of Orientalists at St. Petersburg, gave a Report on the general results of the Congress, in which they expressed a decided opinion in favour of such meetings, as tending to popularise the results of science and promote unity of aim and work among investigators. The courtesy and liberality of the Russian Government, the learned bodies (all of whom unfortunately did not participate in the Congress), and the individual *savants*, were gratefully acknowledged. Mr. H. Sweet then read a paper on the “Text Criticism of the Anglo-Saxon Poetry.” He drew especial attention to the Northumbrian element, and showed that many of the errors of the scribes might be explained by reference to the original Northumbrian forms. The excessive conservatism of Grein was shown to be misplaced when applied to such corrupt texts as those of many of the Anglo-Saxon poems. Finally, some interesting details were given of Kemble’s treatment of the MS. of the poem of “Saturn.” It appears that Kemble’s edition is full of wanton omissions and alterations, many of which are entirely erroneous, some of them making nonsense of the correct MS. text.

MUSICAL ASSOCIATION.—(Monday, November 6.)

G. A. OSBORNE, Esq., in the Chair. MR. Alex. J. Ellis read a paper on “The Sensitiveness of the Ear to Pitch and Change of Pitch in Music.” The first part of the paper consisted of an explanation of a graphic method of representing the division of an Octave into thousandths of a semitone, by means of a diagram containing twelve lines, drawn one below the other, each forty inches long, and each representing a semitone, so that the whole represented a gigantic keyboard of a piano with forty feet for each octave, and strings to every twenty-fifth part of an inch. If only divided into hundredths of a semitone, such an instrument would have 14,400 strings in twelve octaves, and be 480 feet long. It then formed a magnified representation of the apparatus in the internal ear, consisting of 16,400 fibres, by the sympathetic vibration of which we recognise sound. Sensitiveness consists, therefore, in the degree of accuracy with which we can localise the fibre set in vibration. The remainder of the paper was devoted to giving an account of the results arrived at by Dr. W. Preyer, Professor of Physiology at Jena, for estimating the interval between two sounds struck successively, and to expressing them graphically by the arrangement explained. The sensitiveness is the greater the smaller the interval recognised or not recognised. The first question was—Are the tones different? The second—If so, which is the sharper? The third—What interval do they approach? The fourth—If they differ from any named interval is the second tone too sharp or too flat? With regard to Unisons no ear, however acute, that Dr. Preyer had tried in numerous examples could recognise a difference of one-fifth of a complete vibration at any part of the scale, although this represents very different intervals in different octaves. Below 40 vib. a whole vibration was often unheard; above 2,000, the ear was entirely uncertain and mixed all the intervals together. A good ear for Unisons distinguishes one-tenth of a semitone at 64 vib., and gradually less on ascending; eight-hundredths at 128 vib.; one-hundredth at 512 vib., with a little more in the octave below, and a little less in the octave above. The error in the Octave and Fifth seems more easily detected than in the Unison. Dr. Preyer’s experiments referred chiefly to other intervals within the Octave 128 to 256 vib. For the Fourth, an error of the tenth of a semitone was not perceived; for the major Sixth and major Third (which were nearly equal) errors of a very trifle more, as eleven or twelve hundredths, were not recognised. But for the minor Third and minor Sixth, as many as seventeen or eighteen hundredths of a semitone could not be detected. For the major Tone

errors exceeding four hundredths of a semitone were discovered. In concluding a very elaborate paper, illustrated by many tables, Mr. Ellis defined a good ear for music in its melodic relations as one which within the distance 64 to 1,024 vib. appreciates an error of one or two hundredths of a semitone in Unisons, Octaves, and Fifths, and can tell its direction, and can appreciate the errors of equal temperament for all other intervals, except perhaps the major Seventh, for which the ear is spoiled by the habit of taking the leading tone much too sharp with the voice and on the violin. The discussion which ensued turned chiefly on the power of absolute pitch (possessed by Dr. Stainer and Mr. Stephens in a high degree), and the determination of the difference of the pitch of two forks, very nearly alike, but with different character of tone. Dr. Stone considered that the results given by the lecturer disproved absolute pitch in any mathematical sense. The difference of standard-pitch shown by the forks also disproved that there was any such thing as an absolute C, for example. As respects the inability to hear a low note, Dr. Stone imagined that a deep tone might be created in the ear as a kind of differential tone. Dr. Stainer explained that of course a wide margin must be given to the statement of absolute pitch. If a tone was called A, it was nearer A than anything else. Mr. Cummings stated that when out of health he heard out of tune, and hence sang out of tune. He mentioned the case of a person who heard a semitone higher on one side of his head than on the other, and also the case of a child under eight years old, who can tell what note is struck on a piano in the next room. Mr. Stephens said that it was the possession of this power in him as a child which determined his musical career. Mr. Verrinder illustrated the difficulty of getting organs tuned to a fork, by an organ-builder having simply laid aside and lost Sir George Smart's fork left for that purpose, so little attention did he pay to such a request.

FINE ART.

MR. DESCHAMPS' GALLERY—BRITISH PAINTINGS.

THE proprietors of the Gallery 168 New Bond Street have for several years past accustomed us to displays—and choice displays they generally are—of foreign and more especially French art. Now (as we notified last week) a series of exhibitions of a different class has been started, and we have in the same gallery the first "Winter Exhibition of Oil-paintings by British Artists." The number of pictures is not large, about 130, nor are the majority of them of any uncommon degree of importance in subject-matter or scale of work; as a whole, however, the collection is decidedly an agreeable one, showing to advantage the artistic point of view, and technical accomplishment, which have of late years obtained so considerable a diffusion over our school.

By far the most important works contributed are the two by Mr. Madox Brown: one of them, *Don Juan and Haidee*, in size as well as pictorial power generally; and the other, *St. Ives, A.D. 1636*, in fullness and range of invention, and even, with some few exceptions, in dimensions likewise. Both these works are new to exhibition-visitors; but of the latter we gave some account at the date of its completion two or three years ago. The *Don Juan* picture shows the moment when the fascinating young Spaniard, cast ashore on the Greek pirate's island after the wreck, insensible and lapsing rapidly towards death, is found by the beautiful young Haidee, and her female attendant Zoe. The latter feels for the faint fluttering heart-beat which tells that life is not yet extinct, and she has just attained the desired certainty: while Haidee, lingering a few paces behind, anxious and with a momentarily-increasing sense of personal tenderness, strains forward to learn the event with which her fate is to be so closely and mournfully entwined: all the lines of her countenance and action speak thrillingly of the instant of "sweet, reluctant, amorous delay." It is a scene of rocky hollows and grottoes, of sunwarm whispering sea, of sand deeply treasured with the recent fierceness of the breakers, and bestrewn with seaweed and

tangle, of hill-path ascending homewards; steeped in reflected and shimmering light, but not admitting any direct glimpse of the radiant sky. The boat in which Juan and three companions had been drifting, and which finally struck on a rock, is seen bottom upwards, jammed between two boulders. Juan, naked, but with some fragments of drapery clinging about him, and with the oar which has aided in floating him to the beach, lies in youthful liteness and purity of form, with closed eyes and lightly-parted lips, his head dangling forward with listless grace: altogether a remarkably fine study of the nude, elegantly-moulded, of the warm half-golden southern tint, and poised with a master's sense of beauty, and of appropriateness to the situation. The colour of the picture generally is bold in its fullness and combinations, and yet so light and airy as to seem, in its total effect, rather unlaboured than over-enforced. The other painting has as its full title *St. Ives, A.D. 1636, Cromwell on his Farm*, and condenses into a very moderate space (as some of our readers may remember) a very unusual amount of incident, all strongly significant, and centring towards one main purpose: that of exhibiting Cromwell in his double relation of the busy but inconspicuous country-gentleman (as at this period he was), and also of the man much exercised in spirit, weighted with the care of his own soul, and with the thought of troublous times present and impending, which, by the wondrous "births of Providence," it will be his to mix with, and to guide and master towards their momentous issues. Holding a Bible and an oak-sapling, Oliver looks with grim introspection at the burning of a quantity of farm-refuse; he is so absorbed in his reverie that he does not hear the servant-wench who is calling him in to dinner: and a horse, a lamb, a sow and her litter, a goose, and the cattle of the grazing-farm, even the sunshine of the foreground, with the showery broken sky of the distance, are left to tell their tale to eyes which can see that these obvious accompaniments of a country-life may be suggestive of many things besides the mere hides and hoofs, wool and feathers, clouds and sun-shadows. The head of Cromwell is exceedingly fine: the longer one looks at it, the more force of purport does it convey.

The other figure-pieces of leading importance are sent by Messrs. Watts, Sandys, Gregory, and R. W. Macbeth.

The Three Graces, by Mr. Watts, is a treatment of subdued and melancholy sweetness; fair, tall, stately forms of womanly maidenhood. One is presented almost in full face; another, in the back view; the third stands sideways, her arm all-but hiding the face. Beyond the dim flesh-tints, there is very little colour in this work; some leafage is touched-in with fine artistic judgment. Mr. Sandys exhibits a chalk-drawing of *Lethe*. She holds a jar of poppies, and gathers another of these flowers from a thick growth of them which skirts her path as, with closed oblivious eyes, she strays by the margin of the dark river; dark bare rocks, lonely and ponderous, surge up behind, and leave scarcely a gleam of the wan sky. This is an impressive conception, carried out with the designer's well-known fullness of execution; the light, bold, and fantastic curves of the serried poppies were, of themselves, enough to tax the patience and the skill of any artist. The work is far advanced towards completion, but not absolutely finished. Mr. Gregory's principal subject is *Dawn*—the last moments of a ball, when the blue radiance of the young day floods the ruddy-lighted room, streaming-in victoriously through the many chinks of the Venetian blinds. The youthful belle of the evening stands beside the piano, receiving the last attentions of a rather mature cavalier who prepares to wrap her cloak around her; his lounge and eyeglass assist his visage in giving him a *blasé* air. A flush of azaleas, vivid almost to fierceness, and tingling with dawn-light, comes behind the lady's face, set

full in the flare of gaslight. The only other personage is the old gentleman who has been playing the piano at so much per hour, and who now permits himself a discreet yawn behind his hand. This is a very uncommon-looking picture, grappling, with almost audacious force and conspicuous skill, with the great difficulties of effect consequent upon the double light. We cannot say that the total result is beautiful—indeed, we think it almost touches the confines of ugliness; but the man who could treat it with so much strength and *élan*, setting at naught all idea of compromise in any aspect of his subject, ranks himself at once among the athletes of the pictorial craft. A smaller work by Mr. Gregory, *After the Ball* (not to speak of the mailed bust, *A Captive*) tells the same tale. This is a singular *tour de force* in foreshortening, nearly trenching on the grotesque; the young lady, without any undressing, has thrown herself on the outside of her bed, and sleeps heavily after the fatigues of the dance, the immense train of her grey ball-dress flooding the floor, and occupying a large proportion of the canvas. *Sheepshearing* is a well-sized picture by Mr. Macbeth, replete with straightforward and sure-handed artistic ability, and with nice points of character and expression; it has a generous brilliancy of colour, along with fullness of tone. The principal figure is a handsome young shearer, who has just done his hard spell of work, and smears the back of his hand, which still retains the shears, across his reeking forehead; another young man beside him is already well on with the fleecing of his allotted sheep; close by him the intelligent sheep-dog has all the air of a connoisseur. The seeming ease with which this picture is executed, excellent and pleasant as it is, almost constitutes a peril to the artist; yet it cannot be said that as yet he slurs or scamp anything which it behoves him to realise in such a subject. Not a whit less good than this is the smaller picture, *Weaning the Pups*, where an aged Scotch dame has provided a sturdy bowl of milk for a quintet of puppies, who plunge into it with gusto, while the maternal bitch looks on with most regardful attention, laying to heart the demonstration that her own good offices may henceforward be waived. This picture, if engraved, might probably rival the popularity of a Landseer, and would indeed well deserve to do so. It has corresponding merits of composition and expression, with solidity superior to Sir Edwin's average, and a fuller and truer scale of colour.

Another figure-picture of considerable size is the *Una* of Mr. Nettleship—*Una* and the Lion. Here the lion is the best thing; yet even that not so good as several other examples of the king of beasts by the same painter, whose faculty for expressing the character and life-history of the great carnivora is truly rare and excellent. Also the *Crabbed Age and Youth* of Mr. Brewtnall—reminiscent of the style of Mr. Leighton, with some-things perhaps of Mr. Poole as well; we cannot say that its artistic importance is such as to make it, in any respect save that of size, one of the leading contributions to the gallery.

Here we may pause for the present; leaving over the smaller figure-pictures, and the landscapes and miscellaneous works.

THE FRENCH GALLERY.

WE have before observed upon the curious regularity with which a poor and a good exhibition alternate in this old-established Gallery, 120 Pall Mall. The present occasion is the turn for a poor exhibition, and, sure enough, a poor one it is. We find in it one excellent picture, and one remarkable picture; and of course several others in a descending ratio of cleverness and skill, till we come to such as are decidedly stupid. The excellent picture is contributed by Meissonier, and the remarkable one by Gierymski: we shall deal with the latter first. As to the British section of the display, Mr. Burgess and Mrs. Anderson (who is

in strictness, we rather think, an American) claim honourable mention.

Gierymski's subject is *The Trial Scene from the Merchant of Venice*; a long picture, with many but not crowded figures, and in general aspect highly observable. Anyone who has seen the great Carpaccios at Venice (History of St. Ursula) will forthwith perceive that M. Gierymski has had them principally in his mind as he worked; with their style he blends something of Leys, and something perhaps of a mode now very popular in Paris, of which Munkacsy is a leading exponent. The Doge and his counsellors are seated to the spectator's left; then comes Portia; in the centre, Shylock, with Antonio, Bassanio, Nerissa, and others; and at the further end, some female spectators. The success of the picture lies in its colour and tone—deep, rich, firm, and powerfully homogeneous. The handling, too, is solid, although the figures are not by any means vigorously rounded or detached; some of the minor character-heads are good; and the scene as a whole is made to wear a life-like and possible look—there is none of the mouthing or self-display of the stage. On the other hand, it must be said that the personages and their high-strung emotions are reduced to great insignificance—we can scarcely even say whether the moment selected is before or after Shylock finds himself thwarted by the law-logic of Portia, or whether Antonio is expecting a horrid death on the instant, or is exulting in his deliverance; we rather infer, the latter. Antonio is at any rate a most inefficient figure; Shylock ordinary, and not markedly Jewish; Portia neither beautiful nor striking, but moderately agreeable. The architectural background is effective, but its patterns, as soon as one attends to them individually, prove to be meagre affairs, more like modern oil-cloth than the delicate luxuriance of Venetian-Byzantine. Yet all these defects—very serious as some of them are—count for comparatively little, the general impression of the work being so emphatic and distinguished: it was painted, as an inscription purports, at Munich in 1873. The example of Meissonier is named *A Traveller*; a single figure, not of the master's smallest scale, presenting a compendium of technical excellences which the eye delights in, but which it were tedious to specify in detail. The Traveller is a man of something under forty years, in the costume of the close of last century, with long reflective face and reddish hair: he is seated in a small room of a hostelry, taking his leisure over a glass of brandy and a German pipe.

Next to these, the foreign picture most worthy of attention is *The Ship on Fire* by Bolanachi; a large work, striking at first sight, with its massive hulk, green sea, and numerous figures. On fuller inspection, the original forcible impression does not diminish, and the details are found to be rightly chosen and rendered, but they do not carry one much further. Another picture of some importance is *The Knitting School*, by Spring, of Munich; fairly successful in expression and in tone, with well-trained handling, which tends, however, too much to blurry smoothness. Chevillier, Palmarioli, Munthe, Pasini, Mesdag, De Neuville, Wahlberg, Duverger, Knaus, and Vibert, are all well-known exhibitors; upon whose performances here, able as these are but not exceptionally valuable, we need not dwell. Kuhl (*The Antiquarian*), Parmentier (*Courtyard of an Italian Inn*), Anker (*Les Petites Brodeuses*), Windmaier (*The Road to the Village*), and Richet (*View in Brittany*), may also be specified.

Mr. Burgess selects, as usual, a Spanish subject, *The Reprimand*. A mother or duenna has brought two exuberant damsels to the priest's house, to be lectured for some indiscretion which has no doubt something to do with love-making. His reverence, a grave and aged man, treats the matter in a serious style, but without any harshness or brow-beating. One of the delinquents is rather more inclined to cry than smirk, and the other to smirk than cry; but in each of them both these impulses

contend for the mastery. A dark-skinned female servant behind listens demonstratively through the open door. This last incident is one of those obvious and rather vulgarising items to which English painters are but too prone; they think that these assist in "telling the story," but, in fact, such a story as that before us is sufficiently told without any such extra enforcement. In other respects Mr. Burgess's picture is a slightly and satisfactory sample of its class. The like praise belongs to *Scandal in the Harem*, by Mrs. Anderson—two women whose faces of broad laughing enjoyment are spontaneous and genuine; the narrating action in the hands of the speaker is also very natural, and the painting solid and effective.

Passing lightly by some creditable works of Messrs. Gow, Percy, Archer, Forbes Robertson, Pickering, and J. Morgan, and Miss Clara Montalba, we must say a few words in dispraise of three conspicuous exhibitors—Messrs. Goodall, T. F. Dicksee, and Long. The first of Mr. Goodall's pictures is *The Holy Mother*, a smaller duplicate of the attractive work lately exhibited at the Academy, and of this we have nothing further to remark. We find, however, that *Rebecca at the Well* and *Sophia Western at the Spinette* are equally misconceived by the same painter: Rebecca becoming a silly round-faced chit of the "Oriental" type, and Sophia Western a molish *soubrette*. Mr. Dicksee's big *Cleopatra* is highly objectionable in virtue of its very merits, as the artist may consider them—its commonplace beauty, and got-up dignity, and uniform propriety, and lack of anything full-blooded, individual, or independent. Mr. Long, no doubt, must have had a dead set made at him by picture-dealers and patrons ever since the tumult of success achieved by his *Babylonian Marriage-Market* in 1875, and all the dead stock and lame ducks of his studio have become articles of commerce. The *Fanchette* displayed in the present collection, and dated 1872, is one of the most defunct members of this dead stock, and of the most crippled of these lame ducks: Mr. Long can surely count it little short of a disservice to have it here exposed. Another work (in itself picturesque enough) which should hardly have been included in the exhibition is the *Bay of Salerno* of the late Mr. J. D. Harding: this bears a date no less remote than 1831. W. M. ROSSETTI.

A SUCCESSFUL RESTORATION.

A FRENCH correspondent, M. Charles Ephrussi, makes known to us a most happy restoration of a painting by Albrecht Dürer, which has long been supposed to have been hopelessly ruined. The painting in question represents *Hercules killing the Stymphalian Birds*. It was formerly in the gallery at Schleisheim, where it was seen at the beginning of the present century by Dr. Waagen, who found it even then in such a bad condition that he considered it would be difficult to restore it. It was afterwards placed in the Burg at Nürnberg, and either there or elsewhere was so overlaid with oil-colour and varnish that it became difficult to recognise any of Dürer's original work. Dr. von Eye speaks of it as being much blackened and deteriorated, and Dr. Thausing, Dürer's latest biographer, declares it to be in a state of "perfect ruin." Under these circumstances an attempt at restoration could certainly do no harm, and it is pleasant to learn on the authority of M. Ephrussi that the attempt has been eminently successful. The picture in reality only wanted a simple cleaning, and judicious removal of the layers of paint and varnish that had grown over it, to restore it to something like its pristine condition. This fact was first perceived by Herr Bergau, who, having occasion to detach the painting from the wall of the Castle for purposes of study, was struck by its condition, and persuaded the authorities at Nürnberg to send it to Munich for restoration. It was here, in the atelier of restoration belonging to the Pinakothek,

that M. Ephrussi saw it a short time ago. He says,

"A portion of the Hercules was already cleaned, and by simply sponging the rest Herr Hauser, the Conservator of the Pinakothek, gave me a good idea of what could be effected by this means. The painting came out as fresh and beautiful as when it first left the atelier of the artist. Here and there were a few little holes to stop up; this was really all the restoration that had to be done. Simple cleaning with alcohol revived all the beauties of the work."

As we have said so much concerning the restoration of this work, it may be interesting to our readers to learn something of the picture itself, particularly as it is not described by either of Dürer's English biographers, owing, no doubt, to its dilapidated condition.

The *Hercules* bears Dürer's monogram and the date 1500, and therefore belongs to the artist's early time. It is executed in a portrait-like style, with all the detailed minuteness observable in many of his studies, the plants in the foreground especially being elaborated after the Flemish manner and as we see them in many of Dürer's studies of flowers, &c., in the Albertina and other collections. Although the choice of subject betrays the artist's mythological predilections at this time, the naked Hercules himself is conceived according to the German type, and M. Ephrussi even finds a resemblance in his features, which are seen in profile, to those of the painter, whose well-known portrait in the Pinakothek belongs to the same year, 1500, when Dürer was twenty-nine years of age. The young demi-god, who is represented of about half life-size, advances rapidly, drawing his bow with great energy, from which he is about to let fly an arrow at his adversaries. These birds are seen in the air in the shape of small winged dragons, with the heads and busts of women. They have nothing very terrible in their appearance; indeed, their heads have a certain amount of grace and beauty. The scene is set in a river landscape of poetic beauty, with steep mountains in the background and an imposing fortress to the left. The picture is usually stated to have been executed in water-colours on canvas, but M. Ephrussi thinks it possible that Dürer used oils. If so, he must have laid on the colours very thinly.

A pen drawing, heightened with sepia, of the same subject, a study, doubtless, for this composition, is preserved in the Darmstadt collection.

M. M. HEATON.

EUROPEAN PICTURES IN AMERICAN COLLECTIONS.

New York: October 4, 1876.

The Centennial has been the means of giving the public the privilege of seeing some of the best pictures from the private galleries of this city. For the benefit of the Centennial visitors to New York the Loan Exhibition was suggested, the proceeds of which are given to the National Academy of Design and the Metropolitan Museum of Art, the two buildings in which the pictures are exhibited. Perhaps the most interesting collection is that of Mr. John Taylor Johnston. The most remarkable of Mr. Johnston's pictures is Turner's *Slave Ship*. There are also:—Gérôme's *Death of Cæsar*; Holman Hunt's *Isabella and the Pot of Basil*; an exquisite landscape by Daubigny; *The Two Confessors*, by Ed. Zamacois; *In a Spanish Café*, by R. Madrazo; *Christmas in England*, by Geo. H. Boughton; several little pictures by Ed. Frère; *Spring Flowers*, by J. L. Hamon; *A Norway Torrent*, and *Fishing Boats at Sunset*, by A. Achenbach; *The Quarrel of the Pets*, by Leon y Escosura; *Venus Bathing*, by Paul Delaroche; several cattle-pieces, by C. Troyon; Church's *Niagara*, perhaps the most famous picture by an American landscape-painter in existence. There are two or three paintings by Koekkoek of Berlin; *On the Way to the Bath*, and *Blowing Bubbles*, by W. Bouguereau, an artist who figures in almost every Ameri-

can collection; *Italian Bandits surprised by Papal Troops*, by Horace Vernet; *A Brittany Shepherdess*, by Jules Dupré; *Arabs Retreating*, by A. Schreyer; *Prisoners from the Front*, by Winslow Homer; *Bashi-Bazook*, by J. L. Gérôme; *The New Sister*, by Meyer von Bremen; Eugène Delacroix' *Virgil and Dante crossing the Styx*, pronounced by some to be the finest picture in the collection; several striking paintings by E. von Marcke; *The Forest of Fontainebleau*, by N. Diaz; *The Poacher's Death*, by C. Hubner; *Flemish Meadows and Cattle*, by E. Verboeckhoven; *Wallachian Peasants crossing a Ford*; a head, by Couture; *The Outcast*, by G. H. Boughton; and a number of pictures by American artists of more or less merit. The collection of Robert Gordon, Esq., consists mostly of American pictures, the painters being Gifford, G. H. Boughton, George A. Baker, L. C. Tiffany, W. J. Hennessy, W. Magrath, and others. Mr. William Hunt, the well-known Boston artist, exhibits two interesting pictures by himself, a *Marquerite* and a *Boy and Butterfly*. The collection of Lucius Tuckerman, Esq., consists of a landscape with cattle, by Rosa Bonheur; *La Petite Bergeron*, by H. Merle; *The Angel and Child*, by W. Kaulbach; *Interior of San Marco*, by David Neal; and *Early Morning*, by W. Bouguereau. J. Pierpont Morgan, Esq., exhibits:—*Sale of Tickets for a Bull Fight*, by L. Alvarez; *Love's Washerwoman*, by J. L. Hamon; a landscape by A. B. Durand, one of the earliest of American landscape-printers; *A Breton Flower-Girl*, by G. H. Boughton; *Landscape with Cattle*, by C. Troyon, and others of less importance. The collection of W. L. Andrews, Esq., consists of water-colours, chiefly from the brushes of Meissonier, Boldini, and J. G. Vibert. The foregoing are exhibited at the Museum of Art.

The collection at the Academy of Design, while it contains some famous work of foreign painters, is interesting as including specimens of the early and best work of American artists. There is a landscape by A. B. Durand, better than anything he has done recently, and a figure-piece by D. Huntington that puts his later work to the blush. The collection of Ex-Governor E. D. Morgan embraces a larger number of pictures than that of any other exhibitor at the Academy—among them several portraits by the late Charles L. Elliott, who was the best American portrait-painter of his time. The most noticeable of Governor Morgan's pictures are—*Washerwomen on the Coast of Brittany*, by Jules Breton; *The Old Madonna*, by Elihu Vedder; *Sheep and Goats*, by E. Verboeckhoven; *A Storm*, by A. Achenbach; *Industry*, by Meyer von Bremen; *The Butterfly*, by R. Madrazo; *The Happy Wife*, by W. Bouguereau; *Charity*, by W. Kaulbach; and *The Florentine Picnic*, by Elihu Vedder. There are also several Bouguereaus in this collection. Parke Godwin, Esq., formerly editor of the *Evening Post*, has a small but interesting collection embracing a Bouguereau, a Burgers, and a Landelle. In the collection of Chas. Stewart Smith, Esq., is *The Echo*, by Alex. Cabanel, who is a great favourite in America; *The Jealous Landlord*, by F. Hiddemann; *Snow Storm in Russia*, by A. Schreyer; *The Lion on Guard*, by L. Gérôme; *A Spanish Lady*, by R. Madrazo; *The Attack*, by A. Schreyer, and *The Little Scholar*, by W. Bouguereau. W. L. Andrews, Esq., exhibits a good picture by Auguste Bonheur, called *After the Storm*, and the *Gypsy's Revert*, by G. H. Boughton. Mrs. Paran Stevens has a valuable collection, among which is a *Mother and Child*, by Meyer von Bremen; a *Cowbird*, by Meissonier; *Landscape and Cattle*, by Troyon; a curious and richly painted *Falstaff in the Basket*, by H. Makart; *Sheep*, by Rosa Bonheur; *The Dethroned Idol*, by Horace Vernet; *Mirabeau*, by Ary Scheffer; *The Sisters*, by Thos. Couture; and an exquisite piece by Millet, *A Woman Carding*. In the collection of John H. Sherwood, Esq., are several of W. T. Richards' characteristic pictures: *A Diogenes*, by J. L.

Gérôme; *The Spanish Matador*, by J. G. Vibert; *Expulsion of Eve from Paradise*, by Alex. Cabanel; *Convent of St. Montreal at Palermo, Sicily*, by Oswald Achenbach; and *A Brood of Turkeys*, by Juliette Peyrol Bonheur. In the collection of Morris K. Jessup, Esq., is a good Diaz, *Children and Lizard*; some sheep, by Verboeckhoven; *The Summer of Life and the Winter of Life*, by G. H. Boughton; *Sheep*, by Troyon; and *Spring Time*, by G. H. Boughton. John Wolfe, Esq., exhibits *Egyptian Fellah-Woman with Sleeping Child*, by L. Bonnat; *Maternal Admiration*, by W. Bouguereau; and *A Wallachian Teamster entangled in the Marshes of the Danube*, by A. Schreyer. Miss Catherine L. Wolfe exhibits *Church Festival in Brittany*, by Jules Breton; *Landscape with Cattle*, by E. von Marcke; and *Day Dreams*, by Thos. Couture. Mrs. A. T. Stewart makes but a small selection from her famous gallery; it consists of *The Gladiators*, by Gérôme, which I must confess that I liked better in the photographs, and the *Race of the Charioteers*, also by Gérôme, but quite unworthy that artist's reputation. It is an ugly picture, with a good deal of bad work in it. There is a highly coloured Madrazo, *Lady and Monkey*; *The Garden of Versailles in the Seventeenth Century*, by A. Boldini, a striking picture, and one that will bear close study; *The Strategic Device*, by A. Lesrel, and *The Begging Monk*, by Zamacois. Geo. A. Robbins, Esq., exhibits *The Flight after Worcester*, by W. Camphausen; *The Glen*, by A. Bierstadt, and *The Wine-Tasters* of J. P. Hasenclever. Among the best pictures in the collection of Thos. A. Havermeier, Esq., are Meissonier's *On Guard*, and a coast scene, by A. Achenbach. Robert L. Cutting, Esq., exhibits four good pictures, *Leaving Church—Rainy Day*, by R. Madrazo; *Return to the Convent*, by Ed. Zamacois; *Sheep on the Seaside*, by Auguste Bonheur; and *Cattle Drinking*, by E. von Marcke. The collection of R. M. Olyphant, Esq., is made up entirely of American pictures; among them an interesting *Tornado in an American Forest*, by the late Thos. Cole. He has also some good specimens of Wyant, Church, Durand, Huntington, Eastman Johnson, Kensett and Gifford. Marshall O. Roberts, Esq., who has a large collection of pictures, exhibits one of his poorest, *Flower of Fiesole*, by Henry Peters Gray. D. H. McAlpine, Esq., exhibits an interior by Escosura; *Landscape and Cattle*, by Troyon; *French Farm House*, by Jules Dupré; *After the Bath*, by Bouguereau; a *Landscape*, by Daubigny, and one by Corot, both exquisite pictures. Dr. F. N. Otis exhibits some characteristic American paintings, and a charming *Tambourine Girl*, by Elihu Vedder. S. Hawk, Esq., exhibits, among other pictures, a *Landscape*, by Corot; *Charity*, by Bouguereau; *After the War*, by Meyer von Bremen; *Harvest in Normandy*, by Jules Breton; *Arabs on the War Trail*, by A. Schreyer; and *Ruth and Boaz*, by Cabanel. Thos. B. Musgrave, Esq., exhibits Gérôme's *Crucifixion*; *Cattle*, by F. Voltz; *Escosura in his Studio*, by Escosura; *Beggar Boy*, by Meyer von Bremen; *Indifference*, by G. H. Boughton; and a *Tambourine Girl*, by Bouguereau. H. G. Marquand, Esq., exhibits *Landscape and Cattle*, by Troyon; *Spanish Coquette*, by Madrazo; *Blowing the Fire*, by G. H. Boughton, and *The Reader*, by Ed. Frère. James Gordon Bennett, Esq., exhibits two Boldinis, *En Dëshabille* and *A Young Girl*. The collection of R. L. Stuart, Esq., contains one of Gérôme's best pictures, *The Pasha's Forerunners*; *Instruction*, by J. O. Hasenclever; *The Inundated*, by Meyer von Bremen; *Mother and Child*, by W. Bouguereau; *The Visit*, by Escosura; *The Guard*, by Meissonier, and *Grandmother's Story*, by H. Merle. The collection of E. Matthews, Esq., includes *Moving Home*, by E. Plassau; *In the Park*, by Alfred Stevens; *Power of Music*, by Alex. Cabanel; *Return from the Hunt*, by Baron H. Leys; *Going to Church*, by Alma Tadema, and *The Slaves, Cairo*, by Eugène Fromentin. There are a number of pictures, both American and

foreign, which I have neglected to mention, not because they are unworthy, but for want of space. The foregoing are, however, the most conspicuous. This Loan Collection is pronounced the finest ever seen in New York. J. L. GILDER.

NOTES AND NEWS.

At a Congregation held at Cambridge on the 3rd inst., the approval of the Senate was given to the designs of Mr. Basil Champneys for the new Divinity Schools and dependent buildings, to be erected on the site facing St. John's College, and bounded on the south by All Saints' churchyard. The structure will consist of a central block and two advancing wings; the central block, together with the south wing, will contain the Divinity Schools, which are to be built out of the fund given for that purpose by the late Prof. Selwyn; the north wing will be built out of the general University Fund, and applied to one or more of the various purposes for which fresh accommodation is urgently needed. The Divinity Schools consist, on the first floor, of one principal lecture-room in the central block, 54 ft. 6 in. long by 33 ft. 6 in. wide, with a library 41 ft. 6 in. long and 20 ft. 3 in. wide in the south wing facing All Saints' churchyard, and a smaller lecture-room and four professors' rooms on the ground floor. The style of the building is sixteenth-century Gothic, and the material red brick and stone. The central block is lofty, and terminated by gables treated in a manner analogous to that of the banqueting-hall at Hampton Court, while the conspicuous angle of Trinity Street and All Saints' churchyard is marked by an octangular corner turret, or *tourrelle*, which will form, within, an oriel window to the library. Alike from their character, position, and purpose, the new buildings will be an important feature in Cambridge. Their construction will, we understand, be proceeded with immediately.

MR. HERKOMER has now in progress several important subjects both in water-colour and oil. Foremost among the latter is the large upright picture destined for the Academy Exhibition, where the artist has once more taken his theme from the peasant life of the Bavarian Alps. A group of peasants, obedient to a quaint religious tradition, are pacing round their fields in autumn-time praying for the success of the crops. The artist has already exhibited a small water-colour design of this subject, but in the larger picture now on the easel the original scheme of the composition is partly recast. The leading figure in the group, an old man supporting his enfeebled steps with a staff, has just paused in front of a little shrine by the side of a path, his head uncovered and bent in devotion. Behind him follows his aged wife, and further back and higher on the hill-side are distributed the younger members of the family, all alike intent in devout supplication. Not the least attractive and interesting portion of the picture will be the landscape against which the figures are relieved. A second oil painting, a river scene in Yorkshire, gives even more important expression to Mr. Herkomer's study of landscape; and a large water-colour design, in illustration of a beautiful German legend, bears witness to the artist's continued pursuit of the higher aspects of human beauty. It is not improbable that Mr. Herkomer may return on a future occasion to add a companion illustration to his large picture of *Chelsea Pensioners*.

THE designs, almost all of them models, sent in in competition for the proposed monument to Lord Byron have lately been placed on view in the South Kensington Museum. Members of the press were invited to inspect the works last Wednesday. Their number is about fifty. Several of them are evidently from foreign countries, but the competitors, save in a few instances, withhold their names from the public eye. We cannot say that any one of the designs impresses us as coming

from an artist enjoying or deserving European fame; and only a very few of them seem up to the level of work of a man pre-eminent in his own country. The following appear to us the best:—(1.) No. 40 (best of all). Byron stands on an ornamental pedestal, resembling in general character the Choragic monument of Lysicrates. He is attended by a winged and floating figure of Poetry, who inspires him to write. He has—as he ought to have—a proud, energetic, absolute look; the principal point in his costume is a cloak or loose wrapper. At intervals along the pedestal are stationed figures of Greece, Tragedy, Idyll, and Melancholy. This design has an effective quality of posing and composing. The figures simulate bronze, and the pedestal marble. (2.) No. 38. An energetic group, evidently the work of a capable artist, representing Byron solely in the character of the Champion of Greece: it must, we think, be admitted that the monument ought to give him primarily the character of a poet. He protects Greece, a female figure, and has his foot on a prostrated Turk, not very clearly identified in point of nationality. Two bas-reliefs are added, of a classic mode of design, but their precise subject is not distinct to us. (3.) No. 27. Mr. F. J. Williamson sends a simple and agreeable portrait-figure of Byron, with his cherished dog Boatswain. The poet is in his shirt, holding a book, but not reading or writing in it. This is satisfactory as far as it goes, but seems not enough for a national monument. A drawing annexed to the model shows that the figure would stand in a niche, under a domed canopy. No. 28 is an alternative design by the same sculptor. Here Byron has a cloak over his shirt, and is about to write. The canopy would be open, not niched. (4.) No. 29. The pedestal is a modification of the Lysicrates monument, and has some bas-reliefs, not perspicuously designed. Byron is above, half-seated on a ruinous fragment, about to write. This is a fairly attractive design, and would probably look well in its total effect. (5.) No. 2 bears the motto *Ποιητής λέων*, and gives us accordingly the poet and the British lion. Byron, laurel-crowned, in a modern Greek dress and with a cloak, holds a scroll; his general air is rapt and impetuous; his foot rests on an Ionic capital. The face, however, is by no means accurately or efficiently made out. In front of the pedestal, otherwise blank, comes the lion, forcibly designed, along with a lyre and a palm-branch. This is a telling sort of performance—foreign, we presume—but it hardly strikes us as likely to amount to very much, if carried out on a monumental scale.

At a meeting of the Council of the Arundel Society, held on the 1st inst., Mr. F. Lambe Price was elected Secretary to the Society, in the room of the late Mr. F. W. Maynard.

THE *Moniteur* has an article upon the portraits of Raffaele painted by himself, of which there are four existing. Two only are of unquestionable authority, that in the gallery of the Uffizii, at Florence, and the portrait introduced into the *School of Athens*; the two others are the drawing in the University Galleries at Oxford, and the portrait engraved by Marcantonio. The drawing now at Oxford has passed successively through the Wicar, Ottley, Harman, and Woodburn collections. It is in black chalk, heightened with white, on tinted paper, and is the head of a beautiful youth, apparently not more than fifteen or sixteen years old; he has long hair, falling down upon his shoulders, and wears a felt hat with the brim turned up. Passavant, says Mr. J. C. Robinson in his account of the Raffaele drawings at Oxford, engraved this drawing as the frontispiece to the German edition of his book, believing it to be the portrait of Raffaele. The portrait of the Uffizii, representing him at twenty-three, in the full vigour of youth and beauty, was painted for his uncle, Simone Ciarla, when Raffaele was

at the Court of Duke Guidobaldo at Urbino. That in the *School of Athens*, where he stands by the side of his master Perugino, represents him at the age of twenty-seven. Lastly, the engraving of Marcantonio was executed shortly before his death, 1520. These four thus comprise the whole of his short career.

THE Salle Drouot was opened last week for the season, the first sale consisting of a large collection of Oriental porcelain, which realised 80,580 fr. (3,223*l.*)

MR. PARKER has just issued an appeal on behalf of the Roman Exploration Fund, pointing out that now is the time to do the work of excavation; when the new city is completed, and the great drains are finished, the opportunity will have gone by. He enumerates twelve sites on which work might be begun at once, if the money was forthcoming. There is a custom in Rome to grant leases for four years, sometimes with the money paid in advance for the whole period. By acting on this plan the committee might do great things: to purchase the ground in each case is out of the question, but a lease would generally require but a small sum—the cost would not probably exceed ten pounds annually in each case. Subscriptions are received at Oxford and Cambridge, and by Messrs. Coutts, London.

A PROJECT for the erection of a large exhibition-building in Rome has been submitted to the Italian Government, and will, it is supposed, be shortly carried into execution.

THE twelfth annual exhibition of water-colour paintings by British and Foreign artists at Mr. McLean's New Gallery, 7 Haymarket, is now open.

THE *Builder* of last week states that the work of restoration at All Souls' College Chapel, Oxford, is now nearly complete. The reredos, which occupies the whole eastern end of the chapel, has had its thirty-five large niches and eighty-four small ones filled in with statues and statuettes, the work of M. E. Gellowski, while the bay over the reredos has been painted by Mr. Hill, of Oxford, from designs by Sir G. Scott. The floor has also been repaved, and a new altar of Devonshire marble inserted, so that the old chapel must now present quite a modern aspect. The same kind of restorations and additions have been lately carried out, not always in the best taste, in most of the old colleges at Oxford.

THE prizes offered last year by the Prussian Government for the best method of cleaning plaster casts, and also for the discovery of a new material to replace plaster in taking casts of works of art which could be easily cleaned, led to a competition of 146 candidates. No one, however, seems to have hit upon any strikingly new process, though a few good suggestions were made in some of the papers. The jury, which sat last July, finally awarded two first prizes to Dr. W. Reissig, a chemist of Munich, and to Herr Georg Leuchs, a chemist of Nürnberg, and the third prize to Dr. Filsinger, a chemist of Dresden. These prizes were all for the solution of the first difficulty—namely, the best means of washing plaster casts—and the three successful candidates had all arrived at the same process fundamentally, though carried out in different ways. With regard to the second requirement—a new material for casts—the jury decided that the stated conditions were not fulfilled by any of the candidates, none of the materials suggested being capable of easy cleaning; so this prize was not given. The various processes will shortly be published.

AN Artistic Congress has lately been held in Munich to consider the best means of promoting artistic education in Germany, and to discuss various questions relating to the development of the national art-manufactures. A great number of German and Austrian artists, heads of schools, directors of art establishments, and others interested in such matters, were present at the meetings, and most animated and lengthy debates took place on several of the points discussed. These

points, unlike those which have so recently occupied our Social Science Congress, had little relation to the social aspect of art education, or the influence of art in the general culture of a nation, but were chiefly concerned with the practical and industrial aspects of the question. In particular, a resolution was passed (though not without great opposition) condemning the present custom-house regulations as being hurtful to the development and success of the national art-industries, and calling upon the Reichstag to lighten or take off altogether the duties on certain articles, and to draw up a more rational system of classification for international use. The present Protectionist policy in matters of art industry was simply, it considered, an avowal of the artistic inferiority of Germany to other countries. Prof. Dr. Carl von Lützow, the editor of the *Zeitschrift für bildende Kunst*, spoke at considerable length on this subject, and proposed that a commission of enquiry should be appointed by the Chambers of Commerce and Industry, but his proposition was not put to the vote. The other principal resolutions passed at the Congress were:—

“1. That evening schools for artisans, and industrial art-schools for women, having been found of great use, the Congress recommends them for municipal or State help. 2. That the Congress forms the resolution of assisting, by all the means in its power, the formation of art societies and trade guilds in all the principal towns of Germany and Austria, in order that a permanent and friendly union may be established between artists, artisans, and all who are interested in their labours. 3. That no pupil should be admitted into the Government schools of industrial art, or into schools especially devoted to any particular branch of artistic instruction, without being able to show, not only that he has received elementary instruction in art, but also that he has worked practically in an atelier for at least two years.”

This last resolution was vigorously opposed, and only in the end obtained a small majority of votes.

“4. That the Congress is of opinion that schools of industrial art and special schools should not be made preparatory schools to the Fine Art Academies. 5. That the Art and Industrial Exhibition now open in Munich has impressed the Congress with the conviction that Germany will not be worthily represented at the great Paris Exhibition of 1878 unless a definite and artistically considered arrangement be strictly adhered to. That, in order to carry this into effect, it will be necessary to form a committee of competent men who shall have the sole right of rejecting and admitting all works submitted to their judgment; and that for the realisation of this project it will be necessary that a sufficient grant should be voted by the German Reichstag.”

This last resolution was passed unanimously.

THE STAGE.

“BROTHERS” AT THE COURT THEATRE.

PLEASANT acting, brisk writing, poverty of thought and intention—those are about the terms in which one sums up one's impression of Mr. Coghlan's comedy, performed at the Court Theatre on Saturday night. The piece is in three acts, though why it began with the first and why it ended with the third, it would be difficult to say, for the first act does but feebly insinuate that which is to follow in the second, and the third does but drag to a tardier conclusion what the second properly finished. I sat by a person who, when the curtain fell on the second act, asked if the play was not over. There was nothing but the play-bill to inform one that it was not. The play-bill spoke of a third, and so we waited in hope, and an hour afterwards the curtain fell on the third, on what was practically the same conclusion arrived at in the end of the second. A piece less closely-woven, with less of sequence and connexion—with less of substance, in fine—has rarely been performed.

The first act introduces us to the younger of the brothers, and shows us a bit of the particular Bohemia whose centre is Fitzroy Square. But we are not shown anything in this Bohemia that

has not been shown us before by twenty novelists and playwrights; and all that we learn here of the younger brother, the events of the second act—supplemented by three minutes of narration—would have sufficed to tell us. Fred Seymour (*alias* Meredith) is a painter, and Kate Hungerford is an independent young woman who walked into his studio one wet day because she happened to be near his doorstep and he could not lend her an umbrella. The result of this unconventional visit was a flirtation that might almost have been a love affair; the result of the flirtation was its exposure to the painter's brother, a Welsh baronet, to whom the young woman happened to be engaged to be married; and the result of the exposure was that conflict and wavering which are the main theme, such as it is, of Mr. Coghlan's comedy. Which of the two brothers shall Kate Hungerford marry?—the brother who owns Corwen Castle, or the brother who does not own an umbrella?—that is the question Mr. Coghlan and the playgoer ask themselves up to the fall of the curtain.

But Mr. Coghlan is careful that a question so momentous shall not be too speedily answered; and so, as I hinted before, the first act hardly really addresses itself to it. The young woman has come in again, having been persuaded to sit for her portrait; her father has been brought in the disguise of a patron, and has grasped the position of affairs; the young woman has learnt the young man's name, and has left the house because it is imprudent to flirt with the brother of the man to whom you are engaged; and then the author has given us as much of his main theme as he can afford, and must fall back on other resources. So a distant relative of the Bob Sawyer of *Pickwick*—the medical student of a past-away time, or of no time at all but that of a writer's imagination—regales us with his jokes: and the curtain falls, not on any incident or dialogue having the slightest bearing on the course of the story, but on a war of words between a German student who had been valiant, and a French waiter who refused to believe it.

In the second act the main theme is resumed; but not even here at the beginning. Kate and her father are guests at Corwen Castle; Kate is immediately to marry the elder brother, and will meet to her surprise the younger brother, who has arrived in the same house. But all this is not yet. We have first a conversation between Kate Hungerford and a certain Gertrude, who is absolutely without influence on the progress of the piece—who has nothing whatever to do either with action or with development of character, except that she softens the hearts of the important personages by playing the piano very softly at a critical moment—but who is apparently introduced on the broad general ground that two young women are better than one in a comedy. So we get Gertrude and her talk, more amazingly ingenuous than that of the veriest *ingénue* of France. But when this talk is over, there is a return to the serious business of Kate Hungerford's future. Sir Francis, having had his suspicions roused by somebody else, hears at last from Kate Hungerford herself what was the result of the shower that day when Frederick could not lend her the umbrella. It was not terrible after all. She thought she loved him, and found she did not, and so, confirmed in her appreciation of Sir Francis himself, determined to tell him nothing about it, and let the past be past. Now the necessity to tell him had arisen, and she had done her duty. Sir Francis after setting her free to marry Frederick if she likes, renews his offer when he is assured that Frederick was only good for a flirtation. And so the second act closes on what would seem to be a final choice—the choice for Sir Francis and for Corwen Castle.

What does give the third act such claim as it has to be appended to the other two is that a silly mistake that arises in the course of it enables Kate's feeling for Sir Francis to change

and develope. Frederick has done his best to persuade her that his brother only renewed his offer "as a man of honour." "As a man of the world," he adds, "he expected you to refuse it." That subtle thought had never occurred to a young woman by no means without experience of the ways of men; and now it seems for a time that she must needs accept it. But she changes her mind again, and on the old family lawyer's representing that the estates are all mortgaged, Kate is free to feel the excellence of Sir Francis, and to love him for his own sake alone. She has chosen finally the better of the two brothers, and of course no humane playwright would seriously condemn such a woman to estates which were encumbered. That little mistake is easily rectified, and the curtain falls.

One does not know that Mr. Coghlan is to be rightly reproached for having introduced no sympathetic character. Sir Francis, under his chilly exterior, is an honourable person, and Kate herself—though the thing is not sufficiently defined—is by no means an intriguer. The absence of a character entirely congenial to the audience may lessen the favour with which the piece may be listened to, but hardly its real merit; and we should be inclined to reproach Mr. Coghlan not so much for the characters he intended to present as for certain incidental phrases of a very crude and ineffective cynicism, such as the remark about the ingratitude of women and other insignificant attempts at bitterness which we need not particularise. The main defects, however, are those of want of substance and of want of definition in character. In the matter of character, it is not that the author is wholly conventional; he seems to have some glimmering distant outlook upon types which are not the favourite ones with the accepted playwrights, and so far this is good. But he wants definiteness of conception and clearness of execution. A playwright, it will be said, can leave much to his players: he can dispense with that which the novelist has need of in the way of description and characterisation: the novelist being in his own person, as it were, dramatist and player too. But the dramatist has really need of quite as much definiteness; his lines may be fewer, but they must be as decided, as sharp, as unmistakable. Here Mr. Coghlan fails, and judged by this standard contemporary dramatists are indeed very wont to fail; and that their failure passes for the most part unperceived, where in a serious novelist it would be the first thing to be noticed, is only one more proof that the playgoing public is generally too soon satisfied—it will not get better work till it makes, for its own judgment, a higher standard.

The acting at the Court is excellent and life-like, save where the creations of the author are so eccentric as to make naturalness impossible to his interpreters. What are you to do with a father and a friend so fantastic as the two East Indian Company's officers, whom it has not been necessary to speak of here in detail? What are you to do with a girl of eighteen whose simplicity, as the author has shown it, is that of a Miranda vulgarised, or of a heroine of Mr. Gilbert's on the eve of being persuaded to abandon her lover for the sundial and the stream? Miss Hollingshead is pleasant, Mr. Charles Kelly and Mr. Anson full of capital inventions; but what are you to do—what are you to do?

Mr. Hare's Sir Francis Meredith is a very finished little picture. One would imagine it to be a part carefully planned for the actor: it exhibits most of his qualities; none of his defects. He plays it excellently. Miss Ellen Terry, in the character of Kate, the heroine, is entrusted with no strong dramatic scenes. Emotions are called very little into play: the whole thing is within the range of comedy, when it does not fall into the range of farce. A scene in the first act, where the less worthy of Kate's lovers wants to lock her up in his studio, promises at first to be rousing, and one is inclined to find fault

with Miss Terry for not playing it with more of fire, until it is made plain that even in the intention of the author strong feeling had little part in it. There and afterwards Miss Terry abounds in gestures of varied and natural grace, and by her exquisitely pointed and considered delivery she brings into high relief all that is good in the dialogue. And this is fortunate for Mr. Coghlan, who is best in his talk. *Lady Flora* proved to us that he could write dialogue bright and easy. It would have been well had *Brothers* proved to us something more. FREDERICK WEDMORE.

We are apparently to have a season of revivals and adaptations. New plays of importance are not announced, unless indeed it should turn out that the late Lord Lytton kept back from representation during his lifetime a play of serious worth, or that an amateur author, who is known as a painter, is able to give us dramatic literature of value. The next revival is to be that of *No Thoroughfare* at the Olympic Theatre on Monday evening: the last was to be that of *Les Trente Millions de Gladiateur* at the Royalty on Thursday in this week. The Gaiety contents itself for the present with the revival of *Not Such a Fool as He Looks*; the Adelphi with a revival of *Arrah-na-Pogue*; while revivals of an author sometime out of fashion—the author of *Richard III.* and of *Henry V.*—are relied upon at Drury Lane and the Queen's.

The next adaptation from the French will be presented at the Criterion, in due succession to the last; but it will probably be found more difficult to turn the witticisms of *La Boule* into good English than it was to make acceptable the funny situations of *Le Procès Vauradieux*.

MISS JENNIE LEE, the actress of "Jo," has been ill, but is now restored to the theatre.

MR. HENRY IRVING is playing his favourite characters at Glasgow this and next week.

EARLY in December the company now acting at the Gaiety will go to the Opéra Comique.

THE Crystal Palace management announces a second series of representations of the works of Dickens. The first series of representations enjoyed deserved popularity.

MR. ARTHUR WOOD, the comedian, known at the Prince of Wales's and other London theatres, is the author of a new comedy called *Shoddy*, produced this week at the Theatre Royal, Bristol.

WHAT is conventionally called the scenery, but should often more properly be called the stage room-furnishing, has been very happily managed at the Court Theatre, in the new piece. Good taste, almost equal to that which we are accustomed to at the Prince of Wales's, has been displayed in Sloane Square, and the manager of the Court has at the same time steered clear of a mistake towards which the Prince of Wales's sometimes tends—that of so perfectly and elaborately decorating its stage drawing-rooms that attention is seriously diverted from dialogue and acting generally among the best in London. The immense elaboration of stage furnishing—however attractive it may be in itself—must lead either to some "necessary business of the play" being lost to the audience, or, what is quite as bad, to the introduction of mere empty talk to occupy the ten minutes or so during which people's eyes are getting accustomed to the charming rooms in which the actors move often but as secondary figures. Mr. Hare, at the Court, has done wisely, in *Brothers*, in giving us pleasant things to look at, but not too many of them. The pleasant "interior," in the second and third acts, suggests the parlours of a house of taste without absolutely realising them in all their elaboration. There is, as should always be remembered, a happy mean between the spectacle for the eyes alone and that nakedness of the stage which is disclosed at the Français when the three thumps have sounded and the curtain has risen on two chairs, Coquelin and Got, and a comedy by Molière.

MUSIC.

"FIDELIO" AT THE LYCEUM.

IN bringing forward Beethoven's only opera, on Thursday week last, Mr. Rosa undertook by no means a light task. For its adequate presentation, this masterpiece of dramatic music makes no ordinary demands upon all concerned. It is not enough that one or two of the chief parts be well filled; the work peremptorily requires a first-rate *ensemble*; the performance of the orchestra must be above reproach; and the stage arrangements should be of the highest excellence. While it can hardly be honestly said that, as a whole, the rendering of *Fidelio* was as uniformly perfect as some which have been seen under Mr. Rosa, there were yet many most excellent points, and the performance taken altogether was one reflecting the highest credit on the conductor and on his company.

In order to have done with fault-finding as soon as possible, it will be well to begin with the points to which exception must be taken. First and foremost of these is the absurd, at times almost meaningless, version of the English words, from the pen of the late Mr. Thomas Oliphant. In Beethoven's work much, very much, depends on the text, and its illustration by the music. Bearing this in mind it is absolutely inconceivable how a writer, who in general was certainly not a fool, could have written such absolute nonsense as Mr. Oliphant has done in parts of his translation of this opera. This is strong language; but it is perfectly easy to justify it by a few extracts. In Marcellina's beautiful song in the second act she sings—

"Die Hoffnung schon erfüllt die Brust
Mit unaussprechlich süßter Lust;
Wie glücklich will ich werden."

It is almost incredible, but is nevertheless true, that Mr. Oliphant's version of this is—

"Unlike the cold and prudish Miss,
I see no danger in a kiss,
Nor why I should reserve it."

Again, in the well-known quartet in canon, the words begin—

"Mir ist so wunderbar
Es engt das Herz mir ein;"

Mr. Oliphant translates—

"Within this panting breast,
Fond heart, be thou at rest."

In the duet between Pizarro and Rocco, when the former offers the latter a purse of gold, Rocco says—

"So sagt, doch, nur in Eile
Womit ich dienen kann;"

translated—

"I'll take it—no one's near me (!);
Thy purpose, Sir, unfold."

In the same duet Rocco's description of the prisoner—

"Der kaum mehr lebt
Und wie ein Schatten schwebt,"

appears in English as—

"My blood runs cold—
Must I his death behold?"

One more example will suffice to indicate the utter inadequacy of the translation. In the great quartet in the second act Pizarro says to his victim—

"Noch einmal ruf' ich dir
Was du gethan zurück;
Nur noch ein Augenblick
Und dieser Dolch—"

for which we find

"I pant to seize my prey;
Why doth this hand delay
To strike thee dead?"

Such utter rubbish as this cannot be allowed to pass without protest in a great work where so much depends on the expression of the words. If Mr. Oliphant's is the only English version of *Fidelio*, it is high time another one were made which would do more justice to the original poem.

There is a second point on which we most deeply regret to have to find serious fault with Mr. Rosa. We had fondly imagined that we had at last a conductor who thoroughly respected the original scores of the great masters. We heard *Figaro*, *Les Deux Journées*, and *Joconde* exactly as they were written; and if before Thursday week anyone had told us that Mr. Rosa would tamper with Beethoven, we should have indignantly defended him. But alas! our illusion is at an end. It is with real sorrow that we say that in *Fidelio* Mr. Rosa has allowed the addition of trombone parts to Beethoven's score in Pizarro's air in the first act, and in the second finale. Like Mozart in *Don Juan*, Beethoven has in this work reserved the trombones for special dramatic effects, and we say most emphatically that under no circumstances whatever is any conductor justified in adding trombones, or any other parts, to one of Beethoven's scores. Had extra brass parts been added to *Joconde*, the score of which is particularly thin, such a course might have been palliated, if not approved; but with Beethoven! It is perfectly unintelligible how so excellent a musician and so genuine an artist as Mr. Rosa undoubtedly is, could have committed such an error of judgment. We most earnestly hope that when next the opera is performed, the trombone parts will be left exactly as Beethoven wrote them.

And now, having done grumbling, let us turn to the much pleasanter task of commending; and in truth there was much to commend. In the first place we must name the Leonora of Mdlle. Torriani. During the earlier part of the opera the lady was evidently very nervous—by no means a surprising thing when it is remembered that she was essaying for the first time in London one of the most arduous parts in the range of operatic music, one, moreover, which is here especially associated with the magnificent performances of Mdlle. Titiens. As the first act proceeded, Mdlle. Torriani seemed to become more mistress of herself. The celebrated invocation to Hope was extremely well sung, and the applause which deservedly followed appeared to set the vocalist at her ease; in the second act she was excellent throughout, both in respect of singing and acting. Miss Julia Gaylord, as Marcellina, was simply perfect. Those who are acquainted with this very clever young lady's style could have foretold that the part would suit her admirably; but even her warmest admirers would have hardly expected that she would sing Beethoven's music so well. By her impersonation Miss Gaylord has added another wreath to her laurels. It is rather amusing to remember that at the beginning of the present season, when Mr. Rosa's prospectus was issued, some of our musical critics spoke of this young lady in a disparaging, not to say contemptuous, way, as one who was quite useless for any but very secondary parts! It was not merely in ladies, however, that the cast of *Fidelio* was a strong one. Mr. Aynsley Cook was a most capital Rocco. I confess I went into the theatre with some slight apprehension that the *buffo* element in which Mr. Cook so much delights might be too obtrusive. I was very pleasantly disappointed. The character of the honest and kind-hearted old jailer was most admirably presented, and in no one instance over-acted; though Mr. Cook made one slip of the tongue in the second act, in addressing Mdlle. Torriani as "Leonora" instead of "Fidelio." His singing, too, was excellent, both in his one song in praise of gold and in the whole of the concerted music. Mr. Packard's fine voice did full justice to the music of Florestan. Though the part lies very high, it seemed well within the singer's means; he seems also by practice to gain freedom in his acting. Mr. Ludwig sang and acted like the conscientious artist that he is as Pizarro; unfortunately, his voice is not powerful enough for the part, and in his great song in the first act, which Beethoven has scored somewhat heavily, and which was rendered still louder by

the addition of the trombones above referred to, he was at times quite inaudible. The question must be asked, Why was not the part given to Mr. Santley, who used to sing it at Her Majesty's Theatre, and whom it suits to perfection? We hope, and believe, that he is too genuine an artist to have declined it because it was not the most important part in the opera; and certainly the character is more worthy of his abilities than Zampa, Danny Mann, or Joconde! It would, of course, be unreasonable to expect Mr. Santley to sing every night; but surely for such a work as Beethoven's Mr. Rosa ought to give us the full strength of his company. The smaller parts of Jaquino and the Minister, Don Fernando, were excellently given by Mr. Charles Lyall and Mr. A. Stevens. The chorus was, as usual, admirable. The Prisoners' Chorus was extremely well sung; but care ought to have been taken not to make the prisoners look such a set of scarecrows as to excite the laughter of the audience. Two or three of them really appeared as if they had been got up in anticipation of the approaching November 5. With this exception, the stage arrangements were very good.

The opera was preceded by the great overture to *Leonora* (No. 3), which was so finely played by the band as to be redemanded. Mr. Rosa most unwisely repeated it. A protest must again be entered against such a course, which in the present case was more than usually injudicious, as the overture takes nearly a quarter of an hour to play. Of course the effect was less the second time; it could hardly be otherwise. The encore, which is a nuisance in the concert-room, is even more indefensible at the opera, and ought to be once for all stringently put down.

Though in some points open to remark, the production of *Fidelio* is, taken altogether, one of which Mr. Rosa may be proud, and one of the special events of his present season.

EBENEZER PROUT.

THE two novelties at last Saturday's Crystal Palace Concert were the overtures with which the programme began and ended. The first of these was that to Prof. Macfarren's oratorio *The Resurrection*, which had only once before been given in public—on the occasion of the production of the work at the recent Birmingham Festival. For concert purposes the present overture is, perhaps, even better fitted than the overture to *St. John the Baptist*. It is constructed on interesting subjects, and treated with the well-known mastery of its composer. Its reception was deservedly warm. The second novelty was Tchaikowsky's overture to *Romeo and Juliet*, which had not been previously heard in England. The Russian musician is undoubtedly one of the most original living composers. His overture, which is of symphonic proportions, taking nearly twenty minutes in performance, is avowedly an illustration of Shakspeare's tragedy. It is full of most charming and poetical ideas; but it is so absolutely novel both in thought and treatment that, except by a small minority of the audience, it altogether failed to be appreciated, and was received coldly, and even with signs of disapproval. Special praise ought to be given to Mr. Manns, for securing a really magnificent rendering of a most difficult work. No such performance could have been heard elsewhere than at the Crystal Palace. The symphony of the afternoon was Mozart's "Jupiter" which was very finely played by the band. In Mendelssohn's concerto in G minor Mdlle. Arabella Goddard reappeared at Sydenham for the first time since her return to England, and received a most cordial welcome from the audience. Her playing was in many parts very fine; but its effect would have been much improved by a more judicious use of the pedal. We have every reason to presume that she played the octave passages in the finale correctly; but, as she put down the pedal almost incessantly throughout, the effect was so wanting in clearness that she might

have played twenty false notes without their being detected. The vocalists were Miss Anna Williams, who sang with great taste, and Signor Bettini, who gave Rossini's tarantella, "La Danza," in a buffo style quite out of keeping with the character of the concert. This afternoon Handel's *Acis and Galatea*, with Mozart's additional accompaniments, is to be given.

THE Monday Popular Concerts commenced for the winter last Monday at St. James's Hall, when an excellent, though not very novel, programme was given, including Schubert's ever-welcome octett for strings and wind, a quartett by Haydn, Mendelssohn's prelude and fugue in E minor, well played by Miss Agnes Zimmermann, and Beethoven's sonata in G minor for piano and violoncello, in which the lady was joined by Signor Piatti. The performers in Schubert's octett were Messrs. Straus, Louis Ries, Zerbini, Piatti, Reynolds, Lazarus, Wendland, and Winterbottom. The work was given in the abridged form in which it is usually heard at these concerts, with the omission of the variations and minuet. Why does not Mr. Chappell let us hear it entire, as is almost invariably done with Beethoven's septett, a work very similar in form to this? If necessary, some of the repeats could be left out, which would be far better than omitting entire movements. Mdlle. Redeker, whose fine contralto voice and excellent use of it we have before commended, was the vocalist of the evening. This afternoon the first of the Saturday Popular Concerts is to be given; and next Monday Schubert's beautiful though seldom heard trio in E flat will be included in the programme. Mdlle. Norman-Néruda is to be the violinist, and Mr. Charles Hallé the pianist.

THE first of Mr. Dannreuther's musical evenings took place on the 2nd inst. at 12 Orme Square, when Mr. Dannreuther was assisted by Herr Kummer (violin) and M. Lasserre (violinello). The programme included Raff's trio in C minor, Op. 102, Beethoven's trio in B flat, Op. 97, Berlioz's "Rêverie et Caprice" for violin, two violinello solos by Popper and Davidoff, and a selection of Chopin's mazurkas for the piano.

THE second of Herr Hermann Franke's Chamber Concerts was given at the Langham Hall on Tuesday, when Beethoven's great "Rasumoufisky" quartett in F, Brahms's sextett for strings in B flat, and a sonata for piano and violin by Rheinberger, formed the principal items of the programme.

THE *Revue et Gazette Musicale* states that it is at length definitely decided to build an international theatre in connexion with the Exhibition of 1878, at which performances in different languages are to be given twice daily during the whole period of the exhibition.

JOSEPH GRÉGOIR, a well-known pianist and composer in the modern fashionable style, died at Brussels on the 29th ult. He was born at Antwerp in 1817, and was a pupil of Henri Herz.

JOHANNES BRAHMS has written a symphony in C minor, which was announced to be performed for the first time at Mannheim on Tuesday last.

It is only three weeks since we noticed the completion of the sixth volume of Hermann Mendel's *Musical Lexicon*. We little imagined that when that notice appeared the editor was lying upon his death-bed. It is with sincere regret that we announce that he died at Berlin on the 26th ult., at the comparatively early age of forty-two. We trust that the noble work so well begun under his direction will not be allowed to remain unfinished.

In the *Deutsche Rundschau* of October there is an interesting and valuable article on the Bayreuth Festival by Louis Ehlert. The writer thinks Wagner is unhappy in the selection of his subject; his essentially modern music, with its "restless chromatic and freedom of modulation," being

singularly unfitted for "events and conditions to which there always clings something martial and gigantic." Moreover, the Nibelungen legend is in its nature epic, not dramatic. The writer criticises freely Wagner's dramatic treatment of the subject, which he considers to be very inferior to the musical treatment. At the same time he admits that certain moments in the action are full of the highest dramatic effect. Herr Ehlert deems it unreasonable to suppose that poetic and musical genius can unite themselves in the same head. "The human mind in its highest development is eternally specialist." Hence Wagnerism, "this Protean pantechnic thing" (*Allkunstwesen*), will only last till some new spontaneous operatic composer makes his appearance. The writer appeals to Wagner to break up his wearisome long work into parts, and to send it to "those boards which signify the world at large, and not simply the region of patronage."

LITERATURE.

Historical and Architectural Sketches, chiefly Italian. By Edward A. Freeman. (London: Macmillan & Co., 1876.)

THE annual crop of green volumes of travel offers an excellent modern illustration of the old quotation "Coelum, non animus, mutant qui trans mare currunt." Those who can tell us little at home are seldom worth listening to from abroad. Minds which are accustomed to store up trivialities, to observe and read loosely, and to write inaccurately, cannot be made to bring forth good fruit by the simple process of crossing the narrow seas. There are some names—each reader will supply his own example—which act like danger-signals, and stop us short at the title-page. There are others—like Mr. Freeman's—which serve as a guarantee for the quality of what follows. In literature as in art even the rough sketches of a master are worth more than the most laboriously worked-up drawings of an inferior hand.

If we call Mr. Freeman's "Sketches" rough, it is rather because they give little detail than on account of any carelessness in execution. A touch here and there might, we may fancy, have been added or removed. Owing doubtless to the separate shape in which the chapters were originally published we find some repetitions; for example the peculiar character of Ravenna is insisted on several times in almost the same words. Considering the amount of attention bestowed by the general reader, this may not be without its advantage. There are, however, minor repetitions less defensible. Thus in the opening sentences of the chapter on Ravenna, the same words are used over and over again with tiresome and useless iteration.

But it would be waste of time to hunt out small flaws in an excellent book. Others, more competent, may indicate in what points Mr. Freeman's conclusions are open to technical criticism. We are content briefly to indicate the scope of a volume full of valuable teachings and suggestions to all who are ready to profit by them. Those, however, who, like a recent writer in the *Spectator* (Sept. 30), object to be "worried with history," and are not above confessing "what a bore it is to have had ancestors who have left behind them so many tiresome signs of themselves," will naturally turn from these sketches to some more congenial gossip. Mr. Freeman's business is not with their friends, the inn-keepers and *ciceroni* of modern travel; but with the mighty

shades of past ages, with Hadrian and Theodoric. For them his pages will be dry reading; and they will feel only bewildered and annoyed at the illustrations and allusions which his large local and historical knowledge enables him to scatter with a free and certain hand.

Mr. Freeman opens several of his chapters with wise counsel, which travellers will do well to lay to heart. As he says, "thoroughly to get up any city or district in its historical relations is rather a long business." Moreover, even when the time can be given, it is not every traveller who knows enough of general history to be able to study with much advantage local annals. But we may most of us profit by such hints as: "Every place should be visited twice. . . . Even if a man has only an hour to give to an object, he will learn more by giving it in the form of two distinct half-hours;" or, "The only way truly to master any of the great Italian cities is to visit them again and again, looking at them each time with a special view to one class of subjects."

On the last of these precepts Mr. Freeman himself acts. He is impressed with the belief that "to the student of universal history Rome is everywhere," and he holds, not the orthodox view that Romanesque is debased Roman, but that Roman architecture was only a stage in the development of Greek architecture into the more advanced form, known in its varieties as Anglo-Saxon, Norman, Byzantine, Armenian, or Romanesque, which had mastered the true combination of the arch and column. He sets himself accordingly to observe and compare some of the great Romanesque buildings of Italy.

Mr. Freeman does not strictly confine his attention to the study of the architecture of one period. His grasp of universal history is too strong and vivid to allow him in a land of so many memories wholly to pass over the earlier ones. He must sometimes throw a glance backward to the early ages of the Roman Commonwealth, and to the still more remote age when the first Greek colony planted its citadel on the brow of Misenum. He is ingenious in establishing parallels between places and their histories, remote in space or time, which, until united under the keen and far-reaching eye of a scientific historian, seemed to the unlearned reader without connexion. Mr. Freeman is, first of all, an historian, secondly, an architectural student, and this is what gives his book its strength and fascination. We are not puzzled by descriptions of particular buildings, too minute and technical to be followed except on the spot or by a trained student of architecture. His sketches, whether of pen or pencil (the illustrations agree admirably in character with the text), place before us in firm outline the leading features of a series of buildings interesting in their historical connexion, and impress the lesson how in this way, as in so many others, Pagan Rome survived throughout Christian Europe. Mr. Freeman, as all readers know, has a rare power of restoring the dead to life; he has brought before us as real and distinct personages the shadowy figures of our early kings. By the same power he makes the

dry bones of the ancient walls and basilicas of Italy living witnesses to a neglected period in the world's history.

Into digressions other than historical Mr. Freeman will not be tempted to wander. He does not lack enthusiasm in thought or expression. But it is an enthusiasm for political progress, as shown in the records of our race, rather than the personal and sensuous emotion, drawn from art or nature, with which the Mediterranean lands have inspired so many. His "Sketches," therefore, are as unlike as possible those we have lately had from Mr. Symonds or Mr. Pater. No picture is mentioned in his pages. To scenery for its own sake there is scarcely a reference. Twice, indeed, he asserts an opinion that the small Italian towns do not add to the effect of the landscape, and might profitably—at least from a picturesque point of view—be exchanged for Franconian towers and spires. To this suggestion we must entirely demur. Italy, with its glorious expanses of land, sky, and sea, its glowing colours and noble outlines, has no need of the quaintnesses of northern architecture. We cannot wish to turn Siena into Nuremberg, to supplant the stately villa by a dusky Rhine castle, to put a background of Albert Dürer to a *Madonna* of Raphael.

The arrangement of the book is in the main geographical. We enter Italy by Trent and Venetia. Then for a time the chapters fall into some sort of historical order. Ravenna, illustrated by comparison with other seats of imperial power north of the Alps—Trier, Aachen, Gelnhausen—is appropriately followed by Lucca, where the architect, no longer content to construct a casket glowing in all the colours of gold and jewels within, but externally rude and unsightly, raised as at San Michele a front adorned with a forest of columns. To Lucca succeeds Pisa, where the external front and interior of the building, at first ill-fitted, became parts of an harmonious whole, where the style attained its greatest splendour at the same time that in striving to combine other and incongruous elements it showed the first signs of decay.

At this point, however, historical sequence breaks down, and we are carried inland again to hear the early legends and history of Faesulæ, and to glance at the basilicas of Fiesole and San Miniato. Then we cross to the eastern coast at Rimini, where, leaving to Mr. Symonds "the Temple of the Malatesti," Mr. Freeman calls our attention to the arch of Augustus and the magnificent Roman bridge which still links, not only the town to its suburb, but modern Italy to the age of her early Emperors. Ancona next attracts Mr. Freeman to its Duomo, standing beacon-like on a promontory above the waves, and interesting to the architect as "a pure but not very rich specimen of the Italian Romanesque at its best point, when it had shaken itself quite free from classical trammels, and was not corrupted by hopeless imitation of Northern forms."

From Ancona we leap across the peninsula to Rome. Mr. Freeman shows us both the Servian and Aurelian walls, explaining the various kinds of work found in each by pointing out that in both cases the object of the builder was, not to create a rampart com-

plete in itself, but to work into a continuous line all available fragments of earlier buildings. After a visit to the Arx of Tusculum we get back to Basilicas. A most interesting sketch of the process by which the Roman Justice Hall was adapted to the Christian Church is illustrated by two chapters on the great and lesser churches of Rome. Mr. Freeman in his remarks on St. Peter's puts very tersely what seems to us the first and unanswerable criticism on its interior. "Proportions which take off from the apparent size, and therefore from the dignity, of a building are in their own nature disproportions." But we think he is scarcely more justified in his declaration that "among tourists it is received as a kind of moral duty to look on the Vatican Basilica as the noblest church in the world" than Mr. Hare in his monstrous statement that "most people, though they may not dare to confess it, will find it difficult to understand the praises which succeeding generations have heaped upon" Michelangelo's statues at San Lorenzo. The tourist, if one of the class may say a word in self-defence, is superficial and ignorant enough; but he is still a human being with more or less of the tastes of his century. Imitation, after all, is the surest sign of respect. When he goes home and has to build a church, he does not build in the style of St. Peter's. If Evelyn accepted St. Peter's as his ideal, he was the friend of Sir Christopher Wren.

"Greece in Italy" describes the bay of Baia, with its long line of associations from Tarquin to Paul of Tarsus, and Paestum—Poseidonia—where we stand alone and face to face with the early Hellenes, as we have lately at Ravenna with Ostrogothic kings and Byzantine Exarchs.

Turning abruptly homewards we find ourselves again north of the Apennines, and in Milan, Monza, Como, resume the study of Romanesque. We are sorry to pass by Bergamo, the old hill-town which has stepped down on to the plain, and not to get Mr. Freeman's opinion on the churches—one, we believe, locally attributed to Theodolinda—in its neighbourhood. At Vercelli we are introduced to a building which for Englishmen has a special interest—the great church of St. Andrew. The reason for its peculiar features, the square east-end, the westward towers, much of the internal proportion and detail, is explained when we are told that its builder was the papal legate who played, in the days of John and Henry, so important a part in our own history. "It was," says Mr. Freeman, "out of the spoils of England Walo reared the half-English-looking, hardly at all Italian-looking minster of St. Andrew."

Aosta is perhaps the only city of modern Italy where Italian is not the native tongue. The outlying fragment of Italy to which it belongs was for long drawn by circumstances rather to the Burgundian than to the Italian connexion. Lately, when the princes of Savoy transferred their old Transalpine dominions there was fear lest the fate of Savoy should also be Val d'Aosta's. Whether it was saved, as Mr. Freeman suggests, by French ignorance of history, or for the more simple reason that Napoleon III. knew Victor Emmanuel well enough

not to ask him for his favourite hunting-ground, cannot yet be decided.

As we have already said, Mr. Freeman steadily resists the temptation to turn his sketches into pictures. He seizes the outlines he wants, and leaves out much detail which at another time might have interest. His sketches, therefore, will often be filled in by reference to other volumes by those who like to follow up a subject, or to linger over their travels. To his "Aosta," owing to a very recent visit with the Abbé Gorret's useful local guide in our hands, we feel tempted to add a few words. The mosaics, whether of the thirteenth or fourteenth century, which adorn the cathedral floor are of the highest interest, and, showing as they do the survival of Roman thought and work in a Christian church, might well have received more notice. Turning to St. Ours we get from the local writer a curious story as to its foundation. Ursus, a Scotchman by birth, was in the sixth century archdeacon of the cathedral. Finding that his bishop leaned to Arianism, he, in the year 525, in company with six canons separated himself from him, and founded on the site of the church which now bears his name a chapel dedicated to St. Peter. Ursus was buried in his own chapel, and through the miracles wrought by his relics the local saint in time supplanted the Chief of the Apostles, and St. Peter's became St. Ours.

The adjoining priory is reported to occupy the place of an ancient baptistery. It was built in the fifteenth century by Georges de Challant—whose castle of Issogne still stands near Verres—a great local benefactor belonging to a noble family which for long, we are told, did homage directly to the Emperor. Its picturesque octagonal tower, its windows and walls interlaced and surrounded by elaborate bands of terra-cotta ornament, form a curious and most picturesque contrast to the simplicity of the opposite campanile.

To the record of the great names connected with Aosta, Calvin might have been added. The cross which records with pride his expulsion from the town should not be passed by. It stands in a street to which, perhaps as a rough set-off to the inscription, the name of Calvin has been attached.

The date of the cathedral cloister appears from an inscription to be 1460, not 1636. The campanile of St. Ours is of the middle of the twelfth century.

In his preface, Mr. Freeman, we are glad to see, promises us other collections of similar sketches from France, Germany, and Dalmatia. On the southern shores of Italy he may also find fresh material for study. But we should be glad if we could persuade him to extend his wanderings to a further Mediterranean coast. The marvellous ruins of northern Syria have received little attention from English architectural students, and we know them at present chiefly through the beautiful drawings of Count de Vogüé. For one who is specially interested in tracing out the developments of Roman architecture and its adaptation to Christian uses, it would be difficult to find a more inviting field.

DOUGLAS W. FRESHFIELD.

The Offices of the Old Catholic Prayer-Book, Done into English, and Compared with the Offices of the Roman and Old German Rituals. (Oxford and London: James Parker & Co., 1876.)

THE Old Catholic movement in Germany and Switzerland, quite apart from any influence it may be exerting upon surrounding communions, has a special literary interest for English scholars, as helping to illustrate and explain the course pursued in this country three centuries ago by that complex series of ecclesiastical and political events which we group together, as though a single entity, under the name of the Reformation. Unlike in one very material particular, that of the direct interference of the State, there are, nevertheless, several points of contact between the two, chief among which stands the conflicting action of two competing schools—those of the Old and the New Learning respectively. There were no names in either England or Scotland under Henry VIII. and his children, or under James V. and his unhappy daughter, which, on the side of the Old Learning, can claim to be ranked with Döllinger and Friedrich, Von Schulte and Lassen, in mental power or in theological erudition, except Wolsey and Gardiner in the one kingdom, and Quintin Kennedy of Crossraguel in the other. But the New Learning can more readily find names to match with Anton, Kaminski, Junqua, Moulis, and others of the Left among the Old Catholics, while Switzerland and Germany reproduce, with sufficient nearness to be very instructive, the dissimilar temper displayed in North and South Britain in the sixteenth century. The initial divergence between the earlier and later revolt is that the former began as a protest against unredressed practical abuses and unnamed moral scandals, passing thence by a sudden bound to the conviction that the root of these abuses and scandals was to be found in the theological system of the offenders, which therefore must be repudiated and assailed at all hazards. The latter, conversely, began with the rejection of certain modern formulations of dogma, and endeavoured for a time to poise itself on the *status quo ante* the Vatican decrees of 1870, but found itself obliged by necessary process and the progress of events to undertake various reforms, as well practical as doctrinal, reaching a great deal further back into the past of ecclesiastical history. Broadly speaking, and without searching into facts which do not lie on the very surface of the Church, the moral and disciplinary force of the great reforming Council of Trent is by no means exhausted in Latin Christendom, and no such notorious scandals now discredit the clerical body as made the fiery denunciations of the Hot Gospellers possible, and capable of finding a ready echo in the breasts of the people, three centuries ago; so that no wind of popular impetuosity has swept on the Old Catholic movement such as then precipitated the severance of Teutonic from Roman Christendom. The practical issue of this fact has been that it is easier for the leaders of the Old Catholics to maintain a comparatively conservative attitude, even in Switzerland, especially as they

enjoy two very important advantages which were lacking to the men of the New Learning in the days of Luther. In the first place they are not hampered, and at the same time urged further than they meant to go, as the earlier Reformers were, to a degree even still unsuspected by most students of Church history, by the alliance of members of secret Gnostic sects, transmitted lineally from the second century downwards through such channels as the Paulicians, Bogomili, Albigenses, Patarenes, and Fraticelli, and glad to shelter under the aegis of the Reformation tenets compared with which Calvin would have thought those of Servetus orthodox, sure as they were that if they were only loud enough in denunciation of Rome, against which they had stored up long arrears of vengeance, dating from the campaigns of Simon de Montfort, no very searching enquiry would be made into the positive elements of their creed. Although a digression, it is perhaps worth mention in this place that the pedigree of some of the least respectable of the communist sects in the United States can be clearly traced back through the French prophets of Soho (a part of the exiles from the dragonnades of the Cevennes, nominally Huguenot, but secretly Albigensian) up to the Paulicians in the seventh century, and their precursors, the Marcionites and Carpocratians of the second, who cannot be said to have ever accepted Christianity at all, though they have all through their history of sixteen hundred years blended a certain element of its words and ideas—not appreciably larger than that found in Islam—with their own distinctive but less openly avowed tenets. The other advantage which the Old Catholics possess is simply that of experience. They have seen the great experiment of Luther and Calvin fairly worked out in the course of three hundred years, and its failure to achieve any appreciable part of the results which were most confidently anticipated by its sanguine champions and adherents. Whatever respect and admiration they may feel and express—as they have freely done—for much to be found in modern Continental Protestantism, it is plain enough that the sentiment of *hope* from this quarter is absent. Much as Protestantism may yet have to teach the world as a philosophy and as a social influence, it has spoken its last word as a theology and a religion; and, rightly or wrongly, that word does not so approve itself to the Old Catholic leaders as to induce them to abandon that conservative attitude which has drawn much unfavourable criticism upon them from outsiders who hold that logical consistency ought to have led them very much further in the path of change. The *Ritual* which they have issued, and whose translation into English by the Rev. F. E. Warren, Fellow of St. John's College, Oxford, lies before us, illustrates very clearly the reluctance of the leaders to abandon hastily the ecclesiastical traditions in which they were reared, though marks of reform are present in abundance. The Bishop of Winchester was not far astray when he remarked at the Plymouth Church Congress recently that the standpoint of the Old Catholics now is nearly that of the Church of England

when the First Book of Edward VI. was issued in 1549. He would have been more exact had he said that it is what the Church of England would probably have been, had the liturgical reforms on which the Convocation of Canterbury had been engaged from the year 1535 been completed and published before the death of Henry VIII., and ere the supremacy of the Zwinglo-Calvinist party in the State, owing to the favour of the Protector Somerset, had enabled Cranmer and Ridley to begin that disintegration of the Anglican formularies which issued in the Book of 1552, and was meant to have gone the very next year to the full extent of the Congregationalism of Frankfort, had not their schemes—unjustly ascribed to Bucer, Peter Martyr, and Alasco—been defeated by the accession of Mary I.

The liturgical meaning of the word *Ritual* is not that with which modern ceremonial disputes have made the English public familiar; for a *Ritual* is simply the book containing those occasional and *quasi*-private offices for most of which what we call in this country "surplice-fees" may be or have been levied. Thus the *Rituale Romanum* contains the forms of Baptism, Confession, Private Communion, Matrimony, Visitation of the Sick, Unction, Churching of Women, Burial, Processions, and a great variety of Benedictions, nearly all of which latter are retrenched in the English Prayer Book, not merely by reason of theological objections raised by the men of the New Learning, but because of the popular odium under which many of them had passed by being made grounds of heavy exactions on the part of the clergy, great numbers of whom, being unbeneficed, derived their whole income from the accruing fees, which it was therefore their interest to fix at a high tariff. That a similar feeling has not been absent from the German Catholic laity may be gathered from the extreme brevity of this new *Ritual* as compared with the older one which it aims at supplanting. There are twelve items in the Old Catholic formulary, inclusive of one, Confirmation, which has been transferred from the Pontifical; while in the Roman *Ritual*, omitting sub-headings, dissertations, and rubrical directions, there are no fewer than sixty, of which by far the greater number are those special Benedictions already referred to. This great abridgement is the most noteworthy feature of the revised manual, and the next one is the use of the vernacular throughout instead of Latin, thereby extending a provision which has existed all along in Germany in such parts of liturgical offices as need intelligent expression of assent on the part of the laity for whose benefit they are performed; and a defence of this reform constitutes the staple of the preface with which the compilers introduce their book. There has been, further, a great alteration and simplification of rubrics, and occasionally a change of a doctrinal colour and intent, such as the excision of the exorcisms which form an important portion of the Roman offices of baptism and of hallowing of water. Mr. Warren has made his translation a much more useful book than the original to liturgical students, by giving in footnotes the text of the Roman *Ritual*, and of certain select

German ones—namely, those of Freiburg, Strassburg, Mainz, Salzburg, and Cologne, where they throw light on the new forms. There are two others which he seems not to have employed, which might have been consulted with advantage—namely, those of Augsburg and of the Austrian Franciscans. Mr. Warren has also been at the pains to draw up a comparative table to mark the variations of ceremonial in the rubrics of the seven formularies which he reviews, which enables the reader to see at a glance how far the process of retrenchment and simplification has been carried, and to note, moreover, that very much change which looks somewhat thoroughpaced, if only the Roman *Ritual* and the new one be compared, is shown to be the maintenance of a national use, found in one or more local manuals. This is as useful a piece of work as it is unpretending, but it is matter of regret that Mr. Warren did not, on behalf of English students, carry it a little further by tabulating the points of resemblance and divergence which the *Old Catholic Ritual* exhibits in comparison with the English Books of 1549 and 1662; particularly as some words in his preface, referring to the Order of Communion of 1548, show that he is fully alive to the relations existing between them. If this were done, and notably in a rite like Confirmation, where the existing Anglican formulary is considerably altered from that of 1549, it would appear that even this earlier reform was much more sweeping in its character than the Old Catholic one, and thus justify the statement made above, that this latter represents a more conservative temper than even the First Book of Edward VI. How far it will be retained is as yet uncertain, for it was put out avowedly as a merely tentative formulary, liable to future revision on the basis of any suggestions sent in by clergy and congregations to the Synod up to the end of January, 1876. And as many such, not yet acted on, may be under consideration, it is not possible to assume the finality of this volume. Something, however, will soon be gathered from the impending issue of companion works in the series of which it is destined to form a part, especially the vernacular Missal which is promised, and in all probability a Pontifical to follow it. The curious fact that two simultaneous processes in the matter of liturgical revision are actually going on in the Church of England at this moment—partly authoritative, in the shape of change in the order of the existing Prayer Book, as by the New Lectionary and the Shortened Services Act; and partly informal and irregular, but not the less actual, in the growth of a supplementary and unauthorised office-book to meet new wants, and chiefly used by the Episcopate in the performance of acts not provided for in any now legal formulary—makes every recension of ancient Christian ceremonies by learned and competent hands a valuable contribution to the solution of some pressing difficulties; and in this way the interest of the *Old Catholic Ritual* is even more practical than literary, so far as the ecclesiastical body in England is concerned.

RICHARD F. LITTLEDALE.

La Révolution de Thermidor, Robespierre et le Comité de Salut Public en l'an II. Par Ch. d'Héricault. (Paris: Didier, 1876.)

THE time to write the history of the Revolution is hardly yet come. The passions which agitated the actors in that great drama outlived it, and to judge events which were still being felt in their consequences, and out of which all the parties on the political stage had grown, with the impartiality of history was for a long while impossible. Even now there are two classes in France who cease to be just as soon as they begin to speak of the Revolution—those whose reactionary opinions prevent them from forgiving the revolutionists the overthrow of the *Ancien Régime*, and those whose violent and intolerant Radicalism leads them to look on the Republic of '93 and its leaders as their ideal. Between these two classes are those who understand the causes of the Revolution without being its enthusiastic admirers, who are able to recognise the good as well as the harm it has done, and regard it neither as a revelation from heaven nor as a manifestation from hell, but as a phase of historical development to be studied and judged by the same processes as any other. The establishment of a Republic in France which bears happily no sort of resemblance to the Republic of '93, and which was founded by these same moderate spirits of whom I was speaking, free from prejudices and Utopian ideas, is greatly in favour of this historical impartiality. No one can be suspected now of speaking good or evil of the Revolution in order to stand well with the authorities or the people.

To judge the Revolution aright it is unfortunately not enough to approach the subject with a mind free from political prejudice; very deep research and singularly firm and wise critical penetration are necessary for the student to find his way amid the mass of information and valuable documents which have come down to us. Nor does any writer in these days venture to undertake one of the great general works historians were given to writing thirty years ago—works very useful, no doubt, as temporary edifices and for preparing the ground, but which cannot, any one of them, not even Thiers', Michelet's, or Louis Blanc's, claim to be a true, full, and conclusive picture of the Revolution. The need of elucidating each point separately, of establishing the truth of every detail in order to be able afterwards to reconstruct the whole with some degree of certainty, is now understood.

Mortimer Ternaux' *Histoire de la Terreur*, an important work, full of new facts, is something between a general history and a monograph, strictly so-called; but under the latter head we have had *L'Histoire du Tribunal Révolutionnaire*, by M. Campardon; *Charlotte Corday*, by M. Vatel; *Les Derniers Montagnards* and *Camille Desmoulins*, by M. Claretie; the studies of M. du Chatellier on the Generals of the Republic; *Les Volontaires de '92*, by M. C. Rousset, &c., &c.; not to mention M. Hamel's apologies for St. Just and Robespierre, and M. Bougeard's for Danton, and a number of useful monographs on the Revolution in the provinces. M. Avenel, also, in his *Lundis Révolution-*

naires, has brought some interesting facts to light about the secondary personages of the Revolution, and M. Sorel is engaged on some studies of the very highest importance on the diplomacy of the Revolution.

M. Charles d'Héricault's book treats of the causes of Robespierre's fall and of the fall itself. It opens with the trial of the Hébertists and the Dantonists (Germinal, *an II.* = March–April, 1794), and closes with the fall of Robespierre's head beneath the axe of the guillotine (10 Thermidor, *an II.* = July 28, 1794).

M. d'Héricault possesses, in some measure, that impartiality which is in our eyes the first quality of the historian of the Revolution. He does not include all the revolutionists under one uniform condemnation, he takes the circumstances into account, and often recognises, in the worst of them, good qualities co-existent with the most atrocious leanings. Robespierre himself is not painted too black; justice is done to the probity which earned him the surname of *incorruptible*, and to his sense of the necessity of re-establishing order and authority in the Republic if it was to live. No doubt M. d'Héricault is rather hostile to the Revolution than otherwise, but there is nothing violent in his hostility, neither does it seem to obscure his judgment.

He is, moreover, thoroughly well versed in his subject, having gone through a course of sound preparatory study. He is acquainted with the numberless works, newspapers, lampoons, memoirs, reports, to which the events of the Revolution gave birth, and has had recourse, besides, to unpublished documents in the National Archives.

In spite of this excellent preparation, M. d'Héricault must be said to have collected the materials for a good book rather than to have written one. He wants the sound training of a historian, the critical faculty and method. Nothing could be more confused than his work, more unintelligible to those not acquainted with the events, or more unlike the serious tone of history. In point of fact, it is a newspaper article of 500 pages, written in a style so inflated, pretentious and feverish as very soon to weary the reader. He loses himself continually in endless dissertations on the secret motives of his personages, and repeats himself at every turn; we lose sight of the facts, and are presented with his own impressions and hypotheses instead. Moreover, he shows no kind of critical discernment in the choice or the use he makes of his sources. He attaches equal weight to all the pamphlets called forth by the Revolution, all those, at least, written against the members of the Mountain and the Jacobins of '94; he even goes so far as to cite Pagès' novel, *Histoire secrète de la Révolution*, as an authority. He forgets that all the writings of witnesses or actors of the Revolution need to be subjected to severe critical tests, that they are full of partiality and inaccuracy; that there is not one single personage of this drama about whom all the good and all the ill that can possibly be said about a man has not been said and written, and that, consequently, no testimony is to be accepted literally or without careful investigation.

Nevertheless there are excellent things in M. d'Héricault's book. I think that his portrait of Robespierre is just in the main, and that he does not wrong him in considering vanity and cowardice to have been the two most prominent features of his character. Perhaps, however, he has not laid sufficient stress on the sincerity of Robespierre's contradictions at the time when he was now urging the Terror on, now seemingly wishing to hold it back. There was, may be, no duplicity in that, but a terrible necessity. He was like a man harnessed to a waggon upon a steep incline: not strong enough to hold it back, he runs quicker and quicker to prevent being crushed, but at last the speed becomes so great as to overpower him, and he falls and perishes. Robespierre felt that the Terror must be put an end to, but he felt also that it was the source of all his greatness and power; to stop or hesitate was to be lost; he dared not stop, and hurled himself into the abyss.

M. d'Héricault shows, better than anyone else has ever done before, the secret play of the passions which raged round Robespierre, and conspired to his fall. The rivalry of the Committee of Defence, or General Surety, and the Committee of Public Safety, the hatreds, the jealousies, the repulsions that inflamed some of the members of the Committee of Public Safety, the open hostility of the Mountain and the Convention, are analysed with great subtlety and an abundance of proofs. He shows extremely well what were the first seeds of the division between Robespierre and Barère and Billaud Varennes, as also the manner in which an alliance sprang up between the rest of the Dantonists and Hébertists and the Right Side of the Convention. In reality those who overthrew Robespierre were worse than he was; they had been as cruel, and perhaps more so; but he had become the incarnation of the Terror, and it ended with his death.

Again, M. d'Héricault, thanks to documents contained in the archives, throws full light on Robespierre's action from the 23rd Prairial up to the 5th Thermidor. He completely refutes the apologists who pretend that, having been absent from the committee during that period, Robespierre is not answerable for the frightful increase of terror which signalised it. First, he shows that the "Law of Prairial," which was the instrument of that terror, was his own work; that he never ceased personally to direct the police, the arrests, the executions; that he continued the whole time to sign documents, and act in a direct manner, and only withdrew himself from the administrative sittings and from general politics.

Through the medium of the Jacobin Club, moreover, and of the revolutionary tribunal and the commune he continued to be the soul of the Terror.

For this portion of his work, therefore, M. d'Héricault deserves sincere praise, but errs in over-estimating its originality. The strife of the Committees and of the Convention, the origin of the conspiracy against Robespierre, the injury his worship of the *Supreme Being* did him, and, finally, his share in the revolutionary Government even while absent from

the Committee of Public Safety, had all been brought prominently forward by Michelet in the sixth volume of his *Histoire de la Révolution*. M. d'Héricault has defined and proved what Michelet had only indicated and conjectured. But he ought to have mentioned the name of his guide.

His account of the 9th Thermidor is inextricably confused. Without knowing the facts beforehand it is impossible to make anything of it, or appreciate the new and interesting things it contains. M. d'Héricault believes that Robespierre shot himself with a pistol, and that the gendarme Merda did not play the important part which he claimed to have done. We are of the same opinion.

In conclusion, M. d'Héricault, as I said before, has produced the materials for a good book, not a good book. His work is like those nebulae which have in them all the elements of a solar system, but so blended and intermingled as to be in a state bordering on chaos. G. MONOD.

The District of Bākarganj, its History and Statistics. By H. Beveridge, B.C.S., Magistrate and Collector of Bākarganj. (London: Trübner & Co., 1876.)

ALTHOUGH issued in the orthodox form approved by the London publishers, and accepted by the London public, for books of a more solid and instructive character than the ordinary novel, this volume is unmistakably to be numbered among exotics. In point of classification it belongs to the Indian Government Selections—that is to say, to works the publication of which in India, at the public expense, authoritatively recognises the industry, usefulness, and ability of certain officials who submit to State disposal the literary outcome of their experience and researches. It is one of many valuable fractional contributions to Indian history which, however minute in proportion to the whole record, are indispensable to completeness, and of which Mr. Grouse's *Muthura* (noticed in the ACADEMY of October 17, 1874) was so worthy a specimen. The present work, we are informed at the outset, "is the result of nearly five years' experience in Bākarganj, and of subsequent researches in the India Office and Library of the British Museum." The author's primary object has been "to write a book which would be useful and interesting to the officers of Government and the inhabitants of the district, and therefore," he explains, "there is much in it which can have no attraction for the general reader." The History is divided into three parts. The first is chiefly taken up with physical features; antiquities; a financial review of the *parganas* or subdivisions of the larger district described; the "Sundarbunds" (*sic*), or maritime tracts covered with wood, and watered by river mouths or branches; Government Estates, and Land Tenures: the second speaks of the people, the products and the manufactures: and the third contains an analysis of the various heads and departments of internal administration under British rule.

Bākarganj is a flat alluvial district at the northern extremity of the Bay of Bengal

comprising part of the Sundarbans (or Sundarbans); and its capital, Barisal, is about 180 miles east of Calcutta. The climate is damp and enervating, but has its advantages at certain seasons—for March, April, and May, so hot in the City of Palaces and Eastern Bengal, are here comparatively cool. Formed of islands as well as a mainland, "it may be looked upon as a conquest won by the Ganges and the Meghna" from the sea. Moreover, a central depression and deeply indented southern boundary give it "somewhat the appearance of the out-stretched palm of the hand." To continue the quotation with a still quainter similitude, "a fanciful eye might regard it as a glove flung down by the Ganges to the ocean, in gage of battle, and as an augury of future victories."

If there be little matter of general interest and little subject for general criticism in these pages, the fault must not be laid at the author's door. His theme is a dry one; and no pen could well make it otherwise. He has enlivened the monotony of local details by pleasant allusion to old and little-known European travellers in India: he has brought forward such legends and revived such associations of the past as have been found available in the comparatively barren field of a country without annals; and he does not fail to put in the way of his reader the thread of enquiries leading to interesting discussions. We proceed to note one or two passages in the volume which invite remark, and are not unworthy of critical attention.

In the chapter treating of Antiquities and Early History we learn that "Bākarganj" derives its name from one Aghā Bākar (properly Bākir), a turbulent land-proprietor of the last century, but that the district was originally called "Bākla." The common interchange of *l* and *r* renders the similarity of the two names a strange coincidence: but the evidence of the older designation is well-supported by Fitch, Pimenta, Fernandez, Fonseca, Du Jarric, and Sebastian Gonzáles Tibáo, in the sixteenth and seventeenth centuries. Another local word, commonly accepted as "Sundarbund," is said to derive its origin from the *sundari* tree (*Heritiera minor*); but the rarity of this tree in the locality signified is against such a conclusion. *Sundar* is certainly the Sanskrit for "beautiful," and *ban* is a "forest"; and the *sundari* may be called "beautiful on account of the red colour of its wood." We prefer, however, the suggestion of the footnote (p. 24) read by the light of the text in a new chapter (p. 26). There is a tradition that a considerable part of Bākarganj was formerly the bed of the Sugandha or Sunda river, and as the Persian *band*, meaning "dam" or "embankment," would not be an inappropriate affix to the name of the stream itself, in denoting the lands raised above the water-level, it is probable enough that the compound "Sunda-band" may have been used, in the first place, much as we use the term "Thames Embankment," the *r* being a chance addition. In fact, "Bākir-ganj" and "Sunda-band" might both be instances of vulgar district nomenclature quite likely to occur in a land of Muhammadan *zamindars*, and where (p. 246) the Mu-

hammadan population is reckoned at two-thirds of the whole.

Mr. Beveridge has some very interesting notes on the preponderance of the followers of the Arabian prophet over Hindus in Bākarganj. This feature, common to all the districts of Eastern Bengal, and especially marked on approach to the sea-board, he accounts for by the strong local inducements held out to conversion, the Hindu dislike of the sea, and the fact that many parts of the district were uninhabited until Hinduism had fairly declined—in rough terms, to the numerical ascendancy of converts and colonists. "It is probable," he justly says, "that when the stream of Hindu civilisation came in from the north, it spread itself chiefly over Western and Central Bengal, and only slightly sprinkled the eastern tracts, which thus became Muhammadan by right of civilisation and conquest," explaining his view of the former term to be the expulsion of wild beasts and clearance of *jungal*, and applying the latter to aboriginal tribes in the north-east, and to Birmese and Portuguese in the south-east. That the Bākarganj Muslims have adopted many Hindu customs is not surprising. They observe the Dasahrá festival, and are not particular about their own Muharram, but they are stricter in their religious notions than the Shia'hs of Dacca: "they do not drink spirits, and indulge sparingly in *ganja* and opium." All this is intelligible, and in accordance with the practice in many parts of India; though it is usual among Sunnis of the far East to see more fanaticism expended on the Muharram than sympathy accorded to the Dasahrá. Conversions in the present day are occasional only, and attributed rather to the influence of Cupid than of Mammon. The bulk of the Muhammadans of Bākarganj are cultivators, uneducated, and averse to Government schools. Their morals are not of the highest order, nor is our Legislative Code calculated to improve them by the operation of Acts framed for social conditions wholly incomprehensible to the Indian peasant. As regards other religions found here, we are told that Brahmans are scarce; that the Hindus belong chiefly to a low caste called "Chandal;" that the Brahma Somaj, of which we have had a notable representative in England in Kishen Sen, has a church, but does not flourish; and that the Buddhists are all "Mugs"—a tribe from Arracan, scattered over the Sundarbans, and of more interesting history than attractive name. The number of Christians in Bākarganj is stated to be under 3,000; though according to a late census, taken before transfer of certain tracts containing Christian villages to the separate district of Faridpur, there were 4,852. Of this number some 800 Roman Catholics form the Portuguese colony of the "Faringis of Sibpur," in the *pargana* of Buzurg-Umaidpur: their story, told in pp. 106 to 110, is curious and instructive. The remaining 2,200 or so, almost all converted Chandals, reside in the northern and north-western parts of the district. Mr. Beveridge cannot recall a single instance of the conversion of a Muhammadan inhabitant, and therefore concludes that "the Musalman religion is as great an ob-

stacle to Christian missionaries now as Fernandez and Fonseca found it nearly 200 years ago."

There are some interesting topics touched on in the appendix. Among them is the identification of "Bengala," which is thought to be "neither more nor less than the famous city of Gour, in the Maldaha district." Without entering into argument, we may recall what two authorities now before us, each more than two centuries old, have recorded on the subject. Purchas writing in 1617, and giving as his authorities Maginus and Gotardus Arthus, says, "Goure the seate Royall, and Bengala are fayre Cities." Peter Heylin, describing the cities of the Bengala province in 1652, thus places on record in his *Cosmographie*:—

"1. Bengala, which gave name to the whole kingdom, situate on a branch of the River Ganges and reckoned one of the most beautiful Towns of all the Indies. Exceedingly enriched by trade, but more by Pilgrimage by reason of the holyness and divine operations ascribed by the Indians to the waters of it; there being few years in which it is not visited by three or four hundred thousand Pilgrims. 2. Gouro, the seat-Royall of ancient Kings."

Had the learned doctor not been speaking of Banáras in a former section headed "Patanau," we might have supposed he was describing that city in his Bengala.

F. J. GOLDSMID.

NEW NOVELS.

Joshua Haggard's Daughter. By the Author of "Lady Audley's Secret." In Three Volumes. (London: Maxwell & Co., 1876.)

Power's Partner. By May Byrne. In Three Volumes. (London: Hurst & Blackett, 1876.)

Carstairs. By Massingberd Home. In Three Volumes. (London: Chapman & Hall, 1876.)

A Horrid Girl. By the Author of "Margaret's Engagement." In Three Volumes. (London: R. Bentley & Son, 1876.)

It would be hardly possible to lay down the last work of the author of *Lady Audley's Secret* without a feeling of sadness, at finding that after so many years an experienced writer should still think such books likely to suit the taste of the public. Let us not be judged as a nation by our popular novels if this is a fair specimen. There has been an undue amount of sensationalism, of violent incident, and of broadly delineated passion in the former works of this writer, but few have been so weak in sentiment and unhealthy in tone as *Joshua Haggard's Daughter*. It combines some of the faults of inferior French writing with English failings. The plot is sensational, the characters are all abnormal, and the facility of the author in writing only renders the faults of the book more conspicuous. The principal character is a Dissenting minister and grocer, who is a shining light in his native village—

"A man whose life altogether was so wisely ordered, so temperate, regular and honourable, that he himself seemed the highest example of that sober Christian life he preached to others. . . . A man in whose heart there was no lurking evil to be thrust out, for in singleness of purpose, in

directness of aim, in simplicity of life, he came as near perfection as it is given to erring man to come."

The object of the story, if it has one, is to show how jealousy overthrew with ease all that was good in this man's nature, as if the rectitude of a lifetime and all manliness, courage, and religious purpose were mere straws to be blown away without any resistance by this scorching wind of passion. Joshua first saves the Squire's eldest son from drowning and allows him to become engaged to his daughter, Naomi: he then marries a beautiful tramp whom he finds by the road-side, becomes jealous of her, fights a duel and commits murder; tells a lie to shield himself from conviction; turns his wife out of doors; and has a chapel built to his memory. Naomi's lover, after a long course of Byron and the "Sorrows of Werther," thinks that he is more attached to Naomi's stepmother, and is murdered by Joshua in consequence. Naomi consoles herself by marrying the Squire's other son and building the memorial chapel to her father. The beautiful beggar-maid, Cynthia, who unconsciously works all this woe, is represented as being devotedly attached to the minister, and we read of no change in her feeling towards him until we are suddenly told that "she suffered herself to be beloved" by the man who was engaged to her step-daughter, "and in this dreaming, half-unconscious state, had tasted an ineffable happiness." The minister, knowing this, says of her with his dying breath, "Cynthia, chosen, beloved, innocent as a little child, ignorant of evil; of such is the kingdom of Heaven." While of the young Squire it is said: "His only sin was to have let his heart go out to her as a young bird flies from the nest into the glad new world." Can maudlin sentimentality go much further? It is a pity that a writer who has won popularity should not sometimes endeavour to use her influence in raising the ideals of her readers, and run the risk of giving them the impression that our own baser passions and selfish enjoyments are the subjects of most absorbing interest in the world, or that they are worth even the talent which she wastes in describing them.

Power's Partner is apparently written by an Irish author, and has the merits of Irish fluency, and the faults of Irish carelessness, in its composition. The style lacks calmness and strength, but there is much feeling, and an almost unlimited supply of words. The hero is an old clerk in an office, who is wrongfully accused of stealing, and sent to prison for the fault of another. When he is set free he goes to the diamond fields, and really becomes dishonest and cheats his partner by keeping a prodigiously large diamond to himself. With his ill-gotten gains he becomes a millionaire in five years, and gives fashionable parties in Dublin, to which his former partner comes, accompanied by the man who has wronged him in bygone times. The passion for wealth produced by an undue and morbid susceptibility to the deprivations of poverty is as strong in Miriam Dwyer, the daughter, as in her father, the convict-clerk, and very nearly wrecks her life; but she rises superior to it at length, and does tardy justice to the man

whom her father has cheated. The story is a dreary one, and, we think, chiefly so on account of the morbid way in which poverty is regarded in it. Poverty need not be the degradation which this writer makes it appear; it may have its hardships, but they need not necessarily debase the nature, and it will only be an unmitigated evil as long as those who have to bear it regard it as such. If the style of this writer was pruned and restrained, she has talent enough to produce a much stronger story than *Power's Partner*; but she must learn not to write of "a city with numberless abbeyes," of "gauzy anopphanous clouds," of "never being sure of him setting to any real work;" of "hollow cheeks glaring fearfully upon him;" nor indulge too freely in such sentences as this: "Strong enough to be very weak, good enough to be very wicked, there was a misery and wickedness on her countenance upturned to Verschoyle demesne that had nothing of the commonplace herd in its gigantic impiety."

But *Power's Partner* with all its faults is strong compared with *Carstairs*, which, for feeble platitude and largely-printed imbecility, will not easily be equalled. The story is one of cross purposes in love, which comes all right in the end, and might have come right in the beginning if a young girl, one Lady Mary Hargreaves, had not lent her affianced lover 5,000*l.*, which she raised secretly upon her diamonds in three days, and the honourable young man with fine feeling, hesitated to break off his engagement with her until his debt was repaid. One of the chief features of the book is the number of quotations (between seventy and eighty) which are introduced promiscuously, without much apparent connexion with the story. The following is a specimen of their relevance and accuracy: "Just as they finish their inspection, the old clock over the gateway arch of the stable-yard strikes the hour. 'The clock struck one, and away she run, Dickery dickery dock.'" Here is another which is barely recognisable: "'Be thine own self, sweet maid, and let who will be fashionable.'" Of the grave style of *Carstairs* the following will suffice to show the average strength: "There are some emotions, some sensations, some phases of nature that no pen can portray. The first kiss of love, the breath of spring, the glories of a July moon—these can be felt, but not adequately described." The heroine and the clergyman's wife go to drink tea with the organist after a concert. Both are supposed to be models to their sex, but the clergyman's wife is a baronet's daughter, and therefore feels her religion quite inadequate to help her through such an ordeal. She comments thus upon the organist's guests:—"Friends of his, I suppose, farmers and tradespeople evidently, but none that I know; very good people, no doubt, but one doesn't care to meet them in this way." And readers of *Carstairs* must remember that the model clergyman's wife is speaking in sober earnest the sentiments of the author, and is not meant to be a caricature.

A Horrid Girl quite justifies its name, only there are two "horrid girls," and one of them swears, while the other shoots her

greatest friend with a pistol, and publicly horsewhips a man who has insulted her. The plot is an unpleasant one, and is not likely to give pleasure or profit to its readers; but there is little to say about it, except that we hope *dissolution* is a misprint, and that "a masculine figure of *middle height*, and wrapped in a cloak which made him look of *equal breadth*," must, indeed, have been a curious apparition. F. M. OWEN.

CURRENT LITERATURE.

The True Order of Studies. By the Rev. Thomas Hill, D.D. (New York: G. P. Putnam's Sons.) Dr. Hill, who was formerly President of the Harvard University, and has evidently paid great attention to the philosophy of education, appears, from his own account, to have excogitated in a single night the theory expounded in this volume, to which he gives the name of the "hierarchy of sciences." By it he seeks to correlate the various departments of human study under the five heads of: i. "Mathematics, or the field of time and space in which creation is wrought" (geometry, arithmetic, algebra); ii. "Natural History, the material world or the creations of the Infinite will" (mechanics, chemistry, biology); iii. "History, the acts of man, the creations of the finite will" (trades, art, language, law); iv. "Psychology, the finite spirit, the limited will" (mental philosophy, aesthetics, ethics); and v. "Theology, the Infinite spirit, the unlimited will" (natural theology, religion). He thinks that a true insight into the classification thus made throws much light on the order in which various subjects should be taught, and the manner in which a child's faculties should be successively developed. Thus he would give far more attention in early youth to training in right notions of form and number, and to the careful observation of physical phenomena, than to any form of book work, or to the study of words. He would have much of the early discipline of a child regulated by system, and carefully directed towards the strengthening and co-ordination of his powers, even when the little pupil thought himself at play, and was not conscious that he was receiving lessons at all. Incidentally, in discussing each of the various subjects, this little work contains just and shrewd observations on teaching. In arithmetic, for example, it is shown that it is desirable to give much actual practice in counting, weighing and measuring in connexion with all written calculations; in teaching geography stress is wisely laid on a preliminary knowledge of the cardinal points, and on a map of the schoolroom and its surroundings, before the names of distant countries are given; of reading, also, it is justly said that the recognition of words by the eye ought to precede the practice of distinguishing single letters, and that the powers of letters ought to be learned before their names. Throughout the book there is a tendency to undervalue the systematic study of language. The author appears to consider that whether a native or a foreign or an ancient language is studied, it should be taught, in the first instance, by the same methods, by reading and speaking without the aid of grammar or dictionary; and that the analysis of the parts of which language is composed is a rather unfruitful exercise in early life, and should be taken up, if at all, when the mind has been matured by an exact knowledge of the things which words represent. On this point we do not think the conclusions of Dr. Hill would be endorsed by the wisest and most experienced teachers. Sufficient weight does not appear to have been given in his book to two considerations of paramount importance to the practical instructor; the one, that the logical order in which subjects are related is not the actual order in which experience brings them before the mind of the student, nor the order in which a teacher must deal with them; the other, that school can only deal with a small part of education, and that

many things are necessary to the complete development of the observant and practical faculties which must be learned by the experience of life, and which form no part of the business of formal teaching. Nevertheless, as a *carte du pays* of the whole region of intellectual culture, the book has considerable value, and will be found suggestive and helpful to all who are striving to understand the principles of education, whether they accept the author's conclusions or not.

Inaugural Address. By S. S. Laurie, A.M., Professor of the Theory, History, and Practice of Education in the University of Edinburgh. (Edmonston and Douglas.) The recent institution of two new professorships of education at the universities of Edinburgh and St. Andrew's, is mainly the work of the trustees of the late Dr. Bell, who administer a considerable fund bequeathed by him for the promotion of education in Scotland. They have resolved that, since the provision of elementary schools is now accepted by the Government as a matter of national obligation, the best use that can be made of part of the special trust funds thus disengaged is to employ them in improving the quality of the teachers, and in making definite instruction in the principles and practice of education a part of the business of the Scottish universities. No better choice could well have been made for the first explorer into this comparatively untrodden field of academic study than by the appointment to the new professorship of Mr. Simon Laurie, whose various official duties in connexion with the education system of the Church of Scotland, with the administration of the Dick bequest, and with the Scottish Endowed School Commission, have given him unrivalled knowledge of the state of the schools beyond the Border, and who is also known to have paid great attention to the methods and principles of instruction. His inaugural lecture indicates with much clearness and skill the range of enquiry proper to such a professorship:—

"While the professor must," he says, "as representing a practical subject, avoid all speculation, he must yet find some dogmatic philosophic basis as a support for his thought, if his teaching is not to be an aggregate of disjointed essays. In psychology and physiology he must lay his foundation; but from these departments of knowledge he will select only such materials as have a direct bearing on education, and in giving significance and the force of law to educational ends, processes, and methods. This portion of our course has to be treated in detail, as belonging to the Art of Teaching, and will necessarily occupy much of our attention. It will be illustrated by model lessons, and by observation of the procedure of the best schools. The means of obtaining practice in teaching will also, it is hoped, be provided."

It will be evident from this extract that the aims of the Professor, which alone can be fairly estimated from his opening address, are sufficiently practical, and are at the same time clear and elevated. It remains to be seen how far university instruction on such a subject can furnish genuine professional training for the teachers in higher schools, and serve to give to the business of education a better status, and a more definite rank as one of the learned professions. To English schoolmasters it has long been painfully apparent that the utter absence of all instruction in the art and science of education causes much valuable time to be wasted in schools, and is a grave hindrance in the way of all improvement. And it is difficult to suppose that any means will be found more effectual for the supply of this want than the direct action of the universities in recognising the usefulness of a higher kind of normal training, and in providing it for the future teachers in our secondary and higher schools. Prof. Laurie's lecture will be found to enforce with much earnestness and ability this view of the duty of the universities, and it ought to serve a useful purpose in England by calling attention to an experiment of extreme importance and value, which, if successful, will deserve extensive imitation.

Systems of Education: a History and Criticism of the Principles, Method, Organisation, and Moral Discipline advocated by Eminent Educationists. By John Gill. (Longmans.) This volume contains a series of lectures delivered to the students in the Cheltenham Training College, of which Mr. Gill has been the Master of Method during many years. They discuss in turn the principal books on Education which have been written in English, such as those of Ascham, Milton, Locke, and Knox, and furnish an outline of the main principles which were characteristic of the systems of Pestalozzi, and of Fröbel, of Bell, of Lancaster, and of Stow. Much information is also given respecting the early history and development of the system of grants and of supervision, now administered by the Privy Council. The value of such information as part of the professional training of the elementary teacher is unquestionable, and the rules of practice which Mr. Gill deduces from his historical sketches are on the whole judicious and practical. The range, however, of the author's experience appears to be mainly and necessarily restricted to the needs of the primary school, and no attempt is made in the book to explain the general philosophy of education as it is illustrated by ancient writers and systems and by modern French authorities. Such a book as this may be thankfully accepted by teachers as a provisional contribution to a true history of their art; but it serves, in its general meagreness of thought, and in its want of breadth and of philosophic insight, to show how far we are in England from a true science of *Pädagogik*, and how unlikely it is that the need will ever be properly supplied, except by the recognition of teaching as a liberal profession and as an important department of academic training in the universities.

School Inspection. By D. R. Fearon, M.A. (Macmillan.) In this little manual are collected the ripe fruits of a singularly varied experience. Mr. Fearon was for some years one of the Privy Council Inspectors, and has subsequently been engaged in several special and important enquiries relating to the English Grammar Schools, the Scottish Burgh Schools, and other institutions for secondary education. He has thus enjoyed exceptional opportunities of testing different forms of educational work. In this book he has confined himself to the task of setting down, with precision and clearness, the rules which should be observed in a methodical and thorough inspection and examination of a primary school by one of the Privy Council Inspectors. No detail of organisation, of method, of mechanism, of furniture, or of teaching, escapes his attention, and in regard to each of these details, he shows how the skilled inspector should form his judgment, and how he can fulfil in the best way his duties to the Education Department, to the teachers, and to the schools. He has aimed simply at the modest purpose of furnishing a practical manual for the guidance of inspectors, and from this point of view it is impossible to speak too highly of the wisdom and accuracy with which his task has been fulfilled. But his work will not be less valuable to schoolmasters and mistresses, and will, we may hope, be extensively studied by them; for in no English book that we know, of similar size, is the ideal picture of a good and vigorous elementary school so well painted, and in none is there a greater store of judicious counsel as to the practical work of such a school, and as to the spirit in which that work should be done.

A Classified Catalogue of School, College, Classical, Technical, and General Educational Works, in use in the United Kingdom and its Dependencies in 1876, so arranged as to Show at a Glance what Works are Available in any Branch of Education. (Sampson Low.) The title of this book explains its purpose. It may suffice to say here that the information given is very full, extending to 154 closely-printed pages; that ample particulars are furnished relating to the sizes and prices of the

various books; that the classification is such as to facilitate reference; and that such tests as we have been able to apply in the case of books selected at random give an impression that the work has been prepared with commendable labour and exactness.

Silver Vindicated. By Henri Cernuschi. (P. S. King.) M. Cernuschi shows conclusively that the increased production of silver at the American mines does not account for the fall in the value of silver. A vastly greater increase in the production of gold after the discovery of the Californian and Australian mines made hardly any change in the relative value of the two metals. M. Cernuschi accordingly appears justified in affirming that if the German law of 1871 had never been passed, other countries would not have been driven to suspend the coinage of silver, its value would have been maintained, and the Anglo-Indian exchange would have been undisturbed. But when M. Cernuschi proceeds to argue that both silver and gold ought now to be made legal tender everywhere at a fixed relative value of $15\frac{1}{2}:1$, he seems to ignore one difficulty altogether. Supposing silver to be really worth considerably less, as might easily happen, either there must be perfect liberty to everyone to bring silver to the mint, or there must be a restriction to the amount coined. In the former case, the cheaper metal would alone be coined, gold would be driven from circulation, and there would be, what M. Cernuschi abhors, monometallism. If, on the other hand, the coinage of silver were limited, the value of silver in the shape of coin would cease to bear any relation to its value as a metal; and on the same principle copper coins might be issued at the ratio to gold of $15\frac{1}{2}$, with the advantage of a saving to the State in proportion to the lower cost of copper. M. Cernuschi's faith in his cause is equal to his zeal and ability, but faith nowadays does not remove mountains, and we believe it would be an easier feat to remove all the mountains in England than to expel monometallism, in the form of a gold standard, from our currency. *Vestigia nulla retrorsum.*

NOTES AND NEWS.

MR. BREWER has resigned the Chair of Modern History at King's College, London, retaining that of English Literature. He will be succeeded by Mr. S. R. Gardiner.

DR. F. V. HAYDEN, the indefatigable geologist in charge of the United States Government Survey of the Territories, is about to bring out a *Prachtwerk* on the Yellowstone Park and the mountain regions of Nevada, Idaho, Colorado and Utah. It will be illustrated by fifteen chromolithographs from drawings by Mr. Moran, the artist to the expedition of 1871. The text will be published simultaneously in English, French and German. Messrs. L. Prang and Co., of Boston, Mass., are the publishers.

MESSRS. EYRE AND SPOTTISWOODE will publish about Christmas an Edition of the Authorised Version of the Bible, with footnotes comprising the best Readings and Renderings of the Hebrew and Greek Text, and specifying the Authorities (in each case) from which they have been taken.

THE Chaucer Society is reprinting its issue of Texts, &c. for its first year, 1868, its stock having run out. Mr. Furnivall will take this opportunity of adding a few additions and corrections to his "Temporary Preface to the Six-Text edition of Chaucer's *Canterbury Tales*: Part I., attempting to show the true Order of the Tales, and the Days and Stages of the Pilgrimage, &c."

WE are only able this week to announce the death of Friedrich Wilhelm Ritschl, in his seventy-first year. His best-known work is his edition of Plautus (Bonn, 1848-1853).

THE Rev. Joseph Stevenson having resigned his appointment as agent for the Public Record

Office in the collection of copies of State Papers from the Vatican, Mr. W. H. Bliss, of the Bodleian Library, has been appointed his successor.

THOSE who are aware how much of our knowledge of English politics at the end of the reign of James I. and at the commencement of that of his successor is owing to the despatches and State Papers of the Ambassador of the Elector Palatine will be glad to find in Dr. Krüner's *Johann von Rusdorf* a sketch of the life of a man who, if he did not rise to the first rank of statesmen, was distinguished by his good sense and by his thorough loyalty to his unfortunate master. Dr. Krüner is not writing a history of Rusdorf's times, and it is therefore sufficient to say that some of his statements about men and things in England require a good deal of correction; as, for instance, the assertion that Gondomar was in England in 1619, that a Parliament was sitting in 1623, and that the Venetian ambassador in London in 1624 was called Francesco di Bologna. It is quite enough that he has executed his own proper task carefully and gracefully, and has brought out the lineaments of a man who deserves to be remembered, if it were but for his sensible criticism of Buckingham's high-flying schemes. Dr. Krüner informs us that there are many letters of Rusdorf's still in MSS. May we hope that he will add to the benefits which he has conferred on us by committing them to the press? Those written by Rusdorf when he accompanied the two young Palatine Princes to England in 1636 would have a special interest for Englishmen.

MR. CHARLES MADELEY, of the Warrington Museum, writes that he has had some copies printed of the book-scale referred to in our issue of November 4, and that he will be happy to forward a specimen to any person interested on receipt of a stamp.

MR. C. B. CAYLEY's translation of the *Iliad*, in quantitative hexameters, is now all in print, and may probably be published pretty soon.

THE valuable library of Dr. Thomas Willis, of Dublin, is advertised for sale by Messrs. Jones, of D'Olier Street, Dublin, for the 22nd inst. and following days.

M. CLERMONT-GANNEAU has arrived in London for the purpose of carrying out a mission entrusted to him by the French Minister of Public Instruction. M. Ganneau will investigate all the alphabetical inscriptions in the Semitic languages preserved in the British Museum and in the collection of the Palestine Exploration Fund, and will make an exact copy of them for a *Corpus Inscriptionum Semiticarum* undertaken by the Académie des Inscriptions et Belles Lettres.

M. GANNEAU has recently been appointed to deliver a course of lectures at the Sorbonne (École pratique des hautes Études) on Oriental Archaeology. He will begin with a series on the Sepulchral Monuments of Palestine, and on the Towns of the Tribe of Judah.

THE Religious Tract Society has ready for publication a volume on *Jewish Social Life in the Days of Christ*, by the Rev. Dr. Edersheim; and a second series of *Meditations on the Miracles*, by the Dean of Chester, is in preparation. Foxe's *Acts and Monuments*, complete, in eight large volumes, has been reprinted under the editorship of the Rev. Dr. Stoughton and Prof. Stanley Leathes.

MR. W. R. S. RALSTON will give "a Gossip" on Slavs in general and Russians in particular, at St. George's Hall, Langham Place, next Monday afternoon at 3.45.

A NEW German Philological Review, devoted to English Literature and Language, and entitled *Anglia*, will make its first appearance next April. Prof. R. Wülcker, of Leipzig, will edit the first division of the work, consisting of essays on literature, history of the language, grammar, &c.

Dr. Moritz Trautmann will edit the second division, containing reviews of books, and a yearly bibliography of all publications relating to English. Among the writers who have promised support are Profs. ten Brink, Grein, Heyne, Kissner, Schipper, Sievers, Stengel, Wagner, Zupitza; Drs. Flügel, Hertzberg, Alexander and Imanuel Schmidt, Horstmann, &c.

THE pleasant paper on Shakspeare's Young Men—their five classes and their characteristics—in the current number of the *Westminster Review* is by Miss Constance O'Brien, of Clifton, whose help in the New Shakspeare Society's edition of Prof. Spalding's Letter on *The Two Noble Kinsmen* is acknowledged by Mr. Furnivall in his "Forewords" to that book. The article on "The Religion of Shakspeare" in the *Theological Review* for October is by Mr. Edward R. Russell, of the Liverpool *Daily Post*, whose pamphlets on Mr. Irving's *Macbeth* excited some attention last season.

FOR his little book for the Chaucer Society on *Chaucer as Valet and Squire to Edward III.*—the Household Book of Edward II., with extracts from that of Edward IV.—Mr. Furnivall has had Hoccleve's vignette portrait of Chaucer in the Harleian MS. 4566 enlarged to four times its size by the Autotype Company. Though the process has of course roughened the lines and texture of the original, yet the enlarged portrait brings out well the tenderness and pathos of the sad and serious face of the poet in his old age. The light of the blue-grey eye is somewhat missed; but on the whole the portrait will be very welcome to all lovers of the London poet, who from Thames Street and Westminster sang the songs and told the tales that the world resounds with still.

MR. H. SIMON's essay for the Chaucer Society, on "Chaucer's Parson and Parson's Tale," will give a stir to students. Mr. Simon contends that the description of the Parson in the general prologue is that of a Wycliffite, poor, preaching the Gospel, visiting his people, staff in hand, as Wycliffe bade him; that in the Shipman's prologue, or Man of Law-Shipman Link, the Parson is expressly called a Lollard, and does not repudiate the epithet; that in a representative gathering of all the main classes of men of his time Chaucer would have been sure to put a Wycliffite, one of those whom his patron, John of Gaunt, befriended; lastly, that if you carefully examine the Parson's Tale, you can pick out of it a short Gospel sermon on penitence, containing no Romish doctrine, written clearly and well in Chaucer's style. The rest, Mr. Simon contends, is clumsy, tautologous interpolation of Romish doctrines by a monk, made in Chaucer's Tale after his death, by one of the monastery of St. Mary's, Westminster, in the garden of which Chaucer died.

A GOOD collection of rare English Bibles and Testaments was disposed of on Monday and Tuesday this week by Messrs. Sotheby, Wilkinson and Hodge. Among them were: *Byble faithfully translated by Myles Coverdale*, Zürich, 1550, slightly imperfect, which fetched 16l. 10s.; *Testament (Neuve) in Englyshe* (by Tyndale) and in Latin (by Erasmus), 1538, 15l. 15s.; *Byble in Englyshe*, the Great or Cromwell's Bible, imperfect, 15l.; *Testament (Neuve) both Latine (Vulgate) and Englyshe*, by Coverdale, 1538, 17l.; *Biblia Sacra Polyglotta*, editio B. Walton, 1657, 16l. 10s. Among other scarce works sold on the same days were Wilkinson's *Manners and Customs of the Ancient Egyptians*, 11l. 16s.; *More's (Sir Thomas) Works*, black letter, 1557, 16l. 10s.; Dibdin's *Bibliographical Tour in France and Germany*, 7l. 12s.; ditto, in *England and Scotland*, 4l. 12s.; Silvestre's *Paléographie Universelle*, 9l. 15s.; *Turner Gallery*, 9l. 12s.; T. D'Urfey's *Wit and Mirth*, 1719-20, 7l.; Dugdale's *Warwickshire*, 4l. 10s.; Holme's *Academy of Armory*, 1688, 8l. 5s.; sixteen volumes of H. B.'s *Caricatures*, containing 825 impressions, realised 11l.

PROF. C. DE HARLEZ, Canon of the Cathedral of Liège, has just published the second volume of his translation of the *Avesta*. It contains Vispered, Yaçna, the Twenty-first Naska, and the Yeshts, i.-x. The character of the translation is well described by the author himself:—"Si l'on ne peut suivre le Dr. Roth dans ses hardiesses, on ne doit point non plus, en présence de raisons objectives sérieuses, s'astreindre à ce respect exagéré que professe certaine école pour des manuscrits récents et très-défectueux."

In an article on the "Laws of Dream Fancy" in the *Cornhill Magazine*, the writer gives with great precision the conclusions which modern psychology has arrived at on this subject. As to the physiological conditions of dreams he adopts provisionally the hypothesis of Wundt that the cerebral excitations, partial and locally circumscribed, to which every dream corresponds are due to the retardation of the circulation of the blood in the brain, and to the presence in the blood thus arrested of numerous products of decomposition. To the psychologist dreams present three main problems: (a) the elements of which they are composed; (b) the exceptional order of sequence and composition of these elements; (c) the apparent objective reality of the products. Beginning with the last, the writer attributes the apparent objectivity of the dream-images to two circumstances. The difference between a perception and an imagination being one of degree and not of kind, imaginations in waking life are recognised as such through a certain ratio of intensity to actual sensations; they fail to be recognised when this ratio is obliterated by the increased intensity of the imagination, due to an extraordinary irritability in the cerebral elements excited in dreams, and by the almost total deprivation of sensation, so that the mind loses its normal standard of comparison. Passing to the consideration of the constituent elements of dreams, he attributes them to (1) external stimulation of the sensory organs—e.g. by a noise—or (2) to internal stimulation within a particular organ itself, arising, according to Helmholtz, from varying pressure on the nerve exerted by the blood, or from a chemical action of the blood due to its altered composition. The so-called "light-chaos" or "light-dust," which often transforms itself into a crowd of exactly similar objects—e.g. faces—as in De Quincey's dreams, arises from the stimulation of the optic nerve through the pressure of the blood in the retinal vessels. (3) Excitation is due to muscular movement, or to resistance to muscular movement. Wundt attributes the dream of falling down an abyss to an involuntary extension of the foot of the sleeper, and the dream of hurried flight to the movements of respiration. (4) Excitations are due to "organic" sensations—e.g. the feeling of repletion. Volkelt says that a faint toothache will prompt images resembling a row of teeth, and the writer quotes from him a dream, arising from toothache, of two rows of boys, who attacked one another, and then fell again into line. These several kinds of stimulation are called peripheral, as distinguished from the central or automatic excitations of the brain not depending on movements carried to it from the periphery of the nervous system. These central stimulations are either direct or indirect: direct, when due to the state of nutrition of the brain elements, or to the action of the blood upon them, as, e.g., when we dream about the events of the preceding day; or indirect, when to the primary cerebral excitation other imaginative elements are added by the operation of association. A large portion of the contents of every dream arrives in this way; as the image of a face may associate with itself a number of actions performed by its owner. This association of other elements with the primary excitation also happens when the primary excitation is peripheral, as the barking of a dog may lead to the dream that he is licking the sleeper's face. In regard to the laws which govern the arrange-

ment of the elements in dreams, the writer divides dreams into "passive" dreams and "active." In the former, which are the less elaborately ordered, more incoherent, dreams, the mind may be regarded as passive, and the sequence and arrangement of images is referable to the action of association complicated by the introduction of new initial impulses both peripheral and central. Such are dreams in which the sleeper seems to be the spectator of a pageant, or to be borne along by some extraneous force. The greater coherence of "active" dreams is due in part also to association, in the sense in which the latter is held to account for the arrangement of sensations in the waking life as elements of an external order having defined relations of situation, distance, &c.; in part to the disposition to united action among various parts of an organ of sense, and to the same disposition to united action among different organs; in part to volition—i.e. attention—which has been erroneously assumed to be dormant during sleep, but which acts in the fixing and holding of an image, or in the selection of one image among many. In some cases dreamers retain on waking a feeling of strain due to this exercise of attention. There are two principal motives to this attention: the impulse to seek unity and consistency, and the instinct for emotional harmony, in the dream elements. The first produces a reciprocal modification and fusion of the images; the second, which profoundly colours all our dreams, acts in two ways, by one dominant emotion making itself the centre of a group of images, and by the existence of affinities between certain feelings, so that they easily pass one into the other, and produce a common emotional tone. The most direct source for these emotions during sleep is the "organic" sensations, especially if painful. Lastly, the tendency to exaggerated emotion in dreams, entirely disproportionate to the bodily sensation causing it, and to the experience of waking life, and sometimes, especially in the case of terror, taking the form of a graduated succession of images, each more impressive than the preceding, is due to the limitation of the area of consciousness in dreaming; to the absence of any corrective comparison between feelings which we make when awake; to the fact that a feeling is in dreams isolated and hence undefined; and to the high degree of fusibility in the dream-images, which under the influence of a dominant emotion blend into a composite image of greater impressiveness than those of waking experience. One or two subsidiary observations conclude this interesting paper. Certain feelings, especially bodily sensations, have a tendency to present themselves uniformly under the guise of one kind of image—e.g., pressure on the heart under the image, say, of catching a train—the image varying according to the temperament and daily experience of the dreamer. The apparent withdrawal of the mind from the body in dreams is owing to the slight part played by ideas of touch in dreams as compared with those of sight or hearing.

THE *Monatsschrift für Geschichte u.s.w. des Judenthums*, edited by Dr. Grätz, continues its useful investigations on the later history and literature of the Jews. Students of the history of religion, especially of Christianity, might obtain many valuable notices from this little-known and very inexpensive periodical. Among the recent numbers we have a series of papers (not to say treatises) on the following subjects:—The Jewish Ethnarchs or Alabarchs in Alexandria; the Intermingling of Myths in the Hagada; Fables in the Talmud and the Midrash; Date of the Pretended Letter of Aristæus; the Courts and Gates of the Second Temple; the "Second Targum" of the Book of Esther. "Alabarches," or rather "Arabarches," is shown to have the meaning of Governor of the Heliopolitan nome or canton, which belonged to the Arabian part of Egypt. Onias, the builder of the Judæo-Egyptian Temple, stood in high repute with King

Philometor, and apparently received the appointment of Arabarches. One of his official duties was to superintend the customs, and this brought him into relation with the harbour of Alexandria. The Jewish fabulists take a special pleasure in the serpent, who is represented (by a noteworthy development of doctrine) as a penitent sinner. The letter of Aristæus, according to Dr. Grätz, was forged by an Alexandrine Jew in the time of Tiberius. Its bad Greek proves that the Jews in Egypt, and even in Alexandria, were not at home in Greek writing as late as the beginning of the first century, A.D. Hence both the commencement and the bloom of Jewish Hellenistic literature must be placed later than is usually supposed.

THE recent numbers of the *China Review* contain many articles of considerable interest. Among others is a series of papers on the Chinese language, by Mr. Watters, whose Taoistic and linguistic contributions to literature are well known. His present essay, though containing little that is new to Chinese scholars, gives a complete and accurate *résumé* of the advances which have been made in the study of the language both by foreigners and natives. The editor, Mr. N. B. Denny, contributes a paper on the Folk-lore of China, which furnishes additional evidence of the common origin of superstitious beliefs and tales. Spiritualism enters largely into Chinese folk-lore, and Mr. Denny tells some stories of the very practical ends to which this agency is put by Chinese mediums which might shoot a pang of envy into the breast of Dr. Slade. An article on Phallic worship, by Canon McClatchie, presents the doctrines of Confucianism in a new and curious light, and, though at first sight some of the emblems employed in that religion may appear to support the Canon's theory, the freedom of Chinese literature and traditions from all taint of such impurities is sufficient to more than counterbalance the weight of the evidence brought forward by the writer. An account of an outbreak of a secret society known as "The White Feathers," which was probably a branch of the Great Hung League, by Mr. G. C. Stent, shows how incapable Chinese Secret Societies are of accomplishing more than banditti enterprises. Mr. Stent also contributes a translation in verse of a poem on an historical tree in the Palace grounds which was planted by the first emperor of the Ming Dynasty, and on which the last emperor of that line hanged himself. Among other articles are "The Expedition of the Mongols against Java in 1293 A.D.," by W. P. Groeveveldt; "Chinese Intercourse with the Countries of Central and Western Asia during the Fifteenth Century," by E. Bretschneider; "A Trip of a Naturalist to the Chinese Far East," by A. Fauvel; and several important reviews of recent works.

NOTES OF TRAVEL.

IN *Petermann's Mittheilungen* for November, Prof. Mohn, the able director of the Meteorological Institute of Norway, has published another very important study of the temperature of the sea between Norway, Scotland, Iceland and Spitzbergen. In this he has brought together and discussed the whole of the observations which have been made at the stations on these coasts between the years 1867 and 1875, reducing the results of these into six bi-monthly charts, showing by isothermal lines the average distribution of temperature on the sea surface, and thus placing his well-known investigations published in 1870 on a

more extended basis. M. Leo Metschnikoff contributes a full description of the new administrative divisions of Japan, which were introduced in 1871, but of which no complete account has hitherto been given.

M. PAUL SOLEILLET, an enthusiastic advocate of the extension of French commerce in North Africa, who in 1872-74 succeeded in reaching the oasis of Insalah from Algeria, has just published a little work, entitled *Avenir de la France en Afrique*, in which, after giving a good account of the commercial routes of the Sahara, and the means by which French traffic might be established along these, he allows his imagination to wander to visions of a railway from Algeria to Timbuctoo and St. Louis, the fertilisation of the Sahara by flooding it from the sea, and the abolition of slavery by re-peopling the desert.

Old New Zealand: a Tale of the Good Old Times, and a History of the War in the North against the Chief Heke, in the Year 1845, by a Pakeha Maori, with an Introduction by the Earl of Pembroke (R. Bentley and Son), is a series of sketches and descriptions of Maori life and manners of past times, vividly depicted scenes and incidents given exactly as they occurred. The "Pakeha," or white man, who writes the tale has lived so long a member of a Maori tribe as to have entered perfectly into the spirit and mode of thought and action of this strange people, now so rapidly decreasing in numbers, and initiates us fully into the meaning of the laws of the *Tapu* and *Muru*, and other institutions which formerly reigned with iron rod in Maori Land, yet with a literary skill which it is astonishing to find in a man who has lived from boyhood to old age among savages. The Introduction by Earl Pembroke is a severe retrospect of the New Zealand policy of Great Britain and of the radical misconceptions by which we succeeded in creating an imaginary Maori nearly as true to life as Fenimore Cooper's Indian:—

"I have heard (he says) several comments upon us and our policy from intelligent natives, none of them very flattering to our sagacity or consistency, but I will only give one which struck me as being a most striking comment upon a policy that aimed at conciliation, forbearance, and patient improvement of the Maori. 'You are a good people, but you have no fixed plan and no understanding either in matters of peace or war. No man can tell when you will fight or when you will give presents to buy peace, or at what sudden moment you will stop doing one and begin the other. No man can tell your reasons or the meaning of what you do.' . . . If these two little books should suggest to any careless Englishman that foreigners of dark complexion are not all like either those white men who seem to have got into brown or black skins by mistake, whom one reads about in anti-slavery books and some missionary reports, or those equally tiresome black dummies whom one reads about in another sort of book, who have no marked characteristic or intelligible custom except shooting spears and arrows at people for no apparent reason, I shall be glad to have introduced them to an English public; and let me assure those who care more for amusement than instruction that they will be amply repaid by their perusal."

We have received from the Agent-General for Victoria a copy of *Homes and Homesteads in the Land of Plenty: a Handbook of Victoria as a Field for Emigration*, by the Rev. James Ballantyne (Melbourne, 1871), which is a well-known concise and trustworthy guide to every point which can interest an intending emigrant. In a flourishing colony like that of Victoria, however, the statistical facts must change very rapidly, and such a handbook as this requires an annual revision.

THEODORE VON HEUGLIN, whose death we recorded last week, was born at Hirschlanden, in Würtemberg, in 1824, and first became well known through the publication of his travels in the region of the White Nile and Abyssinia, completed in 1854. He took a prominent part with Kinzel-

bach, Munzinger, and Steudner in the German Expedition of 1861-2 to the Egyptian Soudan and the frontier lands of Abyssinia—an expedition first set on foot with the object of finding traces of the lost traveller Vogel. Having reached Khartum again in July, 1862, Von Heuglin there met with the enterprising Dutch lady traveller, Madame Tinné, and, in place of returning to Europe, accompanied her expedition of 1863-4 to the swamp region of the Bahr-el-Ghazal, west of the Upper Nile. His last important journey was to the coasts of the Red Sea in 1875, in company with Herr Vieweg. Von Heuglin's very extensive and important contributions to the natural history and geography of Eastern Africa are chiefly contained in his *Travels in North-East Africa*, published in 1857; his *General System of the Birds of North Africa*, published in 1855; and in a long series of separate papers and monographs published from year to year since 1862 by the geographical establishment at Gotha.

A CORRESPONDENT of the *North China Herald* gives an interesting account of a recent visit to the Island of Pootoo, off the China coast, which is entirely given up to Buddhism. No animals are allowed to be killed there, and neither fish nor animal food may be landed. Temples occupy the most beautiful spots, and everywhere shrines are built by the roadside, or Buddhas carved upon the face of the rocks. The government of the island is in the hands of the priests, and the rents from the land all go to the temples; in fact, though presents of tea, &c., are sent to Peking, the island is more like a dependency than an integral part of China. The few graves to be seen suggested to the visitor the practice of cremation; and not far from the largest temple, and near the beach, he found one of the furnaces, which consisted of a small room in the hill-side, arched overhead, the only peculiarity about it being an excavation in the rocky floor about the size of a small coffin, intended for the fuel, or to create a draught. The following is a brief description of the process, as given by a priest:—Three days after death, the body, seated cross-legged and enclosed in a box, is taken to the furnace. Fuel is placed round it, and after a suitable religious ceremony, the torch is applied, and the whole pile is soon wrapped in flames. It requires several hours and 400 pounds of wood to complete the process.

THE *Pioneer* states that Mr. R. B. Shaw, lately our envoy to Kashgar, is still engaged on his Report, and, when it is finished, he will return to Leh. Those parts of Mr. Shaw's Report which are of general interest will be made public, and a great deal of entertaining information is expected therefrom.

THE *Choya Shimbum* (a Japanese newspaper) says that an iron mine has been discovered in the sacred Koya-san. For many years it has been thought that this mountain contained iron, but the superstitious natives were afraid to mine it. One Yamahara, of Osaka, however, having recently found ore there, and being above superstition, has decided to commence mining operations forthwith.

THE reports on the zoological results of the Yunan and Yarkand Expeditions are well advanced in preparation. That of the former, by Dr. J. Anderson, of the Calcutta Museum, is now passing through the press, under the supervision in this country of Dr. Murie and Mr. R. B. Sharpe. The report on the Yarkand collections, in consequence of the lamented death of Dr. F. Stoliczka, the naturalist attached to the expedition, has been undertaken by Mr. W. T. Blanford and Mr. W. E. Brooks, the former describing the mammals and reptiles, and the latter the birds.

A CORRESPONDENT at Alexandria writes:—"I have seen no mention made of some curious, and probably early, Arabic places of worship which exist on the most prominent points of the eastern range of hills which bound the Nile valley behind Aguba and other villages below the first

cataract. They consist of circles of stones, about four or five feet high, put together with or without mortar and open at the top. These circles generally contain fragments of broken drinking-jars and a shallow earthenware pan in which incense has been burnt. They have, doubtless, succeeded still more ancient 'high places' of worship. Mustafa Aga, of Luxor, informs me that he has noticed a similar circle on the top of one of the mountains near Thebes. No writer on Egyptian antiquities seems to have faced the extraordinary fact that ancient Egyptian art begins as it were, and to speak generally, *full-blown*—that is to say, that the earliest known remains are as good as any which follow, and that no inferior remains exist which show a gradation from bad to better and from better to good. A scarab of Shafra, the builder of the second pyramid, or of Shoofoo, the builder of the first, is of as good work as one of Thothmes III. Nothing, it was thought, could exceed the fineness of the work of the superb statue of Shafra in the Museum of Boulak, but it is equalled by the statues of the young man and his wife discovered in a tomb near the so-called 'False Pyramid,' which are referred by M. Mariette to a very much earlier period. In fact, the false glass eyes of these statues can in point of naturalness and execution be excelled by the work of no succeeding age. If inferior works of art ever existed, one may well ask, in a country where everything is indestructible and where the area is so small, where are they? . . . It is much to be wished that some steps could be taken either to remove or to reinstate in its proper position the splendid colossus of Rameses, which now lies on its face in a hole at Memphis, and which is stated to belong to England. Whatever doubts may exist as to the removal of the prostrate obelisk at Alexandria, there can be none that this monument would well repay the expense of transportation to England. A curious mode of interment has been brought to light in the new railway-cutting about three miles from Alexandria, in the mounds not far from the banks of the Mahmoudieh Canal. Here the bodies were buried in long earthenware pots of a dark red colour. Those I saw lay with the heads towards the east. These interments appear to belong to the Roman period."

AMONG the official reports to the Foreign Office lately issued will be found an interesting account by Colonel Playfair, Consul-General in Algeria, of a tour made by him through the regency of Tunis, a country rich in historical interest, but very little known to the modern traveller. At Zaghouan is to be seen in all its beauty one of the greatest works the Romans ever executed in North Africa—the aqueduct conveying the waters of Zaghouan and Djougar to Carthage. This was commenced by Hadrian, destroyed by Gelimér, the last of the Vandal kings, and restored by Belisarius, the lieutenant of Justinian. Again destroyed by the Spaniards under Charles V., it was reserved for the present Bey, Sidi Saduk, once more to restore this ancient work, with the aid of the French engineer, M. Collin. Near Djebbel Trozza, about 380 feet above the level of the plain, is a remarkable fissure in the limestone rock, called by the natives El Hammam, or the Bath. It descends vertically from a spacious recess or cave to a depth of about twenty feet, when it widens out into a chamber filled with hot vapour. The travellers had no means of testing its temperature, but it was considered to be not much under the boiling-point of water. No fire or water is ever seen, but the vapour rises continuously, and appears to be simply heated air, without the addition of sulphurous gases. The natives have great faith in its remedial effects, and come to it from great distances for the cure of rheumatism and other similar affections. Nowhere throughout the regency of Tunis is a Christian permitted to enter a Mohammedan mosque. Were it possible to visit the Djamaa el Kebir of Kerouan, the antiquary would find much to interest

him. The exterior has no architectural pretensions, but in the interior there are said to be many Latin inscriptions, nearly 500 marble columns derived from Roman buildings in various parts of the country, and a very remarkable collection of ancient armour, some of which is supposed to have been captured from the Byzantine soldiers by the early Arab conquerors. It seems that the great difficulty and unpleasantness of travelling in this country arises from the fact that, without an order from the Bey, no one will show any hospitality towards a traveller at all; and even then it is with ill-concealed reluctance that the officials supply his wants. Colonel Playfair's account is accompanied with a capital chart of Tunis, on which the route taken is carefully noted.

THE ARCTIC EXPEDITION.

III.

The Sea of Ancient Ice.

ONE of the very interesting subjects of investigation connected with the discoveries of the Arctic Expedition is that relating to the ancient ice met with north of Robeson Channel, which is similar to that described in Admiral Sherard Osborn's *Discovery of a North-West Passage*. We used to call this ancient formation "McClure's ice," for want of a better name, but a special name is much needed to obviate confusion, and to distinguish this ice from ordinary old pack. The name palaeocrystic was adopted by the officers at the time; but for present purposes I will use the expression "the sea of ancient ice." By ancient I mean the ice many years old of the area about to be defined, as distinguished from the old pack-ice met with in any other sea.

It now appears that this sea of ancient ice is of much greater extent than was supposed by Admiral Sherard Osborn. We know that it extends from near the coast of North America to the north-west extremity of Prince Patrick Island, a distance of 420 miles. There is then an unknown gap of about 420 miles from Prince Patrick Island to Aldrich's furthest, which is probably occupied by islands and coast-line. Thirdly, there is the coast-line discovered by Captain Nares, extending over about 300 miles from Aldrich's to Beaumont's furthest. We thus have a line extending from the American coast to Beaumont's furthest, in a north-east and south-west direction, for a distance of 1,140 miles, upon which this ancient ice rests.

The sea of ancient ice was first seen by Captain McClure when, on August 19, 1850, the *Investigator* ran into apparently open water off the mouth of the Mackenzie river in a north-eastern direction. But it was soon discovered that they were running into a trap in the main pack, consisting of ice of stupendous thickness, the surface rugged with the frosts and thaws of centuries, and totally unlike any ice ever met with in Baffin's Bay and adjacent seas. They ran up the blind lead in this dangerous ice for ninety miles; but, fortunately, the ship was put about in time, and escaped before the ice closed. There were no two opinions in the ship as to what would have been her fate if the floes had closed upon her.

In August, 1851, the *Investigator* passed along the west coast of Banks Island, and Captain McClure again had opportunities of examining the sea of ancient ice. The pack was of the same fearful description as that encountered in the offing of the Mackenzie river, at least eighty feet thick. The surface of the floes resembled rolling hills, some of them 100 feet from base to summit; and the edge of this wonderful oceanic ice rose in places from the water as high as the *Investigator's* lower yards.

Captain Collinson, in the *Enterprise*, also passed along the southern flank of the sea of ancient ice, and his description agrees with that of his second in command. In the spring of 1854, when wintering at Camden Bay on the coast of North America, Captain Collinson made

an attempt to travel over it with a sledge. He came upon it at a distance of about seven miles from the ship, but he found it to be of such a character as to render all travelling impracticable. His sledge was broken, one of the men fractured his thigh, and he was obliged to return after a few days. McClintock and Mecham found the same ancient ice along the west coast of Prince Patrick Island. Mecham terms this ice "tremendous;" and no one who has travelled elsewhere in the Arctic regions has ever met with similar oceanic ice. Along the coast discovered by Captain Nares the same ice was met with, not as a narrow belt along the shore, but becoming worse and more formidable to seaward, and composing the whole surface of this palaeocrystic sea.

The officers of the *Alert* had longer and better opportunities of carefully examining this most important phenomenon in physical geography than had ever been afforded to previous explorers, and their observations on this point form not the least valuable part of the results of the Expedition. The ice was from eighty to one hundred and fifty feet in thickness, judging from the height of the portion above water; and the surface was rugged in the extreme. Apart from the masses of hummocks thrown up during disruptions, the surfaces of some of these ancient floes were broken into hills and dales, the hills varying from ten to fifty feet in height. This, of course, must be the result of ages of drift, and of alternate frost and thaw. The floes far out to sea were infinitely heavier than those nearer the coast. The formation of this palaeocrystic sea is analogous to the well-known course of formation of glaciers. Year by year layer after layer is added to the upper surface, the lower layers becoming harder, owing to the superincumbent weight, until they are converted into snow-ice. The method of this formation was studied by means of the huge masses, well termed floe-bergs, which were cast upon the beach. Some of these were split by the frost, offering complete sections, which were carefully drawn. In some instances they showed lines of darker colour, at distances of many feet from the existing surface, indicating sections of the pools of water and intermediate rises which, during some far-distant summer, had been on the surface.

Such a sea as this is never navigable, but there was the clearest evidence of frequent, if not annual, disruptions. The vast masses of hummocks, thirty to fifty feet high, and sometimes a quarter of a mile wide, which occur at frequent intervals and divide the ancient floes, are evidence of very violent encounters between the floes; and mud found on the ice some miles from the shore is also a proof of movement. The ice traversed by Captain Markham consisted of ancient floes of small extent and very uneven surface, separated by lofty ranges of rugged hummocks, and there were occasionally narrow streams of this year's ice, that is about five feet four inches thick, connecting the floes. The drift-wood which was found on Prince Patrick and Banks Islands, and also on the scene of Captain Nares's discoveries, is likewise a proof that the palaeocrystic sea is subjected to movements the exact nature of which is uncertain; for this drift-wood must have come from the banks of Siberian rivers.

At the same time the periodical disruption is clearly only partial, and the movement of a particular floe is but slight during one season. For there is no sufficient outlet, apparently, for the ice of this sea. The age of the ice is a sufficient proof of this. Sherard Osborn describes the sea of ancient ice as "a vast floating glacier-like mass, surging to and fro in an enclosed area of the Arctic region." It is bounded on the south by the shores of North America; on the east by Banks and Prince Patrick Islands, Grant Land, and the north coast of Greenland; and on the west by Kellett Land and other unknown obstacles north of the Siberian coast; so that it has an area of about 1,200 miles both from south to north, and from east to west.

Its movement is slight, and the *Enterprise* and *Investigator* observed that it never moved off from the shore more than a mile or two, and then surged back again. The known outlets to the sea of ancient ice are very narrow. Fragments, forming great ice-streams, pour through Banks Strait into Melville Sound, but they never get west of Griffith Island, and are never seen in Barrow Strait. They appear to fill up McClintock Channel, which can never be navigable. Here Osborn saw them in May, 1851, and he describes the floe as of great antiquity, and as like a heavy cross sea suddenly frozen solid, the height of the solid waves being twenty-five feet. Allen Young reached Osborn's point of observation, and formed the same conclusion. He actually attempted, like Collinson, to travel across this palaeocrystic floe, but found it quite impracticable owing to the rugged nature of the ice.

Thus two explorers had attempted to tackle the ancient ice before the memorable journey of Captain Markham—namely, Sir Richard Collinson and Captain Allen Young, and they can well appreciate Captain Markham's difficulties, and the severity of the struggle he entered upon.

There is another outlet for the sea of ancient ice by Robeson Channel, but it is very narrow, and the ancient and heavy floes do not get much further south than Lincoln's Bay in 82° N. Lat., or thereabouts, according to the season. The *Polaris* did not encounter them; but the *Alert* was at one time actually beset in ancient floes off Cape Lincoln, before rounding Cape Union, and was in great danger. Their size and position in the strait would vary according to the season. Fragments of the ancient ice, no doubt, stream down the south coast of Greenland and round Cape Farewell; and it would be a matter of great interest to explore the east coast from Cape Bismarck to Beaumont's furthest, in order to ascertain the limit of the sea of ancient ice in that direction, and the causes which obstruct a freer flow of the ice which now, from want of an adequate outlet, continues to grow in thickness and ruggedness.

It was over this sea that Markham and Parr attempted to force their way; and by dint of perseverance they and their gallant followers, in spite of such difficulties as no other advancing sledge party (except those of Collinson and Allen Young) ever before encountered, achieved a position which will make their journey memorable for ever. Considering the character of the ice, the distance they made good was, as Capt. Nares truly says, marvellous. They advanced the Union Jack and their own standards to a point north of which no human being has ever put his foot.

CORRESPONDENCE.

EARLY COINS OF BOKHARA.

St. Petersburg: Nov. 1, 1876.

In Nos. 227-229 of the ACADEMY you have printed three notices of the Petersburg Congress of Orientalists, in the last of which, at p. 315, the author of those notices, Mr. Brandreth, gives a kind account of my statement regarding the coins of the rulers of Bokhara, struck before the Arabian invasion, and imitated, with some modifications, by the magistrate of the city under the government of the Khaliphs, Samanides and Kharlookh Turks. Besides a fragment of the Pehlevi inscription which was in use on the obverse of the Sassanian coins of the first half of the fifth century, the early section of the said coins of Bokhara, being an imitation of the former coins, bore on the obverse an inscription consisting of eleven characters which I assigned to the *Soghdian* alphabet mentioned by the Arab en-Nedim, author of the *Fihrist*. These eleven letters were deciphered by me, and represent the words *Bukhâr-Khuddâth*, or, "Lord of Bokhara." These words, and not "Kudan Bukhar," as given by my friend Mr. Brandreth, are the title of the princes of Bokhara before the Arabian conquests in Transoxiana. Mr. Brandreth also ascribes to me a statement that a similar title is applied by contemporary Chinese authors to the princes in question. I fear I must have been misunderstood by my honourable colleague at the meeting, since I do not remember having said anything of the kind; on the contrary, I have stated that the title of "Lord of Bokhara" is often quoted, besides *Narshakhi* (not "Narshaki"), my principal authority in this matter, by other Arabian historians and geographers, as Ibn-el-Athir, Khokdadbeh, Istakhrî, Ibn-Hauqûl, Mokaddesi, who render this title *Bukhâr-Khuddâh* or *Bukhâr-Khuddâh*. The History of the Chinese Thang-dynasty gives to the ruler of Bokhara the title "Maowoo," the same which other Chinese sources give also to other princes of Transoxiana, and does not know the title cited by the Arabian authors.

P. LERCH.

DR. SCHLIEMANN'S DISCOVERIES AT MYKENAE.

Oxford: Nov. 13, 1876.

Every student of Greek history and antiquities ought to take a profound interest in Dr. Schliemann's recent excavations at Mykenae. The city of Agamemnon, "king of men," the centre of so many myths and legends, is one of the few relics that have come down to us of the prehistoric period of Greece. No one can look at the huge, well-cut blocks of conglomerate of which the walls are formed, or at the so-called Treasury of Atreus, or at the lions carved in limestone over the great gate of the town, with their Assyrian features and Oriental design, without concluding that the dynasty which reigned at Mykenae must have been both powerful and rich. Mykenae shows a great advance upon the rude architecture of the neighbouring Tiryns, an advance which, perhaps, implies several intervening centuries of culture and civilisation. What struck me most

* Most of the geographers cited also mention the peculiar specimens of dirhems which in the time of the Samanides were in circulation on the markets of Bokhara.

there was the Eastern character of the place; the sculptures over the main entrance might have been carved by an artist of Esar-haddon, and the site of the city was strewn with fragments of Phoenician pottery.

According to Dr. Schliemann, the walls belong to three distinct periods, the oldest portion being the underlying part which resembles the architecture of Tiryns. They surrounded the Acropolis, the lower city extending to the south-west, and being still marked by traces of cyclopean walls and other remains. One of the most curious results of Dr. Schliemann's excavations is the discovery that the city was reinhabited after its capture by the Argives in B.C. 458, although its very site had been so completely forgotten by Strabo's day that he declares no vestiges of it were in existence. The new Mykenae seems to have lasted about two centuries; at all events, the fluted vases found among its rubbish are of the Macedonian era, and come down to the second century B.C. Below the later city lie the ruins of the Mykenae of Homer, and these have already yielded an immense number of objects to Dr. Schliemann's workmen. Bronze, as might have been expected, is very abundant, while stone implements, including two hatchets of diorite, and iron keys, arrow-heads, and knives, have also been met with. Some glass beads, like the pottery, indicate trade with Phoenicia. Fragments of a lyre and a flute, as well as of a crystal vase and a wooden comb, have also been found. Great quantities, too, of terra-cotta images have been dug up. Some of these represent either the whole figure or the head of a cow, and Dr. Schliemann believes that he sees in them a confirmation of his theory that *Βούπις Ἥρη* was a cow-headed divinity. Dr. Schliemann's drawings, however, make me feel a little doubtful as to whether a cow was really intended; the animal seems rather male than female. Besides the terra-cotta "cows" there are rude representations of the goddess whom M. Lenormant (*Gazette Archéologique*, ii., 1 and 3) has identified with the Artemis Nanaea of Babylonia, as well as of a male divinity with a long Assyrian beard. Perhaps the most peculiar of the terra-cottas is a frequently-recurring one with a long handle above which two horns protrude, and above these again comes a neck surmounted by a disk in the shape of a bowl. The neck is provided with eyes and nose, and two breasts are placed between the horns. From Dr. Schliemann's drawing I should infer that the object was not an idol but was applied to some other use. Along with these figures were found also those of an old and ugly woman, of horse-heads, of a lion, of a ram, and even of an elephant, which again indicates intercourse with the East. The ornamentation of the pottery is elaborate and various, and many of the vases are painted inside and out. A favourite pattern seems to be one which consists of broken wavy lines, a specimen of which I picked up at Mykenae four years ago.

Only three inscriptions, or what look like inscriptions, have been discovered: one on a disk, another on the figure of a goddess, and the third on two portions of the hind part of a "cow." The characters apparently belong to the Phoenician alphabet, but their cursive and indistinct forms make it impossible to read them. I have been struck by their resemblance, however, to the *graffiti* found on the *kelebe* of two quadrigae discovered in the Etruscan cemetery of La Certosa by Signor Zannoni. Certain wavy lines on the broken neck of a vase, one side of which is ornamented with two breasts, may also possibly turn out to be intended for writing. However this may be, the form of the letters in a short Greek inscription which reads *το ηροος-εμ (τοῦ ἥροος-εἰμι)* may, Prof. Max Müller thinks, serve to fix the date of some of the buildings.

Among the most interesting objects exhumed are a series of tombstones between four and five feet high, many of which are adorned with sculpture like the tombstones found in the Etruscan

necropolis of La Certosa. The sculptures are archaic in character, and probably belong to the same age as that over the Gate of the Lions. The latter, I am convinced, is of later date than the Gate itself. The Treasury of Atreus makes it clear that a triangular space was left over a gateway in early Mykenean architecture by way of ornament; in the case of the Lions' Gate the triangular space has been filled up by a block of blue Messenian limestone which very nearly fits it. On one side, however, the stones of the wall have had to be cut away to make room for the intruder, while on the other side small stones have been inserted to fill up the vacant space between the wall and the sculptured stone. The tombstones are generally divided into two compartments, one of them bearing the representation of a warrior in a one-horse chariot, the form of which exactly resembles that of the chariots represented on the Assyrian bas-reliefs. The wheel has four spokes, and in the case of one of the tombstones, a drawing of which lies before me, the chariot is provided with a spear-head or scythe protruding from behind. The horse is drawn somewhat spiritedly, with widely extended legs, and in front stands a man on foot with a long lance. In the lower compartment are two circles with spiral ornaments, which are executed with mathematical accuracy. On another tombstone the warrior in the chariot holds a broad sword in one hand and a lance in the other, with which he is piercing the neck of a nondescript animal, whose horn is grasped by a man with a long sacrificial knife. The sculpture irresistibly reminds us of some of the early Babylonian gems.

Some interesting painted vases with the usual drab ground have further been found in a cyclopean dwelling-house, representing warriors in tunic, girdle-belt, greaves, and sandals, and armed with a lance and crescent-shaped shield. In the same locality have also been discovered several other curious remains, among them a fount for casting the mysterious terra-cotta disks, and a large and well-engraved onyx stone.

Close to the Lions' Gate Dr. Schliemann came across the fragment of a quadrangular red porphyry column with an oblong space in the centre and a rose at each end, as well as the fragment of another porphyry column and a frieze of hard limestone, each adorned with spiral ornamentations. It must be remembered that the column was characteristically Babylonian, and that columnar architecture has nowhere been carried to such perfection as among the Assyrians.

Many fresh discoveries of interest may be expected to result from the excavation of the great *tholos* or tomb opposite the Lions' Gate which Dr. Schliemann is at present engaged upon, and where he has already found that the triangular space over the entrance must have once contained a sculptured stone similar to that over the great gate of the city. The tomb is analogous to the "Treasury of Atreus," excavated by Veli Pasha in 1810, an undertaking which shows that the Turks are not so insensible to the claims of archaeology and art as our Slavophiles would wish to make out. Sculptured slabs were found in the "Treasury" similar to those discovered by Dr. Schliemann. It may be noticed that the spear heads incised upon the stone posts of the entrance to the "Treasury" resemble those sculptured on Dr. Schliemann's tombstones, and were probably the emblems of royalty.

A. H. SAYCE.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Nov. 18.—3 P.M. Crystal Palace Concert (Mdlle. Mehlig).
3 P.M. Saturday Popular Concert.
MONDAY, Nov. 20.—8 P.M. British Architects.
8 P.M. Monday Popular Concert.
TUESDAY, Nov. 21.—7.15 P.M. Statistical.
8 P.M. Civil Engineers.
8 P.M. Herr Franke's Fourth Concert, Langham Hall.
8.30 P.M. Zoological: Papers by Messrs. G. B. Sowerby, E. R. Alston, A. G. Butler, and Prof. Garrod.
WEDNESDAY, Nov. 22.—8 P.M. Society of Arts: "Collapsible Boats," by Rev. E. L. Northon.
8 P.M. Royal Society of Literature: "On two Saxon MSS. in the British Museum," by W. De Gray Birch.
THURSDAY, Nov. 23.—8 P.M. Royal Albert Hall Choral Society (*Stabat Mater and Hymn of Praise*).
FRIDAY, Nov. 24.—8 P.M. Quckett.

SCIENCE.

THE VEDA AND ITS INFLUENCE IN INDIA.

Vedārthayātna; or, an Attempt to Interpret the Vedas. (Bombay, 1876.)

(Second Notice.)

PEOPLE have sometimes asked why there is as yet no complete translation of the *Rig-Veda*. First of all, there is one, or, one may say, there are two complete translations—one by Langlois in French, the other by Sāyana in Sanskrit, and from it, in English, by Wilson. Wilson's translation is not quite complete, but there is only one volume wanting to complete it. Besides these, there are in separate essays or in periodicals translations of a large number of really important hymns by Roth, Benfey, Bollensen, myself, and others. Roth, who was best qualified to give us a German translation, has not yet done so; but a small collection of hymns—six translated by Roth, thirty-one by Geldner, thirty-three by Kaegi—has lately been published, and some more are to be found translated into English in the volumes of Muir's *Original Sanskrit Texts*. It is easy, in fact, with the materials now accessible to translate the easy hymns; but what is really wanted, at least by scholars, is not only a translation, but a justification, and, more particularly, an explanation of really difficult passages. This is what I attempted in my translation of the *Rig-Veda*, of which the first volume was published in 1869; and, now that I am free again, I hope to continue that task. In the meantime, two other translations have made their appearance, one by Prof. Ludwig, the other by Prof. Grassmann. Both constitute most valuable contributions, and as they are both the result of original and independent study, they are valuable, not only where they agree, but also where they differ. We hear of other translations which are in preparation, and they will all be welcome. There is work enough for many workers, if only they will work according to a well-defined method. What we do not want any more is guesswork, however ingenious, such as we find in Langlois' and other translations. But a careful analysis of the varying meanings of words, an intelligent exposition of the whole structure of certain hymns, and an elaboration of the characteristic features of each deity, will always constitute valuable contributions to Vedic scholarship.

While all this work is going on in Europe, it may be interesting to know what view is taken of it in India. It has sometimes been supposed that in India itself the *Veda* is antiquated, that its deities have been replaced by more popular modern names, its sacred traditions exchanged for Panrānik legends, its precepts supplanted by the *Smritis* of Manu, and its whole authority destroyed by a different faith. There is some truth in this, but no more than if we were to say that in Roman Catholic countries the worship of the Virgin and Saints had taken the place of the old Christian worship, that the morality of the Bible had been superseded by the prescriptions of modern codes of law, and the authority of our sacred books overruled by the decisions of Popes and Councils. No doubt, among the 240 millions in India there are

but few who can read the *Veda*, still fewer who could understand it correctly. But the tradition of Vedic theology exists unbroken in the country, and those who are recognised as the leaders of religious thought would be as much horrified at the idea of seeing the authority of the *Veda* overruled, as even the most infallible of Popes would be, were he asked to overrule any passage in the New Testament. Whatever the ignorance of the people, whatever the ignorance of the priests may be, there is to the present day no recognised authority on religious matters equal to that of the *Veda*. Everything, law-books, philosophic systems, Purānas and Tantras must bow before the *Veda*. It was but natural, therefore, that the publication of the *Veda* in England, and the studies connected with it, should react on the theology of India. The *Veda* had never been printed in India; it existed, as stated before, in MSS., but chiefly in the oral tradition of the schools. It was considered too sacred a book to be profaned by the press, and for a long time, while every other Sanskrit text was allowed to be printed at the native presses, an exception was made in the case of the *Rig-Veda*. My own edition was under various pretexts represented as impure, and, though it was used by scholars, it never was allowed to take the place of a MS. copy. For several years, however, there have been indications in native papers that the interest in the *Veda* and in a critical study of the *Veda* is increasing. Some of the younger Pandits, who still combine some of the advantages of the old native system of studying Sanskrit with the instruction they receive in the Government Colleges at Calcutta, Bombay, Poona, or Madras, placed from time to time the results of the European study of the *Veda* before their compatriots. They soon began to take an active part themselves, to criticise the works of English Orientalists, and to contribute valuable essays from their own pens. At last some of these young students and religious reformers have combined to bring out a native edition of the *Rig-Veda*, and its commentary, with a translation in Marāthi and English, and notes in the former language. The title of the work is *Vedārthayātna*—i.e. an attempt to find out the meaning of the *Veda*. Three numbers have been published, containing twenty-two hymns. The object of the editor is social and religious rather than philological. While

"there are thousands of Brahmans," he writes, "who know the whole of the *Rigveda* by heart, and can repeat it in *Samhitā*, *Pada*, *Gatā*, *Ghava*, and *Krama*, without making any mistakes [these are different methods of learning the *Veda*, by either reciting each word separately, or by repeating the words in various complicated ways], there are probably not more than a dozen who have ever attempted to understand what the *Veda* contains. There are quite as many who can repeat the *Yagur* and also the *Sāma Veda*, though *Atharva-Vedis* are very few, at least in the Bombay Presidency."

With regard to the authority of the *Veda*, and the influences which it still exercises directly or indirectly on the religious life of India, a young Brahman writes to me:—

"The sanctity of the Vedic texts is as great as it ever was. The belief that the *Vedas* contain all that is great, good, and divine, and that all

they contain is great, good, and divine, is little shaken, except in the minds of a few educated men in and about the Presidency towns. The masses, and most of the higher classes, firmly believe that the *Veda* contains the authority for all that is enjoined and all that is prohibited to the modern Hindu. Widow marriage is believed to be prohibited by texts to be found in the *Veda*. The monstrous division into thousands of little communities of caste is believed to be supported by the *Veda* in all its modern rigour, which prevents a Brahman from drinking water touched by a Brahman of another subdivision, and requires him to purify himself by ablutions, if he is touched by the shadow of a Mahār or Atisūdra. All customs, all usages, all stories, all laws, are believed to be based on Vedic texts. Even things which can easily be shown to have no pretence to any antiquity whatsoever, are represented as based upon Vedic texts."

Those, therefore, who endeavour to introduce any social or religious reforms among the natives are constantly thwarted by the *Veda*, and the spell which it still exercises on the native mind, the people clinging fast to the belief that what their fathers did or abstained from doing was ordained by the *Veda*. The translation now offered to the natives in Sanskrit, Marāthi, and English, is chiefly intended to show what the *Veda* really contains, and especially to prove that those texts which are supposed to authorise modern rites and beliefs among the people, do not authorise them. To this object the greater part of the notes are devoted. Thus the verse i. 6, 3, "*Ketum kṛāvan aketave*" is repeated in a ceremony now performed to avert the ill-will of the imaginary planet Ketu. An ignorant priest, who only knew how to repeat the verse, at once connected the *ketum* of the verse with the planet Ketu, and accordingly taught that all the Purānas tell about Ketu was authorised by the *Veda*. A note of the translator fully explains this, and shows the simplicity of the religious conceptions of the Vedic Rishis as compared with those of their modern interpreters.

We are told that, if the authority of the *Veda* is regarded as invulnerably sacred, the belief that it is impossible for any human being not inspired like the old Rishis, to interpret the *Veda*, is almost as invulnerably firm. Hence the editor has adopted the following plan. He gives first the *Samhitā* text of the *Rig-Veda* with the *Pada* text, because the Vaidik Brahmans regard the *Samhitā* text alone as quite incomplete. He then gives a translation based as much as possible on the recognised commentary of Sāyana. He does not however, follow Sāyana slavishly, but if he finds that the explanation of a word which that infallible commentator gives in one passage is impossible, he takes, whenever he can do so, another explanation of the same word given by the same writer in some other passage, thus shielding his departure from Sāyana by the authority of Sāyana himself. This rendering of the *Veda* into Sanskrit is chiefly intended for the old Shāstris, who despise all vernacular speech, and who would be repelled still more by English. The Marāthi translation will find its way to the educated classes among the natives; the English is intended for that small but important class of Indian society which has adopted the language of the ruler as the *lingua franca* of

the day. It is to be hoped that this important work may be continued, though it will probably take at least ten years to finish it.

It is pleasant to see the liberal tone in which these young native reformers acknowledge their indebtedness to European scholarship.

"I need hardly say," the editor writes, "that this attempt of mine [the *Vedārthayātna*] would have been impossible but for your *Editio Princeps* of the *Rig-Veda*, with Sāyana's commentary. I must further say that such a translation as is given in the *Vedārthayātna* would have also been impossible but for the labours of Śarmāya Pandits like you and the compilers of the Petersburg Dictionary. My text is taken from your editions."

We thus see how intimately our purely philological labours at home are connected with the important problems that agitate the Indian mind. The *Veda* is still the heart of the religious life of India, and if it ceases to beat, something else must take its place. The schism which lately took place in the Brahma Samāj turned chiefly on the question whether the *Veda* should still be considered as the vital source of religious belief, or whether a new authority, the voice within, should be recognised as the only true *Sruti* or revelation. The edition of the New Testament by Erasmus appeared to many a mere feat of scholarship; it turned out to be the harbinger of a Reformation. The first edition of the *Rig-Veda* was meant for students only; it may turn out to have brought on a crisis in the religious belief of India, which must end in death, or in a new life.

F. MAX MÜLLER.

CURRENT SCIENTIFIC LITERATURE.

The Five Senses of Man. By Prof. Julius Bernstein, of the University of Halle. International Scientific Series. (Henry S. King and Co.) The intimate connexion that exists between the organs of special sense and the cerebral mechanism underlying our mental processes is becoming more and more universally acknowledged every day. Owing to this tendency of modern metaphysics, there is a large and increasing class of persons among the reading public who find some acquaintance with the physiology of the nervous system to be an indispensable preliminary to the intelligent study of writers on the philosophy of mind. It is to such readers, principally, that the present work is addressed. Without being popular in the unfavourable sense of the word—without, that is, trying to excite an unreal interest in his subject-matter by the stimulus of rhetorical amplification or illustrative anecdote—Prof. Bernstein makes no undue demand upon the reader's familiarity with the technical commonplaces of physical science. The information he gives may be thoroughly relied upon; and his account of such comparatively difficult topics as the perception of colour, the phenomena of ocular accommodation and refraction, and Helmholtz's researches on the sense of hearing and the nature of musical sounds, leaves nothing to be desired in the way of clearness and accuracy. It is right to add that the author's meaning has not been obscured by ignorance or carelessness on the translator's part. Indeed, the translation, for the work of an anonymous writer, appears to us to be of unusual merit.

Essay on the Use of the Spleen, with an Episode of the Spleen's Marriage: a Physiological Love Story. By P. Black, M.D. (Smith, Elder and Co.) It is not very easy to make out whether the accomplished author of this rather fanciful

brochure desires it to be viewed as a mere *jeu d'esprit*, or as a serious contribution to our physiological knowledge. After some pungent and not wholly undeserved strictures on the amazing confusion of opinion concerning the functions of the spleen, which has hitherto been the only fruit of the experimental removal of this organ, Dr. Black proceeds to settle the vexed question on purely anatomical grounds. The blood returning through the splenic vein mingles with that brought from the digestive tube by the meseraic veins, and the blended currents proceed through the portal vein to the liver. The secreting function of this important gland requires more blood for its due performance than the veins coming from the intestinal tract are able to supply. Hence the necessity for an additional volume of blood, drawn from a special cistern in immediate connexion with the portal trunk. This cistern is the spongy parenchyma of the spleen. Simple and rather bare as this hypothesis appears to be when reduced to its fundamental elements, we should be doing injustice to our author were we not to add that he clothes it in many-coloured raiment of poetic fancies and metaphysical subtleties. The "Spleen's Marriage" is the union of the meseraic with the splenic blood; the former likened to the maiden Ruth, who, after gleaning in rich corn-fields, returns from her labour, her hands laden with the fruit of her industry. Charles Lamb, evidently a favourite with Dr. Black, should have been alive to read his essay; he might have made more out of it than a generation of physiologists whose sense of humour has been dulled by much reading of German *Beiträge*.

Handbook of Rural Sanitary Science. Edited by Lory Marsh, M.D. (Smith, Elder and Co.) About a year ago the editor of this work offered a prize for an essay on certain points connected with rural sanitation. The prize was awarded by Mr. Bailey Denton, C.E., and Mr. James Howard, of Bedford, to Mr. Gardner, whose essay occupies about half of Dr. Marsh's volume. The remaining half is made up of condensed abstracts of three other essays considered by the adjudicators to be worthy of honourable mention. The chief subjects dealt with are: the means of securing a supply of pure air and water for cottage dwellings, and the removal and utilisation of refuse, with especial reference to the powers of the Local Government Board, and the organisation of rural sanitary authority. Although it can hardly be said to contain very much in the way of original suggestion, the book gives a clear notion of the objects to be kept in view by those public-spirited country gentlemen whose belief in sanitary progress is sufficiently active to overcome a natural indisposition to expenditure not obviously or immediately productive. Mr. Gardner's sanitary ideal is not placed too high above the possibilities of every-day life, and he does not damage his case by exaggerated notions of the benefit to be expected from the universal adoption of the earth-closet system. On one important point the editor and his contributors are all agreed—viz., that the existing arrangement of sanitary areas is simply chaotic. "Simplification of areas and authorities," said Mr. Stansfeld, "was the object of the Act of 1872;" and he added that sanitary law can be effectually administered only "by securing the intelligent co-operation of local representative bodies." On this Mr. Cresswell very justly remarks:—

"The theory is admirable, but the facts are against us. We have at present neither simplified areas nor authorities; and Diogenes with his lantern would search in vain to discover any trace of 'intelligent co-operation' among the frequent townships, hamlets, chapelries, lighting and paving districts, and other 'ancient and unobtrusive' communities which are interspersed without sympathy or cohesion throughout the country."

The truth appears to be that a sanitary area should stand in some definite relation to the physical configuration of the country; for it is

on this that the solution of all problems connected with the disposal of sewage and other refuse, the supply of water for household purposes, &c., must primarily depend. The administrative difficulties in the way of the application of this principle might be overcome by vigorous action on the part of the central authority. Experience has abundantly proved that the obstacles arising from the conflict of petty local interests, from anxiety to deal tenderly with vested rights, from the ignorance and want of imaginative foresight so generally exhibited by elective bodies, can only be surmounted by the exercise of a certain amount of salutary despotism.

Sanitary Work in the Smaller Towns and in Villages. By Charles Slagg. (Crosby Lockwood and Co.) This little book, by an engineer, deals neither with the medical nor the administrative aspect of sanitary science, but with the means of carrying out those purposes which are generally admitted to be of primary importance to the maintenance of public health. Sanitary improvement in a village or small town means an outlay of money, an outlay which it is often difficult to meet. Hence the need of mechanical contrivances of a simpler and less expensive kind than those adopted in wealthy and populous centres. A large number of such contrivances are described by the author in language not too technical for the ordinary reader. The book is divided into three parts. The first is devoted to some of the more common forms of nuisance, such as pig-styes, slaughter-houses, &c., with the remedies appropriate to each case. The second deals with drainage; the third, with water-supply. The directions given will be of service, not merely to rural boards, but to the individual householder who is prudent enough to look into the operations carried out on his premises by bricklayers and plumbers, and energetic enough to force the rudiments of sanitary engineering on their reluctant minds.

Cup and Platter, or Notes on Food and its Effects. By G. O. Drewry, M.D., and H. C. Bartlett, Ph.D., F.C.S. (Henry S. King and Co.) This is a compilation of very elementary facts about our food and drink, with an introductory chapter on diet. The weakest part of the book is that which deals with the relation of particular articles of diet to special forms of disease. For instance, it is hardly correct to say that the malady of infant life known as rickets is due to a lack of phosphate of lime in the food, or to attribute *goutre* to an excess of lime in the water habitually drunk by those affected. A few hints on the relative value of different articles of diet, and the more usual methods of adulteration, may be of use to the writer of the next cookery-book. Upon the whole, however, it is not easy to make out for whose benefit the work is intended. Everything it contains—including even its blunders—is thoroughly familiar to the chemist and the physician; while its style is too insufferably dry to attract the general reader.

Fresh Air in the House and How to Secure It. By James Curtis, C.E. (Ward, Lock and Tyler.) A rather wordy pamphlet to recommend the systematic ventilation of all dwelling-rooms by a double system of vertical pipes, one of which admits a downward current of pure air from above the roof of the house, while the vitiated air makes its escape up the other. Continuity of flow is provided for by a difference of temperature, and therefore of specific gravity, between the ascending and descending columns. There is nothing very new in this suggestion. It is not so much to a lack of practicable methods, as to the ignorance of builders and the carelessness of a majority of the public, that the inadequacy of the provisions made for keeping the air we breathe up to a reasonable standard of purity must be ascribed.

SCIENCE NOTES.

ASTRONOMY.

Scintillation of the Stars.—M. Montigny has continued his researches on this subject with especial reference to the influence of the approach of rain on the twinkling of the stars. Eighteen hundred observations referring to seventy stars have been discussed, two hundred and thirty nights having been devoted to this work with the scintillometer, already described in these columns. The conclusions at which M. Montigny arrives are as follows:—1. At all times of the year the scintillation is more marked under the influence of rain. 2. Under all circumstances it is more marked in winter than in summer, and also in spring than in autumn for wet weather; in dry weather the spring and autumn are nearly equal in this respect. 3. Scintillation varies with the atmospheric refraction. 4. The approach of rain, and especially its continuance, affect the intensity of scintillation. 5. The amount of rain is always greater on the second of two days than on the first, but it is less in winter than in summer, and the more marked scintillation in winter results, therefore, from the increased density of the air due to the low temperature and high barometer. Similar conclusions are arrived at by grouping together the observations according to the intensity of scintillation, eighty-six per cent. of the days with very marked scintillation being under the influence of rain. The twinkling of the stars appears also to be very marked in windy weather, and strong scintillation is a sign of an approaching storm, the colours being more decided in the case of rain, and accompanied by irregularities in the image. It is to be remarked that this is the case notwithstanding the fall in the barometer corresponding to a decrease in the density of the air, which would naturally diminish the scintillation. As might be expected, the altitude at which twinkling first becomes sensible is increased by the approach of rain.

The Variations of Gravity.—The pendulum observations made in India have shown that there is a deficiency of attracting matter under that great continent, and this conclusion is borne out by a comparison of the geodetic and astronomical longitudes of stations on the east and west coast, from which it appears that the ocean bed exercises a stronger attraction than the raised land. In the *Astronomische Nachrichten* Herr Hann calls attention to this, and also to the circumstance that oceanic islands show an excess of attraction which cannot be accounted for by the nature of the rock of which they are composed. The theory that there are great cavities under the large continents appears hardly tenable, and the more probable supposition would seem to be that they rise above the sea-level by virtue of their specific lightness, floating perhaps like icebergs surrounded by a floe, with the molten liquid under a thin crust. There are, however, difficulties connected with precession and nutation and tides in a fluid interior, all of which Sir W. Thomson has pointed out, and we can only wait for further data. The balance of evidence, however, seems now to have changed, inclining to the hypothesis of a moderately thin crust with fluid or semi-fluid interior.

The Transit of Venus, 1882.—Prof. Bruhns has calculated the circumstances of this phenomenon, taking Leverrier's tables of the sun and Venus as the basis of his computations. This transit will be visible in England, but the best stations for determination of the parallax will be in America, and in the islands of the Southern Ocean. The experience gained in 1874 will be invaluable for these observations, for which it is to be hoped that all nations will again join in fitting out expeditions. In preparation for this, Prof. Bruhns has done good service in calculating from the best tables the circumstances of the transit.

PHILOLOGY.

THE eleventh volume of the *Hermes* concludes with an important number, almost entirely taken up with discussions on points of Greek scholarship. Gomperz publishes, from Hayter's copy of the original, the Herculean fragment of Polystratus *περί ἀλόγου καταφρονήσεως*, an important contribution to our knowledge of Epicureanism. The fragment of a Greek comedy recently discovered by Tischendorf, and assigned by Cobet to Menander, is discussed both by Gomperz and by Wilamowitz-Möllendorf, who christens the lost play *The Pessimist*. Zeller has a weighty paper on the controversy between Theophrastus and Zeno on the eternity of the world, and a shorter one on Chaerephon and Horapollon. Gardthausen ("Die Tachygraphie der Griechen") discusses the date of the introduction of shorthand writing among the Greeks. R. Neubauer completes (from a fragment misplaced among the Delian inscriptions) the catalogue of *ἑφημερίαι* in the *Corpus Inscriptionum Græcarum*, No. 281, besides contributing an essay on the chronology of the Attic archons from 135–171 A.D. There is an interesting paper by Niese on the documents quoted in Josephus, *Arch.* xiii., 14–16. Eberhard contributes some notes on Moschopolus *On the Magic Squares*, and J. G. Droysen on Duris and Hieronymus. The only contribution to Latin scholarship is Freudenbergs article on Aurelius Victor.

THE most important original papers in the two last numbers of the *Neue Jahrbücher* (Fleckeisen and Masius) are (vol. cxiii. and cxiv., part 8) A. Schäfer's on the Roman consulate, and Lüttger's on the date of the defeat of Varus: in the following number an essay by E. Wilisch on the fall of the Bacchiadae at Corinth, Reuss's paper on Agis and Aratus, and Förster's concluding article on Libanius. Among the reviews in these two numbers may be noticed especially Gutschmid on Baudissin's *Studien zur Semitischen Religionsgeschichte*, Christensen on Lange's *De patrum auctoritate*, and Eassner on Ulrich's *Agricola of Tacitus*, in the 8th part; in the 9th, Gotschlich on Döring's *Kunstlehre des Aristoteles*, Langen on Schöll's *De accentu linguae Latinae*, and Dünker on Merzdorf's edition of *Troilus Alberti Stadensis*. In the educational section of part 8 Hess concludes his review of Kern's *Ludwig Giesebrecht*, and Prühle continues his publication of the correspondence of Lessing, Eschenburg, &c. There are three interesting educational papers in this number: Eiselen on the present system of school certificates, "L. G." on the best method of introducing boys to the study of Greek art, and Fischer on the reform of the Gymnasia. In the following number Erler has an interesting paper on "Seminaries for Teachers in the Higher Schools," and Pansch discusses the best means of solving the "religious difficulty" in Gymnasia and Real-schulen. There are two contributions to the discussion of German orthography, an independent essay by Lohmeyer, and a review by Kohl of Sander's *Vorschläge zur Feststellung einer einheitlichen Rechtschreibung für Allddeutschland*. Hultgren contributes the first instalment of a metrical translation of Tibullus's elegies to Delia.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY.—(Saturday, November 4.)

Prof. G. C. FOSTER, President, in the Chair. Dr. Guthrie read two letters which he had received from Dr. Forel, in reference to the "Seiches" or periodic oscillations which take place in the Swiss lakes. Since his communication he has found, in a pamphlet by Dr. J. R. Mérian, published in 1828, a formula which is strictly applicable to the phenomena under consideration. If t be the duration of half an oscillation, h the depth of the lake, and el its length—

$$t = \sqrt{\frac{\pi l}{g}} \left\{ \frac{\pi h}{l} + \frac{e^{-\frac{\pi h}{l}}}{e^{\frac{\pi h}{l}} - e^{-\frac{\pi h}{l}}} \right\}^{\frac{1}{2}}$$

Considering that probably this formula will be applicable to lakes of irregular depth if h be the mean depth, he has applied it to several with satisfactory results. In the case of Lake Wallenstadt, the formula having shown the mean depth to be somewhat greater than the generally accepted greatest depth, Prof. Forel took a number of fresh soundings and found a great basin of comparatively even bottom, and of such a depth as to render probable the mean depth given by the formula.—Dr. Stone exhibited some diffraction gratings, on glass and metal, ruled for him by Mr. W. Clark, of Windsor Terrace, Lower Norwood. The majority of them were close spirals about 1,000 to the inch, which, when held between the eye and a distant lime-light, exhibited circular spectra of great brilliancy. The metal gratings were of linear form, 1,000 lines to the inch, intended for use by reflection in a spectroscope. The spectra thus obtained were of much greater brilliancy than those ordinarily obtained by refraction, and presented obvious advantages for examining the ultra-violet rays.—Dr. Guthrie then briefly described some experiments which he has made to determine the effect of a crystalloid on a colloid when in the presence of water. Two or three lumps of rock salt were added to a jelly of size, and the whole hermetically sealed in a glass tube. The colloid parted with its water readily, a saturated solution of the salt was obtained, and the size became perfectly white and opaque. Experiments were also made, employing a more hygrometric salt, such as chloride of calcium.

SOCIETY OF BIBLICAL ARCHAEOLOGY.—(Tuesday, November 7.)

Dr. S. BIRCH, President, in the Chair. The following papers were read:—1. "Memoir of the Life and Labours of the late George Smith," by W. St. Chad Boscawen; 2. Notes on the Hymnarian Inscriptions contained in the Museum of the Royal Asiatic Society of Bombay, by Capt. W. F. Prideaux; 3. "Further Notes and Observations on the preceding Inscriptions," by Dr. Heinrich Müller; 4. "On the Writings of Ephraem Syrus," by the Rev. J. M. Rodwell. The writings of Ephraem, the Syrian deacon, generally, whether as commentaries or metrical homilies, offer numerous points of contact with the Holy Scriptures, not only through the affinity of Syriac to the Hebrew, and with reference to the *usus loquendi*, but directly as commentaries upon the sacred records. The Nisibean Hymns have a peculiar interest of their own. They throw light upon that peculiar point of history when Christianity was struggling with the ancient idolatries of Assyria, and when the orthodox Churches of the East had much to suffer, not only from the heathen, but at the hands either of persecuting or Arian emperors. The earlier Nisibean Hymns were written when Sapor II., king of Persia, was laying siege to Nisibis. The peculiar metres in which the hymns are written open a very interesting field for consideration, as it is quite possible that they were primarily suggested by, if not derived from, the rhythmic structure of the Davidic and other Psalms.

ZOOLOGICAL SOCIETY.—(Tuesday, November 7.)

Prof. NEWTON, F.R.S. Vice-President, in the Chair. The Secretary read a Report on the additions that had been made to the Society's menagerie during the months of June, July, August, and September, 1876. A letter was read from Dr. Otto Finsch relating to the supposed existence of the wild camel (*Camelus bactrianus*) in Central Asia. A letter was read from Mr. E. Pierson Ramsay, giving a description of the habits of some *Ceratodi* living in the Australian Museum, Sydney, which he had lately received from Queensland. Mr. W. K. Parker read a memoir on the structure and development of the skull in the sharks and rays. Prof. A. Newton made a correction of some of the statements in Canon Tristram's "Note on the Discovery of the Roebuck in Palestine." Lieutenant-Colonel Beddome gave the description of a new species of Indian snake from Manantawaddy, in the Wynaad Hills, which he proposed to name *Platyplectrurus Hewstoni*. Dr. G. E. Dobson communicated a monograph of the bats of the group *Molossi*. Dr. A. Gunther, F.R.S., read a Report on some of the recent additions to the collection of mammalia in the British Museum, among the more remarkable of which was a new form of porcupine, from Borneo, proposed to be called *Trichys lipura*; and a new marmoset, obtained

by Mr. T. K. Salmon, near Medellin, United States of Columbia, to which the name *Hapale leucopus* was given.

ROYAL MICROSCOPICAL SOCIETY.—(Tuesday, November 7.)

H. C. SORBY, Esq., F.R.S., President, in the Chair. A paper by the Rev. W. H. Dallinger was read, entitled "Experiments with Sterile Putrescible Fluids exposed alternately to an Optically Pure Atmosphere and to one charged with known Organic Germs of extreme minuteness." The previous researches of Messrs. Dallinger and Drysdale had shown that when one of the fish-macerations they employed was allowed to dry up and become brittle, the powder from it contained germs of some of the remarkable monads they described, and which would develop under favourable conditions. In the present experiments they used an air-chamber after Tyndall's plan, and tested it for motes by a beam of oxyhydrogen light. The germs were obtained from a maceration of haddock's head that had been kept for fifteen months, and found to contain a supply of the "springing and calyceine monads" of their former papers, many of them in a condition for emitting spores. A portion of this material was dried at a temperature of 150°, and subsequently kept for ten minutes at 145°, being five degrees higher than the heat the adult forms could stand. Dust from it was diffused through the Tyndall chamber, and after the heavier particles had settled in the course of four and a half hours a light-beam passing through it was found "less brilliant, but more uniform than in the air outside the chamber." Ten small glass basins filled with Cohn's Nutritive Fluid, freshly prepared, were then introduced: six being open, and four covered with glass lids. In this condition they were left for four-and-twenty hours, and then, by a contrivance which avoided all risk of admitting extraneous matter, the lids were removed from the four covered vessels. After four days the first six vessels were examined: calyceine monads were found in all, and in smaller numbers the springing sort. Two days later the four vessels were examined: in three there were no calyceine monads, and very few in the fourth; all exhibited the springing monads. The calyceine monads produce larger germs than the springing sort, and the probable explanation of the above facts is that the largest and heaviest germs settled down first from their state of suspension in the air, and that few were left to fall into the four vessels when their covers were removed. A fresh set of experiments confirmed this view.—Another paper described a new refractometer by Dr. Pigott. The instrument, which may be seen in the Loan Collection at South Kensington, is able to measure the refractive power of thin glass plates or other refractive bodies. It is founded upon the principle of the well-known experiment by which the image of a coin at the bottom of a basin is raised by pouring water over it. By very delicate screw movements the exact height to which the image of a small appropriate object is raised by the interposition of a refracting substance can be read off by inspection.—Mr. Wenham, on the same evening, contributed a paper "On the Measurement of the Angle of Aperture."

LONDON MATHEMATICAL SOCIETY.—(Thursday, November 9.)

PROF. H. J. S. SMITH, F.R.S., President, in the Chair. The reports of the treasurer and secretaries having been read and adopted, the following gentlemen were elected to form the council for the ensuing session:—President, Lord Rayleigh; Vice-Presidents, Messrs. C. W. Merrifield, Smith, and W. Spottiswoode; Treasurer, Mr. S. Roberts; Hon. Secs., Messrs. M. Jenkins and R. Tucker. Other members:—Profs. Cayley and Clifford, Messrs. T. Cotterill, J. W. L. Glaisher, the Rev. R. Harley, Drs. Henrici and Hirst, Messrs. A. B. Kempe and J. L. Walker.—Lord Rayleigh, having briefly returned thanks for the honour conferred upon him by the Society, called upon Prof. Smith to deliver his valedictory address "On the Present State and Prospects of Pure Mathematics." On the motion of Prof. Cayley it was resolved that the address should be printed in the Society's *Proceedings*.—Mr. Glaisher communicated a "Note upon Certain Identical Differential Relations."—The secretary read parts of papers by Mr. Spottiswoode "On

Curves having Four-point Contact with a Triply Infinite Pencil of Curves," and by Mr. E. B. Elliott "On some Classes of Multiple Definite Integrals."

NEW SHAKSPEARE SOCIETY.—(Friday, Nov. 10.)

F. D. MATTHEW, Esq., in the Chair. The thanks of the meeting were voted to Lord Derby for his present of 750 copies of "Stafford's Examination of Men's Complaints in 1583;" to Mr. Richard Johnson for his present of 750 copies of the revised text of "*The Two Noble Kinsmen*," edited by Mr. Harold Littledale, Part I. (and Part II. when ready); to Mr. C. —, Mr. Furnivall, and Miss Phipson for their present of 750 copies of the *Tell Troth*, Lane, and Powell volume; and to Mrs. Bidder, Mr. L. —, and the Rev. Stopford Brooke for their gifts of 10l. 10l. and 4l. 4s. respectively to the reprint of Prof. Spalding's Letter on *The Two Noble Kinsmen*.—Mr. Furnivall made a statement of some length as to the work at press and in hand for the Society, and said the Committee wanted 1,000l. a year instead of 500l. to produce the books needed. He then read a paper on "The Character of Hamlet not entitled to the Admiration often bestowed upon it." He believed that, as most folk got their idea of Satan from Milton, and then said it was from the Bible, so many made their own ideal of Hamlet and then declared it was Shakspeare's, though there was no foundation whatever for it in Shakspeare's text. Folk pitied Hamlet, then they loved him, then they glorified him, and turned a shirker of duty, a do-nothing, a putter-forward of specious subterfuges, into a Christian warrior and hero. Nothing was too good for him in Werder's eyes, and several English critics'. Mr. Furnivall followed Hamlet somewhat pitilessly through his whole career, from his mooning and spooning, instead of watching and acting, after his father's death; through his weakness after weakness and his subterfuge-full excuses for them; in staying at Court, in vowing that he would "sweep to his revenge," and then making notes on his tablets, saying he would go pray, dawdling, turning stago-manager, brutally jeering at Ophelia, quoting ballads and calling for a tune—like an overgrown schoolboy when his trick has succeeded—instead of killing the king at the end of the play; then mouthing rant about drinking hot blood, &c., and, of course, shirking his duty again directly after; then pretending that Heaven had made him stab Polonius, over whose corpse his brutal jeers must come again; still dawdling when he returned to Denmark, straying into graveyards, engaging in fencing-matches—anything to shirk his duty; at last letting Claudius's own plot, not his, work out the king's destruction, Hamlet at last stabbing him, not because he had murdered his brother, but because (1) he had poisoned Hamlet himself; (2) because he was "incestuous, murderous," therefore "follow my mother." Mr. Furnivall contended that whatever virtues Hamlet had, he basely and persistently shirked his duty, which was just a bore to him, and made mean subterfuges to excuse himself. Even at last, it was not as a duty to his father that he killed his uncle; and his friend, Horatio, put forth no such pretence in his behalf. He spoke

"Of accidental judgments, casual slaughters . . . And, in this upshot, purposes mistook Fall'n on the inventors' heads."

Yet we all pity, nay like Hamlet. This is because he typifies each one of us. Weak, shirkers of duty, we all are: but in so far as we are so, we are not to be admired; we are to be despised. In the discussion Mr. and Mrs. Peter Bayne, Miss Toulmin Smith, Mr. Matthew, Mr. Jarvis and others took part.

ROYAL ASTRONOMICAL SOCIETY.—(Friday, November 10.)

THIS was the first meeting after the recess, Dr. Huggins, the President, being in the Chair. Sir George Airy gave an account of the progress of his Numerical Lunar Theory, and exhibited some of the printed sheets of figures, which had required a peculiar arrangement on account of the large number of terms involved.—Mr. Dunkin then read a paper by Mr. Langley on the effect of sun-spots on climate, the chief question being whether the increased activity when the spotted area was a maximum did not more than make up for the loss of heat from the spots themselves. With reference to the variation of climate, Sir George Airy alluded to the observations of the underground thermometers at

Greenwich, and to the attempts he had made to connect the temperature of the soil with the yield of wheat.—In reply to the President, Mr. De La Rue stated that the measures of the sun-spots on the photographs taken at Kew were nearly completed.—Mr. Christie read a paper on the effect of wear in micrometer screws; and Mr. Penrose then described at some length a method which he proposed for taking account of the ellipticity of the earth in the reduction of lunar distances. It appeared, however, that this method had been in use for the last thirty years at Greenwich, and Mr. Marth claimed that it had been invented some years previously by Bessel.—A binocular eyepiece was then described by Mr. Thornwaite, and its action exhibited on a Newtonian reflector; after which Mr. Christie referred to the spectroscopic observations of the motions of stars and of Venus, and of the rotation of the sun and Jupiter which had recently been made at Greenwich, and mentioned a photometric observation of the gradation of light towards the limb of Venus, confirming a previous observation by Mr. Brett.—Several other papers were presented, among them being one by Mr. Finlay on the calculation of an occultation, and observations of a lunar eclipse by M. Arcimis, and of a solar eclipse by Mr. Tebbutt.

ROYAL GEOGRAPHICAL SOCIETY.—(Monday, November 13.)

SIR RUTHERFORD ALCOCK, K.C.B., President, opened the forty-seventh session of the Society with an inaugural address, in which he referred first to the return of the Arctic Expedition, and expressed an opinion that it had proved the impracticability of the Smith Sound route to the Pole, and dispelled the theory respecting an open Polar Sea. The fact that the British flag had been carried to a point within 400 miles of the Pole was a subject of congratulation, as to be first in such a struggle proved the possession of some of the best and highest qualities of our race. Sir Rutherford then announced that the work of the expedition would form the subject of an evening meeting of the Society at St. James's Hall on December 12, and that H.R.H. the Prince of Wales would preside. The President next touched upon the value of Cameron's researches, which, following upon those of Livingstone, had shown that legitimate trade by practicable routes could be established, settlements made, and the slave-trade suppressed. Mr. Stanley had contributed greatly towards solving the geography of the lake region by his circumnavigation of the Victoria Nyanza. After reference to the efforts of the various missionary bodies to found mission-stations in Africa, Sir Rutherford spoke of Colonel Gordon's work and the exploration of Lake Albert by M. Gessi. Mr. Stanley had been enabled to visit the southern end, and had found that it stretched further south than suspected by M. Gessi. The step taken by the King of the Belgians during the recess was a most important one. The great expense of the Cameron expedition had proved that, if Central Africa is to be opened to civilisation and commerce, it must be by a united international effort. At the invitation of his Majesty a Congress was assembled at Brussels, and this resulted in the establishment of an International "Committee of Civilisation and Exploration of Central Africa," to be supplemented by "National Committees" to be formed in each country. The King had consented to be first President of the International Committee, and it remained for the National Committees to be effectively constituted. That for Belgium had already been created, H.R.H. the Count of Flanders being at the head, while H.R.H. the Prince of Wales had consented to accept the post of President to the Committee forming in this country. A meeting at Glasgow had passed resolutions in favour of the establishment of a Scottish branch of the British National Society, with a view to the formation of a road from the northern end of Lake Nyassa to the south end of Lake Tanganyika, and also from the northern end of that lake to the coast at a point north of Cape Delgado. After anticipating some of the results that might be expected within a short period were public co-operation secured, the President went on to speak of the recent Oriental Congress at St. Petersburg, and of Colonel Sosnoffsky's expedition through North-Western China, which had proved that the route by way of Lanchau-fu to Zaisan is 1,400 miles shorter than the Kiachta one; that it is per-

fectly fit for wheeled vehicles, and passes through a populous, fertile and well-watered plain, three days only being passed in arid steppes. The importance of a route which would convey Russian goods from Novgorod and Orenburg by way of Semipalatinsk through Mongolia, and thence to China and the Amur, was quite apparent. The President announced that, in furtherance of the plan for the encouragement of the study of the scientific side of geography (for which a grant of 500*l.* per annum had been set aside by the Council), it had been arranged that not less than three lectures, by persons of recognised attainments, should be delivered each session. General Strachey had agreed to give the first lecture, on the general subject of "Geography in its Scientific Aspect;" Dr. Carpenter would deliver the second, on "The Physical Geography of the Ocean;" and Mr. Wallace the third, on "The Influence of Geographical Conditions on the Comparative Antiquity of Continents, as indicated by the Distribution of Living and Extinct Animals."—A paper was then read by Sir Douglas Forsyth, K.C.S.I., on "The Buried Cities of the Gobi Desert, Eastern Turkestan," a notice of which we are compelled to defer till our next number.

FINE ART.

Finger-Ring Lore; Historical, Legendary, Anecdotal. By William Jones, F.S.A. (London: Chatto & Windus, 1877.)

A WORK, by competent hands, on the history and archaeology of those digital adornments about which, not only so much poetry and sentiment, but so much mystery and so much delegated authority have clustered, from almost the earliest period to our own matter-of-fact and levelling times, has long been a *desideratum* to students of antiquity and history.

The varied handicraft displayed upon these, for the most part, small objects offers an equally rich field to the thoughtful observer of artistic excellence in invention and manipulation, and needed more careful and systematic illustration than the subject has hitherto commanded. True, we have Mr. King's learned remarks in his works on *Antique Gems*, &c., but these are in company with, and surrounded by valuable dissertations on other, although cognate, subjects, and are but limited. Mr. Fairholt, again, although not always accurate—as who can be?—had given us his "Facts about Finger-Rings" in the *Art Journal*, since republished with other essays in a pretty volume entitled *Rambles of an Archaeologist*; and much gossiping matter had been got together, mingling truth and error, in Mr. Charles Edwards' (of New York) *History and Poetry of Finger-Rings*, 1855.

The earlier works exclusively devoted to the subject, or to branches of it, such as those of Licetus, Gorlaeus, of Kirchman, Aringhi, Longi, Kornmann, Curtius (or De Corte), &c., are few, and old, and rare. Other literature of the subject must be sought in ponderous tomes by the earlier writers on antiquities of various countries and places; in later times it is to be found as separate occasional notices and papers in the publications of Antiquarian Societies and in some periodicals. But a thoughtful classification deduced from typical forms and ornamentation in relation to the periods and localities of their production, and their respective uses, is yet wanting.

A great deal of matter has been assiduously culled by Mr. William Jones in the volume of over 500 pages now before us, but, we may ask, does it answer perfectly to

the acknowledged want? and has that matter been sifted and digested by one who is conversant, not only with the statements he has collected, but also with the technicalities and characteristics of the objects of which the volume treats, and by which knowledge such statements may be more or less analysed? Is his work sufficient to make it a trustworthy book of reference for the learned, and a handbook to the student? or is it not rather a compilation of a popular nature?

The general reader will doubtless be amused by the curious anecdotes and scraps of history with which the volume is well stored, and many of which had been lost sight of or forgotten; to him much information will be conveyed. It is, in fact, a collection of fragments—some rich, some of worthless material—gathered together, from which a true artist, knowing their respective value, might have formed, with scientific method, a choice mosaic of well-adjusted and well-harmonised design and solidity: this book is rather a conglomerate of mixed and ill-adjusted pebbles.

We wanted, not so much an additional gathering of heterogeneous material, as its careful analysis and recrystallisation, purified and combined by the skill of one who, having gained special knowledge by the intelligent examination and comparison of many hundred specimens of all periods and countries, stimulated by pure love of the subject, and aided by a natural gift of observation and inference, would have been able to compose a work of the highest authority. There are, perhaps, hardly more than half-a-dozen men in England capable of such; that by Mr. Jones falls too far short of so high a standard to satisfy those who can appreciate the importance of this branch of archaeological enquiry, although it may be welcomed by the general reader. Finger-ring lore is a special subject, requiring special treatment, and implies a knowledge of rings as well as of their history.

Passing his first chapter, for the while, we can with more pleasure dwell on those that follow. As might be expected from some remarks in the preface, the second, treating of "Ring Superstitions," is the best part of the book. In this chapter Mr. Jones has collected together a large amount of curious narrative and anecdote on the mystical value of rings inscribed with cabalistic formulae, or set with stones of healing virtue; and, although much was already familiar to those who have taken interest in the subject, to the majority of readers it will present matter that is new and interesting.

The contents of this and of the following chapters may have the effect of drawing more attention to an engaging subject, and may waken a desire with many to study more minutely and observe more intelligently the numerous varieties of finger-rings preserved in those public and private collections to which they may have access. For all this the writer deserves thanks; and if he has only gathered fruit from orchards that are known, its collective exhibition in the literary market is a claim for commendation.

We dare not venture to quote from among so many, but prefer referring those for whom curious superstitions and poetic fancies may

have a charm to the book itself. We may be permitted, however, to point out a few of the weak points and omissions. There is no allusion to that early practice, referred to by Boldetti, of letting rings down by a cord through the upper grating, that they might touch and thence convey healing and other virtue from the sarcophagus of St. Peter, to the fortunate person to whom such a ring might be sent by the then Pope.

Of the so-called ring of the Blessed Virgin at Perugia we may remark that in form it is of a well-known type of later Roman times, as those cut from a single piece of Zaffarine chalcedony, or carnelian (not all of which are corded). The quoted correspondent of the *Standard* is wrong in describing it as "a plain gold circle, large enough for any man's thumb." And, by the way, the history of this ring given in Patrick's *Devotions of the Roman Church* was derived by him from Jo. Bap. Lauri's work *De annulo pronubo Deiparae Virginis* (1622).

The chapter on Investiture is also well done, full of interesting matter, beginning with the Royal Signet and alluding to its use in conferring different degrees of nobility, the confirmation of charters, &c.; also grants of land and its conveyance through the agency of the lord's ring, and similar facts and anecdotes. Whether the "evidence" "subscribed" at the purchase of Hanamel's field was sealed with his finger-ring or with a signet suspended to the wrist is, however, open to question.

On Ecclesiastical Rings Mr. Jones has gleaned abundantly from Mr. Waterton's published papers on the *Annulus Piscatorius*, on Episcopal rings, &c., and those of other writers, but to what extent he has perused or may be indebted to the valuable notes made by that pains-taking antiquary in the MS. catalogue of his own collection, we know not, as he makes no acknowledgment or allusion to such a work. That volume was secured by the writer for the South Kensington Museum, at the time when, at his urgent recommendation, the Waterton Dactylitheca, of some six hundred specimens, including gems in modern settings, was purchased by the authorities of that institution, and is now preserved in the Art Library. We think that Mr. Jones's work would have been more useful had he generally acknowledged the authorities from whom he has, more or less judiciously, compiled, by giving exact references to names, works, and dates. He throws no further light upon the still vexed question of the large so-called Papal rings of the fifteenth century of gilded bronze, the most complete series of which is owned by Mr. Octavius Morgan: some of hitherto unknown type have been taken to America by Signor Castellani. There is much information also in this chapter on the rings worn by ecclesiastics, nuns and others, as also upon rings of religious significance, iconographic decade rings, &c., but why the Indian ring, set with an inscribed turquoise surrounded by ten rubies, should have been referred to as a pious Christian's tangible remembrance for ten *Aves* and a *Paternoster* we cannot see. The type is not unusual in India, the surrounding stones varying in number and encircling sometimes a cluster, sometimes a

single stone, and frequently a mirror (the *chury* or *cheery*).

Among the numerous cuts on pages 268 to 273, illustrative of Early Christian rings, one only is credited to the private collection in which all, with a single exception, are preserved; a somewhat ungracious omission, the more so as the blocks from which these illustrations were printed, with some others, were gratuitously lent for the purpose, and, as it happened, inadvertently, without the consent of those most interested.

The English rings of the thirteenth century, some of which are referred to as episcopal and "stirrup-shaped," on page 230, may probably also have been worn by abbots, or even by nuns: the double ones of the same form were, possibly, holy sisters' espousal rings. We object to the term stirrup-shaped as applied to this form—a somewhat oval circlet rising to a point on which the stone is set—rather, they are pyriform; whereas certain Egyptian and archaic Greek rings are distinctly stirrup-like in make, a flat and elongated oval bezel, to the pointed ends of which a straight-shanked loop is attached.

St. Ursula's ring at Cologne, referred to at p. 259 as "of very early date," is of beautiful workmanship and much worn; but it happens to be a *fédé* ring of the later years of the fourteenth century, probably Italian, the nearly obliterated and illegible inscription round the hoop being in Lombardic lettering.

The excellent chapter on Betrothal and Wedding Rings will be perused with much interest, especially by the ladies; that on posy rings might with advantage have been included. The long list of posies gathered together by Mr. Jones is an important and valuable feature of his volume, and the returning fashion for their use will necessitate a frequent reference to it. We notice, however, that he does not refer to the rare Umbrian ring of the fifteenth century in the Waterton collection, inscribed in niello *ERVNT . DVO . IN . CARNE . VNA .*; two of similar make and period are before us, on one is the trite sentence **AMORE . VOLE . VOLE . FE .*, on the other **CHI . CANBIA . LOCO . DE . CANBIARE . VZANZA*. All three are from Perugia. It will be noticed how rarely English posy rings of the last century bear Latin mottoes. We know a heavy one inscribed with the self-sacrificing words *QUI . DEDIT . SE . DEDIT*. It may be doubted whether some of the rings supposed to be betrothal, or wedding, from their bearing the joined hands or *fédé* in relief, and inscribed with the sacred name or monogram, may not rather have been of a devotional character, perhaps espousal rings of nuns wedded to the service of Christ.

The ring figured at p. 314 is one of the well-known Madeira gemmal rings of modern make, and that at p. 318 is of those nielloed *fédé* rather than gemmal rings, of which fine examples are in the Waterton and the writer's collections.

Many curious and romantic scraps of history and fiction in which the ring plays an important part, with the occasional assistance of spiritual agency, are well put together in the chapter on Token, Memorial, and Mortuary Rings, and will be found amusing

and instructive. Of the memorial rings of Charles I. perhaps the finest that has come under the writer's notice belongs to Canon Dayman, some of whose ancestors suffered much in the royal cause. *Apropos* of the martyred monarch, it seems curious that he should have provided himself with a mortuary ring of nearly a century anterior date, and on which the letters M and L are interlaced, to give, on the scaffold, as a memento to the good Bishop Juxon, if the family history be true. With still less security could we endorse the Borgia signet (p. 434), without better evidence than itself can offer.

It has been said that no one reads a preface. Sometimes, however, it may serve as a gauge by which the depth and brilliancy of the contents may be estimated. That by Mr. Jones shows, too soon, the open joints of his armour; after confessing that it was "in going through a wide field of olden literature" that he had discovered the fact—already well known to antiquarians and art lovers—that there is "so much of interest in connexion with rings," he tells us how it is important as bringing various subjects "to our notice by invaluable specimens of glyptic art." What has "glyptic art" to do with the fashioning, the enamelling, or other enrichment of a puzzle, a decade, a jewelled Renaissance, or a hundred other ornamental rings, antique and modern? That term is applied, but perhaps with doubtful correctness, to the art of the gem-cutter in intaglio or in cameo—the *sculptor*, not the goldsmith who sets the stone in iron, silver, or in gold, as a signet ring for his patron, or a graceful pendant for some matron's neck.

In the first chapter, after a long foot-note about the supposed "Joseph's ring," we have a series of extracts from Scripture applying to signets, some of which may have been rings, but more were not. Then we are told that the earliest rings are of pure gold, and, further on, that their earliest use was doubtless as signets: we cannot think so. Egyptian and Etruscan scarabs are stated to have been generally used for rings: we believe that their use in *colliers* and other ornaments was equally or more abundant. Quoting approvingly Mr. King's statement, which may, perhaps, have been intended relatively, that Etruscan rings of gold are very rare, Mr. Jones shortly after, and more correctly, refers to their frequent occurrence. At p. 19 we read of Etruscan rings—

"They are frequently found with shields of gold and of that form which we call Gothic—that is, elliptical and pointed—called by foreigners *ogive*, with raised subjects chiselled on the gold, or with onyxes of the same form, but polished and surrounded with gold. There are some particular rings which appear more adapted to be used as seals than rings, and they have on the shields reliefs of much more arched and almost Egyptian form."

We pass over other errors of this passage, and ask ourselves whether Mr. Jones will argue, from this "Gothic" discovery, that pointed architecture had its origin in Etruria or Egypt?

In short the whole of this account of Egyptian and Etruscan rings is inexact and insufficient; moreover, it is painful to meet

with such phrases as the "stomach" of a scarabæus, "mineral stones," and "the Etruscans, the ancient inhabitants of Italy," as though there were none other; &c. &c.

By the note to p. 48 Mr. Jones concludes that Lord Bolingbroke's ring referred to by Swift was of amber; was it not rather a ring set with a piece of amber in which a gnat was embalmed, a rare curiosity at that day, and doubtless brought from Catania?

The portion of the chapter devoted to Anglo-Saxon rings is more satisfactory, but we cannot see why a figure of one of the "Martin Luther" rings should be introduced among them at p. 64. "The gold Middle-Age ring," of rare form, figured at p. 71, is of silver gilt, not gold; it and others of similar type on pp. 79 and 257 are German rather than French; another such, but larger, and inscribed, is in the writer's possession. But we must refrain from further notice of errors in this chapter, which ought to form the back-bone of the work, but the bulk of which is derived from Fairholt and from King, without discriminative judgment.

Glancing at the last chapter, on "Remarkable Rings," which might well have followed immediately upon the first, where some equally remarkable are noticed and figured, we find again more faith than discrimination. Mr. Jones rightly quotes, almost *verbatim*, Mr. Soden Smith's notice of the more remarkable rings in the Devonshire Collection. He ought to have known that archaeologists decline to believe that the "Darnley Ring" is genuine, or the "Rienzi Ring" to have been that of the Tribune. The diamond signet in the Royal Collection, said by Mr. King to have been made for Charles II. when Prince of Wales, turns out to be that of his unhappy father. The ring of Roger of Sicily is not unique; others precisely similar, and probably of equal modern antiquity, have from time to time appeared in the market. That of St. Louis has been too much "*ajustez*." The Braybrooke cameo of Elizabeth is not by Valerio Vicentino. The signet ring that belonged to Lord Buchan did not bear the arms of Mary, Queen of Scots, and therefore is not *apropos* of anything she did.

The less said about the Luther rings the better, and the love-knotted initials of some William and Sarah are but poor warranty for the so-called Shakspeare's ring, despite Haydon's gushing note to Keats; other initials similarly united are frequent upon gold and silver signets of that period.

Very inadequate mention is made of some of the more important collections of rings in public museums or in private possession; one or two are now and again referred to their respective localities or owners, but no special notice is given of such cabinets as that of Mr. Franks, of Lord Ashburnham, of Mr. Octavius Morgan, of Mr. Evans, Mr. Cook, and others; we could name one, sections of which have been exhibited from time to time, numbering over 700 examples of all periods and countries, exclusive of gems in modern mountings.

The revision of the proofs of this volume has been carelessly done; thus we have at p. 15 "Padre Geruchi"; at p. 379 "Garuchi" for Garrucci; p. 267 Signor "Castel-

lane"; p. 43 "Rhine" for "Rhone." The paragraph on Indian rings at p. 78 is repeated *verbatim* at p. 84. At p. 238 "Ghirlandago"; p. 246 "Loretto"; and occasional careless writing, as in the description of the Doge's espousal of the Adriatic. While, in his preface, Mr. Jones thanks his publishers for their liberality in illustrating the volume, he omits acknowledging the loan of blocks from various sources.

But we must repeat that, notwithstanding its many faults, this book is so full of anecdote and story that its want of archaeological accuracy may be condoned in its interest to the general reader. It is the compilation of a diligent searcher among books and magazines rather than the work of one deeply acquainted with the special characteristics of the objects of which he treats.

C. DRURY FORTNUM.

THE SOCIETY OF BRITISH ARTISTS.

A WINTER Exhibition of Paintings and Sketches was opened to the public at the Suffolk Street Gallery on Monday last. It is a characterless sort of display; here and there a good or goodish performance, amid a large slush of mediocrity, and a firm substratum of rubbish. We shall specify first a few things of more than the average value or importance, from all sections of the exhibition, and afterwards proceed through it sectionally so far as may appear needful.

The work we like best of all is a small water-colour by Mr. Smetham, almost sunk out of sight—*Looking into the Sepulchre*; the Magdalen and her two companions gazing in the dark morning into the tomb of Jesus, wherein a marvellous globe of rayed light replaces the body of the risen Saviour. The boughs of trees and shrubs sway aside in both directions, leaving an open space for the tomb and the women; they gaze in reverence rather than astonishment or perturbation. This little work is a genuine outcome of a religious mind and artistic faculty; it has gravity and grace of design, and is hushed, lovely, and mystical. Amid numerous inventions of similar calibre, Mr. Smetham has never probably done himself more justice than in this. Another Biblical subject is *The Sower of Tares*, by Mr. Priolo: not certainly a work of any great attainment, but showing, as in the limbs of the sleeping figures, a somewhat higher endeavour in design than the minor exhibitions of the day accustom us to. Five husbandmen are slumbering in a tent: the "Enemy" slinks through the moon-lit field outside, and sows the tares. Mr. Wallis sends *Arranging for the Marriage, an Idyll of the Sacristy*, in southern Italy. There are two priests, one of them in colloquy with the bride-elect, a barefoot peasant-girl in her early teens, the other conferring with the bridegroom. The former priest wipes his hand on a towel, and eyes with good-humoured complacency the dish of red mullets which the damsel and her little sister have brought round for acceptance: the other is seated on a marble bench projecting from the richly-decorated wall. This work is something between a sketch and a picture: the faces of the young people are extremely handsome, or one might say pretty, and would bear more of naturalistic development with great advantage to the whole. *The Dinner*, by Mr. Moormans, is a work of larger size and pretensions—a hilarious and well-assorted company in the costume of about 1620. The perspective of the table and its occupants is very clever; and the whole thing has a good deal of unity and completeness, as well as efficiency, in its own way—which, however, does not go far beyond the level of well-ordered and methodised furniture-art. Sir John Gilbert contributes a pleasant sketch of *Owen Glendower's House*, commonly

called the *Parliament-house*, *Dolgelly*, painted last year, and of more than common interest just now, in view of the menaced destruction of this homely-picturesque relic; also *A Standard-bearer*, a small figure somewhat in the Meissonnier manner. *Dinner-time, a Sketch*, by Mr. Calthrop, is capitally done, though too opaque in handling: a boy sousing his visage in a tub at the sink, before sitting down to his meal. In Mr. Calthrop's opaqueness takes a dun and leathery tinge: in Mr. W. L. Wyllie the same blemish shows with chalky garishness. His *Enkhuizen on the Zuyder Zee* is nevertheless very enjoyable, with the arbitrary forms and tattered outskirts of its exultant cloud-masses: a water-colour of *Amsterdam*, by the same artist, is quite as good, and not chargeable with the like defect. The *Zaandain* of Mr. C. W. Wyllie, with a foreground of corn-sheaves in the fields, and a plenteous array of windmills along the horizon, is again a very agreeable work.

Sir Francis Grant, who is an honorary member of the Society of British Artists, appears on the present occasion with two pictures: a respectable portrait of *The Honourable Mrs. William Grey*, evidently not a very recent production, and a large canvas of *The Duke of Cambridge, at the Battle of the Alma, leading the Guards up the Hill in Support of the Light Division*—also, no doubt, of rather remote date. Here the dogs of war are let loose in a very tame style, proportionate to the mainly portrait-like character of the piece. With this we may couple two small Crimean battle-subjects to which no artist's name is attached in the catalogue, spiritedly grouped and thrown together—*The Guards at Inkerman*, and *Charge of French Cuirassiers*. Mr. Donaldson makes but little out of *Margaret in the Church*, taunted and tempted by Mephistopheles: his landscapes are far preferable, especially the one in water-colours named *Lake in Arundel Park*. *The Connoisseur*, by Mr. Dever, is sprightly, and moderately mature in finish. A young French nobleman, of a period preceding by a few years the first Revolution, has received the visit of an elderly dame and her bright-eyed daughter, who turn over his china and other curiosities. The mother is busy inspecting a blue kyllin in front, while behind the damsel holds a miniature Cupid with bow and arrow, pointed towards the young man, who is half-seated on the edge of a table: they interchange glances which show that they both appreciate the significance of this situation. Messrs. J. D. Watson and Charlton co-operate in a well-sized picture entitled *A Check*—gentlemen in the hunting-field, one of whom has dismounted to adjust his saddle: this is a simple unelaborated work, not of very marked quality, but able in its line.

We shall revert to this exhibition on a future occasion.

PICTURES IN THE HAYMARKET.

Two leading picture-dealers in the Haymarket, Mr. Tooth and Mr. McLean, have a fresh stock of works on view: oil-pictures in the former case, and water-colours in the latter.

Mr. Tooth's exhibition includes fifty-eight of Mr. Goodall's deservedly prized sketches and studies in the East—works which, when left fairly to themselves, and not smartened up into pictures, are often of uncommon excellence, as, for instance, the *Blind Beggar* and the *Nubian Harper*. Also *In Debate*, a vivid sketch of an aged bishop, by Pettie; *Southampton Water, Sunset*, and *The Gravel-Pits*, by Linnell; *The Tailor's Shop*, a lively caricaturish scene, by Jimenez; *Sempstresses*, a good specimen of Frère; *The Bath and Prayer in the Desert*, secondary but none the less very able examples of Gérôme; *Sunshine and Clouds*, companion-pictures by Boughton, of too artificial a type, and a clever little piece of humour, *The Passing Squall*; *Clearing Off*, a Highland cattle-piece by Peter Graham; *The Close of Day*, by Mc

Whirter; *The Long Sleep*, an old farmer dead in his chair, with his brace of dogs, by Briton Rivière; *A Creek on the Upper Thames*, by Mignot, a fine work very sweet in feeling; *Summer*, by Coleman, a quaint figure of a naked girl, of fanciful character like a fairy-tale; and *The White Cockade* by Millais, a most masterly example of his handling, colour, and chiaroscuro, though a little harsh and forced in the selection of the tints.

In Mr. McLean's Gallery we remark—*Tynemouth*, by Fildes; some single figures of women, by E. K. Johnson; *Hoisting the Standard and The Dog-Fancier*, by Gow; *Prayer in the Desert*, by Haug; flower-pieces by Mrs. Coleman Angell; *Pevensey Castle*, by George Fridd; *The Widow*, by Israels; *Water-Lilies*, by A. Guérin; *Interior of a Cathedral in Spain*, a brilliant piece of work, by Spanaro; *Tigers at Play*, by Basil Bradley; *A Cold Morning*, by Frère; *Chamois on the verge of a waterfall*, by Rosa Bonheur; *The Listener*, by Cipriani; *Morning at Newlyn, Cornwall*, by J. Dickinson; *Springtime on the Trent*, by Edwin Ellis; and *A Storm coming on in the Highlands*, by Dodgson.

Each of these exhibitions contains about 170 works. W. M. ROSSETTI.

NOTES AND NEWS.

WE learn that General di Cesnola is engaged upon an exhaustive work on the antiquities of Cyprus, which will be ready for publication in a few months. It will contain a description of the different localities explored by him during the ten years (1866-76) of his official residence in that island—i.e., Kitium, Amathus, Paphos, Soli, Golgos, Idalion, Cytherea and Salamis, &c., and lastly Kurium. The Introduction will sketch the early history of Cyprus; and a full description will be given of the excavations and the survey of the island. General di Cesnola has discovered no less than thirty-three ancient burial-grounds, and identified the site of seventeen ancient cities, from which the treasures have been exhumed. The book will contain about 300 illustrations, and a map of Cyprus. In an appendix will be printed all the inscriptions discovered—about 200 in number—in Cypriote, Greek, Assyrian, and Phœnician. Mr. C. W. King, of Cambridge, will contribute a notice of the gems found in the treasure of Kurium, and Lord Lilford one on the birds of the island.

ON Saturday next there will be a private view of a series of sketches and drawings made by Mr. H. A. Harper in Sinai and the Holy Land. The exhibition of these drawings will be held in Messrs. Agnew's gallery in Waterloo Place.

MR. TISSOT is likely very soon to surprise the admirers of his recent works in painting by an essay in a widely different style. He is now, we believe, engaged upon an allegorical picture, which will probably be exhibited next year.

MR. E. J. POYNTER, R.A., is now engaged upon his diploma picture, to be presented to the Royal Academy. It is a study of two female figures, one draped and the other nude, and is specially designed, not with the view of illustrating any particular theme, but as an example of art-practice. Both figures are seated, and they are so arranged in relation to one another as to form a graceful and consistent composition.

It is probable that during the course of next season a very large and valuable collection of the works of David Cox will be brought into the market. Mr. Ellis, of Streatham, whose death has been recently announced, was one of the most intimate friends of the great water-colour painter, and a constant companion in his artistic rambles. His collection, which numbers upwards of 300 examples, possesses for this reason a peculiar interest. It was formed in direct communication with the artist, and it includes many slight sketches and studies, highly significant of the

artist's mode of work, which only a friend would be likely to obtain. A large number of the drawings are concerned with the scenery of Derbyshire, and the collection also includes one or two pictures in oil.

MR. ALBERT MOORE is now finishing two companion designs, each of a single female figure, painted upon a somewhat larger scale than he has recently chosen. The subject of both pictures is so far identical that in each the lady holds a book from which she is or has been reading. In the first the motive is that of a complete and absorbed attention. The head is slightly bent in order that the eyes may rest upon the pages of the open volume which she supports in the right hand. In the second of the two designs, the only one that is as yet absolutely finished, the artist has chosen a moment of repose and reflection. With a gesture entirely natural and interesting as showing the artist's research of the most simple and abstract motive for his design, the hand which holds the volume has dropped by her side, and the face turned upwards bears a meditative gaze as though the reader's progress had been suddenly arrested by some vivid image that still enchains her thought. This impression is supported by the left hand, which rests negligently upon the hip and is half concealed by the folds of drapery in which the figure is clad.

At the meeting of the Cambridge Philological Society on the 9th inst., Mr. Percy Gardner read a paper on an unpublished vase in the British Museum, with representations—the names of the figures being inscribed—of the seizure of Thetis and Peleus, on the inside, and, on the outside, of the combat of Aeneas with Diomedes, and of Herakles with Kyknos, from the *Iliad* and the Hesiodic *Scutum Heraculis* respectively.

AN important archaeological discovery has been made in the church of St. Peter ad Vincula in Rome. Between the altar and the apse, in a longitudinal line, a marble sarcophagus has been found about two metres in length. On it are sculptured five groups in alto-rilievo, in excellent preservation, apparently of fourth or fifth century work. They represent (1) the Saviour raising Lazarus, whose sister is kneeling down close to the grave; (2) the miracle of the loaves and fishes; (3) Jesus and the Samaritan woman at the well; (4) Jesus predicting to St. Peter his triple denial; and (5) Jesus delivering the keys to St. Peter. Inside the sarcophagus are seven compartments, which have led to the belief that it contains the bodies of the seven holy Maccabees, who, as ecclesiastical history and tradition hold, were buried in this basilica.

A VERY agreeable and interesting exhibition has been started of late in Brighton (Dyke Road), a collection of British birds, got together by Mr. E. T. Booth, a local gentleman, who appears to be a keen sportsman and observant naturalist. All the birds in the museum were killed or captured by this gentleman. There are 306 glass cases for the birds; the great majority of these are already filled, but there are still several vacancies as yet. The number of specimens far exceeds the number of cases: perhaps three specimens per case would be a moderate computation. The great charm of the collection consists in the care and taste with which the stuffed birds have been treated, with all sorts of appropriate rock-work, grass, and foliage, sands, imitation ponds, &c., &c., so as to bring out, in the liveliest colours of truth, the actual habits and associations of the creatures; they are made to do what they would naturally be doing, and every detail is carried out (entirely, as we understand, by Mr. and Mrs. Booth) in the most delicate, complete, and intelligent manner. On the whole, we have never seen anything in the way of taxidermy to equal, or even approach, this museum, for a clear perception of what is most necessary and most pleasant to tell, and a graceful artistic sense in arrangement and execution. To

give an idea of the birds here represented, we name at haphazard the first and last half-dozen entries in the catalogue:—Osprey, swift, goat-sucker, swallow, golden plover in summer, the same in autumn, little stint in summer, the same in autumn, little grebe, red-neck grebe, stonechat, and bullfinch.

THE Committee for the Byron Monument have not approved for execution any one of the competitive designs recently sent in, as referred to by us last week. They have, however, in inviting a further competition for May next, asked six of the present competitors to come forward again, subject to some arrangement for meeting their expenses. We presume that among these six must be included all or most of the five contributing artists to whom we more especially adverted in our previous remarks.

THE grand ceremony of prize-giving took place at the Académie des Beaux-Arts on October 28, under the presidency of M. Meissonnier. A somewhat tardy *éloge* on Eugène Delacroix, who has now been dead for thirteen years, was pronounced on the occasion by the Vicomte Henri Delaborde. The *Chronique* gives the following list of laureates:—Grand prix for painting (the subject being, as before stated, *Priam asking Achilles for the Dead Body of Hector*), MM. Wencker and Dagnan, pupils of M. Gérôme. Grand prix for sculpture (the subject being *Jason carrying off the Golden Fleece*), MM. Lanson, Boucher, and Turcan. Grand prix for architecture, MM. Blondel, Bernard, and Roussi. For engraving, MM. Boisson and Roussi. MM. Wencker, Lanson, Blondel, and Boisson have also carried off the prizes founded by M^{me}. Leprince, each in his own particular department.

WE are sorry to learn that this restless, energetic nineteenth century of ours is at last forcing its way even into mediæval Nürnberg, which has long resisted its invading forces. One of the obtrusive war-monuments with which Germany has been everywhere commemorating her victories was erected last month in the quaint narrow Adlerstrasse in Nürnberg. Even Rauch's monument to Dürer, excellent as it is in itself, and placed in a good position, always seems a little incongruous in its mediæval setting, so one may judge of the distracting effect of a huge modern Victory bearing the Imperial crown among the many noble and beautiful monuments that are the heritage of Nürnberg from her art-workmen of the fifteenth and sixteenth centuries. It is characteristic of our modern modes of division of labour that the present monument was *designed*, it is stated, by Prof. Wanderer, but by whom *executed* is not said. In olden times the artist and the workman were one. Peter Vischer and Adam Kraft worked with their own hands on the magnificent shrines that have handed down their names to posterity.

PROF. WISLICENTUS is at present exhibiting in Düsseldorf two large compositions symbolical of Spring and Summer, which are destined for the National Gallery of Berlin. They are intended to be wholly ideal works, but are not quite free from *genre*. They have excited much adverse criticism.

FRANCE has recently lost two distinguished sculptors. M. Jean-Joseph Perraud, a member of the Academy, a chevalier of the Légion d'honneur, and well known by his numerous works, died at the beginning of this month, at the age of fifty-six. At about the same date M. Paul Cabot, a sculptor of considerable note, though not a member of the Academy, nor decorated like M. Perraud, succumbed to a disease that had necessitated a painful operation. M. Cabot worked for some years in Russia, where he executed busts of many of the Imperial family, and likewise designed a monumental fountain at Odessa, and numerous sculptures and decorative works for the church of St. Isaac at St. Petersburg. He was a pupil of Rude, and continued to work in the modern spirit of that eminent master to the last.

AN interesting biographical account of Jean-Baptiste Huet, a painter of whom very little is known, although he was Court Painter to Louis XV., is contributed to last week's *L'Art* by M. Genevay. A portrait of Huet is given, and numerous reproductions from his works.

A FINE collection of pictures, formed by the Infant Don Sebastian de Bourbon, himself an artist of merit, is at present being exhibited at Pau, as one of the attractions of that fashionable resort. The collection consists of about 700 paintings, among which the names of Murillo, Velasquez, Titian, Ribera, Goya, Rubens, Rembrandt, and other great masters frequently occur.

THE *Art Monthly* again gives a specimen of Blake's art, in a photograph from a drawing of the Ascension of the Virgin, in the possession of Mr. Fisher, of Midhurst. It is a slight, but graceful work. The other illustrations of the number are *The Dairy Maid*, from a sketch by Mr. T. Graham, and Lord R. Gower's sculptured head of Christ, entitled "*It is Finished*," in the last Royal Academy exhibition.

THE STAGE.

ONE of the things that Mr. Forster did *not* tell us in his *Life of Dickens* is how far Dickens's handling of his themes was influenced by that of brother novelists. Some day it may be an interesting matter for enquiry how the author who began his career with a work in which there is no plot at all ended it with a work in which the plot is neither more nor less than something like the best in English fiction; and when that question comes to be carefully gone into, it may probably be found that the author of *Edwin Drood* took account of the literary taste of 1870 much as the author of *Pickwick* had taken account of the literary taste of 1836. Dickens began his career amid the successes of the novel of adventure, and ended it amid the successes of the novel of plot. In the novel of plot—now happily somewhat out of fashion again—no one had succeeded better than Mr. Wilkie Collins; and Mr. Wilkie Collins's success, together with his personal relations with Dickens, brought his work, we may be sure, very much before the mind of the master novelist. Once at least it was arranged for the two men to work together, and *No Thoroughfare* was produced. Into the secrets of collaboration it is difficult to go; but one need not be very penetrating to conjecture that to *No Thoroughfare* each novelist brought the qualities for which he had long been recognised. The parentage of Walter Wilding gave fit matter for the art of Mr. Collins, and the characters of Joey Ladle and Sally Goldstraw must stand, of course, among the slighter creations of the master. The drama, though ingenious, is without charm: were it not for the cellarman and Sally it would not unfrequently wax tedious. For Wilding is himself so uninteresting a personage that the question of his parentage, however ably manoeuvred, is not one that has power to hold our interest. And Obenreizer, a worthless man with the art to be considered worthy, lacks in the drama—unless, indeed, the drama have the aid of Fechter—most of what might make his fortunes appear probable. The character is played now at the Olympic by Mr. Arthur Stirling, who brings to its representation all sorts of excellent endeavour, but wants the lightness of touch, the delicacy of treatment, needed to make the personage quite readily acceptable. George Vendale, gallant and free, is a character for Mr. Henry Neville; and he it is who plays it, as he played it on the piece's first production, several years ago. Joey Ladle can hardly have been better played in the old days than it is now by Mr. W. J. Hill, whose unction is perfectly in keeping with the part. The heroine, Marguerite, is represented by Miss Carlisle, in her style that is always refined, sometimes perhaps monotonous:

leaning certainly to the side of tameness, though never without grace. Miss Maggie Brennan gives the performance piquancy—sprinkles what salt she can over the whole. That is her especial quality. Force she wants, *finesse* she may want, subtlety she may want. Asked, as she was not long ago, to take up a part in which for many a night before Mrs. Bancroft had displayed an ability second to that of no comedian on our stage, Miss Brennan was tried indeed, and was found partially wanting. But in a character needing no show either of high excitement or subtle pathos—in a character simply and quaintly comical, with a dialogue agreeably acidulated—Miss Brennan has no superior. As Sally Goldstraw, nurse of the Foundling, she is seen not badly in *No Thoroughfare*.

WHY should *La Boule* be taken to task because it is not the same as *Frou-frou*? An out-of-doors sketch in water-colour, so that it have its own right quality of vividness, is not to be reproached as inferior to a large studio-work. There are differences of kind as well as of degree, and no comparison is possible between *La Boule* and *Frou-frou*. *Frou-frou* is a comedy for a serious comedian—one, too, which a comedian of genius happened to make more famous than it would otherwise have been—*La Boule* is a merry pastime, written for the delectation of those who have dined amply at Brébant's, and designed to be interpreted with the freedom of the Palais Royal. And now *La Boule* has come to the Criterion, and *Hot Water* is interpreted by Mr. Charles Wyndham, Mr. Righton, Mr. Clarke, Miss Fanny Josephs, Miss Nellie Bromley, and Miss Eastlake. The piece has borne transplanting, perhaps, a little better than we had expected, but it is not in effect the same thing by any means that it was in Paris. The comic situations are of course preserved; they are only a little less sensibly comic. Much of the original dialogue is at the Criterion also, but the witticisms of Meilhac and Halévy do not gain by translation, and their witticisms were never more pronounced and never more Parisian than in *La Boule*. But *Hot Water*, after all, is something very different from an elongated farce and from a comic drama conventionally comic. It is not only good animal spirits that send it on its way successfully: the thing has observation that is close and original. The cast is for the London stage, as we have already indicated, really a liberal one. Few comic theatres, without making important additions to their company, could have brought out the piece with such a strong support, at least on the side of the men. Mr. Wyndham is much in favour, and he gives to the kind of part to which in general he wisely restricts himself an air of ease and reality which have made the over-sanguine see in him thus early a second Charles Mathews. But he has not the sparkle of the elder comedian, as the elder comedian was "within the memory of men" not only "still living," but not yet middle-aged. However, he rattles through the part of the hero of *Hot Water* as well as need be. Mr. Righton could hardly be surpassed as the ancient *beau*. Mr. Clarke's dry and rarely varied humour has sufficient scope as the servant Muddle. Mrs. Pattleton, the wife of the hero—one of the couple, indeed, whose needless matrimonial squabbles are supposed to make the interest of the piece—is represented by Miss Fanny Josephs, pleasantly and with gentle comedy. The character of Marietta, an actress, is rendered with sufficient vivacity by Miss Nellie Bromley; and that of Lady Rose—a young woman who has little to do with such plot as the story contains—is made acceptable by the grace of Miss Eastlake. *Hot Water* makes the audience merry, and answers perhaps something more than that humble purpose in doing so.

MR. BUCKSTONE has reappeared at the Haymarket Theatre, in a familiar part and familiar piece.

MR. HOLLINGSHEAD announces the engagement of Mme. Chaumont, who will appear to-night and on several following nights at the Opéra Comique. Mme. Chaumont's performances, as we need hardly remind those of our readers who know the Parisian theatres, are in character almost unique. Levasseur, who played in London a dozen years ago, was perhaps the only other comedian who could do so much unassisted.

M. AUGUSTE VITU and M. F. Sarcey are receiving subscriptions for the widow and other heirs of M. Duvert, the dramatic author, whose claims as a writer of excellent old-fashioned vaudeville we stated more fully the other day; and M. Duvert's works, in six volumes, are to be published by subscription by Charpentier *fil*s—the proceeds, when the publisher is reimbursed, going to the writer's family. The subscription for the six volumes is twenty francs.

MUSIC.

NEW MUSICAL PUBLICATIONS.

WITH a pile of nearly sixty pieces of new music, exclusive of large works, lying before us and awaiting notice, it is obviously impossible to do more than make a few remarks upon the more important, and dismiss the others with a single word, and in some cases without a word. There is so much music published in the present day of little or no real value, that it is a mere waste of time to speak about it. After putting aside all pieces of this class, there still remains much to be criticised, and we trust the composers and publishers will be indulgent if we give in many cases less space to our remarks than the merit of the music would demand.

Taking first instrumental works, the most important undoubtedly is Mr. Walter Macfarren's *Second Sonata (in D major) for Piano and Violin* (Novello, Ewer and Co.). It is satisfactory to find that we have among us musicians who cultivate the higher forms of composition merely from love of the art; for nobody would think of publishing a sonata as a pecuniary speculation. Mr. Macfarren's work is very pleasing, skilfully written, and it lies very well for both instruments, showing an intimate knowledge of their capabilities; its weak point is that it reminds us too decidedly of Mendelssohn's sonata in the same key for piano and violoncello. Except in the slow movement it is almost impossible to avoid being struck by the general resemblance of the two works. Mr. Macfarren, however, might have taken a far worse model; and his sonata does great credit to his musicianly skill. His *Two Nocturnes for the Pianoforte* (Novello, Ewer and Co.) have more individuality, and are excellent drawing-room pieces. *Trois Pensées Capricieuses pour le Piano*, par Frédéric W. Fuller (Stanley Lucas, Weber and Co.), are three pleasing little pieces, in which again the Mendelssohn influence is clearly to be seen. But why does an English composer give us a French title? Is he ashamed of his own tongue? The fashion is an absurdity. *Variations on an Original Theme, in G minor*, by Francis Davenport, Op. 12, No. 2 (Stanley Lucas, Weber and Co.), are decidedly clever, and above the average in originality; they are, however, in our opinion, somewhat dry. The theme itself is not very interesting, and the variations follow suit. Four pieces by Franz M. D'Alquen, entitled *Cantilena Affettuosa*, *Minuetto Sentimentale*, *Minuetto Grazioso*, and *Frühlings-Gedanken*, second impromptu (Brighton: J. and W. Chester), show much gracefulness of idea, and are certainly likely to be popular; on the whole they deserve it, though here and there may be found licences in the harmony of which strict theorists will hardly approve.

Messrs. Ashdown and Parry have sent for review a number of drawing-room and teaching pieces, of which the mere catalogue will suffice; we will merely say that they are all good of their

kind—which is not the highest kind—that they will be found useful as teaching pieces, as they abound in scale-passages, arpeggios, broken chords, and octaves; and that they are of various degrees of difficulty, but none of them beyond the reach of an average advanced pupil at a boarding-school. The pieces are the following—Sydney Smith: *Le Bivouac*, *Airs Ecossais*, *Mosé in Egitto*, and *Il Trovatore*; Boyton Smith: *La Danse des Sauterelles*; Edwin M. Lott: *Snowdon* (Fantasia on Welsh airs), and *In the Highlands* (Fantasia on Scotch airs); and Louis Diehl: *Coralline* (Caprice), *La Maja* (Mauresque), and *The Magic Harp* (Morceau de Salon). For the guidance of teachers we have named these pieces as far as may be in the order of difficulty, Mr. Sydney Smith's pieces requiring the most execution, while Mr. Diehl's are, on the whole, the easiest. A series of scales and finger-exercises published under the title of *Technical Practice*, by J. Henry Pollard (Stanley Lucas, Weber and Co.), is usefully and systematically arranged, without presenting any specially novel feature. Parts 30, 31 and 32 of the *Organist's Quarterly Journal* (Novello, Ewer and Co.) are of about the average merit: that is to say, they contain some very good pieces (especially the Minuets by Messrs. Hamilton Clarke, Silas and Henry Smart, the Fugue by Mr. F. Archer, and the Fantasia by Mr. W. S. Hoyte), and a considerable number of indifferent ones. Every allowance, should, however, be made for the editor, Dr. Spark, who has to provide entirely new and original works for each number. Apparently the supply of high-class organ-music is not equal to the demand.

In vocal music, the place of honour should be given to six of the solo numbers from Prof. Macfarren's oratorio *The Resurrection*, composed for the last Birmingham Festival (Stanley Lucas, Weber and Co.), and noticed in our report of the festival at the time. The complete score of the oratorio is not yet published, and the six numbers now before us are the songs, "Let us have grace," "For this our heart is faint," "Now is our salvation nearer than when we believed," and "His right hand shall hold us up;" the duet "In due season we shall reap;" and the trio "The peace of God, which passeth all understanding." We prefer to reserve any detailed notice of the music until we are able to speak on the work as a whole; meanwhile we would call attention to the publication of these separate numbers, and especially commend the very charming trio, which struck us in hearing the oratorio at Birmingham as one of the most effective pieces in the work. *Three Lyrics from Heine's Book of Songs and Two Songs* ("Piping down the valleys wild," and "Infant Joy"), by M. G. Carmichael (Stanley Lucas, Weber and Co.) show the same remarkable aptitude for composition that we have before noticed in this young lady's music. Miss Carmichael, though Schumann's influence is occasionally discernible in her writings, has more than ordinary individuality; and while these songs show here and there marks of inexperience, and little clumsiness which further study will doubtless enable her to avoid, they are far above the average of merit. The Heine songs are particularly good. *Gone and My Marguerite*, two songs by Leo Silvani (Swan and Pentland), while hardly so original as those just noticed, may yet be commended as well written, and showing genuine feeling. *I am the Angel*, song by Rosetta O'Leary Vinning (Stanley Lucas, Weber and Co.), is in no respect inferior to several other songs from the same pen which we have seen. With good singing it cannot fail to be effective. *Under a Lilac Tree*, by Arthur O'Leary (Novello, Ewer and Co.), is a very pleasing and well-written song, which can be heartily commended. *Era Tuall*, Irish song, *Para ten skien*, Ode by Anacreon, and *Donc gratis eram tibi*, Ode by Horace, composed by Charles Salaman (Novello, Ewer and Co.), are the work of a thorough musician, who has never yet (so far as we know) published any

rubish. We doubt, however, whether he has been very happy in his treatment of the accents in Horace's ode; at least he appears to scan his verses in a very different way from that which was taught in schools five-and-twenty years ago, when we learned Horace. With this reservation we have only praise for the songs, which are very graceful and melodious. *The Ivy Tower*, song by Berthold Tours (Stanley Lucas, Weber and Co.), is clever, but contains, we think, too violent modulations for a piece of its class. Within six bars we find four changes of key, three of which are very abrupt, and, moreover, have no apparent warrant in the text. *Shall I Compare thee to a Summer's Day*, song, by Robert Hoar (Hutchings and Rouer), is a setting of Shakespeare's eighteenth sonnet, not strikingly original, but thoughtful, and by no means destitute of good points. *Jesus, tender Shepherd*, sacred song, and *O'er the Waters*, barcarolle, by Martin S. Skellington (Keith, Prowse and Co.), are two very good songs, which evince considerable taste on the part of their composer. *Two-Part School Songs* (second set), by J. F. Borschitzky (London: J. F. Borschitzky), are in reality a set of solleggi, which, to render them more interesting to the pupil, are set to words, instead of being sung, as usual, merely to vowels. They are well adapted to their purpose as exercises, and we suppose the composer did not intend them for anything more.

EBENEZER PROUT.

HANDEL'S *Acis and Galatea* occupied the whole of last Saturday's concert at the Crystal Palace. The work had not been given at Sydenham for seven years, and it is so seldom heard in public that the revival had almost the character of a novelty. The solo parts were all in excellent hands, the distribution being as follows: Galatea, Miss Catherine Penna; Acis, Mr. Shakespeare; Damon, Mr. Henry Guy; and Polypheme, Signor Poli. The chorus singing was extremely good, and Mozart's charming additional accompaniments were played to perfection by Mr. Mann's orchestra. This afternoon Raff's overture to "Ein feste Burg" is to be given for the first time in England, and Miss Anna Mehlig will play Henselt's piano-forte concerto.

At the second Monday Popular Concert, last Monday, Mdme. Norman-Néruda was the violinist, leading Schumann's fine quartett in A minor, and Haydn's in F (Op. 50, No. 5), in both which works she was supported by Messrs. L. Ries, Zerbini, and Piatti. Mr. Charles Hallé was the pianist, playing Beethoven's early solo sonata in F major, Op. 10, No. 2), and joining Mdme. Néruda and Signor Piatti in Schubert's great trio in E flat, Op. 100, a work which is in general most unaccountably neglected, though the companion trio in B flat (No. 1) is very frequently to be heard. The greater technical difficulty of the later work may, perhaps, militate to some extent against its popularity; but no such reason need be taken into consideration at the Monday Popular Concerts, where none but artists of the first rank are ever heard.

On Saturday last Messrs. Hodge and Essex, the agents for the "Estey" American organs, opened their new show rooms in Argyll Street with a musical *soirée*. The tone and power of the "Estey" organs were shown off to great advantage by Mr. Augustus Tamplin; the instruments appear to have considerable variety of quality, and to be capable of more expression than many of the American organs that we have previously heard. In addition to Mr. Tamplin's performances, vocal and instrumental selections were given by Mdme. Liebhart, Mdme. Redeker, Herr Wilhelmj, Herr Niemann, and other artists. The show rooms are spacious and of good acoustic properties, and would be well adapted for chamber concerts.

HERR FRANKÉ's third Subscription Concert took

place at Langham Hall on Tuesday evening. The programme included Schubert's magnificent quintett for strings in C major (Op. 163), the "Deutsche Reigen" of Kiel for piano and violin, Brahms's piano quintett in F minor, two solos by Popper for violoncello, and songs. The performers were Messrs. Franke, Van Praag, Holländer, Daubert, Pettit, and Beringer, as instrumentalists, and Mdme. Redeker as the vocalist. The rendering of the various pieces had, as a whole, much to commend; in the more difficult passages for the strings the intonation was not always entirely above reproach, and the performances are as yet wanting in that finished ensemble which nothing but long practice together by the players can give; but Herr Franke has evidently good material at his disposal, and there is no reason why in time he should not succeed in gaining for his quartett party a very high reputation.

On Tuesday last M. Edmond Andradé commenced at the rooms of the Society of Arts, John Street, Adelphi, a course of six lectures on the Galin-Paris-Chevé method of teaching music. The first lecture was introductory, explaining the special features of the system; the remaining discourses will be devoted to the following topics:—A Common-sense Theory of Music, Musical Notation, Sight Reading, Piano Teaching, and Harmony. The lectures are given in connexion with the Women's Education Union.

M. ERNEST REYER has been elected successor at the Académie des Beaux-Arts to the late Félicien David. The choice will be received with general satisfaction, as M. Reyér deservedly holds a high place among French musicians.

M. EDOUARD BATISTE, for more than twenty years organist of the church of St. Eustache at Paris, and professor of the Conservatoire, died on the 7th inst., at the age of fifty-six.

THE death is also announced from Nice of the formerly celebrated bass singer, Tamburini. He was born at Faenza on March 28, 1800, and was, consequently, seventy-six years of age. He was the contemporary of Persiani, Grisi, Malibran, Rubini, and Lablache, and was in his time considered one of the first singers in Europe. He retired from the stage in 1855, and for many years lived at Sèvres, where he had some property. He recently removed to Nice by the order of his physicians, and died there on the 8th inst.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Christians of Turkey: their Condition under Mussulman Rule. By the Rev. W. Denton, M.A., Author of "Servia and the Servians," &c., &c. (London: Daldy, Isbister & Co., 1876.)

Slavs and Turks: the Border-Lands of Islam in Europe. (London: Leisure Hour Office, 1876.)

THOSE who are still curious to learn what the *status quo* actually is in Turkey, and how far the Turks are capable of "ameliorating" it, will find a variety of data on which to base their conclusions set before them in a popular form in Mr. Denton's little book. Mr. Denton, who has largely relied on Blue-Books for his information, has been at some pains to show the peculiar value of such accounts of Turkish misgovernment as have found their way into English consular reports. Indeed no part of his book deserves more attentive consideration than the Introduction, in which he shows on the direct testimony of English consuls, and from the direct evidence of English Blue-Books, that our Levantine diplomacy has long been engaged in a conspiracy of silence as to the wrongs of the Rayah. These are grave charges, which nothing but the most direct evidence would justify us in believing, but the documents are placed before us by Mr. Denton, and they are such as unfortunately carry conviction with them. These serious charges, however, are not directed against any Government in particular, but rather against the general conduct of the Foreign Office since the Crimean War.

To take a case in point. In the early part of 1860, Prince Gortschakoff issued his circular on the increasingly serious condition of the Christian provinces under the rule of the Porte, especially of Bosnia, Herzegovina, and Bulgaria. This circular was forwarded by our Government to Sir Henry Bulwer, then our ambassador at the Porte, with instructions to draw up and forward to our consuls throughout Turkey a list of questions regarding the true character of the Turkish provincial administration. But Sir Henry Bulwer, fearing, it would seem, that the worst allegations of Prince Gortschakoff might be more than corroborated if the consuls were left to their unaided judgment in the matter, took the precaution to enclose under the same cover as the "Questions" a circular of his own, rightly called by one of the consuls "an instruction," in which he gave them to understand, as clearly as diplomatic circumlocution would allow, that any confirmation of the Russian charges

would be highly unacceptable at the Embassy, on whose favour, as he took occasion to remind them, they depended for their very bread.

"That his circular," says Mr. Denton, "was regarded by the consuls as a dictation as to the kind of answers desired by Sir Henry Bulwer, and 'welcome to the Embassy,' is evident from a circumstance which, if it were not for the gravity of the offence against the first principles of morality, would be simply ludicrous. By some mistake in the office of the Ambassador, the list of questions was received by one consul without the circular which should have accompanied it. On August 4 that gentleman forwarded his answers in simple childlike faith that his Excellency required truthful answers to his questions. A few days, however, after the report had been sent the circular arrived under another cover. It was then evident to him that he had committed a great blunder. . . . He undertook to confute himself, and wrote a despatch full of lamentation at his simplicity, and overflowing with apologies for speaking the truth. In this latter document the consul professes that he is not so competent to speak as his Excellency, his ideas are all 'crude,' and he seeks to recall his former statement.

"I furnished," pleads the consul, 'what information I could, without being aware of the motives dictating the questions, and without being in possession of the valuable instructions conveyed in the other circular. I shall therefore endeavour now to supply the deficiencies of my replies. . . . Your Excellency expresses the belief that it is an exaggeration to contend that things are in a much worse state than, under the circumstances, might be expected. This view of the case is fully corroborated by my experience. . . . I hope that I may be held excused if I have too freely given utterance to these crude notions on a subject the consideration of which may not strictly form a part of a consul's attributes.'

We agree with Mr. Denton that it is a melancholy spectacle to see a man of mature age making appeals for piteous consideration because he has unfortunately spoken the truth! But how often, we should like to know, have these incitements to *suppression* veri been crowned with success? Dr. Sandwith, whose integrity no one would call in question, writes as follows to Mr. Denton:—

"When I was in Turkey about two years ago" (the author should have given the date of this letter), "I had a long conversation with a consul, that curdled my blood with horror concerning the cruelties and barbarities of the Turks, chiefly towards the Christians. . . . 'At all events,' I remarked, 'you have the satisfaction of reporting all these horrors in your despatches?' 'Oh dear no,' he answered, 'I dare not. We have received more than a hint that our Government is determined to uphold Turkey; and if I were to tell the truth, and describe things as they really are, my career would be ruined. More than one consul has been severely snubbed for doing so.'"

We need not multiply such extracts. Enough has been said to show the peculiar value of testimony as to Turkish misgovernment when it appears in English consular reports. Indeed, it says a great deal for the honesty of English consular officials that, in spite of the influences brought to bear on them, Mr. Denton should have been able to compile mainly from their reports what those who know Turkey best will acknowledge to be a fairly accurate view of the condition of the Christian Rayah under Mussulman rule. We have to complain now and then of a certain want of verbal accuracy in Mr. Denton's quotations, and that he is too prone to add

to facts which speak for themselves superfluous sermonising of his own. It would have been wise if Mr. Denton had expunged some of these commentaries, and inserted in their place an account of some such crying scandals as the oppression of the Fanariote hierarchy, which he has altogether ignored. There is also a certain confusion of arrangement, but Mr. Denton was perhaps wise, in a compilation of this kind, not to attempt a too rigorous classification of the evils incidental to Turkish rule, and what the book loses in philosophical method it may gain in general interest.

It is a very gloomy picture that these English reports on Turkey set before us. In the Asiatic provinces of the Empire the wildest extravagances of prophecy are prosaic facts. Were we to describe them in detail we should lapse almost unconsciously into the very words of the Apocalypse. Throughout beautiful lands, once the garden of the world, the human species is becoming extinct. Works of irrigation, the masterpieces of bygone dynasties, are indistinguishable ruins. The Great Desert of Arabia, encroaching on the once fertile Syrian campaign, has crept onwards year by year, overlapping and overlapping, till the sandy Ocean has joined hands with the Mediterranean. Around Aleppo alone, in the space of twenty years a hundred villages have disappeared. From Smyrna to Ephesus the traveller may ride through fifty miles of the most fertile soil, blessed by the finest climate under the sun, without seeing an inhabitant or a cultivated field. Vast and fruitful tracts of country in Turkish Armenia, the Troad—nay, the very environs of the Bosphorus—tilled only twenty or thirty years ago with all the care of garden husbandry, are to-day a howling wilderness, scattered here and there with graves and ruins. On the borders of Armenia rises still, with lofty walls and large stone houses, a city, peopled, it is said, within the memory of man, with 60,000 souls; but it is a city of the dead. "The finest country in the world," says Sir George Bowen, "has been more wasted by peace than other lands have been wasted by war;" and "there is not," in the words of Mr. Senior, "a palace on the Bosphorus that has not decimated the inhabitants of a province."

In the European provinces, as might be expected, the work of havoc is not so thorough, but the picture presented to us is hardly less gloomy. It seems idle to talk of introducing the luxuries of good administration into a country where the most indispensable securities for life and property are wanting. In spite of Hatts and Irades and Imperial promises, the fact remains that there is not a single province where the evidence of a Christian counts for anything in a court of law, and few where it is even nominally admitted. But the most characteristic aspect of the present state of Turkey is the absolute insecurity of life and limb. Anyone at all acquainted with Turkey as it exists at the present day will be quite prepared for the numerous extracts from consular and other sources collected by Mr. Denton to show that the murder of Rayahs by Turks is an everyday occurrence throughout the empire, and that in almost

all cases the murderers escape scot free. One of our consuls has been at the pains to collect evidence of 1,100 such murders committed in a single district in the space of nineteen years. This being the state of Mohammedan feeling, a hint from those in authority is generally at any time sufficient to stir up a massacre; and, indeed, one consul expressly observes that "the popular fanaticism never breaks out until the fanatical tendency of the Governor is visible"—the Governor himself being careful to take his cue from Stamboul. In the case of the massacres of Scopia and Damascus this complicity has been proved; and we have already heard the first whisperings of the truth as to the origin of those in Bulgaria. "Pashas," says Mr. Consul Finn, "(with but one exception that I have known) are *always* promoted when dismissed on the complaint of consuls." This is never more true than after a massacre. For his share in the Syrian massacres, Kurshid Pasha was made Governor of Rhodes. The infamous Tahir Pasha, who presided at that massacre, passed the rest of his life in ease and affluence on an ample pension; while Namik Pasha, under whose auspices the butchery of Jeddah was concocted, "was first rewarded with the office of Minister of War, and then appointed Pasha of Bagdad."

We seem to be reading of some more recent promotions; and, in fact, nothing can be more erroneous than to regard the wholesale bloodshed and outrage that have of late desolated parts of Roumelia as at all exceptional in their character. Looked at from the stand-point of the most recent Turkish history, there is nothing abnormal about these occurrences except their magnitude, and even that is nothing new. In their origin, in their hideous details, in the complete break-down of justice after the event in spite of European pressure, in the decoration of the chief instruments concerned, the Bulgarian atrocities show that the Turk, if he is nothing else, is at least consistent. Nor is there much in occurrences like these to excite surprise. These frantic ebullitions are but symptomatic of a certain stage in the Sick Man's complaint. Turkey has been for many years passing through the last phase of a declining dynasty, and that phase is one of terrorism. Terrorism, in the case of Governments and dominant castes and races, springs mainly from panic fear, and in the case of the Divan and the Mohammedans of Turkey its causes are not far to seek. The recent massacres are due, as Mr. Denton says, to the instinct of self-preservation, and they spring from the alarm felt by the Turks at the increasing numbers, wealth, and influence of the Christians. We have here before us evidence of the most striking character to show that the Turkish race is dying out year by year, while in spite of repression, extending to murder and wholesale massacre, the Rayah, as steadily, is increasing and multiplying. The most degrading vices, widespread infanticide, epidemics bred by unwholesome dwellings, the man-tax of the conscription, have all played, and are playing, their part in that great tragedy. "In towns," says Mr. Senior, "where there were 3,000 Turks five or six years ago, there are now not 2,000. . . .

In the Province of the Dardanelles the deaths exceed the births by about six per cent." In 1830, according to our consul, Mr. Blunt, Smyrna contained 81,000 Turkish inhabitants and 20,000 Christians. In 1860 the proportions were reversed. The Christians numbered 75,000 and the Turks only 41,000. We need not multiply such statistics. The most cruel deficit of the Turks is to be found in the Bills of Mortality, and were it not for the vitality of those non-Mussulmans to whom in the course of nature this wasted inheritance must ultimately escheat, our Government might find itself unawares defending the integrity of a desert, or sticking for the local autonomy of a grave-yard!

Those who wish to learn something of those races of European Turkey which are destined at no distant date to succeed their present rulers, may consult an interesting series of papers which appeared not long since in the *Leisure Hour*, and have now been reprinted in a compact little pamphlet entitled *Slavs and Turks, or the Borderlands of Islam in Europe*. We could recommend this little handbook the more cordially—for the ignorance of the public on the subject is generally crass, and the papers before us are not by any means without merit—were it not for the numerous inaccuracies into which the writers fall. We say *writers*, because from internal evidence it may be gathered that more than one pen has been employed—and from the fact that the Dinaric Alps are repeatedly spelt "Diarnic" in one chapter, "Dinarian" in another, and in others again enjoy their proper orthography, we are tempted to exclaim with Mrs. Malaprop:—"You are not like Cerberus, three gentlemen at once, are you?" This triune arrangement has certainly the merit of allowing one chapter to set right the errors of another; and if in the first we were informed that "Montenegro has attained to a *quasi-independence* of the Turk," we breathed more freely in the third, where the writer says truly that "Montenegro has never submitted to Mussulman rule." We know of no mountain called "Domitor," and "Borgoris" will not be found in the roll of Bulgarian kings; while the assertion that "when Bosnia came under Turkish subjection the Herzegovina soon afterwards shared the same fate" contains almost as much of slipshod history as grammar. A Black Mountaineer would certainly object to being reckoned—as one of the writers reckons him—among "Slavish" peoples, and we doubt whether he would much care to be called a "Slavo-Serb." The statement that the Serbs and Croats "renounced Paganism about the year 624" will not bear the test of modern criticism. From a writer who has never heard of tenth-century *Paganism* we cannot be surprised to get a meagre and incorrect account of the early Protestants of Bosnia, and no account at all of those in Bulgaria. Coming down to more modern times, we find the old organisation of the Military Frontier spoken of as still existing, and are left to infer that the writer has not so much as heard of the *Theilungsgesetze*. In spite of the author's assertion to the contrary, there is a very good road between Serajevo and Mostar; and part of the Bosnian railway, which he sets

down, on the same page, as a mere project, has been open for traffic for at least two years. Again, what is the good of reprinting at this time of day a paragraph discussing the prospects of the Andrassy note? There are, besides, some by no means palatable missionary gushings about Bulgaria, and we are informed that "the one thing needful" in Albania is, not (as some secular minds might have imagined) "political reconstruction," but—Protestant propagandism.

If we have had our grumble at the shortcomings of the little handbook before us, we have all the more pleasure in repeating that, in spite of its inaccuracies, it presents in a short and intelligible form a lively and, on the whole, a truthful picture of the various Christian peoples of European Turkey. To those who, whether from ignorance or party spirit, shut their eyes to the really good qualities of the Southern Slaves, we commend in particular the description of Montenegro—the true nobility of its inhabitants, their glorious "mountain story" and romantic land. As we are on the eve of a new Conference, or Congress, it may be well to call to mind that in 1814 we handed over Cattaro, the one sea-port of Montenegro, which the valour of her sons had aided us to recover from the French, to her selfish neighbour. The cession of Cattaro to Austria ranks among the atrocities of diplomacy, and it rests with this generation to redress it.

ARTHUR J. EVANS.

Histoire de Quatre Ans, 1870-1873. Par Théodore Duret. Tome Premier. (Paris: Charpentier, 1876.)

In this first instalment of his "History of Four Years," M. Théodore Duret tells the story of the fall of the Second Empire. It does not come within the scope of his work to describe the earliest causes or symptoms of its decadence, such as the elections of 1863, the appearance of the *tiers parti* in 1866, the interpellation of the Hundred and Sixteen in 1867, and the elections of 1869. He starts with the Ministry of January 2, which ushered in the memorable year of 1870. It was a time full of excitement and hope. After eighteen years of repression and stupor, France had again found her voice, and public opinion was loudly declaring itself against personal government. The Irreconcilables in the Corps Législatif regretted the formation of a Ministry from the Right and Left Centres, and the consequent break-up of the Opposition. But the *bourgeoisie*, whose growing discontent was much more dangerous to the Napoleonic dynasty than the implacable animosity of the workmen, were well pleased with the turn affairs had taken, and looked forward to obtaining before long all the reforms they much cared about. For them the most significant figure in the Ollivier Ministry was not the brilliant, shallow, and presumptuous talker who was its nominal head, but M. Buffet, who, after eighteen years of opposition, had committed the *bêtise* of taking office under the Man of December just eight months before he was to become the Man of Sedan, and whose obstinate, and even pedantic, attachment to constitutional forms

was supposed to guarantee a thorough change of system.

The difficulty of the new Ministry lay less in the opposition of their late allies of the Left than in the determined hostility of the Bonapartist confederacy. These men saw that their long *exploitation* of France was interrupted, and that unless the newly-inaugurated Parliamentary régime could be somehow smothered they would soon be as completely banished not only from the higher but from the lower walks of public life, as the Legitimists had been during the reign of Louis Philippe. For the first time, therefore, since the *coup d'état*, Bonapartism was in opposition. Its most active spokesmen took no pains to conceal their hostility to the Ministry, and, though on divisions they mustered only about a fifth of the Corps Législatif, it was evident that at the first hint from the Tuileries they would be joined by a majority of that servile assembly. As for the Senate, its hostility was unmistakable. The constituent functions of that body were in themselves incompatible with Parliamentary government of any sort. Whatever M. Ollivier might be prepared to swallow, no one doubted that a Ministry in which M. Buffet consented to sit must inevitably and without delay undertake to provide some other machinery for revising the Constitution.

On this ground, therefore, the two parties awaited each other. The Bonapartist ring were by no means sure of the Emperor. None knew better than they how nerveless his grasp was becoming, and many of them were persuaded that while he was dallying with constitutional government the substance of power was really slipping through his fingers. Their public language, however, betrayed no misgivings. They professed to know that the Emperor was merely allowing the Parliamentarians a trial in order that their inability to preserve order and satisfy the country might be more clearly demonstrated, and they begged everyone to notice that he had not allowed Marshal Leboeuf to be displaced from the Ministry of War.

These uncertainties were put an end to by the Ministerial announcement of March 28. The Bill read by M. Ollivier proposed to divest the Senate of its power of interpreting and modifying the Constitution, and to convert it into a mere Upper Chamber; but it at the same time re-affirmed the right of the Emperor to resort to a *plébiscite*—in other words, to paralyse Parliamentary action—whenever it should seem good to him. Moreover, in the course of the debates which followed it appeared that a *plébiscite* was to be taken immediately.

March 28, therefore, is justly regarded by M. Duret as virtually terminating the essay of Parliamentary government begun on January 2. Messrs. Buffet and Daru showed what they thought of it by resigning office. It was in truth no pedantic pride on the part of the Liberals, no short-sighted impatience of an empty form, that made them regard the Emperor's proposal as equivalent to a declaration of war. The Left Centre was willing to acquiesce in the *plébiscite* for that once, if it might be renounced for the future, or even to give it a permanent place in the

Constitution under certain restrictions. But the tenacity with which the Emperor clung to it in its unconditional form indicated but too clearly the use he intended to make of it. Not the Liberals alone, but the servile majority of the Corps Législatif understood that it was a return to the old régime, and the former at once found themselves in a minority of thirty-four.

Assuming it to be impossible, as it no doubt was, that the Empire could maintain itself as a limited monarchy, Napoleon III. had acted wisely for his dynasty in resorting once more to a *plébiscite*. M. Duret tells us that it was generally looked on as settling the government of France for many a year to come. The Liberals, much as they disliked it in prospect, had but imperfectly estimated the damage it would inflict upon their cause. They had vastly exaggerated the amount of active hostility to the Empire in the country, and the result was a painful disappointment to them. Interest in politics at once began to languish. That part of the *bourgeoisie* which had seemed disposed to insist on the abandonment of personal government, took fright at the disorderly proceedings instigated by some of the more violent revolutionists, for whom even a Republic would have had no charms if it was obtained in a peaceful and orderly way. It was hoped that after all the Emperor would be content with having formally asserted his old claims, and that practically he would leave the government in the hands of Ministers responsible to the Corps Législatif. M. Ollivier was still loud in his professions of Liberalism, and optimists were willing to be persuaded, contrary to their better judgment, that his presence in the administration offered some guarantee against a return to despotism, and its accompanying waste and jobbery. Thus during June, 1870, France appeared to have entered on another long period of lassitude and torpor.

The events which immediately led to the great war are described by M. Duret with remarkable calmness and impartiality. He is less disposed than I am to think that the Hohenzollern candidature was expressly intended to precipitate the struggle. Count Bismarck, in his opinion, was averse to pushing a claim which was looked on with decided disapproval by Europe; and if Napoleon III. had been content with its renunciation, and had not senselessly and arrogantly demanded that King William should pledge himself not to permit the candidature at any future time, he would have come out of the dispute with sufficient credit. But a war had become necessary, if not for the Emperor himself—who, after the *plébiscite*, might count on an undisturbed exercise of power during the few remaining years of his life—yet for the Bonapartists. It did in fact bring them back into office, and nothing but the rapid and stunning disasters which followed prevented them from wreaking a bloody vengeance on the Republican leaders. M. Granier de Cassagnac, indeed, did openly counsel such a course, and probably to this day regrets that his advice was not taken.

M. Duret, if I am not mistaken, considers it a great misfortune that the Corps Législatif did not anticipate the revolution of

September 4 by hastening to adopt in the early hours of that famous day the resolution of M. Thiers, indirectly deposing the Emperor, and creating a "Government for the National Defence," which would thus have been free from the disadvantages of an insurrectionary origin. He shows very clearly that the delay was due, first, to the Empress, who, though constantly professing a desire that the salvation of the country should be placed before the interests of the dynasty, could not be induced to abdicate; and, secondly, to the conduct of General de Palikao, who struggled to have himself named head of the Government. While the precious morning hours were wasted in these vain struggles of the Bonapartists to save something for their faction out of the wreck, the mob arrived, and the Assembly was dispersed.

Those who wish to refresh their recollection of that stirring time will find M. Duret's book a model of clearness, whether in political or military narrative, while his candour and moderation are such that it is not easy to discover to what section of the Liberal party he belongs. His patriotism is of that sober and enlightened kind, which, whatever people may say, has become more common among his countrymen since the war, and which affords the fairest promise of a speedy reinstatement of France in that influence which Europe so sorely misses at the present moment.

EDWARD SPENCER BEESLY.

The Complete Poems of Robert Herrick.
Edited by the Rev. Alexander B. Grosart.
Three Volumes. (London: Chatto & Windus, 1876.)

In dedicating these volumes to an eminent living poet, Mr. Grosart speaks of this as "the first adequate edition" of the poetry of Herrick. As a matter of fact, Herrick has received more care and attention from his editors than any other poet of his age except Milton, and Mr. Grosart has not been able to perform for him such immense services as his exhaustive industry performed for Giles Fletcher, Crashaw and others. Mr. Hazlitt's edition, we must contend, was tolerably "adequate," but, notwithstanding, Mr. Grosart's exceeds it in fullness and usefulness. If, however, by "adequate" is meant "perfect," we cannot admit that this last most able and careful edition has attained the utmost height of excellence. Before making any strictures, however, let us recapitulate the main points of novel excellence in these volumes.

In the first place, Mr. Grosart, who has a genius for discovering biographical facts, has unearthed an interesting document bearing upon Herrick's life—namely, the will of his mother, which was drawn up and proved at her death in the year 1629, the same year that saw her son made vicar of Dean Prior. By considering the condition of the collateral branches of the Herrick and Wingfield families at the time of the Commonwealth Mr. Grosart has moreover shown that the reports of the poet's extreme poverty and living upon charity during the years that followed his ejection are exceedingly improbable, since he had plenty of wealthy

relatives in London. Another new point of interest is the great probability that Herrick intended to publish a volume of personal poems addressed to private friends by name, fragments of which we possess scattered up and down through the "Hesperides," in the seventy-five pieces celebrating kinsmen and acquaintance. Beyond this no new fact has come to light, the events of the last twelve years of his life being, unfortunately, as obscure as ever.

The other points in which the new edition has the advantage of its predecessors are these. An index of first lines is given, a thing without the help of which it is laborious to the last degree to work critically with the text of Herrick. This is a very important feature indeed. There is, moreover, a glossarial index, and what Mr. Grosart calls "other helpful apparatus." The portrait reproduced from the original edition of 1648-47 is carefully engraved, but does not deserve the extravagant eulogies of the editor, who would have rendered us a greater service if he had given a facsimile of the pretty frontispiece that surrounds this portrait in the first edition, wherein two winged boys drop garlands through the air, while five others are dancing a round upon the grass below, and Pegasus, on an adjoining hill, rears into the air with lyrical excitement. We consider the omission of this charming piece of Paganism a serious one.

Finally, the text is very carefully modelled on that of the 1648-47 edition. I have collated it with that text in various places, and found no inaccuracy. This is the more fortunate as, as we shall see, the Introduction is very badly printed. Of the pieces attributed by Mr. Hazlitt to Herrick, Mr. Grosart very properly rejects thirteen as undoubtedly not from his hand. He adds but one hitherto unedited poem, an epitaph in eight lines, of some merit, but here printed in the most maddening way, with long s's at the ends of words. The reader must turn to the passage (iii. 113) to see how unpleasant is the effect of this eccentricity.

The Memorial-Introduction itself will certainly not escape criticism. It is exceedingly interesting and valuable, especially the biographical portion, but it extends to the enormous length of 285 pages in all, and those readers who prefer that an editor should simply introduce his author with a bow, and retire, will certainly not approve of being so long detained by Mr. Grosart. It is not desirable to curtail an editor when he has much to say of a novel and valuable kind; at the same time it is certainly annoying to be so resolutely button-holed in the vestibule of a classic. Since it takes Mr. Grosart 285 pages to make "an attempt," as he says, "at an adequate Estimate of these Poems and of the Man," we would suggest that in future issues of this series, the Memorial-Introduction should form an initial volume by itself. It would then be handy for the student, and would in no way interfere with the pleasant reading of the text. This plan commends itself to us all the more as Mr. Grosart cannot refrain from quoting *in extenso* poems that please him, so that pieces recur twice, and fragments even three times, within the same volume. This

particular Memorial-Introduction is quite remarkable for its extreme typographical inaccuracy. The editor pays me the compliment of quoting, with alternate praise and blame, a few passages from a paper of mine on Herrick. Mr. Grosart says, in his enthusiastic style, that he quotes my "conceptions, *ehou!* misconceptions," with "sorrow and wonder." But the sorrow and wonder are mine when I find myself misquoted *forty-one* times! It will be admitted that "*blazè* Randolph" and "the *Augustus Friars*" are, to say the least, singular expressions.

While occupied with the critical part of the Introduction, it may not be deemed impertinent if I refer to a point on which Mr. Grosart is certainly misleading. In the paper above referred to I took the opportunity of remarking that Herrick appeared to me to have learned much of a technical kind from Ben Jonson's beautiful Masques, and I even ventured to suggest that the younger poet's peculiar treatment of fairy-lore might have been suggested to him by Jonson's "Oberon." On this Mr. Grosart says: "Mr. Gosse is again strangely wrong as to the source of Herrick's 'Fairy' poems. Misled by the title—and the mere title or one word 'Oberon' could never suggest such poems—he assigns to Jonson his inspiration. But Jonson's 'Oberon' has nothing whatever on Fairies or Fairy-land." Mr. Grosart must be dreaming. "Oberon, the Fairy Prince" is the title of Jonson's Masque. The scene is laid in "seats of bliss in Fairy-land." The palace opens, and the whole nation of Fays is discovered. All the central portion of the piece is sung by Fays and Elves, who constantly refer to this being "Fairy-land." There could not possibly be a more complete fairy-drama than Ben Jonson's "Oberon." Again, critically, we have but to read such a poem as the epithalamium at the end of "The Hue and Cry after Cupid" to see how deeply Herrick was indebted as a metrist to Ben Jonson.

To Mr. Grosart is due the credit of having been the first to collate the Herrick poems in "Wit's Recreation" (1640) with the "Hesperides." This is a great service done to the students of the poems. But he entirely omits to note the variations contained in "Wit a Sporting in a pleasant Grove of New Fancies. By H. B.," printed in London in 1657, "H. B." being understood to be Henry Bold. He merely notes that various pieces of Herrick's were printed in that collection. As about half of the little volume is Herrick's, the fact ought not to be so hurriedly dismissed, and as being published not only in Herrick's lifetime, but while we believe him to have been still in London, the most important of these variations ought certainly to have been recorded in the notes. Unfortunately "Wit a Sporting" is excessively ill-printed, and many of the variants are mere blunders. The following, however, are not wholly without interest. In "On Himself" (Grosart, i. 103), the awkward line—

"No herbs have power to cure love,"

is certainly improved, and rendered more like Herrick, in "Wit a Sporting," where it stands—

"No herbs can cure the power of Love."

In the famous "To the Virgins," the first stanza is thus given in "Wit a Sporting":—

"Gather the rose-buds while you may,
Old Time is still a-flying;
And that same flower that smiles to-day," &c.

The last line of "To Robin Redbreast" reads—

"Here, here the tomb of William Healey is,"

instead of "Robin Herrick," an alteration and perversion that requires explanation. In "Not to Love" (G., i. 179) the sixteenth line reads in "Wit a Sporting"—

"And how she is on her left part,"

which, as an extension of the preceding line, about her heart, is at least more intelligible than the odd reading of the "Hesperides":—

"And how she is her owne least part."

In "His own Epitaph" (G., ii. 190) the fourth line reads—

"So I, now having rid my way,
Fix here my pen and make a stay,"

instead of—

"Fix here my Button'd Staffe and stay."

Not to be tedious, I will quote but one more variation, this time in "To Anthea," stanza 1:—

"Bid me to live, and I will live,
Thy Servant for to be,"

which is horrid, but may possibly represent an evil after-thought of Herrick's own; and stanza 3:—

"Or bid it languish quite away,
And it shall do 't for thee."

Another point in which Mr. Grosart reproves me very severely is a remark of mine on the singular unconsciousness which permitted Herrick to busy himself with his little pastorals and madrigals during the very heat of the struggle for liberty. I remarked, perhaps too laxly, that the "Hesperides" was brought out a few weeks before the king was beheaded. Mr. Grosart considers this innocent statement "utterly erroneous," "imaginary," "unfortunate," and "mistaken." He further adds, but on what authority I cannot discover, that the volume was published *early* in 1648. Supposing that this were the case, it would have been not more than twelve months before the king's death, and during the most exciting period of doubt, perplexity, and national peril. If, however, the "Hesperides" was published, as seems to me quite as likely, late in the year, its appearance would be made only a few weeks before the king's execution, as I suggested. It has always appeared to me probable that the "Noble Numbers" went to press while Herrick was still at Dean Prior, and that he brought the sheets up to town with him on his ejection. An opportunity now offering for the publication of the unclerical "Hesperides," he kept back the "Noble Numbers" for some months more, while he hurried the "Hesperides" without arrangement or order into the printer's hands. All this, of course, is pure conjecture. But it is not conjecture that his little amorous poems occupied his best attention during part at least of the most critical year in the history of the English Commonwealth.

The tone of this article, I lament to perceive, is almost unduly controversial. But Mr. Grosart is so earnest, and even so

vehement, a worker in the field of early poetry, and so unsparing of the faults of his certainly less careful predecessors, that if one is not willing to stand aside and passively to admire his zeal, one is forced to gird up one's loins to combat a most agile and untiring antagonist in the very best fashion possible. This must be my excuse for criticising so strenuously a book that I heartily admire and commend.

EDMUND W. GOSSE.

Life, Letters, and Journals of George Ticknor.
Two Volumes. (London: Sampson Low & Co., 1876.)

Owing to the skill attained by Mr. Ticknor, in the course of his experience of men and cities, in throwing off pen-portraits, and illustrating character with discriminative and kindly detail, the two volumes of his biography have served to such an extent as a repertory of anecdote to the critics that the grand lesson of his life has run a risk of being overlooked. A genial soul, and, as regards his years in Europe, a man of good average health, George Ticknor's sketches of his many friends and acquaintances are subject to no spirit of fickleness according to the state of his bile or gout; and hence it is no wonder that readers and reviewers have agreed to ignore the serious purpose in an abandonment to the delights of enjoying the plums of the pudding. There is great excuse, truly, for this very pretty fun; but perhaps it is time to have an eye to the solids, and in this view to read "Ticknor's life," not so much for its *mots*, its anecdotes, its "people we have met," as for the aims and achievements of its central figure—the sustained purpose, and the fulfilled mapping-out of a career from early manhood to an old age singularly honoured and useful. Born at Boston in 1791, of parents in easy circumstances, and both more or less connected with education, George Ticknor found, when he passed out of his father's hands into those of the teachers at Dartmouth College, that the latter were not so capable as the former. Hence (small blame to him, at the age of fifteen or sixteen) "he was idle in college and learnt little." But he retrieved the loss of time under the tuition, subsequently, of a former pupil of Dr. Parr, who taught him a fair amount of scholarship, and admitted him, with special favour, to his literary suppers, where the youth imbibed the real love of ancient learning which becomes a life-passion. So much was this the case with Ticknor, that, although he qualified for the bar, and even paid by his earnings at it his first year's office expenses, he was fain to make a clean breast of his mistake to his kind and indulgent father, and obtain his permission to exchange Tidd and Chitty for German and Spanish, and to proceed to Europe to study its languages and literature. This was no fitful project of one who did not know his own mind. It was no *fainéant* turning his back on a laborious profession for a life of amusement and dilettante-ism. "He saw," says his biographer, "that he should be more happy and useful as a man of letters than as a lawyer," and, feeling his country's urgent

need of scholars, teachers, and men of letters, resolved "in turning from law to literature to exchange one form of hard work for another." "I must spend," he writes to a friend, "some time in Italy, France, Germany, and Greece." "This going to Europe is a sacrifice of the present to the future; a preparation for greater usefulness and happiness after I return." And so, after nine months spent in gauging the hindrances to studying German—his first aim and quest—in a country where there were less facilities for acquiring it *then* than for learning Persian or Arabic *now*, and in visiting distinguished Americans, such as President Adams and ex-President Jefferson, with a view to European introductions, the young Bostonian starts for Europe at the age of twenty-three, with fresh, unworn spirits, a zest for society, an exact and retentive memory, and, above all, a staunch tenacity of purpose. To the run of young men of his tastes and spirits a May and June in England, especially in London amid the pick of its literary society, and with the *entrée* to the "Literary Exchange of Murray's bookstore" might have proved a Capua, all the more subtle because its charms were of kin to his grand aim and quest; but he pressed on to Göttingen for the beginning of August, to make his home there for the next twenty months; and exchanged his London gaiety for a programme which spurned delights and lived laborious days, while he pursued a systematic round of lectures and preparations, in German with Beneke, the English professor; in literary history with Prof. Eichhorn, who also lectured on the three first Evangelists; with Dr. Schultze, the best Greek instructor, on the Greek poets; with Blumenbach in Natural History; besides informal lectures and conversations with his ideal scholar, Dissen. Taking his "hours" rigidly with each, he allowed himself no relaxations but a daily walk with his compatriot, Everett, a five days' run with him to Hanover, and a six weeks' tour in North Germany, at intervals, and a fortnightly light supper with the Göttingen Literary Club, into which they were elected in the winter. The trips and tours were fruitful in introductions to all the greatest German scholars—Wolf, Hermann, Beck, Schaefer, Thiersch, and others. The sojourn in the University showed him the meaning of instruction, and the difference between "reciting to a man and being taught by him;" and it was a treat to revel here in "something like a library"—a treasury of 200,000 volumes, liberally lent out to students, in comparing which with Harvard he says of the latter, "I thought it a large library; when I came back it seemed a closetful of books." The only shadow cast on his satisfaction was the retrospect of wasted time which he could not overtake, and which made him admire Wolf's well-thumbed German lexicon, and reverence the well-worn Greek lexicon of ex-President Jefferson. But a tenacious purpose and strong principle of self-storage amid his European opportunities left scant space for unavailing regrets. At Göttingen his daily course was three recitations and nine hours' study a day. When he reached Paris, and

found himself received in its best and most intellectually fascinating society, he set himself a rule and system of self-improvement which must have entailed much self-denial. Few but himself could have made a rule of rising daily at six and employing every moment from that hour till 5 p.m. with teachers of French, Italian, La Langue Romaine, and the French literature, in spite of dinners overnight at Mme. de Staël's, and evenings with Chateaubriand. It was the same when, with the highest introductions and facilities for amusement, he found himself at Rome. The Eternal City is no sooner reached in 1818 than Prof. Nibby is engaged to visit with him its ruins and antiquities, and he sets to work at learning to speak Italian, in six hours a week with an Italian architect. It was from Rome that he wrote, a year after it was first offered, his final acceptance of the Professorship of Belles Lettres, French, and Spanish at the University of Harvard; but as he made it a *sine qua non* that he should first visit Spain, a land to him of singular fascination, he soon exchanged the hard work of Rome, and the converse of the Bunsens and Humboldts, with the *conversations* of the Duchess of Devonshire and the Buonapartes, for a like round of blended study and society in Madrid, Seville, Salamanca. Here he begins to work at 5.30 a.m., and goes on with a cup of coffee till 11 a.m., when he has a master in Spanish till 1 p.m. Then comes his second, and solid, breakfast; and then, to acquire a double amount of Spanish, he has a second and superior Spanish teacher who reads Spanish poets with him for two or three hours a day, with enthusiasm, taste, and feeling. It was these readings that doubtless strengthened his addiction to the great literary work of his life, and are the germ of his *History of Spanish Literature*. How he made all these work together for his main object may be seen by his attraction to the Cruz theatre at Madrid—because there he could hear the national drama of Lope de Vega, and Calderon—and by his making his excursions and introductions subserve the inspection of the great Spanish libraries, untapped mines of manuscripts and early printed books. Perhaps, however, his wanderings in the south of Spain had more fruit, in *souvenirs* of Don Quixote and the Spanish Ballads, than his researches in the libraries of the Escorial and Salamanca. After all his pains, he had before returning to Boston to have recourse to the King's Library at Paris for books on Spanish and Portuguese researches, which neither Seville, Granada, Madrid, nor Lisbon could yield.

Evidence of the same steadfast quest of national literature and bibliography might be found in his Scotch sojourn, which was not cut short by his mother's death; but it is time that we turned from the contemplation of his acquirement of knowledge to that of his use and manifestation of it. It was on June 6, 1819, that Ticknor returned to Boston, after four years' absence, at the age of twenty-seven, a man of affairs, of culture, and of extensive knowledge of men and books. Two months later he was installed in his Harvard Professorship, and forthwith devoted himself to teaching the languages

of France and Spain, as well as lecturing on their literatures, besides giving sixty lectures a year on all the elegant literature of Europe. Living still with his father, he had filled a copious library with his European purchases; and as he had learnt in Germany the secret of attractive lecturing, he lectured without manuscript so easily and fluently that he succeeded in rousing his classes to enthusiasm more effectually than the governing body, which, however, as years ran on, he took the lead in reforming. In 1821 his father died, and he shortly afterwards married the daughter of the founder of the Greek chair at Harvard, a sister of one of his brother professors. From henceforth we find him working with untiring energy at University reforms, at movements for amalgamating the Athenaeums and libraries of Boston into a great public library on the Göttingen model, in school examinations, and public lectures, and reviews in the *North American Quarterly*, until after holding his professorship fifteen years—years spent in a charming home of his own, with the blessing of children and of such friends as the Prescotts, Everett, and others—the death of his little boy and the consequent shock to his wife's health compelled him to resign his professorship to a fit successor, Longfellow. He sailed for Europe from New York in the spring of 1835, carrying with him his wife and daughters, and travelling, during the English portion of his time, somewhat in nomad fashion in a thoroughly-equipped covered drag with four horses. What additions he made during the next three years to his troops of friends in Oxford, Dublin, York, Edinburgh, London, Dresden, Vienna, Florence, Rome, Paris, others have told, and may tell. His underlying purpose was still to follow up Spanish literature, with Tieck at Dresden, and Wolf at the Imperial Library at Vienna, as well as at Fauriel's Sorbonne lectures in Paris. Nor less so to see all the best public and private libraries, the Vatican with Monsignor Mai, the Spencer Library at Althorp, and the Bodleian at Oxford. It was at the close of this second sojourn in Europe that he met at dinner in London a "Mr. Lewis, an evidently very scholarlike person," the kindred soul whom, as Sir George Cornewall Lewis, he seems to have ranked in the same esteem and value, if not familiar intimacy, as Sir Edmund Head and Mr. Edward Twisleton.

After the second return home, Ticknor found politics a concern to him beyond his former wont, through his intimacy with its accepted leaders, and with the ablest and most honest minds in the United States, though his literary habits kept him from being drawn into their vortex. The fruits of a life of acquisition were to be borne in another field. From 1838 to 1848 his "opus magnum," based on twenty years of study, was being steadfastly, though with lingering fondness, pursued. By the beginning of 1846 the work had been brought up to 1700 A.D., and the completed task was issued in 1849, with the warm imprimatur of his friend W. H. Prescott, who discharged for it that task of revision which his own works had enjoyed at Ticknor's hands. It is superfluous to discuss a book which, written for general readers, has won so signally

the favour of the most fastidious scholars also. Mr. Richard Ford, of the *Handbook of Spain*, Ludwig Tieck, Motley, Everett, Lord Stanhope, rendered it the highest tributes of approval; and the work is one of which the popularity seems to defy supersession, as it deserves to do. Another achievement of this life of purpose—the establishment of the Boston Free Library, mainly owing to the earlier researches and mature administrative powers of Mr. Ticknor—came seven years later. When Boston roused itself to accept and meet Mr. Bates's gift of 50,000 dollars to a free library, who but Ticknor could be singled out to devise its plan, or select its books? This institution might be called the child of his old age, for which at the age of sixty-five he adventured with his family another visit to Europe, its libraries and book-marts, and to which, at his death, he bequeathed his beloved Spanish Library. That death came not till he was truly full of years and honours, having added to his other achievements "the best monument that one man of letters ever reared to his friendship for another," the biography of his friend Prescott, who died in 1858, and whom he survived thirteen years. These latest years were passed in a tranquil indulgence of friendship, memory and hope, and in the congenial study of biography. Many of his correspondents died before him, and he calmly awaited his time. It is characteristic of the now octogenarian that after he had taken to his bed, in his last illness, his friend Dr. Bigelow and he were heard quoting Greek together, *à l'envi l'un de l'autre*. Truly if this man had been tied by a severe father to the office desk, which was his first profession, there would have been one less example of tenacity of purpose, and Samuel Rogers had never said "How these Bostonians do work!" JAMES DAVIES.

Lichens from an Old Abbey: being Historical Reminiscences of the Monastery of Paisley.
(Paisley: J. & R. Parlane, 1876.)

ABOUT half-way through this book there is a passage which so thoroughly explains the principle on which it was written that it ought to have been printed on the title-page as a motto. For the benefit of future readers here it is: "Where facts fail us, we lawfully resort to fancy." No doubt the result may be very interesting, but it is not what is usually expected from "Historical Reminiscences."

As an example of the way in which this principle is carried out, here is the author's account of Eschine de Londonia (Loudonia?) Lady of Molla, wife of Walter Fitzalan, Steward of Scotland, the founder of the Abbey:—

"Eschine de Londonia, Lady of Molla, becomes the wife of the Steward. That she was beautiful and worthy of her lord, we are entitled to believe. One of the privileges of fiction, which history has a right to claim, is this faith in the beauty, grace, and virtue of all those who have come down to us from remote traditional times, without contrary imputations. Particulars having been denied us, we philosophically generalise, and accept the individual for the type. The woman, veiled in the obscurity of eight centuries, becomes the ideal lady. Norman by no means she; Scots-Saxon, with eyes softly blue; some Celtic fervour and

devotion spiritualising her face; her aspect generous, and features pearly fair, with the rosy flush of Northern breezes, like a soft dawn, lighting them into the purest human sweetness; reasonable and benign; no fickle impulses, no exacting egotism, no self-worship; a woman of household pleasures—to be loved by her husband with a constant love, to be tenderly revered by his vassals. Her brown lashes droop not coyly—they are lifted with modest, serene trust in herself and in her world. Her thoughts keep company with her. Such must Eschine of Londonia be."

Why? As far as we can gather from this book there is hardly any information about her, except the mention of her name in one or two charters. But then this "historian" claims "the privileges of fiction," and the result is that no one can tell where the history ends and the fiction begins. In a similar strain we are told that John of Fordun "may have talked" with Richard Rolle, the hermit of Hampole, with Langland, and even with Chaucer; and some space is taken up by descriptions of them. This passage occurs in a chapter on the *Chronicus [sic] Clugniense*, which was a transcript and continuation of the *Scotichronicon* by the monks of Paisley; and its place might well have been supplied by a description of the MS., which is said to be preserved in the Royal Library at St. James's.

It quite goes against the grain to find fault with this book, for its compilation has evidently been a labour of love, but the mistakes are so extraordinary that it is impossible to pass them over without notice.

In the chapter on the foundation of the Abbey, a good deal is said about a chest of silver in a mill given by Walter, the steward, to Radolph of Kent, "the peaceful mill where old Radolph of Kent kept his said silver chest." This was very puzzling, but luckily the charter itself is printed in the appendix, and the silver chest turns out to be nothing more than *unam marcum argenti*, a rent of a mark from the mill. It looks as if the author had heard the charter read, but had not seen it himself; yet he (or she) translates *dimidium marcum*, a few lines lower down, rightly enough.

Another remarkable piece of mistranslation occurs in the description of the tomb of the children of the last abbot, Claude Hamilton. The following lines:—

"Felices animas, vobis suprema parentes
Solvunt, vos illis solvere quae decuit,"

which express the rather hackneyed sentiment that it would have been more fitting for the children to bury their parents, are thus rendered:—

"Blessed souls, to your death this is devoted.

He that hath taken you, hath done what becometh him."

If the inscription had been Etruscan, such a "shot" would have been excusable; but one would have thought it impossible for anyone to print as a translation of a simple Latin sentence what has not even a vestige of the meaning of the original.

Still, with all these errors, if there are any people at Paisley who love the memory of their old abbey, this book will store their minds with vivid, though fanciful, pictures of Walter the steward; of Princess Marjory, the daughter of Robert Bruce, who was killed by a fall from her horse in the neigh-

bourhood; of Lord Claude Hamilton, the firm friend of Queen Mary; and of many other personages whose names are now, perhaps, hardly known in the town in which they once ruled, and thus teach them to look upon their old church with a new and higher interest. C. T. MARTIN.

NEW NOVELS.

Seventeen to Twenty-One; or, Aunt Vonica. By M. M. Bell. (London: F. Warne & Co., 1876.)

Maidenhood; or, the Verge of the Stream. By Mrs. Valentine. (London: F. Warne & Co., 1876.)

The Leaguer of Lathom. By W. Harrison Ainsworth. (London: Tinsley Brothers, 1876.)

Maggie? By Frank Barrett. (London: Tinsley Brothers, 1876.)

If anybody wishes to know the reason of the title *Seventeen to Twenty-One*, we can only inform him that the author formerly wrote a book called *Seven to Seventeen*. It would be a very interesting problem in arithmetic to find out how many more volumes Miss Bell will require to carry her titles to the verge of human life. As the heroine, to whom this title probably alludes, is twenty when the book begins, there is a certain vagueness in the arrangement which complicates the problem. *Seventeen to Twenty-One* is, however, so much more a child's book than a novel intended for grown-up readers that it may claim some indulgence. Its main subject is the Robinson Crusoe existence of a young aunt and her orphan nieces and nephews, in a half ruinous Scotch castle. The author uses words, names, and incidents in a perilously inexact manner. A very slight acquaintance with Scotch history would have taught her not to give the name of Gordon to an old family domesticated for centuries on the banks of the Tay; and a very slight acquaintance with European history would have shown her that an Austrian officer serving with his regiment could not well have been killed in one of the skirmishes which preceded Waterloo. She uses the word "crypt" as if it were synonymous with aumbry; and her Scotch dialect is more suggestive of a diligent study of the glossaries to the Waverley Novels than of actual experience. To notice these little matters is sometimes counted cavilling, but it is very certain that attention to the said matters in most cases decides the value of a novel.

Mrs. Valentine's book is of very much the same kind as Miss Bell's, but it is much better written, is more life-like in its characters and dialogue, and has the advantage of a regularly constructed plot. It is also tolerably free from blunders: although, owing doubtless to the fatality which seems to beset writers of her kind, Mrs. Valentine has spoken of somebody as running the "risk of being tortured" at the Bloody Assizes by refusing to answer a question put by Jeffreys. That unlucky judge has quite enough to answer for without impossible fictions of this kind being laid upon his memory; and Mrs. Valentine may find full information on the subject of torture with-

out going beyond her Macaulay. It is not improbable that some confused idea about the penalty for "refusing to plead" has got into her head; but novelists should clear their minds of confused ideas, at least as to the subjects on which they are going to write. It may be mentioned that both the books just noticed are produced, not in the usual novel form, but in single volumes of handsome shape and good print, but defaced by hideous illustrations.

In *The Leaguer of Lathom*, Mr. Harrison Ainsworth has once more turned to Lancashire for a subject. The famous lady who shares with Lady Blanche Arundell and the Marquis of Winchester the fame of the three most gallant sieges of the Civil Wars has already been utilised in *Peveril of the Peak*. But Sir Walter did not meddle with her early glories, or with the time when Lathom surpassed Wardour Castle in luck, and Basing House in the fact of being commanded by a woman. Mr. Harrison Ainsworth does not confine himself to the actual siege, and indeed his central figure is not so much the Countess Charlotte as her husband, whose ill-fated and in many ways tragical figure seems to have impressed him greatly. The book is mainly composed of sketches of the battles and sieges in which the Earl took part. The personal or romantic element (contributed chiefly by a handsome young gentleman named Standish, and two foreign damsels who in a manner pull caps for him) is not very prominently brought forward. Many, however, of the situations—such, for instance, as the blowing up of Hoghton Tower and the betrayal and sack of Bolton—are by no means lacking in dramatic interest, and would have borne more elaborate treatment. As it is, these volumes in parts bear perhaps a little too much resemblance to the battles and sieges of the book of Joshua, or to those quaint chapters of the *Holy War* wherein Bunyan enumerates the numbers, captains, and dispositions of the "doubters" and "blood-men" who molested Mansoul.

Critics of novels are not, as a rule, expected to indulge in general principles: nor, indeed, does the matter which is commonly brought before them supply much temptation to any such indulgence. But occasionally there appears a book at once good enough and bad enough to demand the assumption of the voice of the Preacher, and to induce one to point out to the author the way in which at least he should not go. Mr. Frank Barrett's *Maggie?* (an eccentricity of title which we do not much admire) is such a book, and the commandment which he has forgotten is no new one. Novels differ from some other kinds of literature in that they require that both matter and manner should be attractive, the *genre ennuyeux* being as bad in subject as in style. Very excellent and immortal poems have been written on a broomstick, but of the excellence and immortality of a novel with a broomstick for subject we doubt. Now, Mr. Barrett has succeeded in acquiring a very tolerable manner. It is not exactly original; indeed, it is little more than a variety of one which Thackeray invented and perfected, and of which Mr. Black is at present the patentee; but it is fresh enough for all purposes, and at

its best, as in some of the earlier interiors of the Carey household in this book, is really good. But his incidents and his characters are not good at all. The plot, such as it is, turns partly upon an incomprehensible confusion between two girls of the name of Margaret, and partly on an equally incomprehensible scheme whereby a retired grocer and stock-broker wins five thousand pounds at loo. In both of these matters a heavy villain is mixed up, and an exceedingly foolish young man also forms a link between them. There is a publisher who drops his h's, but is not so amusing as Mr. Mugford; a literary man who jibes at his wife, but is more insignificant than Pendennis; a good Samaritan with a beard, whose end is more lamentable than Warrington's; and a beneficent little housewife, who is a shade less ladylike than Laura. The actual heroine is the interrogative Margaret, an angel with chesnut locks, immense artistic powers, and but scanty grammar. There are several other people who are generally commonplace or conventional. This is not a favourable account to give of a book, and yet, strange to say, the book is by no means bad. The Careys (the literary man and his wife) are very good at first, and not bad afterwards; the bearded Samaritan is excellent in his earlier stages; and there are besides isolated scenes, many pleasantly and some pathetically written. But wherever the two villains appear they spoil everything. Mr. Barrett has some (and those not the commonest) characteristics of an excellent novelist. We should advise him to look out for a partner who possesses those which he lacks, and to start afresh on the dual principle. With a capable coadjutor to invent situations and criticise characters, he ought to write a capital novel. Of course if he can qualify himself to be his own coadjutor, so much the better.

GEORGE SAINTSBURY.

GIFT BOOKS.

WE should think that no one in these days can reasonably doubt that there is such a place as Fairyland. Its existence is clearly demonstrated by the number of tales which are written about it. Every year the supply grows larger, and no two are exactly alike, though some bear a strong family-resemblance to one another.

Johnnykin and the Goblins (Macmillan and Co.) is a story written and illustrated by Mr. Charles Leland. Parts of it are so funny that we are surprised the whole is not funnier. When the five fingers are supposed to represent five mannikins and laugh at Johnny's joke they are delightful.

"We never heard a joke before in all our lives," said Thumbikin. "I once heard *part* of a one," he added; "and we always did all our laughing on that. After this we shall always laugh at your joke instead. I say," he added anxiously, "it'll keep, won't it?" "Yes, as long as you choose to keep it." "We'll have it on Tuesdays and Thursdays and Saturdays from twelve till ten, and then a little bit of it before going to bed."

The "Dreadful Stupids" also are very amusing, and Johnnykin's conversation about them with Marjolaine when he asks her if she likes looking at them and she answers:—

"Certainly; we think it's charming, it's so very dull, and bores one so; it almost makes me feel sleepy. You know," she added, "that we never sleep in Goblin Land." "Ah," said Johnnykin, "now I understand it all; you refresh yourselves with stupidity just as we do with sleep." "Yes." "Then I think you would find mortal life very nice," replied Johnnykin."

The verses which are interspersed through the volume are rather weak, and not worthy of Hans Breitmann, but most of the illustrations are good. On the whole, though somewhat disappointing as coming from Mr. Iceland, *Johnnykin* is sure to find favour with many readers.

The Pearl Fountain, and other Fairy Tales, by Bridget and Julia Kavanagh. (Chatto and Windus.) This is a volume of genuine old-fashioned fairy-tales, which really please children much better than the books half allegory, half nonsense, which are showered upon them at present, and in which they get hopelessly puzzled as to whether the writer is laughing at them or with them. We confess to a liking for fairies that are fairies, and hags that are hags, and not tall mysterious women who give quantities of good advice when we want to know how the story goes on. In this book we have fountains of which all the drops are pearls which can be carried away in sacks, and hens whose feathers are all of gold. "Fire and Water" is a charming little story.

The Rose and the Lily: how they became the Emblems of England and France. A Fairy Tale, by Mrs. Octavian Blewitt. (Chatto and Windus.) The chief interest of this book lies in the illustration which was done for it in 1875 by George Cruikshank at the age of eighty-three. The eyes of the Demon of Evil looking out of the lake are worth a certain portion of the weariness induced by the story, which might have been better if it had not been told in such studiously affected language.

On a Pincushion, and other Fairy Tales. By Mary de Morgan. Illustrated by William de Morgan. (Seeley, Jackson, and Halliday.) This is another good collection of fairy tales not too heavily weighted with wise teaching and deep meaning, simply and prettily told, and charmingly illustrated. "The Toy Princess" is one of the best fairy stories we have read for some time.

Carrots: Just a Little Boy. By Ennis Graham. Illustrated by Walter Crane. (Macmillan and Co.) This is a much prettier story than its ugly name denotes. We question the wisdom of perpetuating in a book the name which causes such severe suffering to many childish hearts, but possibly the story may have been written to reconcile some special little Carrots to the infliction. Carrots is a very delightful little gentleman with red hair, who gets into a variety of scrapes, but is invariably true and honest. Ennis Graham understands children and writes for them tenderly and simply; all the characters are well sustained, and the kind little sister Floss will be a special favourite, though we think she was preternaturally wise to quote her mamma's beautiful definition of Heaven: "It isn't like a place exactly. It is just being quite good."

Only a Dog. By the Author of "Hetty's Resolve," &c. (Seeley and Co.) One of the most delightful acquaintances we have made among the new books is the dog Peter in this pathetic little story. Peter is saved from drowning by a little London waif, who shares his poverty with him. After a time Peter's master becomes a hop-picker, and is afterwards taken into the employ of a clergyman as a garden-boy. Peter is his constant and most faithful friend, rescuing him from bad company, from stealing, and from many scrapes, watching by a sick boy till he dies, saving the gardener's family by giving an alarm of fire, and nobly saving the lives of some puppies of whom he had been jealous. Altogether Peter is a dog of whose friendship anyone might be proud. The book is nicely got up and well illustrated, and deserves to be one of the most popular gift-books of the season. We could wish there were more dogs like Peter—or men either, for that matter.

Dwellers in our Gardens, by Sara Wood (Groombridge and Sons), is a most attractive little

book of natural history, telling in pleasant language the manners and customs, and many curious and interesting particulars, of snails and spiders, butterflies, ants, bees and song-birds.

Aunt Judy's Christmas Volume (George Bell and Sons) is full of pleasant reading as usual, but we miss the long story from Mrs. Ewing which generally makes the volume of permanent worth in the schoolroom library. There are some short stories by her which are excellent in their way, but make us wish for more, and there is a good serial by Mrs. Reilly called "The Girls of the Square," which contains a useful warning against early attempts at verse-writing.

Good Things for Boys and Girls. (Strahan and Co.) Boys will like *Good Things* this year, because it is full of adventures and stories of the sea. It is a remarkably nautical volume. There are serial stories called "The Mystery of the Island," "Convoying H.M.S. *Brutus*," "The History of a Lifeboat," and "Clerk or Sailor," beside papers on "Warships and Torpedoes," "Deep-Sea Telegraphy," "The Maelstrom," &c. The first-named story is a long serial by the late Henry Kingsley, which will have a sad interest for those who remember that he will never write anything more for this magazine, to which he has been such a constant and genial contributor. Among other contributions are several from David Ker, Matthew Browne, William Gilbert, &c.

Routledge's Every Boy's Annual for 1877. (Routledge and Co.) This seems a thoroughly healthy volume, which will please healthy boys. We are glad to see that it appears quite free from sentimentality. There is a long serial by Jules Verne, and there is also a serial by the Rev. W. Adams, called "The Boys of Westonbury: or, the Monitorial System," beside numerous papers from Mrs. Sale Barker, Colonel Drayson, W. H. Kingston, and other popular writers for boys. The illustrations do not seem quite up to the mark of former years.

Little Wide-Awake (Routledge and Co.) is full of pretty pictures and varied letterpress, and will be quite as popular with the little ones as former volumes have been, but "Mamma's Sunday Talk" is rather stiff reading, and not calculated to make the miracles very interesting in the nursery.

Rosie and Hugh; or, Lost and Found, by Helen C. Nash (Samuel Tinsley), has all the appearance of a one-volume novel, but it is in reality a very simple story in large print. It is not very natural that a little girl should be picked up by strangers at Lucerne—as Rosie was—and that though her relatives were making diligent search for her, they should not find her for many years. However, if they had, this story would never have been written, and we think that the children will therefore be grateful for the stupidity of the police.

Mother Goose's Nursery Rhymes. With 300 Illustrations. (Routledge and Sons.) A volume in gorgeous binding which contains most of the nursery favourites and has some delightful additions, such as "The Walrus and the Carpenter," "Freddy and the Cherry Tree," &c. But we are sorry to see Tom Thumb's Alphabet reproduced in it, for the children have quite good sense enough to know that it is not really funny, but somewhat vulgar. "I don't like men with little bodies and big heads, that make ugly faces," says the three-year-old critic by our side, so we turn over Tom Thumb's Alphabet without looking at it, and come to some charming songs with music, and the story of John Gilpin, and many pictures that we do like very much.

Hood's Comic Album. (Office of Fun.) We are sorry to say that we have looked through the Album without a smile, and laid it down with a sigh. It may be our own fault, but we do not think it is. *Fun* exhausts itself during the year,

and is apt to grow slightly hysterical about Christmas time. Mr. Austin Dobson's ballad seems to us again the best thing in the volume.

We have received several volumes of the Rose Library, which has certainly produced some of the pleasantest books we have had in a cheap form. It has added to those which we have already noticed, *The Guardian Angel*, by Oliver Wendell Holmes; *My Wife and I*, *Betty's Bright Idea*, *We and our Neighbours*, *The Ghost in the Mill*, and *Captain Kidd's Money*, by Mrs. Beecher Stowe; *My Summer in a Garden*, by C. D. Warner; and *Hans Brinker, or the Silver Skates: a Story of Life in Holland*. The two last-named require special notice—the first for its quaint suggestiveness, and the latter for being one of the best children's stories that we know. Messrs. Sampson Low are doing good work in bringing out this healthy kind of literature in a cheap and cheerful form, and we hope the Rose Library will become as well known as it deserves to be. We have also received from Messrs. Sampson Low a shilling series of Jules Verne's stories, which are too well known and appreciated to require more than a passing mention:—*Martin Pay, the Indian Patriot*; *Dr. Ox's Experiment*; *Around the World in Eighty Days*; and *A Winter Amid the Ice*.

MESSRS. WARNE AND Co. contribute largely to the amusement and instruction of the youthful public. No Christmas books are more popular than those of "Aunt Louisa," who this season may be said to outvie herself. Her *Horses and Dogs* consist of twenty-four pictures from the noted works of Herring and Landseer, which have now ceased to be copyright, splendidly printed in colours by Butterfield. "High and Low Life," "Laying Down the Law," "Dignity and Impudence," "A Distinguished Member of the Humane Society," and other famous dogs, are here reproduced. The subjects chosen for *London Favourites* consist of an alphabet of animals, childhood's playmates, and a new version of "A, apple pie": the pictures all very good, but not equal in interest to those of Herring and Landseer. The *Home Book for Young Ladies*, edited by the same talented writer, Mrs. Valentine, the "Aunt Louisa" of the more juvenile books, is the reproduction of a work published more than ten years since, and now altered to meet the modern tastes, "Lawn Tennis" and other new games being added, and directions for the making of "Point Lace," Church embroidery, and other works and accomplishments, forming in the whole a complete manual for young ladies. The *Natural History Album* contains 500 illustrations of the animal kingdom, printed in oil-colours, with descriptive letter-press in large clear print. Equally clear in type is *Aunt Friendly's Sunday Keepsake*, with illustrations of every great event recorded in the Holy Scriptures, and numerous animals and objects of natural history mentioned in the Bible. *The Swan and Her Crew* gives the history of three adventurous young naturalists who build their own boat, in which they visit the eastern coast of Norfolk, its tidal lakes, rivers, and marshes, recalling the scenes described with Chinese accuracy by the poet Crabbe. These abound in fish, and swarm with wild fowl, the reeds and rushes being the haunts of many rare visitants to our island. All these are well described and profusely illustrated. Mrs. Trimmer's *Story of the Robins* needs no comment: for more than eighty years it has been the children's delight.

We have likewise received from Messrs. Routledge a new edition of the *Arabian Nights*; and from Messrs. Marcus Ward and Co. illustrated reprints of *The Vicar of Wakefield* and *Robinson Crusoe*, beside a revised and enlarged edition of *Notes of Travel in Egypt and Nubia*, by J. L. Stephens. Messrs. De la Rue and Co.'s admirable almanacs, diaries and pocket-books are like good wine, which "needs no bush."

NOTES AND NEWS.

WE are glad to hear that Mr. W. J. Stillman is preparing a book on the Insurrection in Bosnia and Herzegovina, mainly examining its causes and the influences that stimulated it in the light of his recent personal experience.

MESSRS. LONGMANS will shortly publish a volume by Mr. J. Bass Mullinger, relating to Carolingian history. It deals with the revival of learning under Charles the Great and the movement which connects that revival with the University era; the main purpose of the work being to trace out both the Patristic and the purely Pagan elements in mediæval education, and to show how, under the influence of the great teachers of the ninth century, the monastic and ecclesiastical societies were induced to embrace a more liberal conception of Christian culture than had up to that period prevailed.

MR. S. R. GARDINER has in the press two more volumes, to be published by Messrs. Longmans. They will be entitled *The Personal Government of Charles I.: a History of England from the Death of the Duke of Buckingham to the Declaration of the Judges in Favour of Ship-Money, 1628-1637*. The author has had the advantage of consulting the despatches of foreign ambassadors preserved in the archives of Paris, Brussels, Venice, Simancas, and elsewhere. But he rests his case mainly on the chronological arrangement of facts more or less known, though often needing critical investigation. Historians have usually been content to pass over this period slightly, presenting their readers with a few important trials, or other acts of the Government, often out of the proper order of events. The view taken by Mr. Gardiner is that there was no general discontent till about 1634, and that the causes of the Puritan Revolution are to be looked for between that year and 1637. The informal Declaration of the Judges on ship-money marked the high tide of Charles's apparent prosperity. The revolution began with the popular applause given to Prynne, Burton, and Bastwick, in the summer of that year, and with the tumults occurring in Edinburgh almost at the same time. The book opens with the preparations for the Parliament of 1629, and, after an account of the session which followed, describes the measures taken by the king to establish his authority, after his breach with the House of Commons. Then follow the sentences on Chambers, Leighton, and Eliot, the abortive diplomacy with France and Spain, the Emperor and Gustavus Adolphus. The prevailing tendencies of thought are illustrated from the lives and works of representative men—Milton, Sibbes, Herbert, Ferrar, Massinger, &c. The narrative of the king's visit to Scotland is prefaced by an account of the passing of the Five Articles of Perth, and the great measure for the commutation of tithes. Laud's entrance upon the archbishopric is followed by the king's decision on the position of the Communion-table at St. Gregory's, the defence of the Somersetshire Wakes, and the first trial of Prynne before the Star Chamber. Then comes the first writ of ship-money, and the claim to the sovereignty of the seas, together with the secret plot for an alliance with Spain against the Dutch. Wentworth's government of Ireland down to the progress in Connaught is then described, and the account of this is followed by one of the second writ of ship-money. The metropolitical visitation and the mission of Panzani are next treated of. The failure of Arundel's mission to Vienna leads to a review of the progress of toleration in the New England settlements, while the last chapter treats of the sentence on Mountnorris and the third writ of ship-money, the resistance to which is checked for a time by the Declaration of the Judges.

MESSRS. SOTHERY, WILKINSON AND HODGE announce for sale, on the 27th inst. and four following days, the library of Italian books of the Cavaliere J. Marchetti, of Turin, comprising an

extensive collection of MSS. and books printed on vellum, curious works, many of the fifteenth century, texts quoted by the Accademia Della Crusca, Aldine editions, and other rarities.

THE Clarendon Press has finished printing the first volume of Prof. W. T. Sellar's *Roman Poets of the Augustan Age*. It is mostly concerned with Virgil, and will be published probably before Christmas.

THE author of *Songs of Two Worlds* has in the press the complement of his *Epic of Hades*, one part of which was published by Messrs. Henry S. King and Co. early in the year. The new portions will comprise "Tartarus," or Part. I., and "Olympus," Part III., between which must be read the "Hades," already published. The author has, of course, the precedent of the Laureate for this arrangement.

MR. E. S. SHUCKBURGH, late Fellow of Emmanuel College, Cambridge, has in preparation an edition of Lysias, being selected orations, with introductions and exegetical notes, for use in colleges and schools. The volume will be published by Messrs. Macmillan and Co.

MESSRS. BICKERS AND SON have now ready for publication Mr. H. B. Wheatley's new library edition of *Percy's Reliques*, in three volumes octavo, uniform with their *Percy's Diary*, in the "Chiswick Press Series." Mr. Percy Fitzgerald is engaged in editing for the same series a complete edition of Sir N. W. Wraxall's *Memoirs*.

THE November number of the *Journal des Economistes* contains an interesting review of Sir Henry Maine's *Early History of Institutions* by M. Ad. F. de Fontpertuis.

MESSRS. WILLIAMS AND NORGATE will publish before the end of the year Mr. John Pennethorne's large work on the *Geometry and Optics of Ancient Architecture*, illustrated by examples from Thebes, Athens and Rome. It will be in imperial folio, and be illustrated by fifty-six plates, many of them in colours.

A VOLUME of selected Sermons of the late Rev. John James Tayler, Principal of Manchester New College, is being prepared for publication.

ON the 15th inst. the centenary of the birth of the poet Ling was celebrated in several towns of Sweden. A monument to his memory at Ljungra, his birthplace, was unveiled, and in Stockholm the festivities took an organised form. Ling was no less celebrated as an athlete than as a poet, and set on foot a scheme of national gymnastic which has proved singularly successful. He died in 1839.

IN consequence of the approaching demise of the *Jahrbuch für Romanische und Englische Sprache und Literatur*, Dr. Eugen Kölbing announces that he will bring out, at irregular intervals, under the title of *Englische Studien*, essays on English literature and grammar, and short unpublished texts. The first part, which will contain four papers (chiefly literary), all by the editor himself, is announced to be published next month, by Henninger of Heilbronn.

THE new German review for English philology and literature, named *Anglia*, which we mentioned last week as to be edited by Prof. Wülcker and Dr. Trautmann, will contain texts of Early-English manuscripts, as well as essays and reviews. In the first number will appear the "Legend of Celestine," and the alliterative poem of "Susanne," both edited by Dr. C. Horstmann, of Sayan, Silesia, and some fragments edited by Prof. Zupitza, of Berlin. Mr. Furnivall has promised to contribute prints of some Early-English carols and songs to later numbers: and the editors hope that many of the Early-English Text Society's editors will print in the *Anglia* selections from their forthcoming books, until a public is found in England to support a journal of like kind.

PROFESSOR PISCHEL's long-expected edition of *Sakuntalā* has at last appeared. It is published by Schweser at Kiel, printed by Brill at Leyden. The labour bestowed upon this edition is extraordinary, as the minute *varietas lectionis* on every page will show. The editor collated five MSS. of the text, two of Candrasekhara's commentary, one of Sankara's. All these are written in Bengali. He used partially one Devanāgarī MS., and recollated all the other Devanāgarī MSS. used by Prof. Boehtlingk for his edition. In addition to this, he examined for the first time three MSS. written in Telugu, one written in Grantha, another written in Malayālam characters, and went through the three Dravidian commentaries, two of which are written in Grantha, the third in Devanāgarī. Of former editions he chiefly used three published in India, and Chézy's edition, published at Paris in 1830. Of this *editio princeps* he says:—

"It is true that Chézy's edition is a very imperfect work, and that it abounds in typographical and other more serious errors. But this is not so much the fault of the editor as of the time and circumstances under which it was accomplished. Chézy is, indeed, worthy of much praise for his energy and zeal, and I look on this book as a second issue of his edition, which I have been fortunately able to bring out in a more correct shape. After all, Chézy's edition has been to the present day the only one from which a true idea of Kālidāsa's *Sakuntalā* could be obtained." This is high praise coming from the first critical editor of this famous play. Prof. Piscchel considers the Bengali recension of *Sakuntalā* as the original, and gives that text critically restored. The chief merit of his edition is the attempt made by him to restore the Prakrit of the plays to something like grammatical accuracy. The love-scene (pp. 61-66) between the king and Sakuntalā, which is absent in the two other recensions, the Devanāgarī and the Iṣṭavidyā (discovered by Prof. Piscchel), is extremely beautiful, and the dialogue handled with a delicacy and innocent purity quite surprising in an Eastern poet. It is difficult to understand why it should have been left out in the other recensions, unless the theatrical representation vulgarised the poetical conception of Kālidāsa. Prof. Piscchel has dedicated his work "to the memory of his dear friend, Robert Caesar Childers."

MR. GARDNER writes that the list of subscribers to the reprint of the *Registrum Monasterii de Passelet* is so far filled that he is unable to guarantee that all who apply for further copies can be supplied.

A NEW tale by the author of *St. Elmo* will be commenced in the *Ladies' Treasury* for January, entitled "A Life's Drama." Mrs. Warren will contribute to the same magazine, during next year, a new domestic story, and Mr. Robert Scott Burn a series of illustrated papers on Cottage-Building.

DR. RICHARD MORRIS's *Specimens of Early English*, selected from the chief English authors, A.D. 1250-1400, which he published in the Clarendon Press series, soon ran out of print. For his second edition he determined to carry up the book to the close of the Anglo-Saxon period, and down to Spenser, making it two volumes instead of one. The second volume he put into the hands of Mr. Skeat, who produced it in 1871, *Specimens of English Literature, from the "Ploughman's Crede" to the "Shepherd's Calendar,"* A.D. 1394-1579; the first volume Dr. Morris has not been able to finish till now. His *Glossary*, of 180 pages, is just complete, as well as his Preface, and the book will be ready by Christmas. It will begin where Mr. Sweet's *Anglo-Saxon Reader* leaves off.

THE New Shakspeare Society is in luck again. It is to have two books presented to it by members next year. Dr. Ingleby will give it his second and enlarged edition of his *Shakspeare's Centurie of Prayse*, a collection of the contemporary notices of Shakspeare or his plays, for which

he has collected above seventy fresh instances since his first edition; and Mr. Richard Johnson, who has this year given the Society the first part of Mr. Harold Littledale's revised edition of *The Two Noble Kinsmen*, will, in 1877, give the second part.

In reference to Mr. Buxton Forman's new edition of Shelley, Mr. Swinburne writes to us:—

"I have not time, even if I wished, to rehandle the question of Shelley's text on this occasion of the appearance of a new edition. Perhaps, too, in this case the expression of approval (which I naturally feel) would come more gracefully from any other hand, as in such main points as the rejection of *Queen Mab* and promotion of *Alastor* in its place to the post of precedence as Shelley's first published poem, Mr. Forman has acted on the suggestion of my already published notes—as also in the restoration of its genuine text and original title to *Laon and Cythna*. I should like, notwithstanding, to acknowledge with all due regret (however fruitless) and apology (however late) the inexplicable slip of my pen in writing 'yawning streams' for 'yawning caves' (*Alastor*, p. 37 of this new edition)—where Mr. Forman suggests an emendation which seems to me as inadmissible on metrical grounds as it is undeniably ingenious on the ground of construction—and the equally unaccountable oversight which allowed it to stand when I came to correct the proofs—a task, however, at which I am usually almost as bad a hand as Shelley himself seems to have been. Of 'other passages misquoted in (my) essay,' I find one instance equally unpardonable as a mark of haste, for which I am bound, and willing, to do penance: the misreading 'air of night' for 'birth of day,' in a quotation from the *Prometheus Unbound* (Act i.). This was evidently due to pure carelessness and lazy trust in a memory which played me false. The only other slip I can trace is less important by a good deal—'I would' for 'I will' give All that the Cyclops feed upon their mountains' (v. 165-6 of the Greek text). I find no other misquotation great or small in my essay; but certainly the first two of these are scandalous, and deserve the Orbilian sentence of Macaulay on Croker's 'construe' of Euripides."

UNDER the significant heading "A Splendid Tribute," the *American Journal of Education* makes the following extract from a lecture said to have been given by Prof. Huxley before the American Science Association at Buffalo:—

"I have visited some of your great universities, and meet men as well known in the Old World as in the New. I find certain differences here. The English universities are the product of Government: yours of private munificence. That among us is almost unknown. The general notion of an Englishman when he gets rich is to found an estate and benefit his family. The general notion of an American when fortunate is to do something for the good of the people."

And the editor proceeds to indulge in the jubilant self-laudation which is naturally suggested to a patriotic American by such a comparison. By what strange confusion or misreporting such words can have been attributed to Mr. Huxley it is difficult to understand. Prof. Huxley writes to us:—

"I certainly was not guilty of the absurdity of saying that 'the English Universities are the product of Government,' nor anything like it. The contrast which I drew was between the immense sums which are being given in the United States for the purposes of the higher education, science, and art, by private individuals, and the relatively scanty gifts of the same kind in this country. Having in my mind the Queen's Universities, the Scotch Universities, and the London University, all of which are subsidised by the Government, it may be that I said something about our going to the Government to found Universities, instead of endowing them by private funds. The last two sentences are rightly reported in substance, but not verbally. I said that the ambition of an English rich man was to 'buy an estate and found a family.' The Americans don't take this line, so they often dispose of their wealth more usefully."

THE November number of the *Theologisch Tijdschrift* contains a thorough article on Lord Amberley's *Analysis of Religious Belief*, by Prof. C. P. Tiele, who, while doing full justice to the conscientiousness and love of truth displayed by the author, professes himself greatly disappointed by the incompleteness and partisan character of his "analysis." Prof. Oort discusses the origin of the name "Sadducees," which he explains—"House of Zadok," a name given in the time of the Chronicles to the whole aristocracy, lay as well as Levitical, of Jerusalem. A century later, the Sadducees became a compact party in opposition to the Pharisees. Prof. Tiele reviews Mr. Fairbairn's *Religious Studies* (favourably); and Prof. Kuenen, Graf Baudissin's *Studies on Semitic Religious History*, an excellent work, of which a review appears in our present number. The Literary Survey contains short articles by Tiele on the three recent translations of hymns from the *Rig-Veda*, by Geldner and Kaegi, by Ludwig, and by Grassmann—the preference is given to the last-mentioned; by Kuenen, on Geiger's posthumous works, vols. i.-iii.; Frensdorff's edition of the *Masora Magna*, vol. i.; Reuss's *Les Prophètes*; Goldziher's *Mythology among the Hebrews* (a detailed review is promised), and G. Smith's *Chaldean Genesis* ("we do not find that which we sought—certainty"); and by Rauwenhoff, on Rambert and Chavannes' *On Alexandre Vinet*. Prof. Tiele also gives an introductory notice of his own short handbook to the study of the History of Religion (described lately in the ACADEMY).

THE following Parliamentary Papers have lately been published:—Judicial Statistics, 1875, for England and Wales: Part I.—Police, Criminal Proceedings, Prisons; Part II.—Common Law, Equity, Civil and Common Law (price 2s. 10d.); Statement exhibiting the moral and material Progress and Condition of India during the year 1874-75 (price 1s. 1d.); Accounts relating to Trade and Navigation of the United Kingdom for September (price 4d.); Digest of Evidence taken before the Royal Commission on the Practice of subjecting Live Animals to Experiments for Scientific Purposes, with a List of Witnesses (price 6d.); Returns relating to Pilots and Pilotage for 1875 (price 1s. 5d.); The Fifty-fourth Report of the Commissioners of H.M. Woods, Forests, and Land Revenues (price 2s.); Copy of Resolution respecting the Transfer of the India Museum to South Kensington, with the Opinions recorded thereon (price 1d.); General Digest of Endowed Charities for the West Riding of the County of York (price 1s. 7d.); Twentieth Report of H.M. Civil Service Commissioners, with Appendices (price 3s.); Thirty-Seventh Annual Report of the Registrar-General of Births, Deaths, and Marriages in England—Abstracts of 1874 (price 2s.); Report on the Discipline and Management of the Military Prisons, 1875, by Lieut.-Col. Du Cane (price 3d.); Agricultural Returns of Great Britain, 1876 (price 3d.); Abstracts of Statements of Receipts and Expenditure on account of Highways in England and Wales (price 10½d.); Index to Report of Committee on Employers' Liability for Injuries to their Servants (price 3d.); Report of the Royal Commissioners on Spontaneous Combustion of Coal in Ships, with Minutes of Evidence, &c. (price 3s.); Statement of the Trade of British India with British Possessions and Foreign Countries for the Five Years 1870-71 to 1874-75 (price 3s. 8d.); The Report of the President of Queen's College, Cork, for the Session 1875-6 (price 8d.); Reports of the Directors of Convict Prisons on their Discipline and Management (price 3s. 4d.); Report on the Laws relating to the Relief of the Poor in Holland (price 2d.); Further Return relating to Cases of Extradition of Prisoners under Treaty between Great Britain and the United States (price 10d.); Statement of Accounts of the Metropolitan Water Companies for 1875 (price 4d.); Index to the Reports from the Committee of Public Accounts (price 3d.); Accounts of Trade and Navigation for October

(price 4d.); Statistical Abstract relating to British India from 1865-6 to 1874-5, Tenth Number (price 7d.).

FRIEDRICH RITSCHL.

Heidelberg: November 18, 1876.

The death of Prof. Ritschl, at the mature age of seventy, has removed from among us a man whom it will be very difficult to replace in the Philological Chair at the University of Leipzig. But the loss of that University is small when compared with that of the cause of philological studies throughout Germany, nay throughout Europe. For Prof. Ritschl was without any doubt the chief and foremost man, the leader of that host of classical teachers who occupy the class-rooms of our German universities and gymnasia, and he was the embodiment of that method of severe and critical investigation which is the characteristic mark and merit of modern philology.

Prof. Ritschl was a man eminently qualified to be a teacher. He had none of that haughty indifference to the persons of those who came to him to learn which seems to grow upon some teachers with their increasing popularity. He could let himself down to the level of his pupils, and, by seeming to work with them rather than for them, he inspired them with confidence and with that kind of delightful enthusiasm which is kindled by the discovery of truth.

What position Prof. Ritschl held in philological science, especially in the department of the older Latinity and the dramatic writers, is too well known to require special notice. His labours bestowed on Plautus have opened a new era in this particular department. But it would be a great mistake to suppose that any portion of classical antiquity was unfamiliar to him. From Homer down to Josephus, from Aeschylus to Dionysius of Halicarnassus, from Umbrian and Oscan down to the latest grammarian and scholiast, extended the field in which he worked indefatigably and successfully. And in all his productions that terse and vigorous style, whether he wrote Latin or German, was evidence of a clear and logical mind. His writings are models of scientific composition. The most abstruse and, at first sight, driest subjects became interesting and attractive if he handled them in his masterly style. He wrote and spoke in a simple, natural, easy manner, avoiding all bombast and rhetorical embellishments and all philosophical slang. The German language, often so obscure and provokingly difficult, is in Prof. Ritschl's writings transparent as glass. And yet style and perspicuity are but the secondary merit of his writings. His vast range of learning, his well-directed research, his exhaustive comparison of previous labours, his severe logic and sound method, and above all his common sense never deserted him and generally led to the discovery of new truths. If the science of philology has reached a much higher position now than it occupied forty years ago, it is owing to the exertions of a great number of zealous and able scholars, but among them nobody can claim a greater share of merit than Friedrich Ritschl.

W. IHNE.

NOTES OF TRAVEL.

A VERY important paper, "On the Surveys and Reconnaissances from 1870 to 1875 for a Ship Canal across the American Isthmus," prepared at the request of the American Geographical Society of New York, in view of the recent movement in France for an international exploration and survey, was read before that society at a meeting on October 31, by Commodore Daniel Ammann, chief of the Bureau of Navigation, who has had general supervision of these surveys during the past eight years. Though no less than ten routes across various points of the Central American isthmus have been examined and surveyed with great labour since 1870 by the Ameri-

can engineers, the results are as yet purely negative, and nothing positive has been accomplished. It seems likely, however, one of three routes—that by the Lake of Nicaragua, which Count de Lesseps considers to offer the fewest difficulties in its execution; that by Panama, fully surveyed by Commander Lull in 1875, and the favourite one of the American Government; or that by the Atrato-Napipi river—will be ultimately accepted as the one to be worked, for all agree that the union of the Atlantic and Pacific is a necessity that must be accomplished, and that before many years have passed. Those who look most hopefully to the accomplishment of this new highway of traffic count on a trade of about three million tons annually as soon as a ship-canal shall be opened across Darien, and that new channels of trade and production would be developed. An official report on the surveys of the Panama route appears in the "Report of the Secretary of the Navy for 1875."

A DESPATCH received at Rome on November 19 from Aden announces that the Italian Scientific Expedition to Eastern Africa has arrived at Shoa, after experiencing some difficulties, and that the Marquis Antinori and his companions were then in good health. The fifth *bulletino* on the progress of this expedition has just been issued by the Italian Geographical Society, and contains the Reports by Marquis Antinori and the engineer Chiarini, sent from Tull-Harré, in July, with Captain Martini's account, given on his return to Rome in September, and a summary of the doings of the expedition up to September 20.

MESSRS. HACHETTE have just issued the first volume of M. Ernest Desjardins' great work, *Géographie historique et administrative de la Gaule Romaine*, which contains the Introduction, references to texts consulted, and the comparative physical geography of the Roman period and of the present time, illustrated by fifteen maps.

WE can very cordially recommend *Brown's Popular Guide to the Isle of Man* (Philip and Son), issued from the *Isle of Man Times* Office, Douglas. The plan on which it has been written, that of employing gentlemen resident in various districts of the island and thoroughly acquainted with these, has secured accuracy in detail and great fullness of information about every part of this most interesting little primitive world. The very numerous woodcut illustrations are from well-chosen photographic views, but have suffered much from somewhat rude execution and bad printing. A very excellent historical summary, and a chapter on the geology of the island are appended. It is, perhaps, too much to expect some account of the peculiar fauna and flora of the island in a popular guide, else this would have added still more to the interest of the well-told physical history of Mona which concludes the book.

AT a recent meeting of the Geographical Society of Paris, under the presidency of M. Malte-Brun, M. Daubrée read letters received from the Abbé Montrosier, who has explored, with great success, both banks of the Mekong in Cochin China, which is in process of becoming a French river. M. Maunoir gave news of the expedition of MM. Marche and Brazza on the banks of the river Ogowé, the mouth of which belongs to France. These travellers have now passed beyond the limit of the region formerly known, and are assured that the Ogowé, after flowing from northward within a degree of the equator, bends round sharply to the south. The expedition had sustained considerable losses in consequence of a boat accident. M. Malte-Brun, making use of the chart prepared by the American Admiralty, gave a *résumé* of the discoveries of the Arctic Expedition under Captain Nares, and explained the reasons for the abandonment of the hope of finding an open Polar Sea, a chimera in which the Society had indulged for several years. Captain Nares and his brave companions have reached the Columns of Hercules of Arctic navigation, but

the rich mines of coal found in Discovery Bay have given an unexpected *fulcrum* for the lever by which the Pole must be surmounted. The assembly warmly applauded the President when he congratulated the British officers on the brilliant success which they have achieved. Dr. Grandet read a memoir on the progressive displacement of the axis of the globe, endeavouring to show that, notwithstanding the investigations of Laplace, the Pole, which we have been making such efforts to attain, will in time come to visit us in our temperate latitudes.

OXFORD LETTER.

Queen's College, Oxford: Nov. 20, 1876.

Oxford must be the halidom of masons and carpenters. The Bodleian Library has been their last victim. Since the beginning of the Long Vacation nearly half the building has been in their hands; the librarians have had to descend into semi-subterranean regions, and the readers have been expelled from their old haunts. Rumour says that the familiar recesses which have witnessed the composition of more than one great book are not to be restored; but what rumour says does not always come to pass. It speaks much for the management of the library that, in spite of the crisis it is passing through, a visitor would hardly notice the disarrangement it has suffered: books are provided with the promptitude to which the librarians have accustomed us, and the work of cataloguing has been uninterrupted. The library was visited in the summer by a Greek, Dr. Lampros, of Athens, who came to consult it on Byzantine matters; also by Dr. David Müller, the young Himyaritic scholar. Some Hebrew MSS., now at Vienna, have lately been offered it for sale; but until they have been examined their value must remain doubtful. The great event of the season, however, has been the Principal Librarian's discovery of a MS. of the *Jugurtha* of Sallust in the binding of a folio known as *Hamilton* 33. The latter came originally from Erfurt, and so far as its legitimate contents are concerned, is perfectly valueless. Not so, however, its binding; the MS. utilised for the purpose containing the larger part of the *Jugurtha*, and being as old as the beginning of the eleventh century. It is not the first time that the casket has proved to be worth more than the relics inside it.

Dr. Neubauer has returned from St. Petersburg, where he was deputed by the university to examine the second Firkovitz collection of Hebrew and Hebraeo-Arabic MSS., and has presented his report upon them to the Vice-Chancellor and the Council. These MSS. are of high importance, as they consist of rolls and fragments obtained by Dr. Firkovitz from the Karaite synagogues of Egypt and Hit in Mesopotamia, and furnish texts either wholly or partially lost, as well as copies of parts of the Old Testament of an earlier date than any previously known. After the death of Firkovitz, the MSS. passed from the possession of his family in the Crimea to the Imperial Library of St. Petersburg, and Dr. Neubauer considers that this second collection is of greater importance than the first, which was acquired by the Russian Government in 1862. The oldest of the Biblical MSS. is dated 913-33, and the Massorah, or Commentary, attached to them affords a number of various readings occasioned by the different traditions of the Rabbinical schools of Babylonia and Tiberias. Works on exegesis, grammar and lexicography are especially numerous, many of which were supposed to have been lost. There are also works on philosophy, medicine, mathematics and astronomy, as well as poetical compositions and controversial tracts, written some in Hebrew and some in Arabic. As is not unfrequently the case in works of the kind of the tenth or eleventh centuries, certain of the fragments, though in the Hebrew language, are inscribed in Arabic cha-

acters. Altogether, the Russians are to be congratulated upon the prize they have secured.

To turn from Russia to Oxford, we also have good reason to congratulate ourselves on having obtained the services of the two new professors of Chinese and Anglo-Saxon. Dr. Legge has already given two lectures upon Chinese and its 40,000 characters, the second lecture being distinguished by the presence of the two Chinese Commissioners sent by the Peking Government to the Exhibition at Philadelphia. Mr. Earle pleaded the claims of Anglo-Saxon in an interesting and suggestive lecture, in which he noted that our present unhappy mode of spelling—the *bête noire* of philologists and teachers—is ultimately due to the Norman Conquest. Two entirely different alphabets were thereby brought into collision with one another—the Anglo-Saxon *c*, for instance, having the sound of *k*, and the French *c* the sound of *s*—and a compromise was effected between them with its usual results. Though not, perhaps, strictly professorial, I cannot pass over the address of the Rector of Lincoln last week at the distribution of prizes in the Oxford City Schools of Science and Art. As might have been expected, it was full of happy irony and epigram, but the public, it is to be feared, are somewhat like the deaf adder that stoppeth her ears. If, as the Rector told us, our taste has been getting worse instead of better during the last thirty years, there is scant chance of any improvement for a long while to come. After all, it is hard to expect the natives of a climate chiefly remarkable for fog and rain, where the clouds seem never able to get near enough to the earth, to show much appreciation of colours and their harmonious grouping. Roses, it is true, grow in England as well as in France; but then the French have the sun and we have only the prophets.

A number of good books have either just appeared or are on the point of appearing. I need only allude to Mr. Robinson Ellis's *Commentary on Catullus*; the name of the author is sufficient to indicate the value of the work. The first volume of the long-expected edition of *Homer's Odyssey* by the Rev. W. W. Merry and the late Rev. J. Riddell, has also been published; the work could not have fallen into better hands. Mr. Thomas Arnold's edition of *Beowulf*, with notes and commentary, has further made its appearance, and put that most interesting and important of all our old poems within the reach and comprehension of the modern Englishman. Meanwhile we are soon to have Mr. Sweet's *Anglo-Saxon Reader*, so that Prof. Earle's pupils will have no reason to complain of a want of text-books. Mr. Bywater's work on the fragments of the pre-Socratic philosophers of Greece is making its way through the press; the book will be a great boon to students, as it has been compiled with more than German care and thoroughness. Another work which will reflect great credit upon Oxford scholarship may be expected about Christmas. This is an edition of the Authorised Version of the Bible, with footnotes describing the various readings and renderings of the Hebrew and Greek text, and the authorities upon which they are based, by Messrs. Cheyne, Driver, Goodwin, and Clarke. Messrs. Eyre and Spottiswoode are the publishers, and in these days of Biblical revision the book ought to be received with a warm welcome.

The new Celtic Chair has at last taken solid shape and consistency. The statute relating to it has been passed, the electors have been appointed, and the election will take place in the course of next term. The professor will find plenty of work in store for him. There is abundance to be done in Celtic philology, as well as in the criticism of Celtic literature, and we in Oxford are anxious to be enlightened about both.

The excitement of last term about University Reform has been damped by the Long Vacation and the collapse of the Reform Bill. Both the advocates and the opponents of Research seem quite content to drop the question of Reform for the present. Indeed, the "Researchers,"

as they have been inequiphoniously christened, feel themselves somewhat on the horns of a dilemma. Reform in the direction they desire must come either from within or from without. But within, the majority are naturally disinclined to root up a system from which they have received nothing but benefit; and without, the temper of the House of Commons was pretty well shown by the last debate on the Universities Reform Bill. Hence the friends of the Endowment of Research appear to think that their wisest course at present is to dream the "Dreams of a Constitution-monger" in the hope that their words may yet fall on congenial soil and bear fruit in a future generation. The golden prime of Peisistratus was followed by the feverish activity of the age of Pericles, and Athens had to wait for the overthrow of its Empire before it could settle down to the calm pursuit of philosophy and literature. Politics and polemics are little compatible with a "Constitution-monger's" ideal of a University.

How far the Colleges are in earnest in their protestations of zeal for knowledge and learning is being put to a practical test. Mr. Parker has asked them to contribute the modest sum of 10*l.* for the next four years to the fund for carrying on his excavations at Rome, to which the University has already subscribed generously. It remains to be seen whether they consider archaeology or the improvement of school playgrounds to have the greatest claim upon their corporate purses.

CORRESPONDENCE.

GENERAL DI CESNOLA'S EXPLORATIONS IN CYPRUS.
 London: Nov. 21, 1876.

Since my arrival in London I have been asked by editors of different periodicals to furnish them with an account of my explorations in Cyprus, assuring me that such revelations would greatly interest the English public. Until now I have declined, because my time is much occupied at

present on an extensive work on that subject; yet when the Editor of the ACADEMY came in person, and promised to be satisfied with a slight outline of my diggings, I could not refuse to give it him.

Archaeological explorations are more or less the same everywhere, requiring much time, labour, study, and expense. Yet in Cyprus the difficulties to be overcome are even greater than elsewhere, from the fact that no remains appear on the surface to indicate the site of either city or temple, and that no written history of the island exists which can guide the explorer in his researches; consequently everything is hypothetical, and often much time and labour is lost in unsatisfactory results. I shall not speak here of the many difficulties which have lain in my path, nor of the large amount of money I have lavished on my excavations. I may mention, however, that my researches, which lasted ten years and extended to every important point of the island, have been carried on without the aid of any Government, and with my private means alone. Nothing is more precarious, more expensive, and, so far as money is concerned, less remunerative than archaeological excavations, and I am sure that such distinguished explorers as Layard, Newton, and Schliemann will easily bear witness to this fact.

My diggings began early in 1866, in a mere amateur way, and on a small scale only; but they gradually extended, and my interest increased in proportion to the results obtained, until I became so entirely carried away by them, that, like a man running downhill at full speed, I could not stop even if I wished. I was thoroughly convinced that my labours would not be fruitless, and that the objects of art brought to light would be the link of that broken chain which once connected the history of Egyptian and Greek art. I had often remarked in the different museums of Europe specimens of Egyptian art, represented by statues stiff and conventional in style, followed almost abruptly by those representing the perfection of the Hellenic art. More than once in contemplating them I questioned whether it were possible that from these Egyptian and Assyrian statues could have come at once the Greek art in all its perfection. Were it not more reasonable to believe that between them existed a long period of slow progress before art could have reached the climax which we see in the Elgin marbles? The few fragments of sculptures which I had met with in different parts of the island during my excursions confirmed me in my theory; and though they did not represent a high style of art, yet they were no longer fettered by the conventionalisms of the Egyptian and Assyrian sculptures.

Nowhere better than in Cyprus could have originated this innovation in art; Cyprus being by its geographical position one of the points where the Asiatic races and that of Hellas must have first come in contact. I commenced my explorations in the neighbourhood of Larnaca, a modern town built upon the necropolis of the ancient city of Kitium. Here at different periods, from 1866 to 1876, I discovered more than 2,000 tombs, most of which dated from 400 B.C. to the beginning of the Christian era. I also identified the site of two temples, one Greek and the other Phœnician. The former, from the inscriptions found therein, seemed to have been dedicated to ΔΗΜΗΤΡΗ ΠΑΡΑΜΙΑ. Among its ruins many terra-cotta statuettes were discovered, some of which are of the best Greek period. In one of the tombs surrounding this temple, a bronze Stannos was found in 1871 by one of my diggers, containing about 600 gold staters of Philip and of his son, Alexander. In the Phœnician temple were many fragments of marble bowls and paterae, having engraved on the rim in Phœnician letters dedications to Melkart and another Phœnician divinity, whose name now escapes me. I also discovered a white marble sarcophagus, with a Phœnician head in high relief; in another tomb

two large vases in Egyptian alabaster, on one of which there is a Phœnician inscription engraved. The Phœnician sepulchres were in general but scantily furnished with funeral objects, while the Greek contained lamps, bronze mirrors, and many glass bottles, jugs, &c., most of them in a fragmentary condition and without iridescence. Dali, the site of the ancient Idalium, a city famous for its ancient sanctuary to Venus, was my next field of operations. Here I opened some 15,000 tombs, mostly Phœnician. They yielded thousands of terra-cotta vases of every size and shape, of the very earliest kind known, simply decorated with concentric circles, zig-zag lines, &c. Some of these tombs were Greek, and, unlike those at Kitium, contained glass objects of the most exquisite iridescence and extraordinary brilliancy.

From Dali I went to dig at Golgos, and there discovered its burial-place and two temples. One, smaller and more ancient than the other, contained but few fragments of statuary and pedestals among its *débris*; the other had nearly one thousand statues, many of which were in an unusual state of preservation. These statues represent the earliest and finest period of Egyptian art. There are bas-reliefs and statues of the Assyrian style, also in a wonderful state of preservation. There are but few of the Greek and Roman period, the largest portion of them being neither Egyptian, nor Assyrian, nor Greek, but they are those which I consider most important, as clearly showing, as they are now classified in the Museum of New York, the gradual departure from the conventional style of the Egyptian, and their blending into and arrival at the pure Greek. There are several life-size heads of men and women as finely cut as any of the Greek marbles known. All these statues, without exception, were cut from the calcareous stone of Cyprus, from a quarry not far from Golgos, wherein I found chips of statuary, &c., showing that the statues of Golgos had been made in the island, and most probably by Cyprian artists. In my opinion, no other place in the world can present, as does Cyprus, such an agglomeration of all the different styles of art which have belonged to the different nations which have now ceased for many centuries to exist.

Very few architectural remains of temples are to be found in Cyprus, which leads me to believe that they were not highly decorated, and probably, like the dwelling-houses of to-day, were built of mere sun-dried bricks. It is certain that the many almost perfect statues of Golgos owe their splendid state of preservation to the mass of fine earth (which was doubtless nothing else but the crumbling of the walls) which entombed and preserved them. From Golgos I went to Salamis, but, after a few months of digging there, and a large outlay of money, I found nothing which warranted the continuation of my excavations in that locality.

I do not believe that in future any discovery of importance can be made at Salamis, as I have convinced myself that extensive excavations have been made there long ago, and at different epochs, for different purposes. The Cyprians, after the destruction of Salamis by an earthquake, built, a mile west of it, a new city called Constantia, with the material of the fallen city. For many years, as a Cypriot writer has recorded, "the Lusignan kings dug at Salamis in search of objects of art with which to decorate their royal palaces." In the year 1290 of our era, Henry Lusignan built the heroic but unfortunate city of Famagosta, with the material brought from Salamis, and raised a defensive wall to protect its palaces and hundreds of beautiful churches, of such solidity and massive proportions as to excite the admiration of the beholder of to-day, and which still render the city a fortress, where the Turkish Government often sends its most important prisoners. Wherever I dug at Salamis I found that even the foundations of its walls and buildings had been removed.

From Salamis I went toward Cape Pedalium

(Greco), and in its immediate neighbourhood identified the site of the city of Leucolla, important on account of the naval battle which took place opposite its harbour between Demetrius and Ptolemy (B.C. 306). I discovered here also the ruins of a temple, with many fragments of statues in calcareous stone, all of Greek art. The many tombs I visited here had each a terra-cotta coffin, with three tiles for the cover. A wreath of coloured flowers around the rim of the coffins was their sole decoration. In this place I found what has always been a great mystery to me—a rock cavern containing petrified human bones in large quantities, and whose approach is only from the sea and very dangerous; in fact, I nearly lost my life on one occasion in endeavouring to examine it.

Beyond Cape Greco, always coasting along the sea-shore, after many difficulties I succeeded in discovering the site of Throni, a city mentioned by Strabo, but in so slight a manner as to leave us in doubt as to whether he means a city or a cape of that name.

From Throni I went eastward, and on my route marked traces of ancient towns, opened many tombs, and, arriving at the north-east coast of the island, identified the site of the city of Carpassia, fabled to have been built by Pygmalion; from this point, travelling westward, I fixed the sites of Aphrodisium, Acte-Achaon, Lapethus, Soli, and Arsinoe. I excavated at all these places, and discovered both temples and tombs.

I then crossed the mountains and visited Neopaphos and Palaeo-Paphos; from thence I came to Pisuri, Amathus, and finished my diggings at Curium.

In the year 1872 I brought to London the results of my first explorations, and it was natural enough that these sculptures, being of an unknown style, should not have attracted at once the attention which they afterwards did. I confess that I was a little disheartened, when I saw that men of the highest scholarship seemed to attach but little importance to these discoveries; and I had a moment of doubt, but only a moment, as to whether all my labour and expense had not been thrown away. However, as they were more critically examined, they became evidently more and more appreciated, and finally were declared by competent judges to be of the greatest importance, and to add a new chapter to the history of art and to archaeology. It would be useless for me to endeavour to give any very distinct idea of the immense importance of the treasures discovered by me during these past ten years, in an archaeological point of view, in so short and desultory an article as this. It may, however, interest the general reader to know that so high an authority as Mr. C. W. King, of Trinity College, Cambridge, regards the engraved gems alone, found in the treasure-rooms at Curium, as one of the most important discoveries of the age.

In conclusion, I may here quote a few of his remarks upon some of them. "Boreas carrying off Oristhyea, a daughter of Erechtheus." This work equals anything known in the style, for the bold drawing and skilful treatment of the nude forms—qualities which, with its wonderfully minute finishing, and unique subject, make the gem, perhaps, the most precious example of Greek art just emerging from the archaic stage as yet brought to light. A sculptor of the highest eminence has praised the correctness of the drawing, and pointed out that the apparent distortion of one of Boreas' feet was necessitated by the limits of the field, a law to which the early engravers are seen in many of their works to have felt themselves bound to conform.

"The Rape of Proserpine."—This intaglio, for excellence of composition and forcible expression of its meaning, with a truthfulness almost indelicate according to modern ideas, aided by the miraculous finish of all its details (for even the little jewel on the maiden's *mitra* is clearly shown), may safely be placed at the head of all that is known in the archaic style.

Of another gem, representing Victory standing, Mr. King, in describing it, winds up by saying:—"Nothing can surpass the beauty of the drawing or the exquisite finish of this example of the perfect Greek style."

The result of my last three years' excavations surpassed that of the seven preceding ones. The discovery of the site of Curium, of which no trace existed, and only two lines of Strabo indicated vaguely its probable position, with the identification of the great Temple of Apollo Hyllates, and the discovery of the treasure-chambers of another unknown temple, with its thousand votive offerings, from those of the humblest peasants to those of kings, will, I trust, serve one day in the hands of scholars to reconstruct the ancient history of the island, and to throw no small light on that of the world. With my excavations at Curium I finished my labours in the island; and though some papers have stated that I am continuing my diggings in Cyprus, nothing can be more erroneous.

L. P. DI CESNOLA.

HINDOSTAN UNDER THE KING OF DELHI IN 1857.

Kensington: November 20, 1876.

I use the name "Hindustan" as it is used in India, for the country between the Punjab and Bengal, and not, as it is often applied in England, as a synonym for India. It was in Hindostan, as thus defined, that the dynasty of the Moghal family was for a time restored. A former number of this year's ACADEMY contained a review of volume iii., the last published volume, of Kaye's *History of the Sepoy War*. That volume concluded with the fall of Delhi. A very interesting chapter, however, of Indian history remains some day to be written, showing how the great Revolution of 1857 was regarded throughout the country. I believe the materials for such a chapter would be found in the Delhi Palace records. There was a Court Journal kept up, and one or two newspapers were published; but of special interest would be the petitions that were received from the different provinces. Some of these petitions no doubt contained extravagant professions of loyalty to the newly-restored empire, but they were sometimes accompanied by statements that it would be necessary to send troops to induce the people in general to believe in it, or that the petitioners were powerless to render any service to the king because of the attachment of the people to the British Government. The reading of some things in these records might not be pleasant to us; but good feelings towards us and an appreciation of our system of government were also shown. From the records as a whole some useful lessons would certainly be learnt. Some of the records were referred to in the proceedings on the trial of the King of Delhi, which proceedings have been published in a Parliamentary return. One of the papers read was written by a Musulman for the purpose of conciliating the Hindus. The principle is here maintained—a strange one for a Musulman to uphold—that God requires every one to continue firm in his own religion, and the English are devoted to destruction on account of their having interfered with the established religions. The records generally, no doubt, were also examined with a view of discovering all the persons who were guilty of treason during the Mutiny; but they have never, I believe, been calmly studied for the political lessons they might convey.

In the preface to his third volume Sir John Kaye mentions what the contents of the next and concluding volume would be, if he were suffered to complete it; but this was not to be; still it is to be hoped that the materials which have been collected will not be lost to the world, but that some one will be found to complete the work on which its distinguished author had been so long engaged. Among the promised contents of the future volume, however, the subject to which I have referred is not specially alluded to; nor is it probable that the requisite information could be

obtained unless some officer were appointed specially by the Indian Government to furnish it, and this is what I hope will be done some day. A good deal is now being written in the daily papers in regard to the feelings of the natives of India towards Europeans, people's minds being stirred by the celebrated Fuller case, but, as I have stated, I believe some of the best light would be thrown on the subject by a study of the Delhi records; there all that might be found in our praise at least would be the genuine thing. I will conclude with mentioning an allusion to Sepoy feeling which was made by a witness at the trial, who said that the Sepoys "who were wounded contrasted the neglect with which they were treated in Delhi with the care they would have experienced had they been fighting for the English."

E. L. BRANDRETH.

KELT AND SAXON.

Ballygrant, Islay, Argyllshire: November 13, 1876.

In Mr. George Stephens' letter on the "Heliand and the Genesis," which appeared in the ACADEMY of October 21 last, occurs the following sentence:—

"At all events, as the tradition attached to the version ran, its author was a 'Saxon' (a term sometimes of old used for 'Anglo-Saxon,' or 'Angle,' especially by men of Keltic race or education; all non-Kelts in England, Ireland, or Scotland, are still Saxons to the Kelts), and he was warned from heaven to write holy verse."

It is not the case as here stated, that all "non-Kelts in England, Ireland, or Scotland, are still 'Saxons' to the Kelts;" for the Highlanders of Scotland call a Lowland Scotchman "Gall" and an Englishman "Sasunnach" in their own language. The native Irish, in like manner, call an Englishman "Sasunnach" and an English-speaking Irishman "Gall." In an old Gaelic poem in the Dean of Lismore's book, a collection of poems made previous to the year 1512, the English are called "gawle," and in other poems in the same book the Lowlanders are so called. In Irish writings the English that conquered Ireland are occasionally called "Seanghoill," "old Galls," and later English settlers are named "Nuaghhoill," "new Galls." Gall is a name for Dane or Norwegian in old Scottish, Highland, and Irish ballads, as well as in old Irish Chronicles. A Frenchman is known to the Bretons by the same name.

Gall is frequently but erroneously rendered in English by "Saxon," the latter being the word put into a Highlander's mouth when he talks of Lowlanders as well as when he talks of Englishmen by Sir Walter Scott and other writers. *Imse-Gall*, "the islands of the Galls," is a name for the Hebrides, which was given to these islands when the Norwegians held possession of them. Gall is defined as primarily meaning "stranger or foreigner" in some Gaelic dictionaries and glossaries, and it is probable that it is cognate with the Anglo-Saxon *Wealh*, "a foreigner."

HECTOR MACLEAN.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, NOV. 25.—3 P.M. Crystal Palace and Saturday Popular Concert.
MONDAY, NOV. 27.—8 P.M. Monday Popular Concert.
TUESDAY, NOV. 28.—8 P.M. Civil Engineers.
8 P.M. Anthropological Institute: "Tribes of British Guiana," by W. Harper; "Classification of Artichokes," and "Prehistoric Objects at Forteviot," by W. J. Knowles; "Physical Condition of the Lapianders," by A. Humboldt.
WEDNESDAY, NOV. 29.—8 P.M. Society of Arts: "Construction of House Drains," by Major-Gen. F. C. Cotton.
THURSDAY, NOV. 30.—8.30 P.M. Antiquaries.
FRIDAY, DEC. 1.—8 P.M. Philological: "On Persian," by Prof. Rieu.

SCIENCE.

The Theory of Sound in its Relation to Music.
By Prof. Pietro Blaserna, of the Royal University of Rome. (London: Henry S. King & Co., 1876.)

THIS is a book belonging to the "International Scientific Series." It professes to be entirely elementary both with reference

to science and music. No doubt well-written text-books of this kind may be of considerable use, and we looked with some interest to see whether any improvement had been effected on the satisfactory books of Tyndall and Sedley Taylor on the same subject, which are elementary enough in all conscience. As a general exposition of the relation between sound and music we must pronounce the book decidedly inferior to its predecessors. It contains deficiencies and inaccuracies of a considerable character. The experimental part of the work on sound is better; with a good deal of borrowing from common sources, there are a few things well put, and some modern experiments are well described.

The book is not free from small errors apparently due to the nationality of the author, which are rather annoying than important: "Inversion" for "inversion;" "Terpandro" for "Terpander;" "temperate scale" for "tempered scale;" "reflection" for "reflexion;" "Sounding board" has its meaning extended to include "resonator."

It will be sufficient to notice a few of the more material points. The table of the compass of the different voices (p. 69) is not correct; the compasses given as normal are in all cases too great. For instance, the normal compass of the tenor is given from A to a': but it is rare for a true tenor singer to sing tenor C so as to be heard, and A, a minor third lower, is quite out of the compass.

In dealing with the phenomena of beats, the production of beats by imperfect unisons is first explained in the usual way. As to the beats of imperfect consonances, the fact of their occurrence is stated, and then we find:—"It is easy, by an analogous reasoning to the foregoing, to explain this phenomenon." No further explanation of this case is vouchsafed in the course of the treatise. But the reasoning in question is certainly not obvious, though it may be to some extent "analogous to the foregoing." For there are two entirely different explanations—the old one of Smith's Harmonics, and the modern one first given by Helmholtz: this latter was nearly, if not quite, the most important discovery announced in Helmholtz's great work on Sound. The point is of the first importance, for it is by this phenomenon that the consonances are primarily defined—namely, by the fact that they give beats if imperfectly tuned. It is not too much to say that, with this unexplained, the remainder of the theory furnishes no adequate *rationale* of music, so far at least as it is based on consonances. In consequence of this omission the law of simple ratios (p. 75) fails to acquire any character higher than that of an empirical rule; and there is no fulfilment of the promise made in the following passage, which is quoted from p. 76:—

"Like a traveller who courageously climbs the steep and rugged sides of a mountain in order to enjoy at last a vast and magnificent panorama, so from the highest peak of this argument a vast horizon will open out before the reader, in which he will discover the synthesis of one of the grandest creations of the imagination."

The allied subject of the criterion of consonance and dissonance in general is simi-

larly left without rational explanation; a subject which is treated fully in the elementary books of Tyndall and Sedley Taylor. In consequence of this omission, we have such expressions as "the *obviously* dissonant harmony $\frac{8}{14}$ " applied to the Pythagorean third; "this *harmony* of the minor sixth is *evidently* on the limit of dissonant notes;" where no principle is laid down by which the limit of dissonance is determined. If high ratios were the only test of dissonance, then 2001 : 1000 should be very dissonant, whereas, in fact, few ears would distinguish it from a perfect octave. Again (p. 93), it is said that the ratios 7 : 4, 7 : 6, 8 : 7 are undoubtedly dissonant to our ears. The two first, the harmonic seventh and a minor third derived from it, are not so in the sense of producing beats, nor otherwise to my ear; and I possess probably a greater practical familiarity with these intervals than anyone else at present.

The sentence (p. 94) about the harmonic seventh being suited to chords of the diminished seventh is simply nonsense. The chord of the diminished seventh is a succession of minor thirds, which cannot possibly contain a minor seventh of any kind.

In the discussion of the consonance of chords by means of the resultant tones, Helmholtz is imperfectly followed. The main distinction between major and minor chords is drawn from that authority; and we have the statement that "chords which in a given position have consonant resultant notes can be transformed by *inversion* into others with more or less dissonant resultant notes." Then, as an example, a series of three positions of a major chord is given, in all of which the resultant notes are consonant, as well as three positions of a minor chord, in all of which they contain dissonant elements.

What is the use of expending space, sadly wanted for other things, on the Greek music? Let us look at the result. Taking an instance, we have (p. 118), an account of the scale as modified by *Terpandro*. We are told that *Terpandro* introduced two additional strings in the lyre, and we are told which they were. Referring to Helmholtz we find (p. 397) that *Terpander* introduced one additional string. Referring to classical authorities we find them agreed that if anything is known about *Terpander* it is that he added three strings to the previously four-stringed lyre, and hot discussion reigns as to which the strings were. What is the use then of such a statement as this in an elementary book?

At page 123, speaking of Palestrina, he says, "The Pythagorean scale, which was in general use at the time, was opposed to a true development of harmony; and the more so when the execution of the music was entrusted to human voices, in which every discord becomes doubly perceptible." Does Prof. Blaserna really believe that human voices, singing in harmony, ever employed Pythagorean intonation? It is an impossibility.

At page 133 we have an explanation of the introduction of flats and sharps in transposition. Apart from any difference of opinion, such as might legitimately be entertained, a part of the process is utterly

wrong. The idea is: constitute the diatonic scale of C as usual; then, to transpose into G, multiply F by 25 : 24, which is said to be the same as employing a (#). Now 25 : 24 is the ratio which transforms a minor third (6 : 5) into a major third (5 : 4). But D-F is not a minor third (6 : 5) but a minor third (32 : 27). Whence the major third thus derived is 100 : 81, or a comma flat; the true third being 100 : 80. Similarly we may show that the employment of the rule, divide by 25 : 24 for a flat, leads to a value of Bb, in transposing into F, which is a comma sharper than that required to make the perfect fourth of the diatonic scale of F.

But it is sufficient to know Helmholtz's original work on this subject, let alone any subsequent developments, to see that flats and sharps are insufficient and misleading as a notation for a system of diatonic scales.

At page 139 it is stated that, in the case quoted, the difference of the exact and tempered third is $2\frac{3}{4}$ vibrations per second. On the next page it is inferred that the beats of the tempered interval would also be $2\frac{3}{4}$ per second. As we have noticed, the theory of the beats of imperfect consonances has been omitted. It is therefore less surprising that we should find this absurd and impossible statement. The beats under the circumstances indicated would be four times the above number, or about $9\frac{3}{4}$ per second, arising from the interference of the tierce of the fundamental with the double octave of the third.

We had marked several other passages for comment, but enough has been said. It is scarcely possible to estimate the harm which may be done to the diffusion of scientific knowledge in these matters, by putting forward, with the semblance of authority, and in the name of science, a publication containing evidence of so much carelessness.

R. H. M. BOSANQUET.

RESEARCHES ON THE HISTORY OF SEMITIC RELIGION.

Studien zur semitischen Religionsgeschichte.
Von Wolf Wilhelm Grafen Baudissin.
Heft I. (Leipzig: Grünow, 1876.)

GRAF BAUDISSIN does honour to the good literary name he bears. In his inaugural dissertation on Semitic polytheism (*Jahve et Moloch*, 1874), he already displayed an unusual width of reading, and in the present collection of "studies," together with an increased fund of knowledge (particularly in Assyrian matters), he shows an accurate comprehension of the grave problems in his subject which still await their solution. He is specially and laudably free from the mania for originality. Indeed, the most striking quality of his work is the fullness with which the facts nearly or distantly connected with the subject are set in array. To some tastes perhaps this fullness will appear excessive, and will excite a longing for the temperance in citation characteristic of most great scholars. But the extracts from Graf Baudissin's note-books are well-arranged, even if too abundant, and will profit many who cannot follow the author to the full extent of his conclusions. For let the reader take notice that Graf Bau-

dissin is a liberal critic, who has "developed" within the last two years, and is quite prepared to "develop" further. The longest of the four studies which compose this volume proves as much. In it he distinctly commits himself to the view that Yahveh (I cannot bring myself to write Jehovah) was originally regarded as the national God of Israel, and that Jeremiah and the author of Deuteronomy were the first Old Testament writers who positively denied the existence of other gods—a view at which even liberal theologians in England shake their heads (*Theological Review*, October 1876). But this conclusion is not hastily reached. Slowly and methodically the author gathers his data from a complete examination of the Old Testament passages bearing on the subject. On some of these it is, of course, perfectly open to hold a different opinion. Thus, in Isa. xxiv. 21, there seems to me to be a plain allusion to the belief in heavenly guardians of empires, who share the fortunes of those they protect, like the angels of the seven Churches. (Cf. Isa. xxxii. 2, 4.) Graf Baudissin, however, sees here simply a judgment upon polytheism, which is expressed by the quenching of the light of the sun and moon, because they had defrauded Yahveh of his due honour. On the former theory, which seems to me more consistent with the general subject of the prophecy, the "shame" of the sun and moon is a mere prophetic commonplace (cf. Isa. lx. 19, 20; xxx. 26), and has no connexion with the phrase "the host of the height" (v. 21). There is another point, too, which I cannot entirely pass over—the date of the prophet Joel, whom Dr. Duhm has ably argued for placing in the Persian period, but who, Graf Baudissin maintains with the older critics, belongs to a much earlier period, earlier even than Amos. The latter, indeed, boldly states it as his opinion, that "the only plausible grounds for the Persian theory are the non-mention of Israel and of a king; though another might have been added by Dr. Duhm—the presupposition that a part of the people is in captivity." Both on grounds of style and of subject-matter, however, it seems to me impossible that the book of Joel should be much earlier than Zech. xii.—xiv.—i.e., than the reign of Jehoia-kim, where, following Dr. Oort, I formerly placed it. If we are to remove the book still further back, there is no halting till we come to Rehoboam, in whose reign it is certain that there was a plundering of the Temple, and a captivity of the Judean people. The reigns of Uzziah and Joash do not satisfy the conditions of the problem. But Dr. Duhm's arguments and a wider survey of Hebrew literary history have now compelled the present writer to place the little book of Joel after the exile, and, more precisely, in the period otherwise unrepresented by literature between Zechariah (about 518) and Ezra (458).

Another important "study"—the first in the series—is devoted to the subject of the value of "Sanchoniathon" for researches in religious history. Are the fragments on Phœnician antiquities, which have received their present form from Philo of Byblus, really translated from the Phœnician origi-

nal of "Sanchoniathon"? or is the work to which they once belonged an amalgamation of heterogeneous material due to Philo himself? Graf Baudissin, with the pioneer-critic Movers, adopts the latter alternative. He thinks the genuine Phœnician element in the fragments is very small, but he admits that the two cosmogonies are "alt-semitisch," and not borrowed from the narrative in the book of Genesis. There is probably not much real difference of opinion among contemporary critics, but it seems hardly worth while to discuss the subject till the mythological cuneiform inscriptions have been more securely interpreted. Passing to subordinate points, it is rather strange that Graf Baudissin should fail to see the additional presumption in favour of the view that "mourning for an only son" = "mourning for Adonis" (Am. viii. 10, &c.) created by Assyriology. Why should Hebrew be the only language without mythological survivals? That the view in question is certain, I do not say; but that (in spite of Zech. xii. 10) it is not at all improbable. On page 39 I am glad to see the competent opinion of Prof. v. Gutschmid quoted in favour of the reading *Israel* instead of *El* in the fifth of the Philonian fragments. A reference to the passage will show the importance of the correction.

The third "study" relates to the divine name 'Idw and its relation to the Hebrew Yahveh. Enormous pains are taken to show that 'Idw was not properly a name of Dionysos, and that so far as our present knowledge extends the divine name Yahveh was peculiar to the Israelites. This supplies, I fear, a refutation to a well-known theory of Bishop Colenso. The fourth relates to the significance of the serpent in Semitic religion, especially in the Old Testament. Graf Baudissin's collection of data is well-nigh exhaustive; his main conclusion (reached long ago by myself through an examination of the supposed Iranian analogues to Gen. ii. iii., and confirmed by every day's experience of Assyrio-Hebraic comparisons) is that the supposition of Aryan influence on the serpent-symbolism of the Old Testament is quite unnecessary. I do not think I can agree with the author that the "sea" in Job xxvi. 12, Isa. li. 15, means the lower ocean. If we read Job xxvi. 12, 13 together, and then look at Jer. xxxi. 35 (not improbably by II. Isaiah), where the sea is in juxtaposition with the sun, moon, and stars, we can hardly doubt that "the sea," "Rahab," and "the fugitive serpent" in Job (*loc. cit.*) are in mythic connexion, and that both Rahab and the serpent mean the well-known mythological storm-dragon; the Accadian liturgy translated by M. Lenormant (*La magie chez les Chaldéens*, pp. 151-2)

* That there was a "survival" of the Adonia in Hebrew practice is certain (Ezek. viii. 14). We have, I may remark, M. Renan's authority for the celebration of a ceremony akin to the ancient Adonia at Djebel (Gabal or Byblos). If such a survival is possible in the nineteenth century after Christ, how much more in the period before the exile! The custom of the Adonia would naturally give birth to a proverb, and popular teachers would as naturally employ it, without a fastidious examination into its origin. That "the only-begotten one" = Adonis in Phœnician is a reasonable inference from Philo of Byblus.

and Mr. Sayce (*Records of the Past*, iii. 127-130) speaks of "the huge serpent with seven heads," and "the serpent which lashes the waves of the sea." Into the discussion of the "dragon Tiamat," which seems also to favour my view, even omitting Mr. Smith's very questionable comparison of *turbuhtu* with *Rahab* (*Chaldean Account of Genesis*, p. 90), I cannot here enter, though Graf Baudissin's contribution to it is very noteworthy. The fifth and last in the series of "studies" is devoted to the demolition of Hitzig's view (adopted of late by M. Reuss in his generally excellent popular Commentary on the Prophets) that "the mourning of Hadad-rimmon" (Zech. xii. 11) means the rite of mourning over the dead Sun-god Adonis. This is of course impossible since the discovery of the Assyrian Storm-god Ramman, and Graf Baudissin seems to be right in substituting the form Hadar-ramman—i.e., Ramman (or Rimmon) is glorious (comp. Tab-rammon [Tab-ramman]—i.e., Rimmon is favourable). We thus gain an additional instance of the presence of "heathen" elements in the topography of the Israelites. How natural that the old local deities should continue to be worshipped, so long at least as Yahveh himself was but a national deity! How clear that the idea of apostasy from Yahveh in the large application given to it in the Books of Kings is of late origin! And we gain further a fixed point in the literary criticism of the Old Testament—viz., that Zech. xii. was written while the mourning for the death of Josiah was still fresh in remembrance, at any rate before it had been cast into the shade by the still more overwhelming sorrow of the destruction of Jerusalem. T. K. CHEYNE.

SCIENCE NOTES.

MICROSCOPICAL NOTES.

M. BARAY states that the nematoid discovered by Dr. Normand in the dejections of patients attacked by diarrhoea in Cochinchina resembles the *Rhabditis terricola* of Dujardin, but is smaller. The female is one millimetre long, and about 0.04 of a millimetre broad, without wings, folds, or tubercles. The mouth has three lips, one unequal and three-lobed; the oesophagus occupies one-fifth of the body. The gizzard is ovoid, intestines anteriorly enlarged, and the anus lateral near the end of the tail. The male is about one-fifth as big as the female. The penis is composed of two small horny spicules. Five days suffice for this worm to attain to its maturity under favourable circumstances. Dr. Normand found it in the stomach, pancreas, choledoc duct, and hepatic vessels. M. Baray names it *Anguillula* or *Rhabditis stercoralis* (*Comptes Rendus*, October 9, 1876).

M. BALBIANI, referring to the observations of Bütschli, Auerbach, Strasburger, Fol, Hertwig, and others, on cell division, describes a series of fresh observations he has made on the development of epithelial cells in the ovary of the larva of an orthopter, *Stenobothrus pratensis*, which specially relate to the part played by the nucleus. He found these cells very transparent, and often noticed in the same ovigerous chamber fifteen to twenty of them in different stages of division. In the smallest chambers of the anterior portion of the ovarian tubes the epithelial cells belonged to the pavement type; they gradually acquired more thickness in the succeeding chamber and ended in constituting a veritable cylindrical epithelium. During this transformation they multiplied actively by fission and their

size diminished as the number augmented. When the egg approached maturity they ceased to multiply and became smaller, and the capacity of the chamber was augmented by another process, for the cellules enlarged themselves again and flattened, thus resuming the pavement pattern which they exhibited at first, and which they now retained till the egg was mature. In these cells the cells did not contain any proper nucleus in the sense usually assigned to the term, but their whole interior in a fresh state appeared as if full of small pale clefts, sometimes parallel to each other, at other times more or less irregularly distributed in the nuclear cavity. The appearance resembled that of a mass of bacteria, enclosed in a nucleus. Acetic acid enabled it to be seen that this appearance was caused by corpuscles in the form of narrow rods, of unequal size, and which became refractive under the action of the reagent. When strongly magnified, each rod was found to be composed of small globules like those of bacteria. As the cells multiplied the rods became smaller and smaller, so that when the chambers contained eggs nearly ripe the nucleus only exhibited a mass of fine granulations. A cellule which is about to divide augments its volume as well as that of its nucleus, often to the extent of becoming twice as big as its neighbours. At the same time it loses its polygonal contour, and becomes more or less circular. The rods of the nucleus become less numerous, but larger and more visible. They also, for the most part, lose their straight form and grow curvilinear, some even exhibiting short ramifications. These larger rods appeared to be formed by a coalescence of the primitive nucleolar corpuscles. At a more advanced stage the cell and its nucleus become ellipsoid, in the interior of which the rods form a loose bundle parallel to the long axis of the nucleus. A still further modification ensues, and the rods appear cylindrical or fusiform, extending the whole length of the nucleus. Soon after this a constriction and division occurs, so that the primitive fascia is divided into two secondary and smaller ones which tend to separate from each other in a rectilinear direction; but the division is not complete, as the two parts are connected by a thin thread. These changes give the nucleus a striated aspect. While the two fasciae separate their component rods approach, and their ends directed towards the poles of the cellule become fused, the free portions opening out at the same time. Each fascia takes the form of a cone with a rounded summit, which grows into a little cupola with its circumference presenting divisions or denticulations formed by portions of the rods that have not become fused with the rest (*Comptes Rendus*, October 30, 1876).

We may mention that *Comptes Rendus* for October 23 contains an elaborate paper by M. Trécul interesting to physiological botanists, "On the Order of Appearance of the First Vessels in the Aerial Organs of *Anagallis arvensis*." It is too long for extract and would not bear much abbreviation.

BOTANY.

Sexual Reproduction in Fungi.—The observations of De Bary (see Sachs's *Text-book of Botany*, English ed. p. 256) have given rise to the general acceptance of a belief in a sexual mode of reproduction in a large class of fungi, the Ascomycetes, consisting in the fertilisation of the female organ, the ascogonium or carpogonium, by a male organ, the pollinodium, the result being the production of the ascospores within the asci. The most recent researches, however, of Van Tieghem and Cornu, as detailed in the *Annales des Sciences Naturelles*, throw considerable doubt on the accuracy of De Bary's conclusions. Van Tieghem claims to have observed that the rod-like bodies termed pollinodia, instead of being fertilising organs, have themselves a power of germination—in other words, are strings of conidia—and that

the ascospores are consequently not produced by any process of impregnation. The same explanation is offered of the apparent sexual phenomena which have been observed on the mycelium of some Basidiosporous fungi, such as *Coprinus*. Cornu's observations were directed especially to the so-called spermatia, produced within receptacles termed spermogonia in certain Ascomycetes. These spore-like bodies were also stated by De Bary to be destitute of any power of germination, and were, therefore, also thought by him to have some sexual functions; but M. Cornu succeeded in inducing germination in them when sown in a nutrient liquid prepared specially for the purpose, consisting of distilled water containing in solution 1 per cent. of sugar and 0.4 per cent. of tannin. He believes that their purpose is the dissemination of the organisms to which they give birth, their excessively minute size and prodigious numbers enabling them to be carried through the air in enormous quantities, until they reach a suitable substratum, on which alone they germinate.

Grouping of Zoospores in Water.—It has long been known that when the motile reproductive bodies of Algae known as swarmspores or zoospores occur in large quantities in water, they arrange themselves in beautifully symmetrical groups and figures, sometimes towards the lighter, sometimes towards the darker side of the vessel or piece of water in which they occur. The determining agent in producing this grouping was generally believed to be light, which was supposed to act in some hitherto unknown way on the zoospores. In a pamphlet entitled *Ueber Emulsionsfiguren und Gruppierung der Schwärmsporen im Wasser*, reprinted from the botanical periodical *Flora*, Prof. Sachs adduces reasons for believing that the phenomenon is not due to the action of light, but of heat; that the zoospores vary somewhat in their specific gravity, and are carried by the currents of water which result from the side of the vessel which is most exposed to the light being in general slightly warmer than the darker side.

Bentley and Trimen's Medicinal Plants.—Thirteen monthly parts are now published of this very useful work, comprising descriptions and coloured plates of about 100 plants employed in medicine, and recognised in the pharmacopoeias of this country, of India, or of the United States. When complete, about 300 species will be thus illustrated. There is no doubt that the publication will supply a want which has long been felt in botanical and pharmacological literature, as there is no other recent work of the same scope; and, as it seems to us, it will fulfil its requirements admirably. The plates are necessarily somewhat unequal; and in a few the artist has failed to catch the distinguishing characters in such a way as to render them at once recognisable. But these are the exception; and the majority are extremely well-drawn and well-coloured. The letter-press also supplies all the information that is requisite respecting the botanical characters and the medical properties of each species, and the mode of preparation of the drugs obtained from them.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, November 1.)

PROF. WESTWOOD, President, in the Chair. Mr. F. Smith exhibited some remarkable specimens of thorns from Natal and Brazil, which had been taken possession of by certain species of *Cryptoceridae* for the construction of their nests. Some of the thorns were as much as three inches in length. Prof. Westwood mentioned an instance of the hairs of a larva of *Lasiocampa rubi* having caused considerable irritation of the skin, and that the irritation was complained of by his correspondent for a week afterwards. The Professor exhibited a singular coleopterous larva from Zanzibar, of a flattened ovate form and a steel-blue colour, with two points at the extremity of the body, and with long clavate antennae. The head bore some resemblance to that of the dipterous genus

Diopsis. He also exhibited a specimen of the butterfly *Hesperia sylvanus*, received from the Rev. Mr. Higgins, of Liverpool, having the pollinaria, apparently of an orchid, attached to the base of the tongue. Also an orchid bulb, which had been purchased by Mr. Hewitson with a collection of roots from Ecuador, which was found to contain nine living specimens of cockroaches, comprising six different species—viz., *Blatta orientalis*, *americana*, *cinaria*, *Maderae*, and two others unknown to him, some being of considerable size.—Mr. Dunning read a "Note on *Acentropus*," in which he remarked 'on Heer Ritsema's second supplement to his Historical Review of the Genus, published in the *Transactions* of the Entomological Society of the Netherlands, in which that author tried to prove that two distinct species existed, of which one (*A. niveus*, Oliv. = *A. Garnousii*, Curt.) has a female with rudimentary wings, and the other (*A. latipennis*, Möschl. = *Zancle Hansoni*, Ste.) has a female with normally-developed wings; whereas Mr. Dunning argued that the facts, as stated by Heer Ritsema, did not in any way prove the duality, but were quite consistent with the unity, of the species.

LINNEAN SOCIETY.—(Thursday, November 2.)

PROF. ALLMAN, President, in the Chair.—The first paper read was "On the Classification and Terminology of the Monocotyledons," by Mr. G. Bentham. We append a summary view of his proposed arrangement:—I. Epigynae, including Hydrocharideae; Scitamineae (Musaceae, &c.); Orchideae; Burmanniaceae; Irideae; Amaryllideae (Haemodoreae, &c.); Taccaceae; Dioscorideae; Bromeliaceae. II. Coronarieae: Rubiaceae; Liliaceae (Smilacaceae, Melanthaceae, &c.); Pontederiaceae; Philhidaeae; Xyridae; Commelinaceae; Juncaceae; Palmae. III. Nudiflorae: Pandanaceae; Aroideae; Typhaceae; Lemnaceae; Naiades (Juncagineae); Alismaceae. IV. Glumales: Eriocaulaceae; Centropideae; Restiaceae; Cyperaceae; Gramineae. Lindley's, Dictyogen's, and Brongniart's grouping according to the nature of the albumen are set aside in favour of Fries'—primary characters derived from perianth. The anomalous Water Plantains (Alismaceae) combine varied characters, but best show alliance with the Pond-Weeds (Naiades) and Frog-bits (Hydrocharideae), though the linear arrangement interferes with the natural dovetailing of affinities. Boundary lines are meagre and cross-relationships numerous between the long series of orders from the Irises (Irideae) to Sedges (Cyperaceae) inclusive. Palms (Palmae), though with woody stem and peculiarity of leaf-shape, have flower and fruit akin to Rushes (Juncaceae). The Glumales have hitherto had different recognition accorded them according to the signification accepted as to definition of the term Glume. On this head Mr. Bentham enters into a survey of the question, and after lengthened comparisons of different genera enunciates that:—(1) Homologous organs ought to be called by the same names; (2) that non-homologous organs should receive different names.—Mr. Duppa Crotch exhibited a live Norwegian Lemming, and explained by charts two migrations witnessed by himself.—Dr. Francis Day, from a study of some Irish sticklebacks (*Gasterosteus*), questions the propriety of using the ventral fins and spines as a classic character, abnormal variations being frequent; and the amount of armature in the *Gasterosteus*, he believes, is dependent somewhat on proximity, &c., to marine habitat.—Mr. A. G. Butler exhibited butterflies of the genus *Euptychia*, illustrating a paper by him thereon; another paper by the same author "On Lepidoptera from Malacca" was taken as read.—There was announced a supplemental notice of Algae brought by the *Challenger*, by Professor Dickie; a paper "On the Respiratory Function of the Carnivorous Water Beetles," by Mr. D. Sharp, and another by him "On New Central American Beetles (Scarabaeidae), collected near Chontales," by Mr. Belt.—There was exhibited, and remarks made on, a specimen of *Tordylium maximum*, gathered near Tilbury Fort, by Mr. E. D. Crespigny; a case of insects and stems of young of the Insectivore *Hemicentetes nigricapsa*, both from Madagascar, by Mr. A. Peckover; and also some Dahlias, raising moot questions as to colour, by Mr. R. C. A. Prior.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, November 14.)

COLONEL A. LANE FOX, F.R.S., President, in the Chair. The President read a paper on "The Black

Burgh Tumulus, Dyke Road, Brighton," explored by him in 1872. This tumulus, about two miles from another opened in 1856, which contained the amber cup, bronze dagger, &c., now in the Brighton Museum, was found to contain toward the centre a layer of charcoal 1ft. 10in. below the surface, and extending to a radius of twenty feet. This, on being microscopically examined, was found to be oak charcoal; portions of ribs of goat or sheep, notched apparently with a flint-saw, were found, a piece of British pottery, and in the centre of the tumulus, in an oblong grave eight feet by twelve, was found a skeleton, in a crouching position, six feet below the surface, and crushed flat by the superincumbent earth—the face toward the south-east. These remains Prof. Flower ascribes to a female of about 5ft. 6in.; about two feet from the feet lay a fine bronze dagger, four inches in length, with the rivets for attaching it to its handle. A curious food-cup, with peculiar ornamentation on one side, and two small discs of metal, apparently rivet-heads, together with a quantity of small flat leads, originally strung together, were found. These objects belonged to the time of the interment. Two flint scrapers were also found near the body. The chief peculiarities of this find are the presence of a dagger with a female skeleton and the curiously ornamented food-cup.—Another paper by the President was read, on "Explorations in 1875 of the Ditch and Tumulus in Seaford Camp." In the ditch, at one foot below the present surface, were found one or two pieces of mediaeval pottery, then Romano-British at about three feet, and below this chalk rubble evidently filled in, until the original bottom at seven feet was found. The tumulus inside the rampart was examined, and a large flint scraper and a piece of British pottery were found at two feet. Below, at a depth of three feet five inches, five flint-saws and more British pottery were found; also fragments of a flint-hammer and a polished flint celt originally five inches long, but broken into three pieces—one of the edges was chipped to make a new edge. The flint hammer was formed from a sea-worn flint-peg. The flint celt had evidently been fractured three or four times at the place of interment. Scrapers and fragments of pottery and a broken but well-shaped barbed arrowhead were also found. No trace of bone was found.—Mr. F. G. H. Price then read a paper on "Excavations in the Romano-British Cemetery at Seaford, Sussex," by himself and Mr. John E. Price, F.S.A. The authors described the cemetery and the cutting they made in it. The surface-soil, extending to a depth of about three feet, contained large quantities of flint scrapers, flakes, and fragments of pottery. Several urns were met with at a depth of three feet from the surface, which contained, in addition to the usual calcined bones, thin iron nails with large heads, flint flakes, and bronze fibulae. The objects found in the above excavations were exhibited, and a discussion of the three papers took place, in which the President and others joined. Maps and sections illustrated the papers.—Photographs of a so-called "Horned Man" from Akim were exhibited by Mr. Hay, per Francis Galton, Esq., F.R.S.

ROYAL SOCIETY.—(Thursday, November 16.)

DR. HOOKER, C.B., President, in the Chair. The following papers were read:—"Experimental Contributions to the Theory of the Radiometer," by W. Crookes, F.R.S.; "Magnetic Observations made at Stonyhurst College," by the Rev. S. J. Perry, F.R.S.; "On Electrical Conductivity and Electrolysis in Chemical Compounds," by Dr. L. Bleekrode.

NUMISMATIC SOCIETY.—(Thursday, November 16.)

JOHN EVANS, Esq., F.R.S., President, in the Chair. The Rev. S. S. Lewis exhibited a cast of a Jewish shekel in his possession, dated year 5, the only piece of that year known to exist. Mr. Percy Gardner exhibited a cast of one of the curious (apparently) iron coins of Hermaeus, King of Bactria, brought by Sir Douglas Forsyth from the ruined cities of Central Asia. A paper was communicated by the Baron von Koehne on an unpublished coin of Aristarchus, Prince of the Colchians, whose reign the writer assigned to the period B.C. 63-47.

CHEMICAL SOCIETY.—(Thursday, November 16.)

PROFESSOR ABEL, F.R.S., President, in the Chair. After the ordinary formal business, a paper "On Barwood," by the late Prof. Anderson, was read

by the Secretary, describing the methods of preparing baphtin from it, and also some of the educts obtained by the action of various reagents. The second communication was on "The Alkaloids of the Aconites, Part I.; on the Crystallisable Alkaloids contained in *Aconitum Napellus*," by Dr. C. R. A. Wright. The author finds that the alkaloids from *A. ferox*, which he calls *Pseudoaconitine*, $C_{30}H_{49}NO_{11}$, differ both in properties and in composition from *Aconitine* $C_{34}H_{57}NO_{12}$, the crystalline alkaloid of *A. Napellus*. In one instance, however, he obtained from the root of the latter a perfectly distinct bitter crystalline alkaloid, *Picraconitine*, possessing scarcely any toxic power. Whether this is an alteration product of aconitine or not remains at present undetermined. Mr. G. S. Johnson then read a paper "On Potassium Tri-iodide," a crystalline compound obtained on saturating a saturated solution of potassic iodide with iodine, and slowly evaporating the solution over sulphuric acid. It forms prismatic or tabular crystals, having an appearance very similar to that of iodine. The last communication was by Mr. T. S. D. Hampidge, "On the Coal Gas of the Metropolis." He has carefully analysed and determined the illuminating power of different samples, and comes to the conclusion that the gas at present supplied is but little, if any, better than it was twenty-five years ago, the actual increase in illuminating power being due to the use of improved burners. This paper gave rise to considerable discussion, after which the meeting was adjourned until Thursday, December 7, when the following communications will be read: (1) "Analysis of a Species of Erythrophyll," by Professor A. H. Church; (2) "On Phenylenediamine," by Dr. Otto Witt; (3) "On Calcium Sulphate," by Mr. Hannay.

PHILOLOGICAL SOCIETY.—(Friday, November 17.)

H. SWEET, Esq., President, in the Chair. Prince L.-L. Bonaparte read a postscript to his paper of April 7 on "The Western Dialects of England," giving an account of the results of his visit to Somersetshire in August last. He finds no French sound to the north and east of the line of the Quantock Hills ending at Taunton, to the west of which it is well known. The district between the Quantocks and the Parrett shows a transitional character between ordinary Somersetshire and Devonian, as the third person singular in *-eth*, and even the use of *utchy* for the pronoun *I*, were in use within the memory of an old man of ninety-four, living at Cannington, who still uses them in speaking to very old people, and was seen by the Prince. The general character of the Mid, North, and East Somerset is that described by Jennings. A slip, described and glossaried by Mr. G. R. Pullman in his *Rustic Sketches* (who accompanied the Prince), including Axminster, Chard, Ilminster, Martock, Yeovil, Crewkerne, and Lyme Regis, and hence a small portion of Dorset and Devon, as well as south Somerset, shows a change of dialect. In this slip there are two villages which form "linguistic islands," Merriott (east of Parrett and near Crewkerne), and Montacute (close by, but west of Parrett). In Merriott *r* final almost disappears; *utchy* and *utch* are used for *I*, and *he talk* for *he talks*, or *do talk*, of the neighbourhood; *hem be* for *he is*, *her* for *she*, *to mow* for *to mow*, without naming the object, and *thick* for this (with flat *th*) are found. In Montacute *utch* (not *utchy*) is used, as in *utchil*, *utchood*, for *I will*, *I would*; also *us went* for both *I and we went*, *he talk* for *he do talk*, *hem be* for *he is*, and a strongly pronounced south-western *r* (the tongue reverted).—Afterwards C. A. M. Fennell, Esq., read a paper on "Corssen and his Critics," in which he endeavoured to show that the Etruscan researches of Corssen had not been treated with sufficient care either by Sayce or Deoche, and illustrated this by numerous contrasts between their statements and Corssen's own. In the discussion which followed Prince L.-L. Bonaparte expressed his opinion that Corssen had treated the subject scientifically, and the Rev. Mr. Taylor unscientifically, but that the only conclusion to which we were yet able to come was that Etruscan was neither an Aryan nor a Semitic language. To what class of agglutinative languages it belonged we had no means of saying, and he considered that there were no grounds for calling it Altaic.—Mr. A. J. Ellis exhibited and explained the engraving of the Prince's English Dialect Map, made for the Philological Society.

FINE ART.

The Flavian Amphitheatre, commonly called the Colosseum, at Rome, its History and Substructures compared with other Amphitheatres. By J. H. Parker. (London: Parker; and John Murray, 1876.)

Historical Construction of Walls in Rome, with Plates. By J. H. Parker. (London: Parker; and John Murray, 1876.)

The Catacombs of Rome and their Testimony Relative to Primitive Christianity. By the Rev. W. H. Withrow. (London: Hodder & Stoughton, 1876.)

THE volumes of Mr. Parker's extensive work on Rome are now appearing with welcome rapidity. In this new part he sets forth the results of the late excavations in the Colosseum, which were mainly carried out at his advice and instigation. They have thrown new light on its history. They show that the Flavian Emperors built their magnificent stone corridors and grand frontage round a brick building previously existing in the centre. Mr. Parker's view is that this brick building contains the Gymnasium and Naumachia built by Nero in connexion with his great palace or golden house. Several of the arches of the galleries in the fine brickwork of Nero remain in the Colosseum, and the brickwork of Nero's time cannot be mistaken. It is the finest brickwork in the world. The bricks are large and thin—ten to the foot—and there is very little mortar between them. Anyone going to Rome this winter should buy the second of the above-mentioned works, which, in a small pamphlet shape, contains plates of the different constructions of walls at Rome, both in stone and brick, of all periods; a little study of which will enable the eye to rapidly catch the character of the old buildings and remains. The stone arcades of Vespasian were built up against the arches of Nero's time, and the bricks are in many places cut in half to make way for the stone piers. The substructions of the work are even earlier, and Mr. Parker assigns them to Scaurus, the stepson of Sulla, who built an "insane work," costing two millions sterling of modern money, and "destined for eternal duration." The lower part of the *scena* was of marble, the middle of glass, the highest part of gilt wood (what Pliny says about "six Hymettian columns" is not rightly construed in the text). Scaurus' theatre soon perished by fire, but the substructions seem to be eternal. Enormous tufa walls still remain, going down twenty feet, with vertical grooves in them, in which to work the lifts by which cages of wild beasts were sent up on the stage when wanted—we hear of a hundred lions leaping out on the stage at once. Recesses, too, remain in these walls for the counterweights also to work in, with holes in the pavement for the sockets of pivots for the capstans necessary to wind up the cords and loose them as required. The immense walls were still further needed to sustain the weight of water in the two canals on each side of the "gulf" which runs along the whole centre of the building, the gulf being necessary for sending up the scenery—for there was no place behind the scenes for the actors and workmen, as in a

modern theatre. At the bottom of this great central passage has been found a remarkable wooden framework, like a "cradle" in a dockyard, on which the vessels probably rested before they were lifted into the canals for the sham naval-fights. Comparison is the first principle of the modern science of archaeology, and Mr. Parker has taken much trouble in comparing other amphitheatres, and especially that at Capua, which is almost of the same size as the Colosseum, and a remarkably exact copy of it. Here we have the same central space, and canals, and grooves in the walls for lifts; and the substructures are far more perfect than at Rome. In Rome the Popes and great families used the Colosseum as a stone quarry for their own buildings—an express agreement was come to in 1362 by the rival families to that effect. The excellent photographs in the book show all this very clearly, and we never before saw anything to equal them in the way of detailed illustration. There are thirty-six plates, several containing more than one view; and besides the photos of the amphitheatres at Capua, Verona, and Pozzuoli, there are several representations from coins, one from a fresco at Pompeii representing an amphitheatre with an awning, and several *graffiti* from the Colosseum itself representing athletes, and a hunt of wild beasts, and the framework of the netting or gilt wire on the *podium*, which prevented the beasts from springing at the spectators in the lower gallery. On the whole we are inclined to think that this, with the forthcoming part on the Catacombs, will be the most popular of Mr. Parker's volumes among English readers, and we are not sure that they will not be in most respects the best. Mr. Parker has taken very great trouble and been at great expense to preserve an exact record of the facts connected with the existing remains, and his photographs preserve notices of not a few things that have recently been destroyed. This service is a permanent one rendered to Roman Archaeology, even if the progress of discovery should render it necessary to modify several of the theories now before the public for their consideration.

Mr. Withrow's book is an American contribution to the literature of the subject, and is a very useful summary of the latest results of explorations; although there is a somewhat polemical tone about it, which is, perhaps, unavoidable in treating of the Catacombs, which have been so eagerly searched for early traces of Roman doctrine and have yielded so little to the search. There are one hundred and thirty-four illustrations, which are very useful; see, for example, the one from a subterranean chapel in the Catacomb of Marcellinus and Peter, representing an Agape or Lovefeast. Three guests sit at a semicircular table, at the ends of which preside two matrons, personifying Peace and Love, with their names written above their heads. An attendant supplies them with food from a small table in front, on which are a cup, platters, and a lamb. The inscriptions, according to Dr. Maitland, should be expanded thus, "Irene da calda[m] aquam]. Agape misce mi [vinum cum aqua]." The value of the book is increased by the number of sepulchral inscriptions, both Pagan and

Christian, which are given. It must be remembered that many Pagan inscriptions are found in the Catacombs; and that, while one party holds that they were merely brought there to have Christian inscriptions cut on the other side—in fact, as old material to be worked up again, which is certainly true in some cases—the other holds that they prove the family vaults to have been used for both Pagans and Christians—in fact, that here we have traces of the gradual transition to the new religion, and this seems the more probable view.

The last news from Rome is that Gori believes some cellars which he has been exploring under the ground west of the Tabularium, and leading to the Caffarelli Palace, to be the *faviæ* mentioned by Anlus Gellius as existing under the Capitoline Temple, and consisting of cisterns and cellars in which the priests deposited the decayed images and worn-out parts of the objects used in the temple worship. If this is confirmed, it is important as helping to determine the true site of the temple. CHARLES W. BOASE.

MR. DESCHAMPS' GALLERY.

(Second Notice.)

In our first article on this gallery we spoke of only seven principal exhibitors. It remains to dispose of the general bulk of the collection, both figure-pieces and landscapes: and first of the former.

Tadema, *Miss Thackeray's Elizabeth*; a single half-figure, with artistic and rather capricious combination of accessories, amid which a rose-tinted porcelain cup, and its elongated recessed saucer, are conspicuous; a work rather of technical proficiency than of actual charm in the result. Valentine Bromley, *One from Venice*; also a half-figure of a very sombre-complexioned young man, in mediæval costume red and black, anything but graceful in lateral contour; done with a view to force of tinting and of handling, and pushed rather to an extreme. Boughton, *A Wet Sunday*; a clever landscape, with figures trudging home from church, forlorn but companionable in the soppy downpour; not carried far beyond a sketch. Thomas Faed, *The Gleaner*; a very poor affair. A. J. Webster, *Lucille*; a pleasant study of a French girl of six or seven, in a cap and grey-blue pinafore. Fildes, *A Venetian Fruit-Seller*, pausing at a door as he floats up one of the narrower canals: quite like the thing, and painted with attractive and skilful simplicity. Marsh, *The Harvest of the Sea*. This is one of the larger contributions: a scene of vapoury and clinging sea-mist, not impressive to the eye at first sight, but gaining as one inspects it. A storm is subsiding, and the women and girls of the coast are gathering spars and wreckage of various kinds. They loom, and move, and work: a cheerless task under cheerless conditions. Herkomer, *Portrait of My Boy*—the same very sturdy little urchin of whom an earlier likeness was displayed in another recent exhibition. He looks marked out by nature for the tyrant and darling of his kin, only too conscious that his will is law. His throne is a chair, with a cross-bar serving as a stand for his toys; one of these, a figure of a bull, is now half-occupying his attention, and a rose lies beside it. His age stands recorded as one year and eight months. This is a powerfully-executed study, with sharp, rapid, substantial handling—the background of close leafage very deftly touched off. Pettie, *A Sketch*, represents a soldier of the middle of the seventeenth century, in a strong illusive effect of light—that which would be proper to a room of contracted space, with the brilliantly-lit sky visible through a single opening, and producing a glare of whitish

light along the man's forehead. Thomas Graham, *Going-a-Milking*; one of the cleverest pieces of work we have seen of late from the hand of this very capable but too easily contented painter—recalling to some extent the similar subject exhibited by Mr. Fildes in 1875, though that was alike larger in scale and stronger in handiwork. Mr. Graham gives us a bouncing Scotch lassie, of the most brilliant florid carnations: she has bundled out of bed in the balmy early morning, with little care for her toilet, and walks straight ahead towards her cows.

Along with these we may name—C. N. Hemy, *Mending the Nets*; Orchardson, *Tête-à-tête*; Scholander, *The Flower-Girl*; Percy Macquoid, *Gathering Seaweed in Brittany*; Small, *A Sketch*, and *At the Well*; Miss H. Montalba, *A Study of a lady in grey*.

In the landscape branch of the collection nothing is more striking than Mr. Wallis's picture, *Amidst the Moors*: at once dark, rich, and luminous, in colour, to a singular degree—a lonely solemn scene, with a message of awe to the thoughtful or impressible, and of a certain physical disquietude even to the frivolous—the vast cumulus-clouds lemon-tinted in sunset as they surge and change over the obscure and limiting hills. Mr. Wallis has not unfrequently proved his uncommon depth of resource as a landscape-painter, but never, perhaps, so superbly as in this picture. Mr. James Macbeth comes not far below him in *The Moor at Whistledale, Loch Long*, severely gorgeous in its tints of ruddy orange, and of slaty-purple blues. *A Scotch Hillside in Autumn*, by the same artist, with a pouring torrent-stream advancing down the centre, is fully as praiseworthy—fine, clear, and free. Mr. Henry Moore is, as usual, excellent in *A Northern Moorland in late Autumn*—grand in its sad sunken aspect, its darkness pallidly gleamed over by the nebulous sky. *A Break in the Clouds, Evening*, and *Yarmouth Jetty*, are also good specimens of Mr. Moore. Mr. Cecil Lawson is represented by three interesting works—two of them dealing with moonlight, and one with sunset: he seems to be somewhat unduly partial to scattered, broken, or divergent forms in his tree-branches, rather than to such as compose with harmonious regularity. In *The Vale of Meifod, North Wales, Making Hay while the Moon shines*, is a very sweet effect, blandly luminous—blended, yet still defined. In *The Thames, Boys Bathing*, the fiery eruptive flush of the sky is a bold attempt.

Mrs. Tadema and two of her sisters show to much advantage in this gallery. By the first-named lady, the view *From Il Fincio*, a suburban road in shadow, which swathes also the houses to the right, while sunlight lies broad on the grass to the left, is a very choice little bit, equally simple and effective. Mrs. Gosse's *Autumn Study of a Birch-tree* is carefully and observantly done: her *Sussex Landscape*, with a contemplative cow in front, is also a sound, though rather heavy, piece of painting. Miss E. Epps works with more freedom and atmospheric openness; *Four Miles from Ryde*, by this lady, gives with genuine feeling and co-ordinate skill the moisture and space of recurring washes of seasand under a loosely shifting sky. Commendation in varying degrees is likewise due to *Sunset on the Lancashire Coast*, by A. Maclean; *By the Sea*, by H. R. Robertson; *What will he do with it?* (a magpie and spoon, with poppies, &c.), by Pickering; *A Pastoral, Evening*, by J. D. Watson; *Evening near Trefw, North Wales*, and *The Valley Sleeps in Shade*, by Aumonier; *Loch Ard*, by Jefferson; *A Homestead*, by Hague; *Winter's Tale*, by J. W. B. Knight, a snow-scene with figures; *Ducks*, by Charlton; *The Golden Hour*, by A. Hopkins; *A Bye-Road, Normandy*, by Hennessy; *The Nieuw Maas*, by W. L. Wyllie; and *Going Home*, by Farren.

W. M. ROSSETTI.

NOTES AND NEWS.

THE general mediocrity of the competing designs for the Byron memorial ought to hasten the accomplishment of a scheme that has been set on foot for the establishment in London of an efficient school of sculpture. A few students, recognising the present decadence of the sculptor's art in England, and fully alive to the very inadequate means of instruction now provided, have proposed to establish an *atelier*, to be placed under the control and supervision of M. Dalou. According to a system common in France, the expenses of the studio are to be defrayed by the pupils admitted to the course of instruction, and we understand that M. Dalou has already consented to grant the time and labour necessary to make the undertaking successful. Such an experiment can scarcely fail to exercise a very important influence upon the progress of art, and it is besides significant as showing a new determination on the part of English students to take the reform of the existing system into their own hands. So soon as it is clearly understood that it is idle to await the initiative of the body nominally entrusted with the control of the higher art education of the country, there will be some real prospect of advancement. The failures of the Royal Academy have not been restricted in their effect to the limited sphere of its own labours. Its enfeebled enterprise has served by way of example to discourage individual effort elsewhere, and therefore any movement which shows a conviction on the part of art students that more can be done than the authorities at Burlington House have chosen to do, deserves the readiest welcome. The choice of M. Dalou as a master is sufficient evidence that the needs of the occasion have been intelligently understood, for, although we may not be able to concede to his work the very highest qualities of style, the perfect sincerity of its aim and its frank dependence upon nature cannot but avail to infuse a new vitality into the artificial and nerveless practice of the English school.

WHILE we are on the subject of art education we may note with satisfaction the serious efforts now being made to encourage the practice of etching among English students. At South Kensington M. Legros has been appointed to the conduct of the etching class, and at the Slade School, over which the same accomplished artist now presides, an etching class has also been established. Considering the high qualifications of the teacher, some important practical results may be expected from these attempts to encourage the study of a branch of art that has hitherto been strangely neglected in England. At present we do not possess any body of trained artists competent to undertake the kind of work that is so admirably executed by the etchers of the French school. It is to the latter that we are indebted for the translation by this means of the pictures of English masters, and in the one English art journal that relies upon etching as a means of illustration, nearly all the most remarkable plates are supplied by foreign craftsmen.

NARCISSE-VIRGILE DIAZ DE LA PEÑA, the well-known French painter, whose death was announced on Monday, was born at Bordeaux in the month of August, 1809. Like Dupré, he began his career as a painter on porcelain, and he first exhibited some sketches after nature in the Salon of 1831. Although his highest claims to consideration undoubtedly rest upon his practice as a landscape-painter, Diaz did not confine himself merely to the study of outward nature. Like Corot, he was constantly pursued by the desire to re-fashion the classic world according to the new ideal of the Romantic School, and he was wont to people his modern landscape with forms that feigned to be the nymphs and goddesses of the antique world. But it is also possible in his case, as in that of Corot, to separate the artifice from the reality, and to accept his sincere and enthusiastic worship of nature without troubling ourselves

overmuch about the strange creatures that inhabit the scene.

"Diaz," says M. René Ménard in his chapters on painting, "has produced some *genre* pictures of doubtful value, but as a landscape-painter he ranks among the first, and no one knows better than he how to show light through the foliage or on the pearly bark of old beeches, or to stud the rocks with brilliant mosses or grey lichens. His *Intérieurs de Forêt* are almost always admirable in colour. They reveal the resources of his opulent palette, when, through the thick depths of the woods he lets fall a ray of sunshine which comes to caress the foliage, to play amid the branches, to run on the brambles, and to shimmer along the earth, whose surface it irradiates."

As a colourist Diaz aimed at a force and richness of effect that vividly contrasts with the more subdued tints favoured by a later school of landscape-painters, and in this respect he stands nearer to Dupré than to Corot. And he also shared with Dupré an intense admiration for the Forest of Fontainebleau, the shrine whither so many of the modern French landscape-painters have turned to worship, and where Millet, the greatest of them, both lived and died. Diaz was a constant exhibitor at the Salon. He contributed *Les Environs de Saragosse* (1834); *La Bataille de Medina-Celi* (1835); *L'Adoration des Bergers* (1836); *Le vieux Ben-Eneck* (1838); *Les Nymphes de Calypso* (1840); *Le Rêve* (1841); *Vue de Bas-Bréau, L'Orientale, Le Maléfice, and Les Bohémiens se rendant à une Fête* (1844); *Baigneuse, L'Amour désarmé* (1851); *Les Présents d'Amour, La Rivale, La Fin d'un beau jour, Nymphes endormies, Nymphes tourmentées par l'Amour, and Les Dernières Larmes* (1845-1855); *Galathée, L'Education de l'Amour, Vénus et Adonis, L'Amour puni, N'entrez pas, La Fête aux joujoux and La Mare aux vipères* (1855-1859). Diaz obtained a medal of the third class in 1844, a medal of the second class 1846, of the first class 1848, and in 1851 he was nominated Chevalier de la Légion d'Honneur. He exhibited nothing in the last Salon.

THE October number of the *Bullettino di Corrip. Archeol.* describes two interesting Greek vases lately found at Corneto (Tarquinii), of the style known as red figure-vases, and good examples of that. The one is a tazza of considerable size, with designs inside and out. On the outside are two scenes mythologically connected with each other. The one represents the birth of Erichthonios. The name of each figure is inscribed beside it. In the centre is Ge (*Ge*) rising from the earth and handing the young Erichthonios (*Erichthonios*) to Athene (*Athenaia*), who holds out her hands to receive the boy. So far the same subject will be found on a vase in the British Museum (Catalogue of Vases, No. 749). On the right of the group are Hephaistos (*Ephaistos*) and Herse (*Erse*). On the left is Cecrops (*Kekrops*), ending in a serpent instead of in human legs. The companion scene to this, on the opposite side of the vase, represents Aglauros (*. lauros*) turning her head towards Erechtheus (*Erechtheus*), who follows her with a sceptre in his hand. After him come Pandrosus (*Pandr . .*), Aegeus (*. geus*), and the Attic hero Pallas (*Pallas*). Inside the tazza is figured Eos (*Heos*) carrying off Kephalos (*Kephalo .*). The other vase has a representation of Ulysses slaying the suitors, and is inscribed *Olyssseus*, there being some uncertainty whether the *o* is long or short. The greater part of the October number of the *Bullettino* is occupied with an account of the excavations on the Via Latina.

AN agreeable collection of "Sketches and Drawings made in Sinai and the Holy Land by Mr. H. A. Harper" is now on view at the Gallery of Messrs. Agnew, 5 Waterloo Place. The catalogue enumerates sixty-six items, with brief descriptions. The works (water-colours) are done with simplicity and ease; they seldom approach elaboration, but have adequate artistic skill and a right sense of effect and of general results in

colour. We may specify as among the more striking examples—*The Mountain of Deliverance, Gebel Atakah, Sunrise; Nazareth; The Convent of Mount Sinai; From the Mount of Olives, Evening, Commencement of the Great Storm of Easter, 1875; The Dead Sea (on the same occasion); Dawn, Sea of Galilee; The South Country looking to Bethlehem; The Bay of Acre from Mount Carmel.*

HANS HOLBEIN the elder is an artist who has suffered somewhat by the reputation of his greater son, but modern criticism and the final clearing up of certain perplexed dates in the life of the younger Holbein have done much to reinstate him in the place that belongs to him by right in the art-history of his country. Though not a great realistic artist like his son, he is yet found to be a painter of considerable ability, and his heads have a more portrait-like character than is common in works of his time in Germany. This is especially visible in his drawings and sketches, a number of which are preserved in different collections, but chiefly in the Berlin Museum. Such works as these, however, can necessarily only be known to a few, but happily by means of photography their multiplication has now become possible. This art is invaluable for reproductions of this kind, which have almost equal worth with the originals for all purposes of study. Lovers and students of art will therefore be likely to welcome a collection of reproductions of the silver-point drawings of Hans Holbein the elder, in the Berlin Museum, which has just been brought out by Herr S. Soldan, the enterprising art-publisher of Nürnberg. They consist chiefly of portrait-heads of Holbein's contemporaries in Augsburg. High and low, rich and poor, laics and clergy, are all represented here with the freedom of style we usually find in an artist's own sketch-book. Some are merely rough outline sketches, others are more carefully finished, and their effect heightened by the use of red crayon and white lights. Almost all the portraits have their names legibly written upon them by the artist's own hand, so that the collection really forms quite a pictorial history of the town of Augsburg at the beginning of the sixteenth century. Several members of the rich family of the Fuggers, with which Dürer has also made us acquainted; the Duke Charles of Burgundy; the Court fool to the Emperor Maximilian; his counsellor, Kunz von der Rosen; Heinrich Grün, of St. Ulrich; Sigmund Holbein, the artist's brother; and many other notabilities of that day, are thus made known to us. The text to this book has been written by Dr. Alfred Woltmann, to whose indefatigable research we owe almost all our present knowledge of the Holbein family. It is needless, therefore, to say that it contains an elucidatory comment on the drawings. The collection is to be completed in five folio parts, containing sixty-nine sheets in all. Only the first part, containing fourteen sheets, has been published as yet. It is of the same form as the interesting collection of Albrecht Dürer's drawings from the Berlin Museum, published by Herr Soldan some time ago.

FROM the last Report of the Trustees of the Public Library, Museums, and National Gallery of Victoria we learn that the attendance of visitors to the Picture and Sculpture Galleries during the year 1875 was 419,253, against 391,705 in 1874. In the School of Painting there were forty-one students, seven male, and thirty-four female; in the School of Design 152 students, forty-five male, and 107 female. Four oil paintings were purchased during the year—viz., *Flamborough Head*, by Edwin Toovey; *Bay of Salerno*, by F. R. Unterberger; *Jealousy*, by S. E. Waller; *A Norwegian Fjord*, by T. Duntze. To the Library Mr. D. Elphinstone Cooper presented twenty-six rare volumes of works illustrated by T. and J. Bewick.

German Artists of the Nineteenth Century; Studies and Remembrances, is the title of a new work, by Fr. Pecht, that has just been published

by the firm of C. H. Beck, of Nördlingen. It claims in the prospectus to be "a modern German Vasari." The first volume contains biographies of Cornelius, Ludwig Richter, Rietschel, Ludwig Knaus, Semper, Moritz von Schwind, Anselm Feuerbach, and Presser.

COMPREHENSIVE catalogues seem to be the vogue in Paris just now. Besides the great national catalogue of the art treasures of France, the Prefect of the Seine has commissioned the preparation of a separate inventory of the works of art in the twenty *arrondissements* of Paris. This must needs be a considerable work, for Paris is already extraordinarily rich in the decoration of her streets and public places, and every year the Corporation acquires at the Salon fresh works, which it is sometimes quite difficult to bestow appropriately. "The squares," says the *Chronique*, "have become perfect museums," and it cites among works that have lately been added to the many well-known monuments of Paris the *Gloria Victis* of M. Mercié, which is considered to be one of the most successful performances of the rising school of sculpture in France, and the *Education Maternelle* of M. Delaplanche, which have been placed respectively in the Square Montholon and the Square Sainte-Clotilde. A group by the late sculptor Perraud has also been erected in the gardens of the Luxembourg, and a fine monumental fountain by Carpeaux consisting of four figures holding up the world-sphere.

A FINE decorative work in mosaic is, according to the *Chronique*, at present being executed by the mosaic-workers at Sèvres to be placed above the doorway and along the front of the principal pavilion of the new manufactory. It has been designed by M. Lameire, and consists of a band of ten metres long and two wide, formed of small squares of ceramic set in a background of gold. The effect of this brilliant decoration has been tried, and is reported to have been very satisfactory, but it is certainly a bold attempt to introduce so much colour into a modern building. Several attempts have been made to bring this mode of decoration into use in France, but hitherto they have not been entirely successful. If, however, this Sèvres work should really be proved to be suitable, it will no doubt lead other new buildings to clothe themselves with the same gorgeous raiment. The difficulty is, we imagine, to find artists in these restless times willing to devote themselves to such patient labour. Besides the large decoration, a panel of mosaic, with the word *Salve* in letters of gold on a blue ground, has been let into the floor at the entrance of the new atelier at Sèvres after the Pompeian manner. While these interesting efforts in mosaic are occupying attention, the discovery is reported of an ancient work of polychromatic mosaic at Sens of great beauty and worth. It consists of a ground of about seven metres in extent, upon which are depicted two stages separated from one another by a graceful vase containing a plant upon which the animals are browsing. The whole is richly set in successive borders of laurel leaves, and the harmonious colours employed are said to far surpass those of modern works of this kind.

THE new building of the Sèvres Museum has just been inaugurated, and will remain open for about a fortnight. At the beginning of next month, however, it will be closed again indefinitely for the necessary works of installation and completion.

We learn from a correspondence which has lately appeared in the *Times* that the statue to Faraday which was subscribed for some years ago, and entrusted to Foley to execute, was modelled in the clay by that sculptor, but never quite finished. Its completion and casting have been undertaken by Mr. Burch, Foley's principal pupil. Faraday is represented in this statue in his robes as a D.C.L., and not, unfortunately, as his friends love to remember him, in his work-a-day costume at the Royal Institution.

A SHORT, but carefully studied monograph on Venetian ceramic (*Studi intorno alla ceramica Veneziana*), has recently been printed for private circulation by Signor Marino Urbani de Gheltof. This is important as a contribution to the history of Italian ceramic, as hitherto very little has been known concerning Venetian faience. Signor Urbani de Gheltof has searched in the archives of Venice and has discovered numerous important documents.

THE New York telegram in the *Daily News* of last Wednesday stating that the Metropolitan Museum of Art in that city has accepted General di Cesnola's "offer of the Curium treasures and other collections from Cyprus," is, we are informed, erroneous. While the negotiations for the sale of the Curium Collection to the British Museum were pending, General di Cesnola has made no offer of it to the Museum or to any other body, and is naturally annoyed at being placed in a false light before the English public. The offer of 10,000*l.* on the part of the British Museum authorities for the Curium Collection was received by General di Cesnola before the telegram from New York offering 60,000*l.* for the whole of his collection arrived. This offer on the part of the Americans General di Cesnola has not considered himself at present authorised to accept.

THE STAGE.

"MACBETH" AT DRURY LANE.

A GREAT performance of *Macbeth*—a performance even which, without being great, is at least very spirited and intelligent—tempts the playgoer, much as he is tempted by a good private reading of the play, to go into all manner of speculation and conjecture as to the effect of character on character, the light in shade, the shade in light, and to involve his own mind a little in the intricacies of great imaginative work. Of such a performance this temptation is perhaps one of the charms. But the rendering of *Macbeth* at Drury Lane, which the public saw for the first time on Wednesday, invites to no such exercise. At best it is somewhat dull and dispiriting.

The most of fire and bright intelligence that there is in the performance is shown by Mrs. Vezin as Lady Macbeth. The plain sense at least, not alone of words but of situation, loses nothing by her delivery of the text. In the reading of the letter in which Macbeth relates what it is that the witches have prophesied, the actress most approaches that ideal of her art expressed once for all in *Hamlet*—

" . . . This player here
But in a fiction, in a dream of passion,
Could force his soul so to his own conceit,
That from her working all his visage wann'd,
Tears in his eyes, distraction in 's aspect,
A broken voice and his whole function suiting
With forms to his conceit: and all for nothing!"

But she does not approach it very closely. And at one point she makes what would seem to be a mistake, in common, as far as I remember, with every English actress I have seen in the part. It is in the scene in which the wife screws up the resolution of the husband for the planned murder. Macbeth in this business "will proceed no further," and after receiving a chiding he replies with the one dignified sentence familiarly known:

"Prithee, peace:
I dare do all that may become a man:
Who dares do more is none."

Lady Macbeth retorts, but in words hardly less august, and it is a mistake surely for the actress to begin this retort and invocation upon a note that suggests a trivial petulance. This is a detail only. Upon the whole Mrs. Vezin's performance is more than respectable.

Mr. Barry Sullivan's personation does not suggest any particular view of Macbeth. It is not expressive enough to do so. It is a performance that throws but scanty light on the character. There is little intention to be seen in it, beyond,

one supposes, the quite simple intention of representing Macbeth as visibly inferior to his wife. He is here seemingly of slower intelligence; and so much so that all the power of his imagination seems hard to be accounted for. More than once there is absence of justification for words addressed to Macbeth, or spoken of him: his face does not answer to what is said: the text is not illuminated, as it should be, by facial expression; it is hardly even made to seem reasonable. Indeed, it is in the lack both of variety and force of facial expression that Mr. Barry Sullivan chiefly fails to make good any claim to be a great tragedian. For the most part in *Macbeth* his face is a mask, on the stage impassive and inexpressive as Maubant's—that typical representative of conventional tragedy among the French of the Théâtre Français. It may well be that he has chosen to adopt a certain fixity as in keeping with his understanding of the part—I have not yet seen him sufficiently in other parts to make quite sure of this—but at all events it is ineffective: it is not far from being tame. From the very commonest fault of the conventional tragedian Mr. Sullivan in *Macbeth* is fortunately free. Unable to impress the imagination by subtle touches—unable by firm and close imaginative grasp to bring the horrors of this far-away tragedy to our doors to-day—he does not fall back upon the resources of mere noise and bluster. He at all events does not rant. It is apparently his care to deliver accurately, and in no sensational fashion, the text of the dramatist.

But though Mr. Sullivan does not, like too many of his brethren now at the same theatre, endeavour to express emotion by mere largeness of voice, there does tell against the merit of his performance a certain largeness of gesture, inevitable perhaps to some extent in that vast old-fashioned theatre, built without regard for the short-sighted folk destined in our time to sit in it. We have hardly ever seen an actor on this vast stage who has not in some degree seemed to suffer by treading it. The art of construction may have made the place good for hearing, but no art has yet succeeded in diminishing distances, and the action appeals to spectators of whom most are far away. Now, Mr. Sullivan being, at least in *Macbeth*, wholly without elaboration and subtlety, almost even without variety or significance of facial expression, he suffers less than would artists of another class. But he too must suffer; and if not in the loss of those qualities which in his acting are scarcely present, then in inducement to disregard their absence. Of what good, mobility of facial expression in an area so vast? These vast areas, in which delicate effects are lost, incline to give to the art of the actor and scene-painter too much in common.

Mr. Sullivan, however, if not free from a certain large looseness of gesture, is free, as we have said, from rant. But he does not, in *Macbeth*, appear so far to forget his audience as to deliver trippingly and incidentally sentences that may but too easily be turned into an effective appeal, while he does not so far throw himself into the character he impersonates as to deliver with fire and impulse exclamations which Shakspeare saw to be involuntary and needful—exclamations wrung from the character by the events or the talk of the moment. Thus, in the scene which has already been alluded to, he utters, in a somewhat staccato tone, and with an eye upon the audience, the lines—

"I dare do all that may become a man:
Who dares do more is none!"

while Macbeth's impulsive invocation to his wife, when he suddenly sees and is struck by her courage—

"Bring forth men children only;
For thy unmaimed mettle should compose
Nothing but males!"

Mr. Sullivan utters calmly, evenly, judiciously even: a notable instance of the inadequate grasp

of the requirements of moment and mood which results in making the thing which should be quiet, emphatic; and the thing which should be emphatic, quiet.

More than once, indeed, Mr. Sullivan's intelligence has served him in better stead. The insincerity of his manner is happy and appropriate when Macbeth announces, to the assembled inmates of the castle, Duncan's death; and in answering Macduff's summons—

"Is the King stirring, worthy Thane?"

And then in conducting Macduff towards the King's chamber—"I'll bring you to him," "This is the door"—Mr. Sullivan's stumbling hesitation conveys quite successfully, and even artfully, the sense of how greatly the "deed" has overcome him, and how much there has come upon him already—not only the remorse which will not be shaken off, but the mental and moral numbness of one stunned. If Mr. Sullivan gave us more touches of the like significance we should be able to think better of his performance, and to take a more vivid interest in it, and to speak of it as something different from what on the whole it must now appear—a respectable and painstaking and generally monotonous effort, and little beside.

FREDERICK WEDMORE.

IN *Madame attend Monsieur*—played for a very few nights by Madame Chaumont at the Opéra Comique in the Strand—the actress accomplishes a *tour de force*: holds closely the attention of an audience by her wellnigh unaided art. She does, in fact, by finish and elaboration and ceaselessness of gesture, tone, and look, what a whole company is generally combined to do. Of by-play she has none, because she is always in the foreground, always actively engaged in conducting the very business of the story. The story of *Madame attend Monsieur* is worth nothing in itself: it is only the actress's conduct of it that makes it remarkable. "Monsieur" has given rendezvous to a person who will not go out of her way to meet him; "Madame" knows that, and will go instead, and by a hundred devices will test Monsieur to the uttermost. The interest of the thing is in the quite French fertility of resource, and in the delicate wavering and balancing between a rage never very serious and a pleasant spitefulness never very hearty. No other art than the most accomplished and refined—albeit exercised upon not too refined a subject—could establish this interest and uphold it to the end. Madame Chaumont never for a moment wearies the playgoer. She is seemingly of infinite variety, and yet her variety is always displayed within very narrow limits. That is, her art does not show contrasted colours, but of one colour a score of shades.

THE transpontine Drama has invaded the West End, and has taken possession of the St. James's Theatre, notwithstanding that it has hitherto been one of the distinctions of this play-house that it is situated in a quarter from which an audience for pit and gallery can only be drawn with peculiar difficulty. One would have thought this not the most appropriate place for the production of such a piece as *The Virginian*, which unfolds in a crude fashion, without either literary art or delicate sentiment, without even any novelty of situation or freshness of comic character, a story with which the bare skeleton of *Enoch Arden* has something in common. *The Virginian* is the work of an American playwright, Mr. Bartley Campbell, and the scene of its somewhat scanty action is laid in America. The play begins during the War of Secession. It is 1861, and a certain Mrs. Calvert, whose husband is to the front, is awaiting, like many another anxious wife at that moment, news from the battle-field. But before she has received it, there enters to her one Vandyke Vernon, the Virginian, whose claim to distinction it is that he gives the title to this drama. He is rapidly in love with Mrs. Calvert, and would gladly have seen

her before his more fortunate rival, when news arrives of the husband's death, and the widow is free to marry the Virginian. Years pass; the marriage of course has taken place, and a child has been born of it, when there appears upon the scene Calvert himself, not dead indeed, nor looking through a window plaintively as in the verse of the Laureate, but boldly claiming his own. He gets his own after a while, though his own is unwilling to come to him. Subsequently, he develops into a brute and a drunkard, and is only prevented from killing his wife by the timely arrival of the Virginian; and later still he dies in the snow to the equal joy of his wife and the Virginian, and of the playgoer, who has been rather bored by his history. It is a pity that a brisk comic actress like Mrs. John Wood, a genial and funny comedian like Mr. George Honey, and a thoughtful and painstaking artist such as Miss Lydia Foote, should employ themselves on a piece which no art in acting could, we think, make interesting. The piece will probably not long be held out as a bait to the educated playgoer.

A NEW little piece produced at the Adelphi, and called *Give a Dog a Bad Name*, is chiefly valuable as giving the spectator an additional chance of seeing Mr. Emery in one of the parts for which he is very well fitted. The revival of *The Shaughraun* at the same theatre—after "injunctions" laid down and injunctions removed—will suffice to draw popular audiences to Mr. Chatterton's house until Christmas, and perhaps longer.

THE Vaudeville comic drama, *Our Boys*, has now reached and passed its six-hundredth night.

MR. HARE announces the early withdrawal of Mr. Coghlan's *Brothers* from the Court Theatre. A revival of *New Men and Old Acres* is to be the substitute for it.

Hunted Down will be revived at the Globe Theatre on Monday, when *Jo* will be withdrawn.

MISS ADA CAVENDISH has arranged with Mr. Neville to appear at the Olympic Theatre in January in a new part and new piece.

MR. JOHN CLAYTON is playing in *All For Her* at the Standard Theatre, after a long tour in the country.

THE manager of the Folly Theatre has accomplished a feat—he has brought out something wilder than *Blue Beard*. But alas! though *The Very Latest Edition of Robinson Crusoe* is wilder, it is not half so funny. Mr. Brough, truly comical and grotesque, delightful in the eyes of his admirers, in *Blue Beard*, has not the same scope in the new piece. M. Edouin appears. Miss Lydia Thompson is a spirited Crusoe, and Miss Violet Cameron, a young actress fortunate in the possession of a style unusually refined, is welcome in the performance. There is no saying how much of inverted nonsense supposed to be witty a special kind of London audience will not approve, and to prophesy the early failure of the new piece at the Folly would undoubtedly be a rash act. We were right in prophesying the failure of *Pecksniff*, but can hardly be equally bold in respect to a piece which makes no attempt to rely for its attractiveness on comedy-acting, either good or bad, but which is supported by ingenious devices of stage managers, by a profusion of "stage business," by songs and choruses, the appearance of many comely persons, and the efforts of an orchestra out of its proper sphere. Perhaps the novelty in the efforts of the orchestra is the only thing that may safely be grumbled at. It was first noticed, unless we are mistaken, in the later representations of *Blue Beard*. The men with the musical instruments were not content only to play them: it was required of them that at given moments they should shout. The innovation has been carried far in the *Very Latest Edition of Robinson Crusoe*, and to our thinking it is not funny at all, as it is supposed to be, but a nuisance, and nothing more. A manager so enter-

prising as Mr. Henderson, an actress of burlesque so famous as Miss Lydia Thompson, should surely be able to devise better means of amusing audiences than some of those employed in the new production.

THE long-announced *Déidamie* of Théodore de Banville was brought out on Saturday at the Odéon, and is sure at least of a *succès d'estime*. It is full of fine lines, and has one dramatic scene, the last in the piece.

THE *Comtesse Romani* has been brought out at the Gymnase, and though M. Alexandre Dumas does not avow his part in it, his part is understood to be far more considerable than that of his fellow-worker. M^{me}. Pasca has re-appeared in this comedy, of which we shall speak more fully on another occasion.

AT the Athénée Comique a light scene called *Ma Cousine Octavie* has lately been brought out. It is of the kind that Charles Monselet, with his genial wit, knows how to make pleasant, though the story be insignificant, or worse.

MUSIC.

CRYSTAL PALACE CONCERTS.

RAFF's overture, entitled "Ein feste Burg ist unser Gott," produced last Saturday for the first time in England, is not a new work. We are not able to give more than the approximate date of its composition; but as it bears the number Op. 127 it must evidently come between his first symphony (Op. 96) and his second (Op. 140), the former of which was completed in 1861, while the latter was first performed in 1867. Probably we shall not be far wrong in assigning the overture to 1865.

It seems rather a mistake on the part of the directors of these concerts to place so elaborate a work as Raff's at the end of a tolerably long programme. It is the custom at the Crystal Palace to commence and conclude the concerts with an overture. There is no doubt that if a new work is placed at the beginning, the audience is disturbed by late arrivals; but there is certainly at least as much confusion at the end from early departures. Might it not be well to modify the scheme, as has indeed occasionally been done, and when a novelty of importance is to be introduced, to place the symphony (if, as on Saturday, it be a well-known one) at the end? This plan is generally adopted at the celebrated Gewandhaus concerts at Leipzig, and might, we think, be imitated with advantage with such a programme as that of last Saturday.

Raff's overture is described by its composer as "to a drama on the Thirty Years' War." Beyond this intimation on the title-page no clue is given as to its meaning. As will be inferred from its name, it is founded on Luther's well-known chorale. Like too many of its author's works, it suffers from over-elaboration, and, one might add, from excess of cleverness. It occupies more than a quarter of an hour in performance; and the length is in this case not justified by the beauty or interest of its subjects. A curious feature in the work is that, whereas Luther's melody is of a broadly diatonic character, the themes with which Raff has associated the chorale are for the most part extremely chromatic. Hence there results a want of unity in the overture as a whole. In some parts the chorale has accompaniments so curiously foreign to it in character that the effect is absolutely *bizarre*, and the grand old melody sounds like an intruder. That the thematic developments are highly ingenious may be taken for granted by all who know Raff's music; because it is in this, rather than in great inventive power, that the composer's specialty consists; but the overture, as a whole, will not compare with his best symphonies.

Henselt's pianoforte concerto in F minor, though not an absolute novelty at Sydenham, having been played in 1873 by Mr. Oscar Beringer, is so seldom heard in public that its appearance

in the programme on Saturday was very welcome. That it is not more frequently brought forward is chiefly, if not solely, owing to its enormous difficulty. It is one of the most exacting works ever written for the instrument, requiring, not merely technical resources equal to all demands, but considerable physical power. In style it resembles the classical models, such as we find them in the concertos of Beethoven and Hummel, rather than the more modern pieces of this class, which might be called rhapsodies for piano and orchestra rather than concertos in the strict sense of the term. Henselt's style has some affinity to that of Chopin, but with less romance and more breadth. The pianist last Saturday was Miss Anna Mehlig, who played in a manner of which it is impossible to speak too highly. Not only was she technically faultless, surmounting the immense difficulties of the work with apparently consummate ease, but her reading, with its perfectly natural expression, never tame and yet nowhere exaggerated, left nothing to desire. To have achieved such a success in such a work is no small triumph for the talented pianist.

An extremely fine performance was given by the orchestra of Beethoven's symphony in B flat; and the overture to *Semiramide* (which would certainly have been better placed at the end) opened the concert. The most noteworthy feature of the vocal music, which was divided between Miss Sophie Löwe and Signor Foli, was the revival by the lady of a fine song from Handel's *Hercules*, which, however, though carefully sung, produced less effect than might have been expected.

This afternoon Schubert's great symphony in C (No. 9) is to be played. Mr. W. T. Best's Festival Overture, written for last year's Norwich Festival, will also be given, for the first time at these concerts; and Mrs. Beesley will make her debut at Sydenham on the same occasion in Liszt's Hungarian Fantasia. EBENEZER PROUT.

BRAHMS's third piano quartett (Op. 60, in C minor) was the special novelty of the last Monday Popular Concert, though it had been at least once previously heard in London—at one of Mr. Coenen's chamber-concerts last season. Like the same composer's two string quartetts (Op. 51), the work is of a very abstruse character, full of interesting and original thought, but far less popular in style than his earlier quartetts in G minor and A, or the quintett and sextetts. It was very finely played by Mr. Charles Hallé, M^{me}. Norman-Néruda, and Messrs. Zerbini and Piatti. The programme also included Schubert's sonata in A major for piano solo, a sonata by Boccherini for violoncello, and a quartett by Haydn.

THE first production, under Mr. Carl Rosa, of Mr. F. H. Cowen's new opera *Pauline*—the libretto of which, by Mr. Henry Hersee, is founded upon *The Lady of Lyons*—which took place on Wednesday last, is too important an event to be hurriedly criticised at the moment of our going to press. We shall therefore reserve all comment upon the work and its performance till next week, and confine ourselves now to a mere record of the fact of its complete success.

THE last of Herr Franke's four chamber concerts took place at the Langham Hall on Tuesday evening, when Brahms's piano quartett spoken of above was performed by Messrs. Walter Bache, Franke, Holländer, and Daubert. The other concerted pieces of the evening were Schumann's string quartett in A major, and J. S. Svendsen's very original and interesting octett, for the first hearing of which in London, as of many other modern works, we are indebted to Mr. Coenen, who produced it a few years since at Hanover Square. A special feature of the concert was the co-operation of Herr Wilhelmj, who gave Bach's chaconne for violin in his own unsurpassable manner. Herr Franke announces a second series of three concerts to be given in January.

At Mr. Dannreuther's musical evening on Thursday week last, music with wind instruments formed the specialty of the programme, which included Brahms's trio for piano, violin and horn, two movements from Spohr's concerto for clarinet in C minor, the Adagio and Allegro from Weber's bassoon concerto, and Beethoven's quintett for piano and wind instruments.

IN recording, a fortnight since, the death of Herr Mendel, we expressed the hope that the sad event would not interfere with the completion of the great Musical Lexicon of which he was editor. Herr Robert Oppenheim, the publisher of the work in question, has written to us stating that Dr. August Reissmann has undertaken the editorial duties, and that under his direction the publication of the lexicon will be continued without interruption. We congratulate Herr Oppenheim on securing the services of a musician in every way so well qualified for the work as Dr. Reissmann.

M. VICTOR MASSÉ's new opera, *Paul et Virginie*, the libretto by Messrs. Barbier and Carré, was produced at the Opéra-National-Lyrique, Paris, on the 15th inst. In a long criticism in the *Revue et Gazette Musicale* of last Sunday, M. Adolphe Jullien analyses the work, speaking of it on the whole in favourable terms, but with no great enthusiasm. The principal performers were M^{lle}. Céclie Ritter, and Messrs. Capoul, Bouhy, and Melchissédec.

M. ERNEST GUIRAUD has succeeded the late M. Batiste as Professor of Harmony and Accompaniment at the Conservatoire.

M^{me}. PRADHER, formerly a distinguished singer at the Opéra Comique, recently died at Gray (Haute-Saône), at the age of seventy-six. When five years old she made her first appearance on the stage, and at the age of sixteen was engaged for the Opéra Comique, where she held a distinguished position for nearly twenty years. She created the principal parts in *La Fiancée, Lestocq, Le Cheval de Bronze, Acton, L'Eclair, Le Châlet*, and many other operas by Auber, Adam, Hérold, &c. She retired from the stage in 1835.

LITERATURE.

History of English Thought in the Eighteenth Century. By Leslie Stephen. In Two Volumes. (London: Smith, Elder & Co., 1876.)

MR. LESLIE STEPHEN has long stood out from the crowd of clever writers who make the pages of our magazines and reviews brilliant with wit and wisdom, as a definitely marked figure, with more matured intellectual shape and solid foundation in character than the generality of those to whom we look for periodical instruction. Hitherto it has been only as an occasional essayist that we have had an opportunity of knowing Mr. Leslie Stephen. In the two volumes now published, he comes before us for the first time with a work of research and deliberation. It is every way worthy of his reputation. Conscientious, thoughtful, abounding in ripe reflection, and in judgment tempered and weighted by experience, we feel that we have in our hands a book which it is worth while to read.

The work is one which we may best designate by the word "enlightened." Its tendency is wholesome. In these days of reaction and rebuke it is less common than it was to come in contact with a healthy intellect, uninfected with the measly spiritualism of a pseudo-Hegelianism. Mr. Leslie Stephen, in writing of rationalism, is himself eminently rational. If we are not treated to startling novelties, or to brilliant effects of style, we find ourselves in God's sun and the free air of heaven, and are not withdrawn into some murky cave, and summoned to worship the *idola specus*, the fictions of a diseased metaphysical imagination. There is light in Mr. Leslie Stephen's pages; and he himself has the fearless eye which does not blink in the presence of whatever that light shows. He believes in the validity of reason, the trustworthiness of sensation, and the reality and regularity of the external world.

This healthy mental habit comes out, in the volumes now before us, both negatively and positively. It is negatively felt in the absence of the tendency to sophistication and mystification which is creeping into our English writing of a philosophical kind—a tendency which the writers I speak of mistake for depth, when it is only theological obscurantism. The same healthy habit is shown positively in the many shrewd and pithy remarks which come up spontaneously under Mr. Leslie Stephen's pen as it travels the paper. To give a few examples:—

"Truths have been discovered and lost because the world was not ripe for them."

"Society may be radically altered by the influence of opinions which seem to have no bearing on social questions."

"There are times when the emotions take side with the intellect; when the old symbols have become associated with an oppressive power, and have been turned to account for degrading purposes by their official representatives. These are the periods of the moral earthquakes which destroy an existing order."

"Mankind resent nothing so much as the intrusion upon them of a new and disturbing truth."

"Where the ancient creed no longer satisfies the aspirations of mankind, the philosopher has his chance, and too often fails to turn it to account."

"The strong point of the English mind is its vigorous grasp of facts. Its weakness is its comparative indifference to logical symmetry."

"The dogma of authority asserts more or less clearly that a doctrine is to be believed simply because other people have believed it."

"No creed really flourishes in which the faith of the few is not stimulated by the adhesion of the many."

"Tillotson can never have been a lively writer, but he had the merit, which is naturally confounded with literary excellence, of expressing fully the vein of thought most characteristic of his later contemporaries."

"Happy is the nation which has no political philosophy, for such a philosophy is generally the offspring of a recent, or the symptom of an approaching, revolution."

"As, on any hypothesis, error has a majority on its side, to maintain the right to persecute is to say that truth must generally be persecuted."

"A clergyman who opposes sacerdotal privileges is naturally the object of a sentiment such as would be provoked by a trades-unionist who should defend the masters, or a country squire who should protect poachers."

"Nothing is less poetical than optimism; for the essence of a poet's function is to harmonise the sadness of the universe."

"A discontented sceptic worships competition, as a contented sceptic worships calm."

But these are the crumbs which fall from Mr. Leslie Stephen's table. To appreciate his work we must survey it in its whole compass.

It is little to say that these volumes are the most complete survey we have of our eighteenth-century literature. For there exists no other, as far as I know, except Rémusat's *L'Angleterre au dix-huitième siècle* (2 vols., 1856). I do not observe that Mr. Leslie Stephen makes any mention of Rémusat. Possibly he did not think it worth his while to notice a book which could have been of little use to him; yet, as the only work which had at all pre-occupied his ground, it seemed to claim at least a mention. Dr. Tulloch in his *Rational Theology*, Mr. Hunt in his *History of Religious Thought in England*, Mr. Tayler in his *Religious Life*, all confine themselves to one branch of literature. But the religious movement cannot be treated intelligently without including it with the philosophical speculation. And the speculative schools cannot be adequately exhibited but through their concrete embodiments in politics and literature. Mr. Leslie Stephen's plan is not merely an enlargement of that of Hunt or Tulloch; it is a first attempt at such a survey of the eighteenth century as shall present religious thought in its proper connexion of subordination to the rest of the movement. Besides this, both the English writers named, as well as Lechler, deal only with the earliest

deistical phase. Mr. Stephen brings his survey down to, and into, the period of the Revolution. Beginning with Descartes, he comes down to Paine, Malthus, and Bentham. But the philosophers do not engross more than a fair share of the author's attention. The deists have a careful treatment in three chapters, throughout which Mr. Stephen's judicial impartiality never deserts his pen. The starting-point of deism is admirably traced in chapter ii. to the "golden period of English theology" in the seventeenth century, when rationalism was naturally expressing itself in terms of Protestantism. "The theologians of the middle and end of the seventeenth century, Taylor, Barrow, Cudworth, Leighton, were anxious to construct a philosophical religion, and they were not alive to the possibility that such a religion might cease to be Christian." Butler, Hume, and Warburton, have each a chapter to themselves. The "later theology" is a heading, which has the fault of being meaningless, under which to bring all the varied religious jets of the latter half of the century. This period is rich in most remarkable religious phenomena, and almost wholly new ground for the philosophical historian. But we have to hasten over these, because after philosophy, religion, and morals we have political speculation still before us, and Locke, Bolingbroke, Junius, Delolme, Brown, Price, Priestley, to pass in review. On Burke Mr. Leslie Stephen has a most elaborate section, in which ample justice is done to that magnificent genius, and Mr. Buckle's uncandid tirade passed over in silence. The Bangorian controversy is related in fifteen pages, and the theories of the economists disposed of in fifty more.

The survey is made complete by a chapter on the general characteristics, on the poetry and fine literature, of the age. True to his purpose, Mr. Leslie Stephen regards the literary product of the time historically, not critically. It is the light it throws upon the political and social conditions of the age which he looks for. The imaginative literature of a period is the translation of its philosophy in terms of emotion; for the doctrines which men ostensibly hold do not become operative upon their conduct till they have generated an imaginative symbolism. The interest of this investigation increases with its intricacy. For here the poet, who feels rather than reasons, often fuses into a whole very inconsistent materials. Pope's *Essay*, for instance, imbeds boulders from very heterogeneous strata of thought. In the *Hours in a Library*, first series, Mr. Stephen had shown up with caustic humour the sort of act-of-parliament criticism which Pope's recent editor had applied to the *Essay on Man*. Mr. Stephen returns to Pope in his present *History*, and has ten pages on him quite fresh, as if he had never said anything before on the subject.

For some reason or other Mr. Stephen's review of the poetry and general literature is chiefly confined—Pope is an exception—to the second half of the century. Historical literature, too, is omitted, the evidence it contains of the thought of an age being too indirect. Yet Mr. Stephen is quite aware that the most permanently valuable element of thought in the last half of the century is to

be found just in this feeling after the historical method, and the one work of the century which is still capable of influencing thought is an historical work.

With these exceptions, there is in these volumes an effort at comprehensive treatment not often found in this day of "collected essays." We are not offered an account of detached books in chronological order, as in a history of literature. We have the continuous tracing of the co-operation, quite unconscious, of the writers of a period in a common movement. What is dwelt upon is the logical relation of books as units of thought. The successive generations of writers are regarded as a stream of continuous debate, in which each generation starts from the positions determined by the previous course of the discussion. These volumes, in short, are a Philosophy of Literature, not a History. And in this philosophical digest books, though the principal, are not the only material. The common beliefs, or forces of cohesion by which society is held together, must be searched for in many directions. "It would not be extravagant to say that Mr. Darwin's observations upon the breeds of pigeons have had a reaction upon the structure of European society."

It will be seen that Mr. Stephen's volumes aim at being something more than a collection of detached studies upon the principal figures of the last century. He aspires to the unity of an historical work. I will not undertake to say that he has throughout succeeded in keeping his eye fixed on the progress of the idea. On the contrary, the personalities and the incidents tend many times to overbear with their luxuriant growth the law of secular change, which is the proper material of the historian. This lapse into anecdote and individual traits is partly to be ascribed to the necessity of making the book interesting to the public, partly, perhaps, to the habit of article-writing. Indeed, four at least of the biographical sketches seem to have been originally articles, and to have been introduced into the framework of this history. Just so the article on William Godwin, which appeared in the October number of the *Fortnightly Review*, may take in a second edition the place of the analysis, already too long, of Godwin's books in chapter x. of the work before us.

One word on the Index. An index there is, but, like most publishers' indexes nowadays, it is a delusion. An index in which it is a mere chance whether you find what you want noticed or do not find it had better not be there. In the present instance the index-maker has committed an additional error. His Roman numerals refer to the chapters. But the number of the chapter is not indicated at the head of the page, so that you have a long search to find what chapter you are in. Even this is not the worst. At the head of the page does stand a Roman numeral, but it is the number of the section, not of the chapter, while it is the number of the chapter which is employed in making the index.

MARK PATTISON.

Catullus, Tibullus, and Propertius. By the Rev. James Davies, M.A., Prebendary of Hereford Cathedral. [Supplementary Series of Ancient Classics for English Readers.] (Edinburgh: Blackwood & Sons, 1876.)

MR. DAVIES had a difficult task before him when he undertook to describe in the small compass of one of Mr. Collins' volumes the life and poetry of three writers so well known as Catullus, Tibullus, and Propertius. To discriminate shades of passion is at no time easy: and it is less easy when the only mode of conveying to the reader some idea of the form in which each poet expressed himself is the very imperfect one of a translation. In the case of Catullus this is, perhaps, less sensibly felt: but almost the whole charm of Tibullus, and much of the interest of Propertius, lies in the expression; and it would be as impossible to judge either poet fully by the existing translations (excellent as at least one of them is) as it is hopeless to give an English reader the faintest idea of the grandeur of the *Aeneid* by Dryden, Conington, or Morris. Hence it is not surprising that Mr. Davies's work fails to convey, what surely we might reasonably look for, a distinct impression of the peculiarities which stamp each of the three erotic writers of Rome with a character of his own. Yet a few incisive sentences of real criticism will do much; and these we miss.

With this drawback, Mr. Davies has given us a not uninteresting book. Of the three sketches, we prefer the first. Catullus and his Lesbia are so clearly defined by the poems, and from the exciting character of his period are so interesting, that a veracious account of his life will always find readers. Mr. Davies has, however, done more than this: he has consulted some of the latest authorities, and has worked in their views, thus making the life and love of the poet more real. If, indeed, Lesbia was Clodia, the story of her amour with Catullus connects the poems with all the scandals of a most unbridled time; and English readers, hitherto unaware of the probability of this theory, may find in it a fresh motive for a minute study, on the one hand, of Catullus, on the other, of the whole contemporary literature. But Mr. Davies must forgive us for excepting to his identification of the person addressed in the latter half of c. lxviii. with Manius Acilius Glabrio, a view not supported by the MSS. and metrically impossible. Still less can we at all agree with "the sensible and correctly-judging Dunlop," that the Attis legend was unpromising as a subject for poetry. Here we think Mr. Davies returns to an extinct era of criticism; we believe that to many, perhaps to most, readers the *Attis* is the highest specimen of Catullan—indeed, of Roman—genius.

Of Tibullus the elegies give us but a shadowy outline, and his life was too uneventful to be interesting. The plaintive melancholy which, as Mr. Davies well remarks, is his chief characteristic, is almost unattainable in translation. He is the Bellini of elegy, and like Bellini had but a short life. But as Bellini's operas have a

peculiar charm of their own, so Tibullus has a distinctive sentiment not to be confounded with that of any other poet. Mr. Davies does well to mention the doubts which modern critics have raised as to the authorship of the third book. Yet, if Lygdamus wrote it, he certainly reproduces the tone of the first two books wonderfully.

The sketch of Propertius might be much better. Cynthia was as real as Lesbia, and her lover much in earnest, despite his pedantry. There are men who find in the *Monobiblos* as well as in the subsequent books the intensity of a very deep passion. But even if the feeling was insincere, the clear exhibition of Alexandrian models which these elegies present, the value of their mythological allusions, the tempting field which they offer to the conjectural critic, give them a permanent interest for scholars second only to Catullus. Whether Merivale's theory that Propertius is the bore so amusingly described by Horace in the *Satires* (I. ix. 1), is true, seems very problematical; we suggest as a more plausible conjecture that none but Propertius could fittingly be styled by the Roman Alcaeus the Callimachus of his time (Hor. Ep. II. ii. 100; cf. Prop. V. i. 64).

R. ELLIS.

Tables of European Literature and History.

By John Nichol, LL.D. (Glasgow: Maclehose, 1876.)

THE design of this little book is good. It is intended to present to the reader in parallel columns the leading events of English and foreign history, and the names of persons who during the several periods were distinguished in literature in England and abroad.

The work consists of eight tables, each divided into four columns, and the number of dates is very considerable. The value of a book of this kind depends entirely on the accuracy with which it is performed, and we are afraid that Prof. Nichol has frequently depended on inferior assistance and inaccurate tables. The literary columns must have cost much labour, and the numerous errors that occur in them may be more easily excused than the confusion and inaccuracies which disfigure the historical portions. We cannot undertake to pass the whole work in review, but we will select one of the thirty-two columns and examine it in detail.

Let us take the first column of the third table, containing the foreign history between 1350 and 1500.

The column contains sixty-four entries, divided into six periods of twenty-five years each. Eleven of the entries have no special date. We will now examine the periods in succession and point out the errors.

"1350-1375. Marino Faliero at Venice, 1352." The date should be 1354 or 1355. "Hanseatic League, 1140-1723." These figures are a perfect mystery. "The Schism, 1378-1439." The year given for the end of the schism is one in which an antipope was elected, who did not resign for ten years.

"1375-1400. Austro-Swiss war, 1385-1470." These dates are not right either for the beginning or the end of the dispute between the Cantons and the House of Hapsburg.

"1400-1425. Executions of Huss and Jerome, 1415." Jerome was executed 1416. "Hussite war, 1420-1436." The war began 1419. "Charles VII., 1422-1462." Charles died in 1461.

"1425-1450. Council of Basle, 1433-1449." The Council met in 1431. "Alphonse V. at Aragon, 1449." This we cannot understand. Aragon is not a town. Alfonso became King of Aragon in 1416. Some years after, he left the government to his brother, and went to seek his fortune in Italy, where he became King of Naples. "The Sforzas at Milan, 1449." If we date the rule of Francisco Sforza from the death of his predecessor, the date should be 1447; if from his entry into Milan, it should be 1450. "Mahomet II." He belongs to the next period. "Nicholas V., single Pope 1447-1454." Felix V. did not abdicate till 1449.

"1450-1475." Here we have twelve entries—one of which ought to be in the preceding, and four in the following period. "The Foscari at Venice." Francisco Foscari was Doge from 1423 to 1457, but before the year 1450 he had lost three sons, and the fourth had been relegated, and he had himself become a helpless old man. "The battle of Murten; the union of Burgundy to France; the death of Charles the Bold, and the marriage of Maximilian," all took place after 1475, and Prof. Nichol gives the dates correctly.

"1475-1500." Out of fourteen entries seven require correction. "Ferdinand and Isabella, 1479-1512." The date 1512 has no meaning. It is not the date of the death of Ferdinand or of Isabella. "Prince Henry of Portugal." He died in 1460. "Provence joined to France, 1487." The proper date is 1481. "The Moors driven from Spain, 1491." The Spaniards did not enter Granada till 1492. The Moors were expelled at the beginning of the seventeenth century. "Columbus (1436-1505)." The date of his birth is uncertain, but we have the authority of his son for saying that he died on Ascension Day, 1506. "Alexander VI., 1493." This should be 1492. "Louis XII., 1493-1515." The right date is 1498.

It would not be safe to trust the tables for the dates of very recent events, many of which are erroneous. Thus we are informed that Palmerston was in power from 1850 to 1865; that Gladstone was in power from 1865 to 1874; that the Irish Church was disestablished in 1869; that the Irish Education Bill failed in 1874; that *Metz*, *Strasbourg*, and Paris were taken in 1871, &c.

Not unfrequently conflicting dates are given in different columns for the same event—*e.g.*, in one place we learn that Napoleon and Wellington were born in 1769, in other places that they were born in 1768. The death of George III. occurs in 1820 and in 1819, and George IV. is allowed to encroach at both ends by reigning from 1819 to 1837. It is possible that some of the errors may be put down to the printer; but this is not often the case.

In conclusion we may notice that Prof. Nichol has undertaken by the size of the type to decide upon the relative importance

of the persons whose names he records. We will not quarrel with his judgment, though we frequently differ from it, but we must commend him for not undertaking the invidious task in the case of contemporaries. Once and once only in the last two columns has he ventured to distinguish anyone by larger letters. The names of three ladies occur together—Grisi, Rachel, and Lind—and the Glasgow professor has not hesitated to give the golden apple to Rachel. We hope that no future Virgil may in consequence have to sing the destruction of a northern Troy.

H. A. POTTINGER.

Frederic Ozanam, Professor at the Sorbonne; his Life and Works. By Kathleen O' Meara. (Edinburgh: Edmonston & Douglas, 1876.)

IN spite of the humility with which he insisted on repeating "We were eight," Frederic Ozanam will always be remembered as the founder of the Society of Saint Vincent de Paul, which does all over the world the kind of work which is done on civic principles at Elberfeld, and which Chalmers did at Glasgow on religious principles which Ozanam would have disavowed, with a measure of success which Ozanam and his associates never attained, and which Chalmers's successors failed to maintain. Ozanam belonged to a generation who had grown up in Catholic families, to whom the restoration of the national worship was a boon, and, as his own parents were pious both by temperament and practice, and as when he reached the class of philosophy he passed into the hands of Abbé Noiroi, a very earnest and accomplished priest, he was one of the minority whose faith survived the ordeal of the system of public education established by the Revolution and maintained by all succeeding Governments. Even his faith was disturbed by the atmosphere of unbelief around him, and he suffered so much from his doubts that when they were dispelled he resolved to show his thankfulness by dedicating his life to the service of his creed. Before he was eighteen he had brought out a successful *brochure* at Lyons against the St. Simonian propaganda, and when he removed to Paris to study for the bar under more congenial circumstances than when he was copying documents in an office at Lyons he soon made himself conspicuous as a leader and champion among the minority of students who, like him, had adhered to the religion of their home, and began as soon as they knew one another to protest against language on the part of their professors which they thought disrespectful to the Church. Jouffroy, who even then was hardly an atheist, though Miss O' Meara calls him one, was rather pained by this treatment, and assured Ozanam on one occasion that he had been till lately too spiritualist for his class. A spirited printer, M. Bailly, constituted himself the Mæcenæ of Ozanam and others like him: he started a journal, in which he invited them to write; he organised a debating society, where they met representatives of all opinions, and it was in consequence of one of these meetings that Ozanam and his seven companions united in the Society of Saint Vincent de Paul.

The Saint Simonians were still confident of the benefits they were about to confer upon the world, and, while they recognised the benefits which Catholicism had conferred, they asked with pardonable arrogance what benefits it was actually conferring there and then, and the Society of Saint Vincent de Paul was the reply. One of its first and most useful achievements was to put some lay pressure on the Archbishop of Paris to break through the clerical timidity which had led to the interruption of Lacordaire's conferences.

Meanwhile Ozanam himself was hardly as happy as he deserved to be. Soon after his arrival in Paris he called upon Chateaubriand, who did him the service of warning him against the theatre, so that he was thenceforth able to plead a promise to Chateaubriand to his companions, to whom he would scarcely have cared to plead a promise to his mother. The elder Ampère took him into his house, where he laid the foundations of a life-long friendship with the younger Ampère; in fact, it was easy for him to make friends, he was so transparently unselfish and so exuberantly affectionate. Moreover, he had that natural turn for thankfulness which doubles the pleasure of fine natures, as self-complacency doubles the pleasures of natures not so fine; and he had the gaiety which is the proper reward of young people who do nothing they seriously disapprove and are free from sordid cares. But, as Miss O' Meara truly observes, gaiety does not exclude *découragement*, a general sense that things are too difficult and one's own faculties are too inadequate, which is apt to torment persons who are weakly by constitution and languid by temperament, and linger on the threshold of production when their conscience forces them to be industrious. His conscience, too, intensified another source of discomfort. Clever young men, before deciding on their career, are apt to hesitate from mixed motives compounded in all proportions of idealism and legitimate and illegitimate self-esteem. Ozanam's piety made this hesitation take the form of anxiety about his "vocation," especially as he shrank from marriage in a way that in the other sex is called maidenly. He actually thought of joining the Dominicans when Lacordaire entered the Order. However, the question settled itself for him naturally and happily enough. He was appointed to a chair of commercial law at Lyons; he fell in love and was married. Just before his marriage he had to decide the question whether he would go to Paris as Fauriel's deputy at the Sorbonne on a salary of 100*l.* a year, or stay at Lyons and keep his chair of law and succeed to Quinet's chair at a salary of 600*l.* His wife approved his choice of Paris, which proved as prudent as it was generous; he succeeded Fauriel in due course as he deserved to do, and his lectures were a brilliant success, and contributed in their measure to the rehabilitation of the mediæval Church. His chief merits seem to have been a graceful, if too exuberant, style, ardent and generous sympathies, and, above all, a sincere and indefatigable curiosity. The field of mediæval research is mapped out now among specialists; even the laity know

something of the main tracks and the general bearings of the ground. In Ozanam's day it was still possible to range at large, and every traveller was a discoverer, at least for those who staid at home. Of his vast scheme of lectures, which were intended to show that from the fifth century to the thirteenth progress of all kinds was due to the fostering initiative of the Catholic clergy, little was executed, and less was preserved. The most perfect in execution are the fragments on the Franciscan poets and the treatise on Dante and Catholic Philosophy. Perhaps the most ingenious in conception are the *Études Germaniques*, in answer to Gervinus, which show that Germany flourished in all senses precisely in proportion as it incorporated itself into the general life of mediæval Christendom. He might have enforced his argument by a reference to the barren centuries between Luther and Lessing, when the German mind was left to itself, and the great name of Leibnitz is an exception that proves the rule. Unfortunately for Ozanam's argument the period from Lessing to Goethe, when Germany was incorporated in the life of unbelieving Europe, was the most fruitful and glorious for the German mind, though when Ozanam lectured it was still possible to believe that the German mind had been in travail of Romanticism and Neo-Catholicism. At other times his insight was more seriously at fault. He gravely quoted Cato's recipe for a cheap tippie for slaves as a proof that paganism had degraded labour, without ever asking himself what proportion of the field-labourers in Christendom have had anything better to drink.

As a publicist Ozanam was generous, keen-sighted, short-sighted, and impracticable. He was never weary of insisting that the social question was at the bottom of all others; but he never asked himself what he had to offer to the urban proletariat half so attractive as the prospect of carrying through for themselves the spoliation which the rustic proletariat carried through between 1789 and 1794. He saw that the virtues of democrats have a certain resemblance to the characteristic virtues of the Gospel, and he never asked himself whether they were more likely to be a preparation for Christian faith or a substitute for it. He might be pardoned for sharing the fatalistic views of De Tocqueville on the future of democracy, but one who was so generally equitable ought not to have expected the Breton nobility to turn democrats in 1848 to help him to save Catholicism.

In conclusion we have to thank Miss O'Meara for her very graceful and intelligent sketch of an admirable talent and a most amiable character.

G. A. SIMCOX.

Bible Lands: their Modern Customs and Manners Illustrative of Scripture. By H. J. Van-Lennep, D.D. (London: John Murray, 1875.)

DR. VAN-LENNEP'S work is, in its scope and character, identical with Dr. Thompson's *The Land and the Book*, but it scarcely shows the same intimate personal acquaintance with the East, although it is certainly more minute

in its details. The frame of mind in which the author has set about his task may be gathered from the following sentence, which occurs in the Introduction: "The remarkable reproduction of Biblical life in the East of our day is an unanswerable argument for the authenticity of the sacred writings; they could not have been written in any other country, nor by any other people than Orientals." We were not aware that modern scepticism had gone so far as to accuse the Bible of being an Occidental forgery, nor should we have thought that two goodly volumes were necessary to prove the contrary! Seriously, the real fault of the book is, that in the anxiety to set before us all the facts in modern Eastern life which can explain and illustrate the Scriptures, Dr. Van-Lennep has collected together a vast number of minor details that are perfectly uninteresting, and only tend to make the volumes cumbersome and difficult of reference.

Like its prototype, *The Land and the Book*, the present volume has a great many illustrations which are borrowed from other works without acknowledgment, and not always very successfully copied. Among the original engravings are several of considerable interest, among them one of the *Camû'a* (not *Caïm*, as in the text) *Hummûl*, near the sources of the Orontes, in Coelo-Syria, which we do not remember to have met with before. The monument in question consists of a square tower crowned by a pyramidal roof, and having representations of hunting scenes on its four lower faces. I cannot agree with the author that it is a sepulchral monument.

Dr. Van-Lennep's notions of philology are, to say the least, peculiar:—"It is fortunate for the historian and the Biblical scholar that for the original languages of Syria and Palestine a cognate language has been substituted—the Arabic—the best able, on account of its affinity to them, to preserve unchanged the names of places in those interesting regions." "Substituted"—as though Arabic had been decided upon by a Government Commission and introduced into the country arbitrarily, instead of being, as it is, the modern form of the most important of the Semitic group of languages which necessarily prevailed and absorbed the rest. The illustrations are drawn quite at random from Egyptian, Assyrian, Jewish, and Persian, and other sources ancient and modern; thus to illustrate the fact that the ancient Hebrews really did catch fish and swim, as described in the Bible, we have a picture of an Egyptian drag-net and of an Assyrian in the act of swimming! There is, it is true, a good deal of information contained in the book on the present physical aspect and customs of the country, but it is rather dull reading in its consecutive form, and would have been certainly more available for reference had it been cast into some such shape as the *Dictionary of the Bible*.

But Mr. Murray has already given us the last-named excellent work, and I do not think that it is in any way likely to be superseded by the present volumes. They are, however, extremely well "got up," and contain, if one only has the patience to learn the geography of them well enough to be able to find it, much that will help the untravelled

reader to understand the Scriptures. From the spelling and the general style of the printing and illustrations I should imagine the impression is from "early plates" received from America. E. H. PALMER.

Jahrbücher der Deutschen Geschichte. Jahrbücher des fränkischen Reichs unter Ludwig dem Frommen. Von Bernhard Simson. Band II. *Geschichte von Otto des Grossen.* Von Prof. Ernst Dümmler. (Leipzig: Duncker & Humblot, 1876.)

THE great undertaking of the issue of the *Annals of the German Empire*, which has been made possible by the munificence of the Bavarian Government, makes as rapid progress as could be desired. Last year we (ACADEMY, vii. 134, February 6, 1875) gave a minute account of the object of the collection and of the publications which had at that time appeared. When it is completed a work will have been done for the mediæval history of Germany the like of which scarcely any other nation has hitherto been able to produce. In the present year two new parts have been issued, the second volume of Simson's *Lewis the Pious*, and the *History of Otto the Great* by Prof. Ernst Dümmler.

Simson begins his present volume with the year 831, and carries the narrative on to the death of the Emperor in 840. It is a sad time which has fallen to his lot to describe. Fierce and unnatural struggles rage in it, and of the prominent personages that play a part in them there is hardly one who wins our sympathy. Yet, in spite of this, things were done during these years which for centuries influenced in the most important way the destinies, not only of Germany, but also of France and Italy, and even of the whole of Europe. After the death of Charles the Great the question of the day was whether it was possible to preserve the unity of the mighty empire which he had brought together, and which comprised the greatest part of Christian Europe. On the one hand, the Frankish principle of hereditary right, which had maintained itself from the foundation of the monarchy of the Franks, called for its division among the sons of the sovereign, while, on the other hand, the higher and the lower clergy took the lead in contending for the unity of the empire, because only by the preservation of this unity the imperial dignity would be able still to exercise that influence on behalf of the Church which it had put forth in the days of Charles. At first Lewis had been in perfect accordance with the clergy, and the ordinance of succession which he issued in 817 assured to his eldest son, Lothar, the authority of his father almost undiminished, while the younger brothers, Lewis and Pippin, had to be contented with smaller dependent governments. But when, shortly after, the emperor married a second time, and had by this marriage another son, Charles, he renounced his former principles, and decided upon a formal division of the empire in order to act fairly by his newborn child (829). The struggle which arose between the father and his sons from this resolution forms the main subject of the present

volume. The most painful and horrible episode in it is, perhaps, that which took place in 833, not far from the present town of Colmar. In the month of June in this year the two armies encamped here opposite each other in the wide plain through which the Rhine flows from Strassburg to Basel. Pope Gregory, who had undertaken the long journey across the Alps in order to maintain the principle represented by the Church, was in the army of the sons. His influence and his intrigues of every kind brought about that sad treason which gave to the plain of Colmar for all time the name of the "Lügenfeld." Lewis, deserted by his vassals and dependants, and left almost alone and unable to defend himself, fled into the camp of his sons, that there he might at least escape the vilest insults. He was there deprived of his dignity, and forced to submit, at Soissons, to that shameful act of ecclesiastical penance which marked the point of deepest degradation to which the imperial dignity has ever descended. It was of little avail that, either moved by penitence for their unfilial behaviour, or by jealousy of Lothar, who had drawn to himself the chief advantage of their common treason, the Emperor's younger sons drew the sword again in the following year, 834, and replaced their father on his throne. Things once done could not thus be undone, and the imperial authority never fully recovered from the blow which then struck it. There were fresh conflicts among the sons even before their father's death, and they continued after it; when they were come to an end, in 843, the combatants were compelled after all to agree to a division, and out of the ruins of the one Frankish Empire arose Germany, France, and Italy as independent nations.

It is evident that the epoch which Prof. Simson has treated of may fairly be described as one of universal importance. The manner in which he has acquitted himself of his task deserves full and unrestricted praise. He is not in a position to produce many new facts, as this epoch has already been repeatedly treated of by different authors, and some of them have performed their task excellently. But he deserves the credit of having collected with great and indefatigable care the existing materials, and of working them out in a clear and comprehensible manner. It will seldom be possible to come to a different opinion from him, and, unless some new sources of history be discovered, which is by no means likely, there will, in all probability, be very little to be added to his investigations by a later generation.

The same may be said of Dümmler's *History of Otto the Great*, which we have also placed at the head of this article. The learned professor from Halle has performed a task which we know from our own experience not to be a very agreeable one. When, in 1863, the *Annals of the German Empire* were distributed among several German scholars, the late Prof. Rudolf Köpke undertook the history of Otto I., and began the preparatory work with the conscientious assiduity, and the determination to notice even the most infinitesimal points, which was peculiar to him. He threw him-

self into the subject which he had himself selected with the utmost ardour of devotion. He especially busied himself with the contemporary authorities. His learned and thoughtful writings on Widukind of Corvey, the historian of the Saxons, and on Hrosvitha, the learned nun of Gandersheim, who is certainly the most important among the authoresses of the Middle Ages, are evidence of this. However, those preparatory studies took so much time that only a small part of the history of Otto was done when, in June, 1870, he died prematurely; much regretted by all his friends and acquaintances. According to the wish of the Historical Commission of Munich, Prof. Dümmler undertook to finish the work which had been begun, and in this way the present volume has come into existence. Herr Köpke had written the first sixty pages, as well as the excursuses (pp. 557-587); all the rest is the independent work of his successor, who only refers occasionally to Herr Köpke's preparatory work. It was inevitable that this double authorship should make itself felt in the book. Not only does the reader miss the perfect harmony of style which he looks for, but the whole character of the presentation of the subject is without that unity which can only be obtained when a work has proceeded from one mind. Prof. Dümmler himself foretold this result, and we are, therefore, called upon all the more to admire his self-denial in undertaking the task, and the extreme conscientiousness with which he has fulfilled it.

It does not come within the range of a brief notice like the present to give even an approximate idea of the rich materials of Prof. Dümmler's book. His narrative of the reign of Otto I., descending as it does into the smallest details, leaves no doubt of the justice of his claim to the surname of "The Great," a title which has never been given to any of the Frankish or German kings, except to the first Charles, either before or after him. It will be sufficient to draw attention to one point. A question of great importance to the right understanding of mediæval Germany has often been raised in modern times. It has been asked whether Otto I. was wise in uniting the crown of a Roman emperor to that of a German king, thus forming that connexion between Italy and Germany which was maintained for centuries, though often only after torrents of blood had been shed. Many writers have answered this question decidedly in the affirmative. Others—Herr von Sybel among them—have taken a different view. They hold that the foundation of a Roman empire reaching beyond the limits of the German nation has been the cause of Germany's decline and impotency during the later Middle Ages. Prof. Dümmler has avoided pronouncing a direct opinion upon this question, and, as a rule, he prefers to let facts speak for themselves rather than to intersperse his narrative with reflections of his own. But he evidently does not share Herr von Sybel's views. He lays stress on the fact that the Emperor in Italy only brought into subjection a people which had been long accustomed to the dominion of a stranger, with which, indeed, it was unable to dispense. He shows, too, how Otto was praised by the

Italians as the re-founder of firm monarchical order, and as the restorer of peace and justice. These advantages, as he points out, were bought at a proportionally small sacrifice of property and of blood. It is true that Otto II. and Otto III. had sad experience of their Italian rule, but this was only through their own faults, not in consequence of the act of Otto I. The error of Otto II. was to pass beyond the limits which his father had wisely respected; the error of Otto III. was to give himself up entirely to foreign influence, despising his native country, and almost ceasing to be a German. Nor should the immense influence which the union of Italy with Germany has exercised upon the civilisation and the mental development of the latter country be left out of the account. Prof. Dümmler repeatedly points out traces of this influence, but I almost doubt whether even he attributes quite so high a value to it as he perhaps might. It would be a work of the greatest interest for the history of civilisation to pursue these traces minutely through the tenth and the following centuries. H. BRESLAU.

The Theory and Practice of Banking. By Henry Dunning Macleod. Third Edition. Vol. II. (London: Longmans & Co., 1876.)

THE historical chapters of this volume are careful, and for the most part accurate. But Mr. Macleod is not quite correct in the contrast which he draws between the state of the currency in 1696 and 1811. He asks why it was that in 1696 merchants and statesmen could clearly perceive that the cause of the rise in prices and of the fall in the foreign exchanges lay in the baseness of the coinage, when in 1811 they could not perceive that the cause of similar phenomena was in like manner to be found in a depreciated currency, though in the latter case of bank-notes instead of coin. And his answer to this question is, that the men of 1696 could see that the coinage did not contain much more than half its proper weight of precious metal, whereas in 1811 the bank-note bore no outward and visible sign of its variation from the true standard. Mr. Macleod speaks as if the coinage in 1696 had fallen in value in proportion to its baseness; but this is not so, and to suppose it shows a confusion of thought respecting the causes which govern the value of a currency. As in the reign of Henry VIII., so in that of William III. the value of the coinage fell in proportion to the quantity of base money in circulation, not in proportion to its baseness. At the latter period the coin contained only half its proper quantity of silver, but its value fell only one-third. The facts stated by Mr. Macleod in his first volume sufficiently prove this, although he has not himself seen their significance:—

"The current coins had been for many years clipped and adulterated, which in 1694 reached such a height that the silver coins current had lost nearly half their value, while a great part of the current money was only iron, brass, or copper plated. During 1694 the silver coinage became worse daily, and by the end of the year guineas gradually rose till they reached 30s." (Vol. i. p. 383.)

Had the coin in circulation fallen in propor-

tion to its baseness, the price of the guineas would have risen to 40s. and upwards. In like manner the inconvertible bank-note in 1811 had fallen, not to a level with the intrinsic worth of the paper, but in proportion to the quantity over-issued.

Mr. Macleod follows in the present volume the practice of repeating the contents of former publications which we noticed in a former review. Chapters xii., xiii., and xiv. contain 140 pages reprinted *verbatim* from his *Principles of Economical Philosophy*. There is, of course, a repetition in capital letters (p. 334) of "the great fundamental conception that where there is no debt there can be no money." Yet Mr. Macleod himself argues (p. 330) that "where money is exchanged for goods no debt arises." The whole business of a country might be carried on by ready money without credit, and in that case there would be "no debt," but will Mr. Macleod say there would then be "no money"?

Mr. Macleod's practice of repetition has also led to his reproduction of a singular blunder in legal history. He repeats (p. 282) a statement made in his *Economical Philosophy* that "the *Mirror of Justice* was originally written in French long before the Conquest." Andrew Horn, who compiled the *Mirror*, was City Chamberlain and a member of the Fishmongers' Company, and died in 1328. The *Mirror* speaks of Ranulf Glanvill, and of the Great Charter, and expounds the obligations of countors or barristers, and attorneys. Does Mr. Macleod suppose that Glanvill flourished, that Magna Carta was enacted, that a legal profession was organised, and that French was the literary language of England, "long before the Conquest"? It is true that Lord Coke has ascribed great antiquity to the *Mirror*, but historical learning has made some progress since the days of Coke, whose forte was not history, and Andrew Horn's book was not then as easily accessible as it is now.

T. E. C. LESLIE.

NEW NOVELS.

Walter Lee, a Tale of Marlborough College.

By H. W. Green. In Two Volumes. (London: Sampson Low & Co., 1876.)

The Atelier du Lys; or, an Art-Student in the Reign of Terror. By the Author of "Mademoiselle Mori." In Two Volumes. (London: Longmans, 1876.)

Edina. By Mrs. Henry Wood. In Three Volumes. (London: R. Bentley & Son, 1876.)

A Woman's Victory. By the Author of "Elsie; a Lowland Sketch." In Three Volumes. (London: Tinsley Brothers, 1876.)

More than a Million; or, a Fight for a Fortune. In Two Volumes. (London: Daldy & Isbister, 1876.)

Those who take up *Walter Lee* in the hope of finding done for Marlborough what *Tom Brown's Schooldays* did for Rugby, will be disappointed. In truth, save that the story begins at the school, and that a cricket-match makes part of one of the early chapters, there is little or nothing to warrant the secondary title. The hero is in the Sixth

and is Captain of the Eleven at starting, and leaves for good immediately afterwards; nor is there any subsequent reference to school-life. Throughout, the book is purely imitative. Mr. Thomas Hughes is copied at the outset; Mr. Blackmore's diction, particularly in *Alice Lorraine*, is attempted with no great success, and scarcely more disguise, further on; and there is an odd mixture of Mr. Chermiside's *Ned Locksley* with Mr. Henry Kingsley's *Stretton* in the scenes laid in Hindostan during the Mutiny. Nevertheless, there is some merit in the story. It does not flag, but moves freely on, and the author allows a good deal of his own personality to disclose itself in the delineation of his autobiographical hero, so that, though he borrows lendings freely enough to drape himself in, there is real flesh and blood, and no mere lay-figure, underneath them. One of the private details he gives is that he never could bear geography, which perhaps accounts for his sending a tourist party to "St. Limoges;" and we doubt whether the Modern Side at Marlborough was fully organised in his day, judging from the mess he makes of a professedly Old-English inscription, into which he introduces such vocables as "whensome'er," "eek," and "yfelling." He had better keep to plain narrative, and not try scraps of learning, which are quite out of his way.

The Atelier du Lys has the great merit of striking a new vein in a mine which has been so long and sedulously worked that it might be hastily thought exhausted. Many as are the scores of novels which find their motive in the French Revolution—exceeding in number, perhaps, even the English tales of Cavaliers and Roundheads—and constant as are the situations based on the antagonism and reconciliation of members of the rival factions when also of opposite sexes, Miss Roberts has nevertheless not only succeeded in devising a wholly new one, but in grouping fresh surroundings about it, and presenting a very charming story as the result of her experiment. The principal character in the book, the heroine herself, Edmée Leroux; the aristocratic old Mademoiselle de St. Aignan, of quasi-liberal and wholly sceptical views; the old French artist, Delys, and the young Swiss one, Balmat, are all cleverly drawn and skilfully coloured; and if the scheming statesman, De Pelven, stands out less vividly on the canvas, it is rather from the greater complexity of type selected than from lack of graphic power in the delineator. The glimpse of the continuance of a demand for art and of the possibility of making a living by it, which is one of the many peculiarities which differentiate the French Revolution of 1789 from all previous and subsequent civil conflicts, shows close attention to its less conspicuous phenomena; and the manner in which the position of Louis David in art is described as rousing a contemporary enthusiasm which was never destined to confer immortality, and yet as having some just basis in his careful drawing, despite the poverty of his colour and the frigid conceits of his subjects, displays a keen interest in the history of painting, and a knowledge of the influence which David still exerts through the succession of Ingres upon the *Salon* of to-day, which is accurate and praiseworthy.

We doubt only two things in the story, so correct is its costume, and those are whether Hebrew studies had become common enough under Louis XVI. for *tohu-bohu* to have made then, as now, part of the vocabulary of Parisian slang; and whether there be any justification for the spelling Collet d'Herbois. Students of the Terror are familiar with the varieties of spelling which occur in many notable instances, as that of Vergniaud, Fouquier-Tinville, Henriot, and others; but Collet d'Herbois never changes, so far as we know.

Edina is one of those books of which the critic is bound to say that which is the tritest and vaguest of all criticisms—denounced in the very infancy of the art as already antiquated and unsatisfactory—that it would have been better if the author had taken more pains. Mrs. Henry Wood has many of the qualities which go to make up a successful novelist, but she lacks self-restraint, ambition, and patience. Her books are poured forth at a pace almost equalling that which G. P. R. James attained, for there are two dozen already published, and no sign of slackening is yet evident. That is to say, in other words, her mere fertility has even now equalled that of Scott, doubled that of Dickens, and trebled that of Thackeray. Yet although there is real cleverness in some of her stories—notably *East Lynne*, *Verner's Pride*, and *Trevlyn Hold*—there is no prospect whatever of her popularity being durable and her reputation permanent, simply because she will not be at the trouble of bestowing conscientious labour on the distasteful task of finish. She has quite imagination enough to make a good plot—better than Mr. Wilkie Collins' far more elaborate ones, which are simply chess-problems in literature—and though her gallery of characters is not very large, and the same people meet us under different names in several of her books, yet she has at various times succeeded in making her readers see her creations as she sees them herself, albeit unable to make any one so stand out from the canvas as to become clothed with personality and to live, as Mrs. Poyser lives. Her great literary defect, next to her extremely slipshod English (for which Dickens must be held mainly accountable, as it is a characteristic not only of his own writings, but of the whole school of novelists whom he reared in *Household Words* and *All the Year Round*), is the mannered colloquialism of her style. If she had written one book, say, in this fashion, making it autobiographic in form, and representing all the stage asides, moral reflections, and incessant detail as to the clothes worn by her ladies and the meals eaten by her gentlemen, as the way in which a comfortable middle-class English gossip, dropping in to a neighbour's for five o'clock tea, talked over all the concerns of the neighbouring families, telling everything she knew or fancied of their private history, it would stand as a very clever conception. But, unfortunately, it is no ideal personage who acts thus, it is Mrs. Henry Wood herself. She manages her *dramatis personae* exactly as a little boy does the cardboard figures of a toy theatre—pulls them back and forwards with a too visible hand and wire, and does all the talking for them

in a too audibly single voice and intonation. They are not allowed to work out the story in action and dialogue without incessant explanation how they ought to have done this, and ought not to have done that; and the narratives are almost always too indirect. *Edina* is no exception to the rule. The whole situation of the book is clever, the plot is well managed; the sensationalism is not greater than would occur in real life under the by no means impossible incidents of the story; the tone is mainly on the side of truth and honesty, and the tale is quite easy and even pleasant to read. But it will not live, though, of course, it will be added to the long series of reprints which begin with *East Lynne*, and its lack of vitality is chiefly due to the prominence of the faults noted above. If Mrs. Wood could but be persuaded that the true life of all permanent novels—except a very few, which may almost be counted on the fingers of one hand—is drawn either from graphic and powerful delineation of character, as in Fielding, Scott, Thackeray, and George Eliot; or else from brilliant picturing of society, as in Lord Lytton—himself no portrait-painter—she might learn that the unceasing stream of didactic monologue which runs through every one of her books—though probably enough an element of their popularity with a reading public which detests the effort of thinking for itself—is an artistic fault, which reminds the more cultured part of her audience of the remark of the poor lunatic confined in a Scottish asylum, that although he had a well-organised establishment, a skilful cook, and an abundant variety of the choicest dishes every day at his table, yet somehow everything tasted of oatmeal porridge. Let her turn Mrs. Henry Wood bodily out of the next story she writes, and allow the characters to act it out for themselves, and she may do better than she has ever done since the initial success of *East Lynne*.

The promise which *Elsie* held out of better work from its author is not belied by *A Woman's Victory*. There is a distinct advance made in it, and the interest depends rather on character than on situation, which is artistically an improvement. The chief motive of the book involves some skating on rather thin ice, but is treated with restraint and judgment, and, moreover, with a certain freshness of handling which is very commendable. The weaknesses of the work are two—first, that the minor characters are not sufficiently wrought into the texture of the story, but contribute so little to its development that they might for the most part be cut out innocuously so far as the plot is concerned; and, next, that such of them as are introduced obviously for the purpose of giving variety and local colour are not worked up enough to produce that effect. The hero and heroine of the book have had adequate pains bestowed on them, but the minor personages, Mrs. Hillett, Cecil Newton, John Holden, and others, are no more than outlined, and lack breadth and shading. Now, the starring system is as disadvantageous in a novel as in a play or an opera. There is more complete intellectual satisfaction and artistic pleasure to be derived from a performance in which there is a good average level of acting or singing through-

out, and where all the company, down to a stage-servant or a chorus-singer, help one another, and each contributes an appreciable share to the general effect, than where one or two celebrities have to sustain the whole burden, and to hide by their brightness the dulness and incapacity of their subordinates. And that, too, is a better story where the lesser people are felt to have a real part, and to be individualised, than one in which all the pains are lavished on the central figures. If the author of *Elsie* will once grasp this truth, and profit by the increased sense of dramatic action which experience has already brought with it, there is no reason why a third book from her pen should not exhibit as great an advance on the second as it does upon the first.

More than a Million is an extravaganza, belonging to the same school of writing as *Ginx's Baby*. The book turns on the strife stirred up by a will in which a vast fortune is left to John Smith, without any further particulars of identification, by a millionaire John Brown, who has no visible legal heirs or relatives; and describes in a series of episodic narratives the havoc, ruin, and death wrought among the rival claimants of the inheritance, up to the time when the bequest at last devolves into the hands of the heir-at-law, who applies it to the extension of an amateur police or Vigilance Committee, which is described at considerable length. In the preface the author mentions that one at least of his objects in writing the book was to show the mischievous working of the Court of Chancery in days before its procedure was simplified and accelerated; but this is not merely fighting an extinct Satan, but trying to do over again, with very inferior powers and little more real knowledge of the subject, what Dickens essayed in *Bleak House*. The author obviously had in his mind a plan for producing brilliant effects by the juxtaposition of tragedy and farce, but his gift of natural humour is certainly no greater than Mr. Edward Jenkins's own; and as *More than a Million* is about four times as long as *Ginx's Baby*, to which we have compared it, tediousness, by reason of continual strain and lack of spontaneity, is the ultimate result. Compressed into one-half of one of its two thick volumes, it might have been a tolerable squib, for a few scenes here and there are sketched in with some humorousness, but they lie as far apart as the raisins in the pudding of a Drury Lane eating-house, and the "stickjaw" which forms the main constituent is somewhat tough and flabby. One merit, far too rare, must in justice be credited to the anonymous author. He has actually cited correctly the stock line in Milton's *Lycidas*, "To-morrow to fresh woods and pastures new," which is misquoted more persistently, perhaps, than almost any other in the English language.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

A Calendar of the English Martyrs of the Sixteenth and Seventeenth Centuries. With an Introduction by Thomas Graves Law, Priest of the Oratory. (Burns and Oates.) Some trouble must have been taken by the author of this little work whose name appears on the title-page, as well as

by the Duchess of Norfolk, who assisted in the compilation and to whom it is dedicated. It consists of forty-nine pages only, yet it appears with the Imprimatur of the Cardinal Archbishop of Westminster, followed by a curious protestation on the part of its compiler that in calling his heroes martyrs he does not presume to anticipate any judgment that may be pronounced upon them by the Holy See. We find it difficult to place ourselves in the exact position of the writer, and so we venture to demur from a literary and historical point of view to the arrangement of the names in order, not of their chronological period, but according to the day of the month on which they suffered death. However, it is not our business to find fault with a method which has been adopted with a view to devotional purposes. The catalogue will be useful for reference, though the names are not in alphabetical or chronological order. The *Calendar* itself contains little that is new excepting a few corrections of dates, but the Introduction is extremely interesting as well as suggestive. The heroic endurance of sufferings and death in the cause of the Roman mission in England is, or was till lately, wholly unknown to ordinary English readers. There is a valuable mine of information on this subject which has yet to be worked, and we are glad to find that it is already in operation. And we hope soon to see some trustworthy accounts of the mission in Elizabeth's reign which may prove a worthy sequel to "Father Gerard's Narrative" and Mr. Simpson's *Life of Campion*. We learn from Mr. Law's Introduction that the process for the canonisation of some of these martyrs has been going on for more than two years, and we suppose the present volume must be considered in the light of a pioneer to prepare the way for more detailed narratives of the lives and deaths of those of whom in this *Calendar* nothing more is told us than the date and the mode of their execution. Perhaps some readers will be surprised to hear that the number of those who were hanged is 342, while about fifty more, to use our author's words, "terminated their lives in prison under the sentence of death, or died from the effects of cruel usage and in the odour of sanctity" (p. 15).

THE fifth and concluding volume of M. Paparregopoulos' *History of the Hellenic People* (*ἱστορία τοῦ Ἑλληνικοῦ ἔθνους*) embraces the period from the Fourth Crusade to the establishment of Greek independence. We cannot help congratulating the author on the completion of his work, which, as he tells us, has occupied more than thirty years of his life. In saying that it is a work of great importance to the modern Greeks, we do not wish to produce in our readers' minds a false impression regarding it. It is a chronicle, with no pretensions to a graphic or vivid style, and without the general sketches of particular periods, summaries of prevailing influences, and general estimates of the condition of classes and interests, to which we are accustomed in Mr. Finlay's works on the same subject. The 1,000 pages of which this volume is composed are crowded with facts and figures, but there is not a single reference to any authority, and though in the latter part, where the subject admits of it, the narrative is enlivened by the introduction of numerous ballads, yet it can hardly be called easy reading. But independently of its carefulness, and the clearness and purity of its style, it has the great merit of freedom from exaggeration. The author is fully justified in saying of himself, "I have no liking for hyperboles, which are the white-lead of history."

G. F. HERTZBERG'S *Geschichte Griechenlands*, the first part of which is now published, is in many respects a great contrast to this. It is a book well calculated to supply a great want—namely, a learned, critical, interesting, and tolerably succinct account of the history of mediæval and modern Greece. The present volume commences with the reign of Arcadius, and concludes

at the point where M. Paparregopoulos' last volume begins. Unlike most of the books that have been written on the Byzantine Empire, it is deeply interesting: for, strange to say, notwithstanding the strong element of romance which characterises this period, it has usually been treated in a very dry manner, and even Gibbon has regarded the Eastern Empire rather as a peg on which to hang his general history than as a subject of study for its own sake. M. Hertzberg, while he introduces the salient facts and leading personages, weaving them together into an attractive narrative, and bringing the various component parts of the empire successively into view, so as to produce a collective impression, at the same time devotes ample space to the discussion of the numerous, and not unfrequently recondite, subjects which the study of the period suggests. Such are—to take only one group of subjects—the adoption of various heathen rites and ideas into Eastern Christianity, the growth of the modern Greek language and its various dialects, the Slavonic element in the population and the language, and the origin of the modern names of places in Greece. Points such as these are critically discussed, with ample citation of authorities, whether Byzantine historians, or the larger modern works, as those of Finlay, Hopf, and E. Curtius, or pamphlets, such as Miklosich's *Investigations into the Slavonic Words in Modern Greek*, or Gass's *Historical Study on the Monasteries of Mount Athos*. We can strongly recommend the book as combining solid information with agreeable reading.

Short and Easy Book-Keeping. By George Flint. (Published by the Author.) This little brochure gives a good deal of useful information in a small space and at a trifling cost, although it would be a remarkably clever youth who would acquire the art from this or any other treatise, however simply or elaborately compiled. Book-keeping can only be learnt practically, and treatises devoted thereto are only useful for reference. A grave and unaccountable omission is observable in this book. No folio numbers are attached to the various entries either in the Cash Book, Journal, or Ledger, nor is there any reason given for their absence. Want of space is no sufficient plea, even if it had been stated, for the pages should not have been so small or the type so large as to necessitate the omission. The folios are not only necessary to show that every entry has been posted, but they are indispensable for reference, particularly if discrepancies occur in balancing the books, rendering it necessary often to call over and check every entry—a task most laborious and wearisome, but doubly so if the index has to be referred to at each entry.

The Ordinance of 1787. By William Frederick Poole. (Cambridge, Mass.: University Press.) A reprint of an article in the *North American Review* for April, 1876, the chief object of which appears to be to prove that the Rev. Dr. Manasseh Cutler was one of the main agents in the formation of the celebrated Ordinance, the most important feature of which was that it absolutely prohibited the existence of domestic slavery in all the new States and territories thereafter to be formed in America. The authorship of this remarkable instrument has long been a matter of dispute; and, considering the effect which it undoubtedly had upon the future history of the United States, it is only right and proper that the credit of its construction should be given where it justly belongs. Mr. Poole has certainly presented a strong case in behalf of Dr. Cutler.

The American State and American Statesmen. By William Giles Dix. (Boston: Estes and Lauriat; London: Trübner and Co.) This is a remarkable little volume, evidently written by a man far in advance of his generation, and independent enough to say boldly what will not be generally palatable to his immediate audience, although it will be unquestionably accepted here-

after as the language of profound wisdom. His object appears to be to warn his countrymen against settling down in the conviction that their national character is already established, and that it is such that they themselves ought to be contented, and the rest of the world satisfied, with it. He tells them plainly that this is a great mistake, and that, at the end of their first century of national existence, they have lived for a hundred years under a merely Provisional Government which must, sooner or later, and he thinks very soon, be discarded for one entirely different, but of what precise character he does not venture to predict:—

"Is our Government," he says, "or what we call a Government by conceit, as foreign nations call it a Government by courtesy, anything more, have we ever tried to make it anything more, has it not been our special American pride that it is nothing more, than an ingenious balance and compromise of policies?" Again:—

"It was a Provisional Government only, and yearly proves to be more and more unsuited to the vast and growing empire of North America. I call it a Provisional Government, because its organic powers have been the subject of contradictory interpretations from its beginning to this very hour. Of no other Government on the face of the earth can the same thing be said."

The volume is composed of a series of essays on various national subjects, and it is only now and then that the writer's special objects are revealed. He is clear enough on one point, and that is the superiority of the British Parliament over the United States Congress. He thinks that there will never be any real progress in national life until the members of both Houses of Congress are no longer directly responsible to their respective districts or States, but go to Washington as the independent representatives of the whole nation. He objects to the exclusion of members of the Cabinet from Congress, and says that there can be no Congressional debates, properly speaking, so long as this exclusion is maintained. "Congress, without authorised and commissioned representatives of the Government, is like a ship without a compass, a helm, or a pilot." He also quarrels with the term "United States" as the national title, which itself indicates a mere association of distinct governments, and seems to suggest its rejection in favour of the one word "America." The book abounds with quaint sayings.

"Daniel Webster could not be President. There were two fatal objections to him. He was a great man, and that was a strong reason why he should be put down and kept down. He had deserved well of his country, and that was a yet stronger reason why he should be put down and kept down. In all countries except America great men are regarded as special gifts of God. In America great men are regarded as curses, not as blessings. Their greatness is deemed an intolerable injury to everybody else in the land," &c.

The truth of this is unquestionable, and the sarcasm inimitable. Again, he closes an admirable appeal for some national effort for intellectual eminence thus:—

"Must our country wait for a literature worthy of herself until she shall be so crossed by rival railroads from every Atlantic to every Pacific port, and from the Lakes to the soil and the Gulf of Mexico, as to be a continental gridiron, on which stocks will be cooked to a crisp, and burn the fingers of all who touch them?"

Mr. Dix will at once find at home an appreciative, but, alas! a comparatively small, audience. He has, however, the merit of being a pioneer in a movement that must eventually be successful, unless (which God forbid!) we live to witness the alternative result of a confederation that has lasted a full century tumbling in pieces from its own inherent weaknesses. English readers will find an hour's amusement and some instruction in Mr. Dix's little volume.

NOTES AND NEWS.

MR. HERTSLET has ready for publication the third of his series of volumes on our Treaty relations with various countries. The two first were devoted to Austria and Turkey; he now gives us an analysis of Italian treaties. A list is given of those with the ancient dominions of Sardinia, the two Sicilies, Tuscany, and the Roman States, which have now all lapsed. The changes by which all Italian States were merged into the Kingdom of Sardinia, which became, ultimately, the Kingdom of Italy, are also detailed. We have a special and very complete copyright convention with Italy, which dates from November, 1860; and the chief other treaty which exists between Great Britain and that country is the general one of commerce and navigation, which was signed in August, 1863. In this treaty is inserted the "most favoured nation clause," under which we claim many additional advantages, accruing from conditions inserted in treaties of a later date between Italy and France, Austria and Switzerland. The tariff, which is divided into twenty "categories," is most plainly arranged, and an index is prefixed in which each article is referred to its particular category. It seems a pity that this portion of the work will become a dead letter in the event of the proposed alteration of the Italian tariff to be made next year. But these handbooks supply a great want which has long existed among statesmen and merchants interested in the commerce of the countries treated of.

MESSRS. R. BENTLEY AND SOX are about to publish in two volumes the articles on the history of the tenth Royal Hussars, by Mr. William Douglas, which have appeared in successive numbers of the *United Service Magazine*.

WE understand that Mr. S. Lane Poole is engaged in writing a short memoir of his great-uncle, Mr. Lane, the Arabic scholar. It will be prefixed to the sixth volume of Lane's *Arabic Lexicon*, and also be published separately in a modified form.

DR. W. SPITTA has published, at Leipzig, an able and interesting biography of the great orthodox reformer of Mohammedanism, El-Ash'ari. Prof. Mehren has, we believe, already compiled a more extensive work on the same subject, but we doubt whether he can deal more thoroughly or more successfully with the subject than has been done in Dr. Spitta's *Zur Geschichte Abu-l-Hasan Al-Ash'ari's*.

DR. BARLOW, the Dantophilist, whose death was recently announced, has, we are informed, left 1,000*l.* Consols to University College, London, for the endowment of an annual course of lectures on the *Divina Commedia*, with all the books in his library which relate to Dante and Italian history. He also leaves 500*l.* Consols to the Geological Society, the income to be applied as the Council may think best for the furtherance of geological science.

MISS ROSSETTI (Maria Francesca), the authoress of *A Shadow of Dante*, died in London on November 24, in the fiftieth year of her age, after a severe illness of about four months. The *Shadow of Dante*, published by Messrs. Rivington in 1871, offers a compendious view of the scope and scheme of the *Divina Commedia*, and was received with general approval. Miss Rossetti's other publications were of minor account—namely, *The Rivulets*, a little prose tale of religious allegory, 1846; *Exercises in Idiomatic Italian*, 1867, with its key, named *Aneddoti Italiani*; and *Letters to My Bible-Class on Thirty-nine Sundays*, published subsequently to the *Shadow of Dante*. In 1873 Miss Rossetti joined an Anglican Sisterhood, having for many years previously been an "Outer Sister" in the same community.

WE regret to notice the death of the eminent Hebrew scholar, Prof. Duncan F. Weir, of Glasgow University. His solid acquirements and

sound judgment are better known to his friends and pupils than to the public at large, but readers of the ACADEMY may remember the striking emendations of the text of the Psalms which used occasionally to appear in its pages. These were due to Prof. Weir, and it is much to be hoped that some more specimens of his accurate scholarship may be published—not merely as a tribute to his memory, but for the benefit of Hebrew studies.

MR. QUARITCH informs us that the new edition of Kemble's *History of the Saxons in England*, revised by Mr. W. de Gray Birch, is now nearly ready for publication. This valuable work has long been out of print, and scarce. Another book of historical importance from the same publisher is also nearly completed—a new edition of the late Mr. Hawkin's *Silver Coins of England*, which is virtually a new work, as the numerous "finds" of ancient coins made in England during the past twenty years have been carefully utilised, to the great improvement of the original treatise, and the correction of its chronological tables.

DR. JULIUS JOLLY has published at München, under the title *Ueber die rechtliche Stellung der Frauen bei den alten Indern*, a sketch of the legal position of women in ancient India. The rights of unmarried women, the different forms and essential ceremonies of marriage, the references to the purchase and capture of wives, the law as to dowry and divorce and widowhood and remarriage, are discussed on the authority, not only of Manu, but of Nārada, Yājñavalkya, Gautama, Āpastamba, and other law-books. Previous essays on this subject have almost exclusively depended upon Manu, or comparatively modern text-books; and Dr. Jolly's accurate and detailed account is the best that has yet appeared. We are glad to notice that Dr. Jolly hopes, as soon as he has completed the translation of his edition of Nārada, to publish a complete treatise on Ancient Indian Law.

THE *Ceylon Friend*, a monthly magazine published by the Wesleyan Mission in that island, continues to reprint the papers contributed by Gogerly and Spence Hardy to those numbers of the Ceylon Asiatic Society's *Journal* which are out of print, or to the extinct journal called the *Friend*. The issue for October, 1876, contains an essay by the Rev. Spence Hardy, on "The Language and Literature of the Sinhalese." We hope that the editors of the *Ceylon Friend* will publish separately in one volume these literary articles, just as they have already issued a separate edition of Spence Hardy's *Christianity and Buddhism Compared*, which first appeared in parts in the *Ceylon Friend*.

SUBHUTI UNNANSE, the Buddhist priest of Waskaduwa, in Ceylon, is already well known as the careful editor of the *Abhidhānappadīpikā*, a native Pāli glossary, which, until the appearance of Childers' great work, was the only lexicographical help available to Pāli students. He has now published a work entitled *Nāmanālā*, or "The Garland of Nouns," a treatise in Sinhalese on the grammar of Pāli nouns and adverbs. The Introduction, extending to more than a hundred pages, contains a most valuable summary of all that is known to the native paṇḍits concerning the history of Pāli grammar, and gives the author's name and date, the length in stanzas or cantos, and quotations of the first and last verses of no less than sixty-four Pāli grammars still known in Ceylon. We shall notice this important work more fully in a later issue.

A BOOK of Basque Legends, collected, chiefly in the Labourd, by the Rev. Wentworth Webster, with an essay on the Basque language by M. Julien Vinson, is announced for publication. The book will be published by Messrs. Griffiths and Farran, and Messrs. Walbrook and Co.

THE authorities of the University of Halle-Wittenberg have just conferred the degree of Dr.

Theol. on the Rev. J. K. Seidemann, in approval of the services rendered, during the last twenty years, to Luther-literature by his unrelenting labours. The two volumes of Dr. Seidemann's most recent work, "*Dr. Martin Luthers erste und älteste Vorlesungen über die Psalmen aus den Jahren 1513-1516*. Nach der eigenhändigen Handschrift der kgl. öffentlichen Bibliothek zu Dresden herausgegeben, von Lic. Theol. J. K. Seidemann" (Dresden: R. v. Zahn), are just appearing. This work, for the publication of which the university degree has been awarded, contains the detailed lectures on the Psalms which were read by Luther in Wittenberg during 1513-16. The publication is from a MS. written by Luther himself, and now in the possession of the Royal Library of Dresden; it was for many years preserved as one of their most precious heirlooms by Luther's family, and passed, about 200 years ago, from Johann Ernst Luther (1637), Luther's grandson, into the collection of MSS., for which the Royal Library is famous. Here its existence was, for some time, no secret for Luther-scholars; but its present publication will be due to the munificence of the authorities.

THE notice of the *Specimens of English* in last week's issue of the ACADEMY was, we are informed, incomplete. It was said that Dr. Morris "determined to carry his book up to the Anglo-Saxon period, and down to Spenser, making it two volumes instead of one." The part of the sentence containing the clause "down to Spenser" was due to a mistake easily made. Dr. Morris proposed to divide his book into two parts, carrying it up, but not down. At the same time Mr. Skeat proposed to write a third volume in continuation of the second part, while he also assisted Dr. Morris in preparing a new edition of that part. The result is easily understood by remembering that the whole series will consist of four volumes, not of three only. The first of these, Mr. Sweet's *Anglo-Saxon Reader*, has just been issued. The second, Dr. Morris's continuation down to 1300, is still in the press. The third, edited by Dr. Morris and Mr. Skeat conjointly, was, to some extent, a re-issue of the original volume (now out of print), with an increase of notes and glossary; it reached what was practically a third edition in 1873. The fourth volume, A.D. 1393-1579, edited by Mr. Skeat alone, appeared in 1871. When the second volume appears the series will be complete; the later authors being less adequately represented by specimens. The Clarendon Press has, however, also published some "Typical Selections."

MESSRS. GARNIER FRÈRES have just bought the entire stock of the great Migne collection, *Patrologiæ Latinae et Patrologiæ Græcæ Cursus Completus*, and they are now engaged in reprinting the volumes destroyed by a fire a few years ago.

M. BERTHOLD ZELLER is preparing two very curious works, based on documents in the Archives of Florence, on the Marriage of Henry IV. and Mary de Medicis, and on the Conspiracy of Biron.

A NEW edition of Herzog's valuable *Realencyclopädie der protestantischen Theologie* has begun to appear in parts. This, we need hardly remark, is the most comprehensive Thesaurus of the multifarious subjects grouped under the head of Theology which at present exists.

M. CLERMONT-GANNEAU's lecture at the Royal Institution on the peasant population of Palestine has been printed in French, under the title *La Palestine inconnue*, in the charmingly got-up *Bibliothèque orientale elzévirienne* of the publisher M. Leroux. As is well-known, M. Clermont-Ganneau agrees with Prof. E. H. Palmer in regarding the *fellahin* or peasants of Palestine as the descendants of the ancient Canaanites. They are at any rate neither Jews nor Arabs. We may, it is said, look forward shortly to receive a detailed account of this talented scholar's Palestinian researches from the same Parisian publisher.

UNDER the title *A. Firkowitsch und seine*

Entdeckungen; ein Grabstein der hebräischen Grabschriften der Krim (Leipzig: Hinrichs), Dr. H. Strack has published a complete exposure of the forged epigraphs of the Hebrew manuscripts now at St. Petersburg (referred to in our Oxford Letter of last week), and the forged dates of the tombstones in the Crimea, which some years ago misled Dr. Davidson and so many other scholars.

PROF. DE LAGARDE has given notice that he is obliged to publish the recension of the Septuagint by Lucian alone; that by Hesychius must for the present be reserved. Underneath Lucian's recension, the fragments of Aquila, Symmachus, and Theodotion will be printed.

THE *Revue des Deux Mondes* for November 15 contains a very interesting article by M. Leroy-Beaulieu, on "Agrarian Communism in Russia," which is mainly a defence of it against the Report of the Imperial Commission of 1875. Among other things it is shown that many of the inconveniences of the existing system are due to the way in which houses are grouped. M. Ludovic Carrau has an article on madness from a psychological point of view, which contains some good remarks on the question how far madness is a crime. M. F. Brunetière discusses the new letters of M^{me}. de Sévigné, published by M. Capmas, from a MS. whose bibliographical value seems greater than the literary value of the new letters. The number for November 1 contains a translation of M. Franzos' story of "The Judge of Biala," and an account, by M. Émile Daireaux, of the native races of South America.

THE *Nuova Antologia* for November contains an article by Signor Tirinelli on "The Comedies of Ariosto," bringing out their full importance in the development of the Italian drama. There is a notice of a work by Signor Rajna, *Le Fonti dell' Orlando Furioso* (Firenze: Sansoni), which is a minute examination of the poem and a comparison of its facts and situations with passages from the mediæval romances of chivalry.

THE *Archivio Storico* has a valuable contribution to the bibliography of Italian history. Herr Alfred von Reumont has contributed a supplement to his former list of works published in Germany on Italian history. This supplement reaches to August, 1876, and is a very welcome addition to the library of all students of Italian history.

A NEW edition of Vasari, under the supervision of Signor Milanese and Signor Carlo Puri, is announced by Sansoni (Florence). The first volume will be ready for publication shortly.

IN the November number of the *Deutsche Rundschau* there is an instructive article from the pen of Professor Friedländer, of Königsberg, on "Kant's Attitude towards Politics." Though in a less ardent fashion than Fichte, Kant entered into the political movements of his time, being most deeply interested in the American War of Independence and in the French Revolution. His sympathy with the promoters of the latter seems at first sight to conflict with one of his cardinal political ideas—namely, that rebellion against existing powers must always be wrong. The essayist shows that Kant justified the part he took on the ground that Louis XVI. virtually made over the power of government to the French people when he gave them the control of the ruined finances of the nation. Kant in his later years elaborated a complete system of politics, which stands in the closest connexion with his ethics. He was in favour of what he calls a republican constitution which is based on freedom and equality. He connects this with the hypothesis of a social contract; yet he regards the latter idea, not as the statement of a fact (as Rousseau), but as an idea of the reason "which binds the legislator so to shape his laws as they might have sprung out of the united wills of a whole people." As to the form of government he is not very explicit, only denouncing unrepresentative democracy, or mobocracy, which he held to

be still more ruinous than despotism itself. By-the-by, he held that the English Constitution is essentially a despotism, owing to the power of the king to bribe and constrain the representatives of the nation. One of the most prominent ideas in Kant's politics is that of a confederacy of States, through which international obligations might be enforced and war prevented; yet he makes no attempt to define how such an organisation is to be brought about. The essayist emphasises the dominion of fixed principles in Kant's political judgments. Even the happy consequences of the rule of Frederick the Great could not reconcile the philosopher to this enlightened despotism.

On the 22nd ult. Messrs. Puttick and Simpson sold a rare English collection of English Liturgical Treatises, mostly in black letter, consisting of forty-one tracts, issued from 1547 to 1639, among which are:—*Injunctions given by Edward Sixth* (London: R. Grafton, 1547); *Order of the Communion* (London: R. Grafton, 1548); *Articles agreed on by the Bishops, in the Synod, 1553* (London: R. Grafton, 1553); *Interrogatories set forth by Philip and Mary, 1558*, with Bishop Bonner's autograph (London: R. Caly, 1558); *Injunctions given in the first year of Elizabeth* (London: Jugge and Cawood, 1559); *Form of Prayer used during the time of the Plague*, drawn up by Bishop Grindal (London: Jugge and Cawood, 1663); *Advertisements, partly for Ecclesiastical Apparel* (London: E. Wolfe, 1568); *Book concerning Church Discipline* (London: J. Day, 1571); *Form of Prayer to avert the Earthquake* (C. Barker, 1580); *Form of Prayer to avert the Spanish Armada* (London: C. Barker, 1586). These curious tracts were sold in one lot for 53s.

UNDER the title of *The Israelitish Question and the Comments of the Canaan Journals thereon* (Civil Service Publishing Company), we have a series of extracts from telegrams, occasional notes, and leading articles supposed to appear in the *Canaan Banner*, the *Canaan Whirligig*, the *Canaan Daily Worldwide*, the *Canaan Evening Douche*, and last of all the *Canaan Weekly Prophet*, during the month before the Exodus of Israel from Egypt. The Canaanitish press does not relish the immigration of the sons of Jacob into their country. From the last named journal we take the following characteristic passage:—

"He has consented to let the Israelites go. Good. Six hours more delay and there would have been no Pharaoh to consent, for he would have been assassinated; and no Israelites to go, for they would have already gone. Pharaoh slain, the whole Egyptian Empire would have been shivered like a potsherd. Aethiopia, which lies watching its occasion this many a day, would have swarmed in its ebony thousands across her southern frontier, and the King of Marmarica, the ablest African of this generation, would have completed her destruction on the west. Her army is wholly unready for the field, and she is without any power of extemporising a defence," &c. The writer is, we suspect, a familiar and inveterate joker, who spares neither the grey-haired sage nor the sucking child; and who, if we mistake not, had the audacity many years ago, when we ourselves came into existence, to make himself merry at our expense, because, forsooth, like all other infants we were born naked into the world. However, his present effusion is more worth reading, and we commend it to the public perusal.

AN illustrated journal of politics, literature, and society, will be published early in the coming year under the title *Mayfair*. The staff of the new journal has been formed from among some of the best-known writers on the London daily press. The writer of the Parliamentary articles in the *World* entitled "Under the Clock" has transferred his services to *Mayfair*.

A UNIQUE copy of the first edition of Marlowe's *Edward II.*, dated 1594, has lately been found at the Cassel Library, with a large number of other early printed books. English bibliographers have as yet registered no edition of *Edward II.* earlier

than 1598. We hope the German Shakspeare Society will at once reprint the text of 1594, or let the New Shakspeare Society do it.

THE following Parliamentary Papers have lately been published:—Criminal and Judicial Statistics, 1875, Ireland, Parts i. and ii. (price 2s. 6d.); General Digest of Endowed Charities for the County of Worcester (price 6d.); Index to the Report of the Committee on the Civil Employment of Soldiers, Sailors, and Marines (price 6d.); Commercial Reports of H.M. Consuls in China, 1875 (price 8d.); Returns relating to Trade with China, 1875 (price 2d.); Tenth Annual Report of the Warden of the Standards on the Proceedings of the Standard Weights and Measures Department, for 1875-76 (price 1s. 7d.); Report of the Board of Visitors of the Royal Military Academy, Woolwich (price 1d.); Annual Financial Reports for 1874 and 1875, by the Auditor-General of Barbadoes (price 1s. 3d.); Miscellaneous Statistics of the United Kingdom, Part ix. (price 4s. 10d.); Further Correspondence relative to the Colony of Fiji, with Charts, &c. (price 4s. 6d.); Report upon the Condition, &c., of the Welsh Colony of Chupat, in Patagonia, by Captain H. Fairfax, R.N. (price 1½d.); General Digest of Endowed Charities for the County of Anglesey (price 3d.); Reports of the Chief Registrar of Friendly Societies for 1875, Part i. (price 1s. 8d.); Return of all Surveys of the Coasts of Ireland and Scotland, published by the authority of the Hydrographical Department of the Admiralty (price 1d.).

WE have received *Literary and Social Judgments*, by W. R. Greg, fourth edition, considerably enlarged (Trübner); *A York and a Lancaster Rose*, by Annie Keary (Macmillan); *The Spiritual Body*, by J. C. Earle, new edition, enlarged (Longmans); *Abstracts of Specifications of Patents* applied for from 1854 to 1866; *Metals*, Part II., by Richard Gibbs (Melbourne); *An Architect's Letter about Sewer Gas and House Drainage*, by H. Masters (Spon); *Les Discours de M. le Prince de Bismarck*, vol. 6 (Berlin: van Muyden; London: Dulau); *Gesammelte Schriften von David Friedrich Strauss*, 1. Bd. (Bonn: Strauss); *Geological Observations*, by Charles Darwin, second edition (Smith, Elder, and Co.); *Parliamentary Buff-Book for 1876*, by T. N. Roberts (Wilson); *The Tender Toe: Essays on Gout, &c.*, by W. Lomas (Wilson); *Mushrooms and Toadstools*, by Worthington G. Smith, third edition (Hardwicke and Bogue); *Church Sunday School Magazine*, and the *Sunday Scholar's Companion*, 1876 (Simpkin, Marshall and Co.); *The House of Stanley and the late Lord Derby*, by T. Aspdon (Preston: Herald Office); *Fire Surveys*, by E. M. Shaw, second edition (Wilson).

NOTES OF TRAVEL.

DR. PETERMANN has sent us a proof of a very beautifully-executed preliminary chart of the Smith Sound region, showing the results of the British Arctic Expedition of 1875-76, of the *Polaris* Expedition, and of all former voyages in this part of the Arctic basin, which will accompany the December part of the *Mittheilungen*. One of the chief features which it brings out clearly is that of the limit beyond which either land or sea may, for aught we yet know to the contrary, occupy this part of the polar area; this limit is obtained in joining by a line the extreme horizon points of farthest vision gained by the various sledge parties in their journeys east, west, and north.

A COPY of the long-delayed "Report to the President of the United States of the Action of the Navy Department in the Matter of the Disaster to the United States Exploring Expedition (Hall's, 1871-73) towards the North Pole, accompanied by a Report of the Examination of the Rescued Party," has newly been received by the Geographical Society. This, the only official

account of the *Polaris* Expedition, will have a new interest at the present time.

THE *Times* of Monday, November 27, publishes an interesting journal kept by the Rev. Mr. Lawes during a coasting voyage in company with Mr. M'Farlane, in the mission steamer *Ellangowan*, from Port Moresby, round the south-eastern shores of New Guinea to China Strait and Milne Bay, referred to in the *ACADEMY* of August 12. A number of fine harbours, several new river mouths, and not a few native villages, were discovered and visited in this trip, and this without a single hostile encounter with the natives, who were everywhere friendly and eager for barter.

WE welcome a revival of the excellent French geographical magazine, *L'Explorateur*, under a slightly changed name, and in a new form Part I. of *L'Exploration: Journal des Conquêtes de la Civilisation sur tous les Points du Globe*, has just been issued under the direction of M. Charles Hertz, and gives promise that it will maintain the interest and originality of its short-lived predecessor. It contains for its chief articles a sketch of Abyssinia by M. Denis de Rivoire, notes on M. Largeau's work in North Africa, and an account of the Brussels African Congress, with a good map of the lake region of Central Africa.

THE most important paper in the last number of the *Bulletin de la Société de Géographie de Paris* is one by Dr. Harmant describing his journey in Cambodia during January-March of this year; le Comte Meyners d'Estray contributes a paper on the Arab geographers, and there is a letter from P. Duparquet giving a general description of the lower Congo river.

TO the four existing volumes, published from 1864 to 1873, describing the results of the Prussian Scientific Expedition to Eastern Asia, a fifth has just been added by Dr. Eduard v. Martens. This contains a general description of the fauna of the countries visited, Japan, China, and Siam, in a first part, and of the terrestrial mollusca in a second. Along with the more elaborate representations of specimens drawn and engraved in Europe it is interesting to find in this volume a number of reproductions of very characteristic drawings of animals by native Japanese artists. Dr. Martens contemplates the publication of two more volumes, treating of the fresh-water and marine mollusca, and of the Crustaceae and Radiata.

TWO very important Russian geographical works, both unfortunately sealed up to ordinary readers in the Russian language, have newly been published—the *Notes of Travel in Turkey and Persia* (1842-52), by the late General Tchirikoff, Russian Commissioner in the demarcation of the Turco-Persian frontier, edited by Michael Gamarzoff; and the *Bibliographia Caucasica et Transcaucasica*, an attempt at systematic bibliography relative to the Caucasus and Transcaucasia and to their inhabitants, by M. Miansarof, vol. i., sections 1 and 2.

THE *Mittheilungen der Kais. Königl. Geogr. Gesellschaft in Wien* for this month has an important paper describing the districts of Benguet, Lepanto, and Bontoc, in the island of Luzon, by Dr. R. v. Drasche, and a Report on his journey through the southern provinces of Japan, by Dr. A. v. Koretz. Dr. Josef Chavanne supplies a good hydrographic map of Central Africa, to accompany Dr. Ferd. von Hochstetter's Report on the International African Conference.

THE news comes from Australia that the expedition of Signor D'Albertis and Mr. Hargrave to the Fly river in New Guinea has returned to Somerset in North Queensland. They ascended the river to a point 350 miles above the spot reached by Macfarlane's party, but were unable to communicate with the natives, who were numerous and hostile.

ON the 11th ult. a meeting of the Geographical Society of Cairo was held to receive the well-

known African traveller Signor Piaggia, on his return from an expedition in the service of Colonel Gordon. From Dufi on the Upper Nile he accompanied Romolo Gessi (the explorer of the Albert Lake) as far as Magungo, and then turned off, ascending the Somerset Nile to the Murchison Falls and Mrooli, whence, aided by a party of natives lent by King Mtesa, he explored the lake called Capechii, probably the Lake Ibrahim of Colonel Long. He has brought back a fine collection of curiosities.

THE death of Mr. Freeman, the companion of Mr. Lucas, on October 5, is announced from Khartum.

A USEFUL report by Dr. N. B. Dennys, Secretary of the Hongkong General Chamber of Commerce, on the two ports of China and Annam recently thrown open to the commerce of the world has newly reached Europe. These are the town of Hoi-kow, the seaport of K'ung chow, the capital of the island of Hainan, and that of Hai-phong at the mouth of the Song-ka river, which leads up to Hanoi, or Kesho, the capital of the Annamese province of Tonquin. Dr. Dennys visited these places in April of this year; he found Hoi-kow to be a place of about 12,000 inhabitants and that, though it occupies a very inferior official station to K'ung Chow, it is in reality by far the more flourishing and lively place of the two. After an account of the capabilities of the port, its tides and anchorages, and liability to typhoon storms, he gives a statement of the articles which form the staple of trade; among these the number of animals which form articles of commerce is remarkable, including deer of several sorts, monkeys, tigers, the civet, mongoose, porcupine, anteater, and Chinese whale, besides the domestic breeds. Of reptiles (exclusive of those which are eaten), the boa-constrictor (*Python Molurus*) is the only one which possesses value in Hainan as an article of trade, its skin being sold to form drum-heads. The port of Hai-phong in Tonquin, recently opened to trade under a treaty made by the French Government with that of Annam, is not shown by that name as yet on any British chart, and as a place of trade is of small importance in native estimation; but as commanding the river approach to the capital Hanoi it has been strongly fortified, the forts being now in occupation by the French. In contrast to the relation of Hoi-kow to K'ung chow, Hai-phong in a commercial sense is merely a place of anchorage for vessels, the capital Hanoi being the centre of traffic. Hanoi, the capital of Tonquin, now the headquarters of French influence, 60 miles up the river Song-ka, has a population of about 60,000 natives, besides 2,000 to 3,000 Chinese, and about 175 Frenchmen. Regarding the probability of the opening of a new line of trade by the Song-ka to the interior Chinese province of Yunnan, Dr. Dennys says:—

"Much has been and might be written on this subject, but I content myself with stating the few facts in connexion therewith that have come to my knowledge. The route has been traversed by a portion of M. Dupuis' expeditionary force, but involved the use of very light-draught boats, while at times even these were detained by the numerous banks and shoals. Native communication is carried on in light-draught river boats with sharp bows and flat bottoms. The outskirts of the Yunnan province have for a considerable period been in the possession of Chinese rebels, who are at one time waging war against the Chinese authorities, while at another fighting Annamite rebels for Annamite pay. These 'Black Flag' mercenaries, as they are termed, are frequently seen in Hanoi; they are a reckless, bold-looking set of men, and swagger about armed with double-barrelled pistols. . . . At the end of March just past, a Chinese general with coral button, who was in command of the Kwang-si mercenaries, visited Hanoi with an escort of 400 braves, and reported that he had gained important victories over the rebels infesting the river, and had driven the remnant to the mountains. . . . The French Consul at Hanoi intends to go to Yunnan as soon as a suitable steam-launch which he expects to arrive

shortly, is at his disposal. . . . The only trade as yet attempted with Yunnan has been in arms, but the people are reported to be anxious to obtain foreign cotton and woollen goods."

THE ARCTIC EXPEDITION.

IV.

The Sea of Ancient Ice (Continued).

IN our number for November 18 (p. 499), we noted all that was known of the "Sea of Ancient Ice," tracing it, by the descriptions of Collinson, McClure, Meham, McClintock and Nares, from the coast of North America to Beaumont's furthest on the north coast of Greenland, a distance of 1,140 miles. With regard to its width, and to its limit to north and west, we have fewer data. All who have seen this ancient ice are convinced of the impossibility of penetrating into it without certain destruction for the ship whose commander committed so foolhardy an act. Meham, who saw it from the Western shore of Prince Patrick Island, reported:—"The character and appearance of the pack driven against the land, and in every direction to seaward, thoroughly convinces me of the impossibility of penetrating with ships to the southward and westward, against such tremendous impediments." Meham also came to the conclusion, from the nature of the pack, that if land does exist to the westward, it is at some considerable distance from Prince Patrick Island. Captain Nares, and his officers, came to the same conclusion from even better data, for they obtained frequent views over the frozen sea, from lofty hills upwards of 2,500 feet above the sea-level. They thus ascertained that there was no land to the northward for a great distance.

Other indications confirm the conclusions, derived from actual observation, with regard to the great extent of the sea of ancient ice, or palaeocrystic sea. If there was land to the north, there would be navigable lanes of water along it. But there are proofs that this is not the case. The northerly winds were cold winds. There were no flights of birds to the northward. With the palaeocrystic ice all life upon the sea ceases. The cetaceans, the seals, the bears which prey upon them, the sea-frequenting ducks and guillemots, all come to an end, or are only represented by one or two stray stragglers. Arctic man, too, who, like the bear, preys upon seals, has turned away on approaching the palaeocrystic sea. There are no traces of him on its shores. All these facts are clear evidence of the great extent of a sea covered with floes of ice from 80 to 150 feet thick, which, though drifted to and fro, are never discharged from the sea on which they are formed. They probably fail to develop a still greater thickness owing to the summer drift, and to the action of submarine currents.

The existence of this sea of mighty floes to the north of Grant Land has caused a revolution in our notions of Arctic geography, and has dissipated many cherished theories. In the belief that there might be land, and occasionally navigable seas over part of that unknown area, we had, in imagination, led the tribes which, some centuries ago, disappeared from Siberia, partly along the shores of the Parry Islands (an undoubted route), but partly also across the open Polar sea and bird-frequented lands which inaccurate information led us to expect in the far north.

We now know that the latter route was impossible. No wanderers ever crossed the sea of ancient ice. Those vestiges which are scattered so thickly along the shores of the Parry Islands and Banks Island were doubtless left by wanderers from Siberia; but their route must have been along the edge of the palaeocrystic sea, not across its rugged and impassable surface. The emigrants must have travelled along the coast of North America, crossed the strait to Banks Island, and so have found their way along the shores of the Parry Islands, where such numerous vestiges of them remain, to Baffin's Bay. Then we find

them passing up through Smith Sound, and advancing as far as 81° 55' N. But here they met the floes of the palaeocrystic sea, the seals and bears went no further, and man also stopped. The wanderers crossed to the east side of the channel and made their way south again. The Eskimo, like the bear, depends upon seals for his existence. North of 82° no vestige of a human being has been found; and there can be no more certain proof that the palaeocrystic sea is incapable of supporting human life.

These remarks do not apply to the land animals, which are met with everywhere, even along the shores of the ice-laden ocean, though in greatly diminished numbers, as compared with Melville Island. Up to the most northern point we have musk oxen and the melancholy wolf which follows them, hares, lemmings and the great snowy owls that prey upon them, snow buntings, a few ptarmigan, and the frequenters of inland lakes, such as brent geese, knots, turnstones, and phalaropes. It is a remarkable fact that the only signs of life met with by Markham and Parr during their memorable journey over the palaeocrystic sea were land animals—stragglers from the shore—a hare and a snow bunting.

The musk oxen and the lemming, both American types, have found their way round the north coast of Greenland, and were met with by the Germans on the east side. Captain Clavering, in 1823, met with Eskimos on the east coast, vestiges of whom were found by the Germans. It was part of our cherished theory that they, too, like the musk oxen and lemmings, found their way round the north coast. But this, we now know, is also a delusion. Arctic man, as has already been observed, depends mainly upon the seal, not on land animals, for his subsistence. The shores of the palaeocrystic sea would fail to sustain him, and we know that traces of Eskimos in the channel leading from Smith Sound entirely cease to the north of 82°. We must, therefore, conclude that the people seen by Clavering on the east coast of Greenland were stragglers from the south.

Nature has repelled all advances to the north in this direction. Men, bears, seals, whales, birds, all recoil from the forbidding solitudes. The crustaceans and echinoderms, and the smaller organisms of the sea-depths alone abound, and remain undisturbed by the larger animals that prey upon them in warmer latitudes. For there is no region, from the Pole to the equator, in which life of some kind is not plentiful; and which would not, in this branch of science as in others, yield rich and valuable results to those who succeed in exploring it. But for the higher animals the palaeocrystic sea has no place.

It is into this forbidding solitude that our gallant explorers have penetrated. No human being, savage or civilised, had ever before trodden the shores of the sea of ancient ice, or stormed its mighty hummock ridges. Its shores have now been explored for a distance of 300 miles, and it has been forced to yield up all its stores of previously hidden knowledge. Its depths have been sounded, its temperatures have been registered, its vast floes have been minutely examined whether in motion or at rest, and its living organisms have been collected. This is only one of the results of the Arctic Expedition—a small portion of its valuable work—but this alone repays the cost over and over again, and, which is of more consequence, repays the unparalleled exertions that have been made, and the dangers that have been so gallantly encountered.

Hereafter we may turn to the results that have been received as regards the land, to the geological discoveries that have been made by the Expedition, to its natural history collections, and to its valuable observations connected with physics and terrestrial magnetism.

CORRESPONDENCE.

AN EARLY CEMETERY AT SELBY, NEAR YORK.

York: Nov. 25, 1876.

Within the last few months an ancient burial-ground at Selby, the existence of which was detected in 1857, has been again opened with some remarkable results. In the first-mentioned year the draining of one of the streets contiguous to the Ouse revealed, at a depth of six or seven feet, several coffins formed of the trunks of oak trees, split in two and hollowed out. One of these is preserved in the Museum at York. It contained the skeleton of a female, near whose neck were seven beads, of graduated sizes, somewhat oval in shape, and with two bands of red on the edges. In the centre of the skull a very curious feature was observed. A small round hole was detected in it, evidently artificial, and resembling in every respect a perforation in the skull of a Roman lady which has been recently discovered in one of the old cemeteries at York. What was the object of these peculiar efforts of ancient surgery? It has been suggested that they might be intended to cure epilepsy?

In the summer of the present year the rebuilding of a small public-house was the means of discovering other fifteen or twenty of these wooden coffins, packed closely together, at a depth varying from five to eight feet. In several instances, an oaken post about three feet in height was found upright at the head of a grave. Seven of these coffins were raised to the surface and were carefully examined. They contained, unfortunately, no ornaments whatever, but in four of the seven, hazel rods or twigs were observed in the right hand of the corpse. I am aware of the papers in the *Archaeologia* in which there is a record of similar rods having been found in a cemetery at Oberflacht, in Suabia, but I should be glad to know if they have ever been detected elsewhere in

England. The beads which were discovered in 1857, and the presence of these hazel sticks, suggest the age of the burial-ground as well as the nationality of the dead. In appearance, these tree-coffins closely resemble the example of the *Todten-baum* which was discovered some years ago at Gristhorpe, near Scarborough. I need not say that interments of this kind are of very rare occurrence in this country.

One of the London daily prints honoured the discovery with a leading article, and accounted for the presence of the coffins under a country public-house in a somewhat remarkable manner. The imagination of the writer flew to the stories in *Guy Mannering*, and he at once supposed that these graves contained the remains of unhappy travellers who in comparatively recent times had been robbed and murdered by their host, and then laid away quietly beneath the cellars of his inn!

JAMES RAINE.

SHAKSPERE'S MOTHER'S ESTATE OF ASHBIES.

3 St. George's Square, N.W.: Nov. 27, 1876.

We know that about 1578 Shakspeare's father got into money difficulties, and that on November 14, in the twentieth year of Queen Elizabeth, or 1578, he and his wife mortgaged to Edmund Lambert for 40*l.* their little property at Wilmcote, called Ashbies, that she had taken under her father's will. But what ultimately became of this property has been hitherto a question; and one imaginative critic has supposed that it reverted or was reconveyed to John Shakspeare. This I do not believe for a minute. At the time of the mortgage the later doctrine of the mortgagor's equity of redemption after default of payment was not recognised by the Courts; and if the mortgage money was not paid on the day named in the proviso for redemption, the mortgagee became entitled to the land in equity as well as at law. John Shakspeare may have borrowed his 40*l.* of Edmund Lambert, at Michaelmas 1578 (though the mortgage was dated later), as his day of redemption was fixed for Michaelmas Day, 1580. He was not to pay interest, because, according to the custom then, the mortgagee, Edward Lambert, at once entered on the land, and took its profits instead of interest. And it is clear that John Shakspeare made default in payment of the 40*l.* at Michaelmas, 1580, whereupon Edmund Lambert still held the land, as his son John did after him, and as they had good right to do. I say this is clear, because, in John Shakspeare's own bill in Chancery in the second suit he brought against John Lambert—he abandoned the first—he admits that Edmund Lambert entered on and occupied the premises “for the space of three or four years [& took the profits], after which your said orators did tender unto the said Edmonde the sayde somme of fowerty pounds” (Halliwell's *Life of Shakspeare*), but it was of course too late. Edmund Lambert, in his answer, denies the tender; and then John Shakspeare, in his replication—flat in the teeth of his former statement that he had not tendered the money till after three or four years from November 20, 1578—declares that he did tender it within two years—namely, on Michaelmas Day, 1580. Such a contradiction must have been fatal to his claim, unless he could produce indisputable evidence of the fact; and one does not wonder that he did not proceed with his suit. Edmund Lambert says that the cause of John Shakspeare's discontent was, that the old lease of the property had nearly run out, and the land was to be let again at an increased rent, in which the said John wanted to share. At any rate, Edmund Lambert, and his son John after him, stuck to the land. Then John Shakspeare, unable to do anything in equity, turned to law, and claimed 30*l.* damages of John Lambert, the son. He alleged (Halliwell's *Illustrations*, p. 126-7) that after Edmund Lambert's death on March 1, 1587, his son, John Lambert, doubting whether

his estate and interest in the premises were not void, and having notice that John Shakspeare meant to bring an action against him, agreed on September 26, 1587, that if John Shakspeare and Mary his wife, and William his son, would when required, assure or confirm the Ashbies property to him, and hand him the title-deeds (which John Shakspeare had not handed over on the making of the mortgage, as he ought to have done), he, John Lambert, would pay John Shakspeare 20*l.*, namely, 1*l.* on November 18, 3*l.* on November 23, and 16*l.* on December 4, 1587. John Lambert did not pay the money. John Shakspeare says he went to him at his place, Burton, and demanded it on September 1, 1588. But still he did not pay it. So in Michaelmas term, 1589, John Shakspeare brought an action against him for 30*l.*, the extra 10*l.* being for the profit that John Shakspeare would have made by dealing with this 20*l.* John Lambert declared that he had never promised to pay the 20*l.* at all. Both parties put themselves on the country, and a day was appointed for the trial. But we have no record of whether the case was tried. I have little doubt that it was abandoned as “no go,” just as the two prior Chancery suits had been, though of course it might have been compromised for 5*l.* or 10*l.* At any rate, I think it certain that as John Shakspeare had dropped his claim to the land, and sued for damages, John Lambert still held the land, and did not give it back to John Shakspeare. Why should he give it back? He and his father had had possession of it for ten years. And they were clearly entitled to it, by John Shakspeare's own admission that he did not tender the mortgage money till after three or four years, instead of within two, from the date of the mortgage. The books and plays that treat of social topics always complain of money-lenders ousting extravagant young heirs and old landowners out of their estates by means of these mortgages, in default of payment on the day fixed.

This entry in the *Coram Rege* Rolls in Michaelmas Term, 1589, of John Shakspeare's action is, as Mr. Halliwell says, the only notice we have of William Shakspeare's existence during the years 1585-92. But the entry only shows that John Shakspeare said, in 1589:—1. That John Lambert said, in 1587, that if William Shakspeare would join in assuring the land to him, he would pay 20*l.*—a statement which John Lambert stoutly denied; 2. That his son, William Shakspeare, had always been willing so to join if the money had been paid. Not important intelligence of the poet certainly; but still one is grateful for anything regarding him, and one only hopes that Mr. Halliwell's searchers may be able to reward his zeal with something better for this unknown time (like Chaucer's seven years, 1360-7) some day.

F. J. FURNIVALL.

AN EGYPTIAN MODE OF BURIAL.

Brighton: November 20, 1876.

The “curious mode of interment in long earthenware pots” mentioned by your correspondent at Alexandria (see *ACADEMY*, No. 237, p. 498) can be nothing new to any resident who takes an interest in the ancient relics of that city. In May, 1860, while walking several miles along the sea-beach to the eastward of the fortifications of Alexandria, I noticed hundreds of such “earthenware pots” imbedded in the face of the low sandy cliffs which form the coast-line; they were somewhat of a sugar-loaf shape, but with one diameter greater than the other; the smaller end having no opening, and the larger end being closed with a flat cover. Their material was a thick red pottery, resembling that used for large garden flower-pots in England; and, so far as I recollect, they seemed full of sand, earth and bones, but I had no opportunity of examining them minutely. It was evident that the sea had encroached upon the nekropolis east of the ancient city, as it has upon the catacombs to the westward.

Many of these catacombs are now open to the sea on the beach, and as the floors of some of the chambers are two feet below the present surface of the sea, but yet have drainage openings leading out of them seawards, I came to the conclusion that the land has sunk at least two feet since these catacombs were excavated. Whether the new works, executed in connexion with the railway and harbour since 1860, have destroyed all these remains of catacombs on the beach, I am not aware, but there seemed to be a few remaining some months ago.

E. W. WEST.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, Dec. 2.**—3 P.M. Physical: "On some mechanical Illustrations of Thermo-electric Phenomena," by O. J. Lodge.
 3 P.M. Crystal Palace and Saturday Popular Concerts.
 8 P.M. Rosa's Opera Company, Lyceum Theatre (last night of season).
MONDAY, Dec. 4.—2 P.M. Royal Institution: General Monthly Meeting.
 5 P.M. London Institution: "On some recent Additions to our Knowledge of the Pedigree of the Horse," by Prof. Huxley.
 8 P.M. British Architects.
 8 P.M. Monday Popular Concert.
 8 P.M. Society of Arts: "Carriages from 1770 to the present Time," by G. A. Thrapp.
 8 P.M. British Archaeological: "On Ancient Canterbury," by John Brent.
TUESDAY, Dec. 5.—8 P.M. Civil Engineers.
 8.30 P.M. Biblical Archaeology: "On some recent Discoveries at Abu Simbel," by Miss A. B. Edwards; "On the Babylonian Cylinders found by Gen. di Cesnola in the Treasury of the Temple of Kurium," by the Rev. A. H. Sayce; "Notes on the early History of Assyria," by W. St. C. Boscawen; "On an Aramaean Seal," by Lieut.-Col. Prideaux.
 8.30 P.M. Zoological: "Corrections of, and Additions to, Raptorial Birds of North-Western India," Part III., by A. Anderson; "On the Fishes of Yarkand," by Dr. F. Day; "Description of new Genera and Species of Phytophagous Coleoptera," by M. Jacoby.
WEDNESDAY, Dec. 6.—8 P.M. Society of Arts: "Street Trams," by Capt. Douglas Galton.
 8 P.M. Microscopical: "On *Narcicula crassiuscula*, *N. rhomboides*, and *Frustulia saxonica* as Test-Objects," by the Rev. W. H. Dallinger.
THURSDAY, Dec. 7.—3 P.M. Crystal Palace: Production of *Alcistis*.
 7 P.M. London Institution: "On Mesmerism, Odylium, Table-turning and Spiritualism," by Dr. W. B. Carpenter.
 8 P.M. Linnean: "Geographical Distribution of Indian Fresh-water Fishes," by Dr. F. Day; "Uses of a Species of Phyllostachys," by J. R. Jackson; "On the Male Genital Ornament of the European *Rhopalocera*," by Dr. F. Buchanan White; "A General Systematic Arrangement of Iridaceae," by J. G. Baker.
 8.30 P.M. Antiquaries.
 8.30 P.M. Royal Society: "On a new Form of the Sprengel Air-pump," by C. H. Gillingham; "The Diurnal Variations of the Wind and Barometric Pressure," by F. Chambers.
FRIDAY, Dec. 8.—8 P.M. New Shakspeare Society: "On Ben Jonson's *Every Man in his Humour*," by H. B. Wheatley; a Paper by Frank Marshall; "On 'by holy' in the *Passionate Pilgrim*," by E. G. Dogget.

SCIENCE.

The Primaevial World of Switzerland. By Prof. Heer, of the University of Zürich; Edited by James Heywood, M.A., F.R.S., &c. In Two Volumes. With 560 Illustrations. (London: Longmans, Green & Co., 1876.)

Die Urwelt der Schweiz, after having been in the hands of scientific men for more than ten years, comes before us for the first time in English dress. That it should be translated at a date so distant from the period of publication sufficiently shows the editor's matured conviction of its value. Nor will many geologists be disposed to question the justice of his decision. Prof. Heer is, indeed, one of the highest authorities in the difficult departments of fossil botany and fossil entomology. The works of the venerable professor are valued, and his words respected, wherever the science of geology is cultivated. It is scarcely necessary to remind the English student that the Geological Society of London has on three occasions borne testimony to the great

merit of his labours, and in 1874 awarded him the highest honour in its gift. Mr. Heywood, therefore, deserves our warm thanks for placing before the English reader the work of so distinguished a geologist. Nor are our thanks less due to Mr. Dallas, of the Geological Society, who was entrusted with its translation, and has executed his trust with singular ability. As the reader runs through these pages, he may rest assured that he is realising the actual thoughts of the Zürich Professor, as expressed in the original edition.

But while freely acknowledging the value of *The Primaevial World of Switzerland*, we are tempted to ask whether it would not have been well to abridge the translation rather than present it in full form. Men of science will assuredly continue to consult the original work, as they have done when occasion needed during the last decade; and for those who are not free German readers is there not a French translation ready to hand? The ordinary English reader who wishes to gain an insight into the geological structure of Switzerland, will certainly rejoice to have the work brought within his reach, but we doubt whether he will care to wade through seven hundred octavo pages. Dr. Heer's attractive style of writing, which has been admirably preserved in the translation, unquestionably throws a charm over subjects otherwise dry and uninviting; yet we fancy even his power of popularisation will hardly tempt the non-technical reader to dip into a mass of local details, or go through fifty pages, for example, on the Articulata of the Swiss Miocene beds. The work, in fact, presents a curious interblending of popular and technical writing: the popular part may be tolerated by the scientific student, but we are not sure that the technical part will be equally tolerated by the non-scientific reader.

A notable feature in this work consists in the numerous tinted illustrations in which attempts have been made to restore the primaevial world of Switzerland. Dr. Heer has taken the fossils preserved in the various geological formations of his country, and, by giving them living forms and bringing them together in judiciously-disposed groups, has endeavoured to reproduce the history of Switzerland at successive geological periods. The work of restoration in one shape or another is the great work of geologists. It is their business, as Mr. Gladstone says on another subject, "to piece together, as children do with a pattern-map, the fragmentary annals of the Past." Unfortunately, however, they find that many a piece of the map is missing, and thus they can never pretend to present a perfect restoration of the physical features of a country, or of its fauna or flora. Such restorations as are not uncommon in popular geological works are too often illuminated by the coloured light of the restorer's own imagination. Although Prof. Max Müller says, with much justice, that "the torch of imagination is as necessary to him who looks for truth as the lamp of study," yet in geological matters the light of the restorer's imagination has often led him astray. We are glad, therefore, to observe that Prof. Heer with great discretion

has included in his restorations only such elements as his palaeontological studies unquestionably warrant. As we approach towards modern times the data become more numerous, and we are consequently more likely to have trustworthy restorations. Thus we should be inclined to pin our faith on Prof. Heer's view of "Lausanne during the Miocene period" with greater readiness than on his restoration of "Basle during the Keuper period." For the Miocene flora and fauna of Switzerland are well preserved, and have been diligently studied—thanks to the indefatigable labours of Prof. Heer—but as much can hardly be said of the relics of the far older Keuper period. The mention of the term "Keuper" suggests that it may be well to quote from our author the supposed meaning of this curious word, which has so long been a standing puzzle to geologists in this country:—

"In Coburg, 'Keuper' or 'Köper' is the name given to a variegated checked stuff; and from this, no doubt, a variegated rock belonging to the Trias which occurs there has received the same name. Leopold von Buch transferred the local denomination to the whole formation."

With reference to the editorial improvements we may remark that Mr. Heywood has added an attractive tinted plate representing Swiss miocene life, as portrayed by Prof. Holzhalt in an oil-painting which adorns the Geological Museum of the Zürich Polytechnic. We are also indebted to the editor for appending a translation of a paper by Prof. Rüttimeyer published in last year's *Archiv für Anthropologie*, in which he describes some relics of human workmanship in the shape of pointed wooden rods found in lignite of interglacial age near Wetzikon. It is pleasing to note that in this, and many other respects, the work has been brought well up to date, but on the other hand we meet here and there with passages which would certainly have been improved by slight modification.

In closing these volumes we may confidently recommend those who are not already familiar with Prof. Heer's writings to commence their acquaintance with them through the medium of this excellent translation. The tourist of geological tastes who is about to visit Switzerland should by no means overlook this work, for he will find in Dr. Heer a most trustworthy and painstaking guide to everything that bears upon the geology of his country. A glance, too, at the little coloured map which forms the frontispiece to the first volume will give an excellent notion of the broad features of Swiss geology.

F. W. RUDLER.

Mandäische Grammatik. Von Theodor Nöldeke. (Halle: Waisenhaus, 1875.)

THE important facts derived from the active pursuit of comparative philology of languages belonging to the Aryan branch awakened the Semitic scholars out of their somewhat lethargical state. Why should we not follow the footsteps of Bopp by creating a comparative Semitic grammar? said probably M. Renan, when he began to compose his excellent history of Semitic languages. Well, he made the attempt,

but soon came to a standstill: he could do no more than treat of the Semitic dialects as spoken by the various tribes, but not trace them back to the Sanskrit of the Semitic dialects. And it is, we are afraid, a hopeless case for this branch of languages, for neither Hebrew and Phœnician, nor Assyrian, and much less Arabic, can claim to be the most ancient. We must, therefore, be satisfied with the comparison of one dialect with another, but we shall never find laws for the gradual change of consonants and vowels in the Semitic branch, such as are established in the Aryan. Now, for this comparison, which in our opinion will remain the *omega* of Semitic scholars, we must, at all events, have grammars of the various dialects, elaborated by specialists; and here we find Semitic scholars in no way behind the Aryan. There is no need of saying that for the languages of which we possess a comparatively large literature—viz., Hebrew, Arabic, Syriac, Aethiopic—the utmost has been done as to their grammar by old and modern scholars, such as Ewald, Olshausen, Wright, Dillmann, Merx, and many others. The grammar of Samaritan, Chaldee, and the dialects of the Mishnah and the Babylonian Talmud is also well known; and the last few years have produced minute grammars on branches known only from inscriptions, such as Dr. Schröder's Grammar of the Phœnician language, and those of Oppert, Schrader, and Sayce on the Assyrian. We may also expect soon a grammatical guide for the Himyaritic dialect, based on the numerous inscriptions brought to France by the well-known Joseph Halévy. We have also grammars of the Arabic as it is spoken now in various countries, as well as of the Neo-Syriac; the latter is by the eminent scholar Prof. Nöldeke, who has also recently brought out one on the Mandaic dialect, which he began partly in the *Transactions* published by the University of Göttingen.

The Mandaic tribe are in the same position as the actual Samaritans: both are daily diminishing in number, both know little at the present time of their literature, and both have a dialect which may be called a degenerated one from the Aramaic or Syriac language. There is, however, one difference between the two tribes, and it is an essential one—viz., that the Samaritan dialect can be understood without equivocation, because we possess a literal Samaritan translation of the Pentateuch, while the Mandaic books are full of a degenerated mysticism, and therefore the sense of many passages in them cannot always be defined with certainty. We are told that there was only one single man among this small tribe—which inhabits the most unhealthy part of lower Babylonia and Khuzistan—who could give Dr. Petermann any information about the traditional explanation of their books and the pronunciation of their ancient dialects. Dr. Socin, who visited them only four years ago, could no longer obtain such information. If Rashi's (R. Salomon's, of Troyes) commentary on the Babylonian Talmud did not exist, many passages of this work would remain obscure; such is, indeed, the case with the Talmud of Jerusalem, the early commentaries on which are lost. Much more difficult, indeed, than the Talmuds are the Mandaic

books, and without a native exegetic guide, Prof. Nöldeke justly says, it will be impossible always to give the right meaning of many words. Unhappily by the death of Dr. Petermann we have now lost the only one who possessed the native tradition, and so with him have lost the tradition itself.

Let us now say a word about the religion of this sect and about their books as known from various libraries in Europe. For the former we shall simply give the following passage out of Prof. Nöldeke's preface (p. xix.):—

"The confused religious ideas found in the books of the Mandaites may be traced back to the most important spiritual movements of the first century of Christianity. We obtain from them, in some respect, very faithful reflexes of important systems of Gnostics of whose writings we possess only very little, especially of the Manichean, the most important and most prominent of all. On the other hand, we find here represented doctrines and usages of those Judeo-Christians who, mixed with heathen elements, appear as the *Elkesaites*, and later in Babylon as the *Almugh-tasiles* (the Ablutionists). These elements, partly homogeneous and partly entirely heterogeneous, have been mixed up in the religion of the Mandaites in the most strange and even often rough and ridiculous manner. They call themselves *Nasarayé*, that is Nazarenes or Christians, yet they consider Jesus a wicked being, and the Holy Ghost, whom, following an old Judeo-Christian idea, they regard as his mother, a cunning, devilish woman. Nevertheless, they are really a kind of Christians: there is nothing they lay so much stress on as the orthodox Christian idea of the Redemption; only, just as the Manichees, they do not take the historical Jesus to be the Redeemer, but the *Mandā d'Hayé*, the incarnation of the *γνώσις ζωής*, and hence they call themselves *Mandayé* (Mandaites). To these Christian elements we may add those derived from the Persian fire-worship, and there are even to be found traces of the old Babylonian heathenism. One can easily conceive that a careful investigation of the Mandaic writings, which unfortunately for the most part can only be explained with the greatest difficulty, must be of great interest for the history of religion."

Their books are the following: (1) The *Ginzā*, or the Treasure, called also *Sidrā rabbā* or the great book, badly edited by Norberg (1815 and 1816) under the title "*Codex Nazaraeus, liber Adami appellatus*," and re-edited by Dr. Petermann in the original characters under the title of "*Thesaurus, sive liber magus vulgo 'liber Adami' appellatus*" (Berlin, 1867). This is the oldest book of the Mandaites and of the highest importance for the grammar of their dialect. (2) The *Sidrā d'Yahyā*, the Book of John, called also *D'rāsē d'malké*, Homilies of the Kings, which exists only in MSS. (3) The *Qolasta*, "Hymns and rules concerning the Baptism and the Departure of the Soul" (edited by Dr. Euting (Stuttgart, 1867), and the book of marriage form (only in MS.). The last two, although of a more recent date, are equally important for grammatical purposes. Of a still more recent date are (4) the *Divān*, or "Explanation of the Performances necessary for the Expiation of Religious Crimes;" and, finally (5), the astrological codex, both in MS. Prof. Nöldeke has based on the first three books his excellent Grammar of the Mandaic dialect, of which we chiefly have to admire the syntax. The language as well

as the grammatical forms of the earlier Mandaic dialect (there is a more recent one, just as with the Samaritans, which is rather an artificial dialect kept up by some half-learned men) agrees mostly with that of the Aramaic part in the Babylonian Talmud, composed in the neighbourhood of the country where the Mandaites lived. Prof. Nöldeke has made full use of that vast collection of Rabbinic learning, without neglecting the *variae lectiones* made by Rabbino-vicz from the MS. of Munich. He acknowledges, also, Luzzatto's part of the Grammar of the Babylonian Talmud. Prof. Nöldeke not being a professed Talmudic scholar, we must not cavil about some omissions. For instance, at the passage (p. 58) where he speaks about the confusion of the gutturals he might have mentioned the authority of the Talmud of Babylon (*Erublin*, fol. 53^a) concerning the pronunciation of the Galileans. The *Halakhoth gedoloth* composed in Aramaic dialect also, and probably in Babylonia about the ninth century, might have been of use for comparative matter, although we must confess that the editions of it are in a most pitiful state.

AD. NEUBAUER.

SCIENCE NOTES.

GEOLOGY.

"DIMETIAN" and "PEBIDIAN" are two new words which have just been added to the geologist's vocabulary by Dr. Hicks. This acute geologist, who has worked with such excellent effect among the entangled rocks of Pembrokeshire, has directed attention to the ancient ridge which, passing directly beneath the city of St. David's, runs for about five miles in a north-easterly course, while in the opposite direction it extends to the coast of St. Bride's Bay. This ridge forms the geological axis of the district, and supports upon its flanks the beds of the Harlech or Longmynd group, which, without doubt, extended at one time completely across the central mass. The rocks of this ridge are therefore clearly of pre-Cambrian age. Now the vast series of pre-Cambrian rocks in Canada constitute the Laurentian system, and it has been the fashion of geologists to refer to this system any rock which may be older than the Cambrian, wherever situated. Most geologists placed in Dr. Hicks's position would, therefore, have rashly jumped to the conclusion that the St. David's ridge should likewise be called Laurentian. There would, however, have been no reason for this correlation, save the single fact that both series of rocks are certainly older than the Cambrians. But obviously there may have been a vast difference of age between the Canadian and the Welsh rocks; and, in the absence of either lithological or palaeontological evidence, Dr. Hicks has done well to forbear from committing himself to any expression of opinion as to the relation of the old Welsh rocks to those in other parts of the world. To distinguish, therefore, the pre-Cambrians of Pembrokeshire, a local name was clearly desirable. Dr. Hicks has been able to divide the series into two groups, unconformable to each other; the lower of these groups he terms *Dimetian*, from the ancient name of the district; while the upper he distinguishes as *Pebidian*, from the Welsh name of the Hundred. It is satisfactory to learn that the mapping of this ancient ridge, as laid down by Prof. Ramsay on the Geological Survey map thirty years ago, is still remarkably accurate in its broad features, and the principal change in our interpretation of the facts is consequent upon the advance which has since been made in certain branches of geological science.

THAT singular tract in India, known commonly as the Great Desert, lying on the east side of the Indus, between Sind and Rájputana, has been recently described by Mr. W. T. Blanford, in the *Journal of the Asiatic Society of Bengal*. Although the peculiar nature of this district has often been described, Mr. Blanford's observations on its physical geography, coming from an experienced field-geologist who has recently traversed the country, are of especial value. From the saltiness of the soil, and the discovery of a marine mollusc, *Potamides (Pirenella) Layardi*, in some of the small salt-lakes in the so-called desert, he concludes that within very recent times the Ran of Kachh must have been part of an inlet of the sea, which certainly extended for a considerable distance up the eastern edge of the area now occupied by the Indus alluvium, and possibly occupied the whole alluvial area of the Indus Valley. The central part of the desert, however, was not covered by the sea, but formed either an island or a promontory. A large part of the surface is covered with sand-hills of considerable height, known locally as "Thar." The origin of these hills has been a matter of dispute, and Mr. Blanford does not commit himself to any decided opinion on the subject; he evidently inclines, however, to the supposition that the tract of country along the edge of the Indus alluvium was originally covered by sand to the height of the present sand-hills, and that the valleys between the hills have been cut out by "wind-denudation," the sand having been scoured out of the valleys by the wind, leaving intervening ridges which stand out as the present sand-hills.

METAMORPHISM is a subject which needs for its elucidation the combined studies of the geologist, the mineralogist, and the chemist. Herr Unger's paper, with which the last number of the *Neues Jahrbuch* opens, is a valuable contribution to the chemical side of the subject. A mass of granite intruded among clay-slates at Barr-Andlau, in Prussia, has altered the slate in the neighbourhood of contact, giving rise to the formation of nodular schist (*Knotenschiefer*) and andalusite schist. Nine analyses have been made, with the view of determining whether such alteration has been accompanied by chemical changes or not. The analyses of the altered and unaltered slates are, however, remarkably similar; and no relation can be traced between the slight chemical variations exhibited by some of the specimens, and the extent of their metamorphism. It appears therefore, that the alteration which the rocks have suffered, and the development of the crystalline minerals, are purely the results of molecular changes, nothing having been added to the rocks and nothing taken away.

IN the rhaetic beds of the Krälah, near Hildesheim, the wings of several fossil insects have been discovered, associated with plant remains. These fossils are described by Prof. Ferdinand Roemer in the current number of the *Zeitschrift of the German Geological Society*. They have been referred to three new species of Coleoptera; one named *Elateropsis infralassica*, another *Helopides hildesensis*, and the third unnamed. No remains of insects referable to this geological period had previously been found in Germany.

WE have received *The Report of Progress of the Geological Survey of Victoria*, by Mr. Brough Smyth, the Secretary of Mines for the Colony. It forms a volume of upwards of 300 pages, filled with details of much value, but for the most part of only local interest. Several members of the Survey have contributed Reports on the Geology, Mineralogy, and Physical Structure of various parts of the colony; and these are sufficient evidence of the energy with which the Survey of Victoria is being prosecuted by Mr. Smyth and his colleagues. From the *Mineral Statistics* for the year 1875 we learn that quartz-mining is still progressive, though the alluvial workings are not so productive; the total yield of gold raised in

Victoria during 1875 is less than that extracted in the previous year by about 60,185 ounces.

A NEAT little manual of *Historical Geology*, by Mr. James Geikie, F.R.S., has been recently issued by Messrs. Chambers in their series of *Elementary Science Manuals*. The publishers are to be congratulated on having secured for the preparation of this little work the services of a distinguished officer of the Geological Survey of Scotland, who has made his mark by the publication of the *Great Ice Age*. Mr. Geikie's descriptions, though necessarily succinct, are thoroughly trustworthy; and this is all that can be expected in an elementary work, where originality is, of course, out of the question.

Two lectures, prepared for delivery at the Edinburgh Philosophical Institution, by Prof. Page, have been published under the title of *Geology: its Influence on Modern Beliefs; being a Popular Sketch of its Scientific Teaching and Economic Bearings* (Blackwood and Sons). The author is so well known as a prolific writer on popular geology that it is almost needless to remark that these essays may be read with a good deal of pleasure. It is true they contain nothing new, but they set forth in attractive form some of the leading teachings of modern geology.

FROM Germany the news reaches us of the death of two distinguished geologists. Heinrich Credner died at Halle-on-the-Saal, after a tedious illness, on September 28. He was born in 1809, at Waltershausen, near Gotha. After studying at Freiberg and Göttingen, he entered official mining life, first in the service of the Duchy of Gotha, then in that of the Kingdom of Hanover, and afterwards of Prussia. Among Herr Credner's chief writings we may note his *Uebersicht der geognostischen Verhältnisse Thüringens und des Harzes*, 1843; *Versuch einer Bildungsgeschichte der geognostischen Verhältnisse des Thüringer Waldes*, 1855; *Ueber die Gliederung der oberen Juraformation und der Wealdenbildung im nord-west. Deutschland*, 1863; and *Geognostische Karte der Umgegend von Hannover, mit Erläuterung*, 1865.

WE regret that we have also to announce the death of Franz Foetterle, one of the most prominent members of the Geological Survey of Austria. Born at Bramotitz, in Moravia, on February 2, 1823, he joined the staff of the Survey in 1849, and rose by his great diligence and ability until he was appointed Vice-Director in 1873. His premature death, from heart disease, will be sincerely lamented by all who take interest in the progress of the great scientific work which is being carried on in the Austro-Hungarian Monarchy.

METEOROLOGY.

Report of the Permanent Committee of the Vienna Congress.—The second Report of this Committee has now appeared, containing the account of the proceedings at the meeting held in April last, and of the preparations for the next Congress, to be held at Rome in September, 1877. The most interesting portions of the Report are the particulars which it contains as to the organisations and methods of observation in different countries.

Physical Meteorology.—Profs. Guldberg and Mohn, of the University of Christiania, have published the first part of a mathematical investigation into the movements of the atmosphere,* in which they have endeavoured to apply the principles of mechanics to the solution of the problems before them, and with very marked success hitherto. They state their conviction that among the most pressing wants of the science must be recognised those of observations from high levels,

* *Etudes sur les mouvements de l'atmosphère. 1^{re} Partie.* Christiania, 1876.

and of additional stations in the tropical regions of the earth. They have employed extensively the data afforded by the publications of the Meteorological Office on the meteorology of the Atlantic doldrums. The whole paper is a most valuable contribution to the science.

Barometric Measurement of Heights.—Dr. J. Hann has laid before the Vienna Academy an interesting paper on the influence of the correction for vapour tension on the calculation of mountain heights, which appears in their *Sitzungsberichte*. He shows how in the commonest case, that of the deficiency of hygrometrical observations at the upper station, a formula proposed by himself (*Journal of the Austrian Meteorological Society*, 1874, p. 198) gives, without the employment of vapour tension, results according most closely with those derived from the actual observations. In the case of the entire absence of all hygrometrical information, he proceeds from the Relative Humidity, for which he assumes a certain probable value, according to the season and the hour of the day, and the meteorological conditions of the country, and gives for this purpose tables suited to all climates, the adoption of which in all hypsometrical tables he strongly recommends. From the long attention which Dr. Hann has paid to the subject of hypsometry his remarks will carry great weight. The paper concludes with an interesting deduction from Babinet's abbreviated formula for mountain heights. The difference of heights which corresponds to a change of a single unit (e.g. 1 mm.) of pressure at any level is given by dividing the height of a homogeneous atmosphere by the pressure at the level in question, and multiplying the quotient by $(1 + at)$.

Kew Observatory.—The Report of the Kew Committee was read at the Anniversary Meeting of the Royal Society, and we are glad to learn from it that the state of the work and of the finances is satisfactory. While the ordinary magnetical and meteorological work has been maintained, the verification of instruments has exhibited a steadily increasing activity, the amount of fees derived from this source having increased 34%, being at the rate of about 10 per cent. Mr. George M. Whipple, B. Sc., has been appointed Superintendent, a post which he may be considered to have fairly earned, as he entered the observatory in January, 1858, and has worked successfully through the different steps in the establishment.

Meteorology of Canada.—Prof. Kingston has issued his fifth Report, a bulky octavo of 523 pages, of which more than half is occupied by a reproduction of the tri-daily weather reports from some thirty stations, the remainder consisting of tables of mean results for each element at each station, of the daily extremes of temperatures, and of rain tables. The Report itself shows a goodly amount of work effected in the face of many difficulties inevitable in such a sparsely populated and comparatively poor country, and is highly creditable to its author, to whom the entire system owes its existence.

Meteorology of Holland.—Prof. Buys Ballot has published his *Marche Annuelle du Thermomètre et du Baromètre en Néerlande*, from thirty-two years simultaneous observations, which is a sort of sequel to his well-known work with a similar title, published in 1860. In the preface we find, not only the precise method followed in the calculations, but a most interesting digest of the contents of the successive volumes of the Dutch *Jaarboek*, extending back to the year 1849, which enables us to trace the thread of reasoning running through the whole series, and the gradual development of the ideas, sketched out at the commencement of the undertaking by its author. It shows how the systematic prosecution of ocean meteorology was proposed in 1850, and only two years later the suggestion of synoptic weather-charts for the entire globe was made in Pog-

gendorff's *Annalen*; a suggestion only carried out some twenty years later, and generally supposed to have been first made by the Chief Signal Office at Washington. These few pages of self-justification may be permitted to Prof. Buys Ballot when we see what a mass of solid contributions to the science has been elaborated under his superintendence. The paper itself consists, firstly, of the normal means for temperature and pressure; secondly, of the differences between these normals and those formerly employed; and, lastly, of the deviations of the actual temperature and pressure from the normals at each station, and for each hour of observation.

Climate of Geneva.—Prof. E. Plantamone has published, under the title of *Nouvelles Etudes sur le Climat de Genève*, a continuation of his former paper on the same subject, published in 1863, which referred to the observations up to the end of 1860. The present paper, extending to 264 pages, 4to., contains the results of the fifteen succeeding years, and may justly be considered as a monograph on the subject of the climate of a limited district: each individual element being discussed on strict mathematical principles, and the results explained at length in the text. The present work is self-contained, which is a great convenience, for the more important tables in the former volume have been reproduced. M. Plantamone may be considered as one of the foremost of "climatological," as opposed to "weather," meteorologists, and this work is a solid contribution to the literature of the science. Among other tables it gives one for the mean value, for every day in the year, of the temperatures of the air and of the Rhone, of pressure, vapour, tension, and humidity. It is interesting, as bearing on recent theories, that the author is unable to detect any trace of periodicity in the occurrence of cold or warm years, or in rainfall.

Climate of the Amur.—Dr. L. von Schrenck has at last brought out the meteorological portion of his travels in this region.* The volume, however, does not confine itself to the author's own observations, but contains a complete *résumé* of all the existing Russian observations in that part of the world, much of the material having originally appeared in the *Correspondance Météorologique*. The discussion has been carried on by different hands, having been entrusted first to Wesselovski, then to Kämtz, until his death in 1867. W. Köppen then took it up until he went to Hamburg in 1876, and the final completion of the work has been undertaken by Fritzsche, who, besides his residence at Peking, was further qualified for the task by his repeated journeys in Eastern Siberia. The actual observations at ten stations, such as they are, are given for various points, and to them is appended a discussion of the different elements—pressure, temperature, wind, cloud, and rain—but some idea of the paucity of material in some respects may be gathered from the fact that the entire subjects of humidity and rain only occupy two pages out of 372. We have, however, much reason to be thankful to the Academy of St. Petersburg for enabling Dr. von Schrenck to give us what may be deemed to be all the available material for the district.

Agricultural Weather-Warnings in France.—A very interesting account of this system, noticed in our number for August 5, will be found in *La Nature* for November 11 and 18. It appears that the system is in full operation in at least three departments, and at Limoges, Poitiers and Clermont-Ferrand the observations transmitted daily by telegraph are entered on charts by the local authorities and posted up for public inspection at the respective Mairies. The main obstacle to the introduction of a similar system here is the want of funds for telegraphy.

* *Reisen und Forschungen im Amur-Lande in den Jahren 1854–56.* Vol. iv. part 1. (Leipzig: Voss.)

MEETINGS OF SOCIETIES.

METEOROLOGICAL SOCIETY.—(Wednesday, November 15.)

H. S. EATON, Esq., M.A., President, in the Chair. The following papers were read:—"Results of Meteorological Observations made at Rossinière, Canton Vaud, Switzerland, during 1874 and 1875," by William Marriott; "The Climate of Fiji," by R. C. Holmes. This paper contains the results of meteorological observations taken at Delanasau, Bay of Islands, north coast of the province of Bua, Fiji, during the five years ending 1875. The average annual mean temperature is 79°·1. The highest temperature recorded was 97°·7 on January 12, 1871, and the lowest 58°·5 on August 20, 1875, the extreme range in the five years being 39°·2. The average annual rainfall is 124·15 in., and the number of rainy days 170. The greatest fall in twenty-four hours was 14·95 in., which occurred on March 19, 1871. After describing somewhat fully the chief characteristics of the months and seasons, hurricanes and storms, earthquakes, waterspouts, &c., the author concludes with the question, "Is the climate of Fiji a healthy one?" In reply he says that, considered as a tropical country, an affirmative answer may be given without hesitation. Those fatal diseases so common in tropical countries, fevers of various kinds, cholera and liver complaints, are almost unknown. This is owing partly to the geographical position of the group, lying in the region of the Trade winds, so that it enjoys almost perpetual breezes, calms being rare, and the islands so small that the sea-breeze from all directions can penetrate into every corner.—"Notes on some remarkable Errors in Thermometer Records at Sydney Observatory, 1876," by H. C. Russell. For upwards of five years the same hygrometer has been in use at the Observatory; the dry bulb is small, only 0·3 in. in diameter, and the instrument up to February 26 had always given very satisfactory readings, tested by those of a standard which hangs only 3 in. from it; the difference in the readings was usually 0°·2 to 0°·3. On that day the maximum shade temperature rose to 96°·4 about noon; at 3 P.M. the dry bulb and standards read 83°·7, and at 9 P.M. 68°·9 and 69°·0. Next morning they read 69°·6 and 69°·8; as this was Sunday they were not read again until 9 A.M. on the 28th, when the dry bulb read 87°·3 and the standard 64°·9, showing a difference of 22°·4. It was at once thought that the glass had cracked and let in the air, but, as no crack could be seen after careful examination, it was determined to continue the readings. The author had always found before that if a thermometer cracks in the bulb the mercury rises till the tube is full, and he expected it would be so in this case, though he could see no crack. The result, however, was that the difference steadily decreased, at first at the rate of 1° each day, and in thirty-five days the difference had fallen less than 0°·5, or almost to its normal condition. Between April 7 and 17, it rose again, then fell; on May 3, and again on May 7 sudden rises took place, since then the difference has been diminishing, except a slight rise on May 21 and 22. When very closely examined with the microscope, a very small piece of coloured glass is to be seen in the bulb, as if lead had been reduced by the blowpipe, and on one side of the bulb a mark is visible, as if there was a minute quantity of water between the mercury and the glass at one spot.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—(Wednesday, November 15.)

THOS. MORGAN, Esq., F.S.A., in the Chair. Mrs. Baily forwarded some curious oak carvings, one of which, a Madonna and Child, of late date, was remarkable for some attributes of a much earlier period.—The Rev. S. M. Mayhew exhibited a curious tile from Ludlow, with a portrait of Our Lord in yellow lines on a red ground, and various other relics, from recent excavations in London.—Mr. Huyshe showed a beautiful Italian vase made of a ware closely resembling ancient Samian.—Mr. De Gray Birch read a Report upon the portraits of the Abbots of Evesham, which, he had discovered from documentary evidence, had been removed from the celebrated abbey at that place and refixed in the church of Preston-on-Stour. The Report was prepared by the Rev. M. Batt and Mr. Herbert New, of Evesham.—The discovery was announced by Mr. Trigg of an inscribed sword found

at Farnham, on the site of the battle of 1173.—The Rev. M. Smith reported the discovery of some curious Saxon carvings in the church of Dinsdale, near Darlington, and Mr. H. J. F. Swayne forwarded some elaborate sketches of the old frescoes in the Swayze Chapel of St. Thomas, Salisbury; also a drawing of the interesting Saxon Arch at Britford Church, built partly of Roman brick in the Roman manner, and with interlaced patterns, which determine the date. The drawing was ordered to appear in the *Journal*.—In the absence of Mr. C. Roach Smith, his elaborate paper was read by Mr. Isaac, detailing his survey of the Roman Stane street from London to Chichester. The perambulation was commenced at Ewell and continued to its termination.—Mr. Loftus Brock detailed the discovery of a part of the Roman wall of London in Camomile Street, and also that of several sculptures of much interest found built up as old material within it, on its demolition. The discovery of further sculptures and the head of a statue of large proportions, and probably of the period of the Antonines, was also announced, and Mr. Haviland exhibited a rubbing from one of the stones.—The proceedings were brought to a termination by the exhibition of the illuminated address of the Town Council of Bodmin to the Association, and by two papers, by the Chairman, on recent excursions into Kent made by the Council, and on the results of the recent Cornwall Congress.

LINNEAN SOCIETY.—(Thursday, Nov. 16.)

PROF. ALLMAN, President, in the Chair. Mr. R. Bowdler Sharpe gave the gist of a memoir "On the Birds collected by Prof. Steere in the Philippine Archipelago." It appears some 285 species are now registered from the region in question, and of these sixty are new ones, obtained by Prof. Steere. This large addition is remarkable, since only lately Lord Tweeddale (President Zool. Soc.) issued an excellent monograph of the Philippine Avifauna, containing very many entirely new forms.—A paper "On the Flora of Marion Island" was read by Mr. H. N. Moseley, of H.M.S. *Challenger*. The isolated position of this island, nearly 500 miles distant from the Crozets, and over 1,000 from Kerguelen Land and the African Continent, lends an interest to its flora; and the more so since the vegetation exhibits relations rather to the Falklands and Fugea, distant 4,500 miles. Marion Island is of volcanic origin, and snow-clad. About midwater mark *Darvillea utilis*, and above highwater mark *Tillaea moschata* grow abundantly. Beyond the beach a swampy, peaty soil covers the rocks, and upon this a thick herbage, composed of such genera as *Acarna*, *Azorella*, and *Festuca*, flourishes. The *Pringlea antiscorbuta* is not so abundant as at Kerguelen's Island. Of ferns four kinds were obtained, *Lomaria alpina* being most numerous; there are few lichens. Great yellow patches of mosses are scattered here and there among the green vegetation up the hill-sides to near the snow line. Mr. Moseley suggests there having been once a connexion between Marion Island, the Crozets, and Kerguelen Land, partly from the occurrence of *Pringlea* on all three, and from the existence of fossil tree-trunks on the two latter, besides other data relating to their physical constitution, &c. He attributes the Antarctic drift and even birds as the probable carriers of seeds giving prominence to the Fugean flora.—A letter from a correspondent in allusion to the grasshopper *Caloptenus femur rubrum* was noticed, and two specimens of this devastating insect shown.

PHYSICAL SOCIETY.—(Saturday, November 18.)

PROF. G. C. FOSTER, President, in the Chair. Mr. Tylor read a paper on the "Cohesion and Capillary Action of Films of Water under Various Conditions." The author endeavours to eliminate the action of all forces except that of gravity by immersing his "valves" in water. The models which he exhibited consisted of glass tubes about three inches in diameter and six inches high, filled with water and containing each a piston, which, on being raised, was capable of lifting by cohesion a heavy mass of metal, the nature of the surfaces in contact differing in the several instruments. From experiments with them he concludes that the time during which a heavy valve can be supported depends on the size of the surface of contact, the difference of pressure within and without the moving parts, and the smoothness of the valves. On

the contrary, dry bodies, such as Whitworth's surface planes, will adhere for an indefinite period. Mr. Tylor considers that the supporting of a body in water is due to a difference of pressure in the water itself, and he adduced Giffard's Injector as showing that such differences can take place. He has also studied the form assumed by a drop of water at a tap, and considers that when a fly walks on a ceiling its weight acts in the same manner as the heavy valves in the models exhibited. Prof. Shelley exhibited some of Sir Joseph Whitworth's surface planes and gauges, and showed their bearing on the subject.—Dr. Stone then projected on to the screen the spectra produced by the diffraction gratings which he exhibited at the last meeting of the Society. When received on a screen at a distance of 25 ft., they showed bright bands in the red and violet, after transmission through a strong solution of permanganate of potash. Mr. Clark has since ruled for him gratings on the backs of right-angled prisms, and Dr. Stone has cemented, by means of glycerine or oil of cassia, gratings on glass and steel on such prisms. The lines were two thousand and three thousand to the inch.

ROYAL ASIATIC SOCIETY.—(Monday, November 20.)

SIR EDWARD COLEBROOKE, Bart., M.P., President in the Chair. A paper, contributed by Captain E. Mockler, was read, giving an account of some excavations made by him at Gwader in Makran during the spring of the last year, the results he obtained showing clearly that this portion of Asia must have been occupied at a very early period by a population using flint implements and other prehistoric objects.

ZOOLOGICAL SOCIETY.—(Tuesday, November 21.)

PROF. FLOWER, F.R.S., V.P., in the Chair. Mr. Sclater exhibited and made remarks on the skin of a young Rhinoceros (*R. sondaicus*), belonging to Mr. W. Jamrach, which had been captured in the Sunderbunds, near Calcutta, in May last.—The Secretary exhibited, on behalf of Mr. Andrew Anderson, a coloured drawing of a specimen of *Emys Hamiltoni*, lately captured at Futteghurh (Ganges). The occurrence of this *Emys*, chiefly confined to Lower Bengal, so far west as Futteghurh, was considered as of much interest.—A letter was read from Count T. Salvadori, containing remarks on some of the birds mentioned by Signor D'Alberty, as seen by him during his first excursion up the Fly River.—A communication was read from Mr. G. B. Sowerby, jun., containing descriptions of six new species of shells, from the collections of the Marchioness Paulucci and Dr. Prevost.—Mr. Edward R. Alston read a paper containing the descriptions of two new species of *Hesperomys* from Central America, which he proposed to call respectively *Hesperomys teguina* and *H. couesi*.—A paper was read by Prof. Garrod, F.R.S., on the Chinese Deer, named *Lophotragus michianus*, by Mr. Swinhoe, in which he showed that the species so called was identical with *Elaphodus cephalophus* (A. Milne Edwards), obtained by Père David in Moupin. The close affinity between the genera *Elaphodus* and *Capreolus* was demonstrated, the latter differing little more than in the possession of frontal cutaneous glands not found in the former.—Mr. Arthur G. Butler read a paper containing descriptions of new species of Lepidoptera, from New Guinea, with a notice of a new genus.—A communication was read from Dr. J. S. Bowerbank, being the eighth of his series of "Contributions to a General History of the Spongiadae."

ROYAL SOCIETY.—(Thursday, November 23.)

DR. HOOKER, C.B., President, in the Chair. The following papers were read:—"On the Influence of Geological Changes on the Earth's Axis of Rotation," by Geo. H. Darwin; "On the Structure and Development of the Skull of the Urodelous Amphibia," by Prof. Parker.

FINE ART.

THE SOCIETY OF BRITISH ARTISTS.

(Second Notice.)

WE have already spoken of the principal pictures in this exhibition, and will now conclude what we have to say regarding it.

Figure-pictures.—J. R. Dickinson, *Market-day, Norway*; a rather noticeable combination of the

crowd of small figures with the large features of the scenery—the colour too husky. Miss C. J. Weeks, *Fourscore Years and Ten*, a head of an aged gentleman (far less aged-looking, however, than his years might suggest), of a somewhat Carlylean cast of countenance. Haynes King, *Scribbling*; a young cottage-woman—a clever little picture in its way, the best which the artist contributes. Cattermole, *Parted*, represents a cavalier dead in the snow, and his horse scanning him with uneasy solicitude; well realised in its facile picturesque way. Mrs. J. L. Cloud, *The Difficult Lesson*; a little boy on a stool, perplexed over his task, and almost sulking himself off (it might seem) into a doze—cleverly expressed. F. S. Walker, *Idle Hours*; a gentleman and lady enjoying themselves beside a stream thronged with water-lilies; skilfully touched in light and sheen, in a manner that reminds one somewhat of the late Frederick Walker. Cerio, *First Sorrow*; an Italian girl mourning her lifeless turtle-dove—true and gentle in expression, and fairly done. L. Smythe, *Spring*, portrays a girl, dressed in a violent tint of blue, gathering cowslips by a rivulet: it evinces some faculty, but over-confident, and not well directed. Miss B. Jenkins, *Little Jack Tar*, and *Happy-go-lucky*; two heads of boys, bright in painting and expression, and, if the artist is youthful, promising. H. Leslie, *The Pony-stable*. The pony is inside his stable, and only his head is visible, projecting over the door, and fronting you point-blank; a little girl holds out towards him a slice of bread and butter. No doubt the artist felt a certain childish oddity in this combination, and he conveys the same impression to the spectator. Miss S. Beale, *Paris Sweepers*; a line of dilapidated women trudging along through slushy snow with their brooms, appropriately dismal. Sembach, *Young Jessica*, a girl dressed in sky-blue, lying on a couch, a rather piquant sketch. Miss G. F. Koberwein, *Little Sunshine*, a careful study of a small girl. Miss W. A. Walker, *Study of a Head*—a female head, vigorous in swerve, and in light and shade, but the vigour is not duly blended with delicacy.

Landscapes.—Penstone, *The Last Gleam*; a pleasant homely view, with sheep and figures; the colour is a little crude, yet heedfully handled. D. Carr, *On the Turn*; a good river scene—our own Thames, it would seem. Miss H. Montalba, *Landscape, Naas, Sweden*; nice, but unfinished; a woman, knitting as she walks, and accompanied by some geese, follows the pathway through a riverside woodland. A. F. Grace, *An Early Summer Morning among the South Downs*; an agreeable rightly-felt landscape, with numerous sheep, well drawn, and with plenty of varied action. Meyer, *Near Beddgelert, North Wales*, *Moonlight*; a rather large and creditable view—termed "a sketch" in the catalogue, but by no means more sketchy than many other works to which the same modest designation is not applied.

In *Still-life*, the *Flowers* (94) of Mr. Muckley, and *Apples*, by Mr. Holliday, are to be observed; the former shows uncommon force and litheness of hand.

Water-colours.—Yeend King, *Evening*, with sheep passing a gate, nice in feeling. A. Duncan, *Autumn on the Moors*, a pleasant view, in a style resembling that of Mr. North.

W. M. ROSSETTI.

N. DIAZ.

Paris: November 21, 1876.

The news of the death of Diaz, the painter, came yesterday with sudden surprise to his friends. He had gone to Mentone to spend his second honeymoon there, having a fortnight ago, at seventy years of age, married a charming young wife. He was young-looking for his years, and, considering his infirmities, extremely active.

Narcisse Virgile Diaz was born August 20, 1807, at Bordeaux, where his father and mother, both Spaniards, had taken refuge from the perse-

cutions of King Joseph. He lost his parents very young, and on their death was taken charge of by a M. Paira, a Protestant clergyman living in the neighbourhood of Paris. While asleep on the grass one day he was either bitten by a viper or stung by some poisonous insect, so that two portions of his right leg in succession had to be amputated, which, however, did not prevent him from dancing, shooting, swimming, and riding on horseback. He had a very quick play of feature, a dark complexion, a black beard, and large black eyes, which varied in expression from extreme softness to extreme severity, according to what people addressed him. He had received no education, for he was apprenticed when very young to painters on porcelain, and we know what the porcelain-painting of those days was! But his natural refinement and distinction were remarkable, and he had tact and, above all, eloquence. There was nothing more amusing than to hear him speak of the poverty of Ingres' imagination, of his pupils' airs, and their intrigues! He would stride about in his studio, his wooden leg—his "pilon," as he called it—resounding on the parqueted floor, shake his beautiful curls, which had a blue light in them like Indians' hair, and brandish his hand-rest as if he would cut in pieces "ces ennemis de l'art et de la nature."

The primary cause of these childish and feminine outbursts was the passionate love Diaz had for "son art et la nature." But there were many human motives at work besides. For instance, indignation at seeing modern criticism—then represented in France by the Academies, the Ministère des Beaux-Arts, and the great Reviews—accept the paradoxical distinction of *dessinateurs* and *coloristes*, and allow no painters either merit, help, or success but those who pretended to enclose form in an outline as a hand is enclosed in a glove or a foot in a boot. The qualification of *coloriste* had in consequence become a reproach. Rubens and Rembrandt were only tolerated because they were dead. But those who were still capable of being troublesome, geniuses such as Eugène Delacroix or Théodore Rousseau, were overwhelmed with injury. Diaz, for his part, is one of the warmest and most brilliant colourists of our modern school. He had made Correggio his study, and in more than one of his early sketches we see a ray of the same tepid sun that shines in the pictures of the great Italian shining on the breast, the back, or the arm of his nymphs sleeping in the woods, of his Dianas with the rose-pink tunic tied up at the knee and the golden quiver at their shoulder. These are the things to collect, for they are priceless, as having the ardour of youth. Unfortunately they are as short as an epigram in the Anthology. If Diaz had met with less ill-natured criticism and a less sceptical public, there is no doubt he would have developed these rapid and lukewarm indications into compositions analogous to André Chénier's poems in the antique style. Later on, after a journey in the East—which did not teach him much, for he had an essential aptitude for collecting within him all the elements of his work—he began to bestow less pains on the flesh and more on the silk dresses. His brush and palette might have been compared in those days to a fairy wand which transforms stones into emeralds, rubies, and sapphires. Spangles that shine like the wings of the Brazilian butterflies glitter on the vests and petticoats of the gipsies who are reading the ladies' fortunes in the palms of their hands, of the Turkish children at play with tortoiseshells, of the Odaliskes telling each other stories of the Arabian nights under the cypress trees. All these pictures of his are full of a charming fancy. But Diaz' success was just beginning, and he painted with feverish diligence. He had extraordinary ease of hand, and composition cost him no great effort of mind. He is chiefly known in England, I believe, by the productions of this period, and they are not what he should be judged by, although as a harmonist he still showed

vigour and feeling. Two masters shared his admiration: Correggio and Prud'hon. If he learned from the former the secret of bringing the flesh of his Loves and goddesses into harmony with the sky, the shadows of the great trees, the grass and the flowers, he also entered into the voluptuous melancholy of the latter. He has often painted moonlight effects in the country, where the light fell on some deserted nymph, bathed in tears, bowed down by the weight of a cruel despair. In 1855, roused by the base outcries of the critics, who defied him to paint a large figure, he was unwise enough to exhibit an immense canvas, entitled *Les dernières larmes*. In this picture, though Diaz took enormous pains with it, all his qualities as a pleasing colourist were wanting: it was dull, wan, like the morning after a masquerade. And what was worse still, his want of elementary teaching was revealed by the drawing. Any stupid pupil of the school of Rome, without genius and without originality, knew more in that respect than he did. His friends were terribly distressed at his having so innocently fallen into the snare. Proud and sensitive as he was himself, he was deeply wounded. And yet, what an unjust quarrel it was. The first, instinctive qualities are so rare in the history of art! Why then ask the favoured ones who have them to show that there are other qualities they have not and never will have? It is certain that Diaz had a sufficiently good notion of form and outline to be able to make his figures, when they were the size he had chosen, express all he wanted them to express. His heads are animated, his movements elegant, his attitudes expressive and clear. He must be judged by the masses, not by the detail.

Diaz had a very just sense of the relation of figures to landscape, but he was also a distinguished landscape-painter, and, though his efforts in that direction show neither the energy of a Théodore Rousseau nor the tenderness of a Corot, he has stamped the sites he selected with a singular individuality. He was, particularly, the painter of the Forest of Fontainebleau. He has represented it silent and coquettish as it is to its lovers. He has rendered with an incredible intensity of life and light, the effect of the sun glinting through the green, striking on the silver trunk of a birch tree, or streaming across the heather glades. These little studies upon panel, which he sold for twenty or twenty-five francs apiece, are masterpieces, and acquire with age the firmness and brilliancy of enamels. They are celebrated in our studios, and are only to be found in the possession of artists. When Diaz fell in with any of them he bought them back at any price, and hung them up in his room. Diaz then asked five hundred or even a thousand francs for putting his name or initials to them. I have heard him blamed for this, but, for my part, I do not see that he deserved it. It seems to me fair that the painter whose youth was one long subjection to misery and contempt should one day openly take his revenge. In the latter years of his life he sold his smallest pictures for very large sums. I have noticed that colourists as they grow old pass through a time of abuse of violet and lilac, and then pass to an abuse of yellow and black. Diaz leaves a considerable quantity of drawings, pastels, water and body-colour and oil sketches. They will be sold this winter—I shall let you know when. They are the descendants of one of the last of the Romantic School. Apart from his painting he was a man of very great taste. He loved life, fine stuffs, horses, pleasant company, the country, rare furniture, and his family, too, very much. He lost, ten years ago, a son he worshipped, who was a painter and wrote pretty verses. He cannot be said ever to have got over this loss, and the least allusion to it moved him to tears. He leaves another son, a talented musician and composer of *La coupe du roi de Thulé*, an opera which has been represented on the stage. He was a good

friend, and helped Jules Dupré, Millet, and Barye—whose start in life was as difficult as his own—to the utmost of his power. He has some splendid water-colours of Barye's among his possessions. He bought their then despised works of Delacroix and Rousseau; afterwards he was obliged to part with these treasures. A very rich man who had opened a large account with him would now have an unrivalled gallery and collection, for he was a good judge in all that relates to art.

PH. BURTY.

THE LIPHART SALE OF PRINTS AT LEIPZIG.

A MAGNIFICENT collection of prints, the property of Herr Karl Eduard Liphart, a German collector of Dorpat, but at present settled in Florence, is to be sold next week at Leipzig by C. G. Boerner, in the Hôtel Stadt Dresden. We have before announced this sale, but some particulars of it, now that it is so close at hand, may be of interest. Herr Liphart made his first venture in print-collecting in 1836, when he made a large purchase from the founder of the firm which is at present occupied in selling the rich artistic fruits that he has been constantly gathering in ever since that time. Numerous journeys all over Europe were utilised in the manner the print-collector deems most profitable, and no opportunity was lost by Herr Liphart of adding to his knowledge and to the contents of his portfolios, so that at the present time the sale catalogue enumerates no fewer than 1,894 engraved works. Among these, those by old German masters are perhaps the most noteworthy: some very early plates, such as *The Return from Egypt*, out of the *Biblia Pauperum*; an *Ars Moriendi*, with text by Nicolaus Götz of Schlettstadt, of the greatest rarity, only two other copies of this edition (1474–1478) being known to exist; several other works very seldom met with, by early and anonymous German masters, including a number of designs for goldsmiths' work and ornamentation, many of them of extreme delicacy and beauty; also rare specimens of such masters as Franz von Bocholt, Glockenton, Mecken, Zwott, and the Meister El S., Meister B. M., Meister W., and others of the same time. More generally interesting, however, is a very admirable selection of Martin Schongauer's works, most of them early impressions and in excellent preservation. Connoisseurs will know how to estimate their worth when we say that early and very fine impressions of the *Annunciate Angel*, *The Birth of Christ*, the *Adoration of the Kings*, the *Flight into Egypt*, the *Death of the Virgin*, the *St. Catherine*, the *Elephant*, and the *Standing Bishop*, all plates of great rarity, are to be found among them.

But the chief strength of the whole collection lies in its Dürers, of which Herr Liphart has collected no fewer than 116 examples. Earliest among these is the curious *Pest-bild* or *Pest-kranke*, with Latin verses on either side by Dr. Theodore Ulsensius, a poetical doctor of Nürnberg, which is assigned by most authorities to Dürer, although it is not signed with his monogram, nor does it much resemble his later work. The present copy (of which a photographic reproduction is given in the illustrated edition of the catalogue) is dated 1498, but we believe an earlier edition was printed in 1496. It is now of the greatest rarity. Even the British Museum does not possess a copy. Such a work as this is, of course, only remarkable as a curiosity, but there are other Dürer prints offered in such fine impressions that they must make the hearts of collectors beat even to read about: for instance, an *Adam and Eve*, in the first state, before Dürer added the cleft in the bark of the tree under Adam's arm-pit, a fine and well-preserved impression, with a small margin outside the plate-mark; a good impression of the unfinished plate *Christ on the Cross*, before the monogram; a fine and excellently preserved copy of the *Copperplate Passion*; two copies of the little *Circular Crucifixion*, called Maximilian's *Degenknopf*; the first editions of Dürer's "three great

books," as he called them—namely, the *Great Passion*, the *Apocalypse*, and the *Life of the Virgin*—all complete and in the best preservation; several of the cuts from the Maximilian Ehrenpforte, some of them very rarely met with; the two plates and border, known as the "Great Tapestry, with the Satyr family," the *Great Column*, the *Rhinoceros*, and other rarities of Dürer's art that seldom come into the market.

Of the "Little Masters" may be mentioned a good selection of the works of Aldegrever, Altdorfer, Georg Pencz, J. Bink, and the two Behams, even Barthel, whose works are less frequently met with than those of Sebald, being represented by sixteen plates.

Passing to the Netherland masters, with Rembrandt at their head, we find as many as 223 plates by that supreme master-hand, many of them being first states and impressions of the highest beauty, and among them some of the treasures most coveted by the connoisseur. Other Netherland engravers such as Both, Berghem, Dujardin, Van der Meer, P. Potter, Teniers, Van Melen, and Waterloo are also well represented.

Of Van Dyck we find, not only a number of magnificent etchings by the master himself, but a large series of plates executed by different engravers after him, forming altogether an Iconography of the most valuable description, for all the portraits are by good engravers and only occur in the best states. Indeed, throughout the whole catalogue there is not a single work enumerated that has not a distinct artistic value. Collectors, therefore, even although they may not have acquired the wariness of experience, may feel tolerably safe in their purchases at this sale, for no rubbish seems to be included in it.

Italian engravers do not appear to have been much sought after by Herr von Liphart; nevertheless we find a fair selection of the works of Marc Antonio and his school; a fine *niello*, by Peregrini, and a fine impression of the stately *Madonna in the Grotto*, surrounded by cherubs, by Andrea Mantegna, a plate of the very greatest rarity, which is generally only met with in the largest public collections. Among the curiosities of the sale must also be mentioned three embroidery-pattern plates, ascribed to Da Vinci, and a number of charming designs, many of them coloured, for goldsmiths' work.

MARY M. HEATON.

ART SALES.

IMPORTANT sales of oil and water-colour paintings generally begin later, but the season of art sales, so far at least as rare prints are concerned, may be said to have commenced last week, when Messrs. Sotheby held two auctions: the one of works chiefly by certain great German and Dutch masters—the old masters of engraving and etching—and the other of modern workers in the same craft, among whom were included some works of Méryon. The following prices were realised for works of the old Dutch and German masters, many of which were in a condition that left much to be desired. By Israel van Mecken, *Christ Bearing the Cross*, after Martin Schongauer, 20*l.* (Noseda); the *Decapitation of St. John*, 11*l.* By Martin Schongauer, *St. James Fighting against the Infidels*, 120*l.* (Lauser); *The Crucifixion*, 6*l.* By Albert Dürer, *St. Geneviève*, 10*l.* (Lauser). By Lucas van Leyden, *Samson and Dalila*, 4*l.* 4*s.*; *Esther before Ahasuerus*, 6*l.* 6*s.*; *Jesus Christ taken Prisoner by the Jews*, 8*l.* 10*s.*; *Jesus Christ brought before the High Priest*, 8*l.*; *Jesus Christ bearing the Cross*, 8*l.* 10*s.*; the same subject, with the rare ornamental border, 10*l.*; the large *Good Homo*, 8*l.* 5*s.* The Rembrandts were generally unimportant.

On Thursday was sold an assemblage chiefly of modern etchings, and notable mostly as containing a considerable number of examples of Méryon. The Méryon collection, as a whole, was fairly comparable with the Méryon collection of "a Parisian

Amateur"—M. Carlin, we believe—sold at the same auction-room in the end of July, 1875, but certainly not with that of M. Philippe Burty, sold in the spring of the present year; but it contained, nevertheless, two or three impressions equal to anything in the collection of M. Burty, and superior to anything in the collection of the "Parisian Amateur." Méryon's work may be broadly divided into two classes; first, the work done mainly in his earliest time, after drawings by old French and other artists; and, second, the wholly original work in which best of all he recorded those parts of the Paris of his own day, and yet of the Middle Age, which were passing away under the improving hands of the Second Empire in its first years. There are also the New Zealand views—among the earliest of all his works—and the insignificant or bizarre fancies of his latter days, when his mind declined; but the work of artistic interest is of course that in which he recorded Old Paris, and he did this, as has been said before, well in the etchings which were copies of old drawings which his art had made into finer pictures, and supremely well in the etchings which were wholly original. Of the examples of his work sold on Thursday we mention only a few. They are the following:—*Le Strijge*, a fine impression of an undescribed state, with the verses engraved and a variation of the verses in the handwriting of the artist, 4*l.* 4*s.* (Palmer); *Le Pont au Change*, first state, pure etching, 3*l.* 10*s.*; *La Morque*, an extremely rich and brilliant impression of this most fascinating and characteristic print, 10*l.* 15*s.*; *L'Abside de Notre Dame*, first state, with verses in the handwriting of the artist, 20*l.* (Thibeaudeau); a remarkable example of an undescribed state of the same subject, also with lines in the artist's handwriting, 14*l.* (Thibeaudeau). This subject is generally recognised as the most poetical of all the works of Méryon.

NOTES AND NEWS.

THE grave imperfections of the prevailing system of art instruction seem at last to have attracted the notice of persons who can scarcely be accused of prejudice against the Royal Academy. Mr. Marks, A.R.A., in distributing the prizes to the students of the Wedgwood Institute at Burslem, made some pertinent remarks on the subject, and, as they are not restricted in their application to the faults of a particular school, it is right that they should be widely known and carefully considered. The speaker dwelt with special emphasis upon the method of laborious finish in drawing that has been encouraged in the art schools.

"The months," he said, "that are devoted to shading a single figure with the point are simply waste of time. Understand that in saying this I do not find fault with your teachers, who, I am sure, strive their utmost to do their duty towards you, but with the system under which they and you have hitherto worked. I feel great hope that in the appointment of an artist of such high culture and knowledge as Mr. Poynter to the head-mastership of South Kensington a new and better order of affairs will take place, and that the painful spectacle of an intelligent being devoting several months of what may be a valuable life to the mechanical dotted shading of an antique figure will soon be an impossibility. I am glad to learn that the new regulations for examinations will do more than they have hitherto done to educate the power of eye and hand and do away with the absurdity of these nigged, tortured drawings."

The subsequent remarks of the speaker go far to explain and almost to excuse the imperfections in the system adopted in the Government schools, for when we turn from these schools to the one institution that should serve as an example to them in such matters, we encounter the same failure, but without as yet the same effort at reform.

"It is not only in the departmental schools," says Mr. Marks, "that this brainless process of so-called finishing, but which is really finicking, obtains. The

same system prevails at the Royal Academy. As visitor in the schools, I have too often encountered students in the life class, sometimes even painting from the life, so ignorant of the proportions and balance of the figure, of the first laws of light and shade, and in some cases even of drawing, that I have wondered how ever they escaped from the more elementary classes."

THE Gibson Gallery at the Royal Academy has at last been opened to the public, and its contents provide ample material for appreciating the sculptor's powers. The works exhibited are chiefly plaster casts from the artist's principal statues, but there are also a few examples in marble, including a specimen of the style of polychromatic sculpture which Gibson affected. The kind of talent displayed in these works is scarcely of sufficient strength or originality to bear repeated illustration, and for this reason we are inclined to think that the effect of the exhibition will scarcely tend to increase the sculptor's fame. Gibson was a worthy exponent of the style of Canova, but he had but little of his own to add to his master's teaching. The entire devotion to the antique which he frankly professed was not in his case, any more than in that of Canova, productive of masculine achievement; rather it was an influence that tended to limit the artist's vision and impoverish that sense of energy and vitality that is never destroyed, though it is always controlled, by the classic spirit. Canova and Gibson secured the calm but not the strength of a great style. Their art did not accept in any liberal manner the fullness and energy of nature, and the revival they strove to accomplish can scarcely claim to be more than a revival of the decadence in antique sculpture. The Academy, however, are fortunate in the possession of a collection worthily illustrative of a style that now scarcely survives. If we except Flaxman, whose art has a deeper and more lasting sincerity, Gibson was certainly the greatest of the English sculptors concerned in the modern classic revival, and, as such, his works deserve attentive study.

MR. HOLMES, the Queen's Librarian at Windsor, has lately returned from Florence, bringing with him a small but very valuable example of the art of Fra Angelico. The subject is the Madonna and Child surrounded by angels, executed with the utmost refinement of painting, that has fortunately been almost perfectly preserved. The public will probably have an opportunity of studying this little work at the next exhibition of Old Masters. In qualities of brilliant and delicate colour it is entirely characteristic of the painter, and the expression of the faces offers illustration of the happier mood of the great master of religious sentiment.

GENERAL DI CESNOLA's Curium collection is to go to the Metropolitan Art Museum in Central Park, New York. For it, together with all his other collections at present warehoused there, he is to receive 66,000 dollars gold. No doubt Mr. John Taylor Johnston and the other directors of the New York Museum—of whom, by the by, General di Cesnola is himself one—are to be felicitated on getting the Cypriote treasures almost entire, as the nucleus of their institution. And we may hope that the New World may some day produce a crop of serious students of the archaeology of the Old. At present, with the exception of General di Cesnola himself, there can scarcely be said to be such a student in the United States. For European scholars, perhaps, the best thing would have been if General di Cesnola had accepted the offer made by the authorities of the Louvre, to take the Curium treasure along with the right of selecting any objects they liked from the rest of the collection. General di Cesnola will send us a series of articles on his whole collection, so soon as he shall have returned to New York—i.e., as soon as his book on Cyprus is out.

AN important antiquarian work on the Crosses of Somersetshire will appear probably in the

spring. Mr. Charles Pooley, of Weston-super-Mare, the author of a similar work on the Crosses of Gloucestershire, published a few years ago by Messrs. Longmans, has been engaged on his present task for now a long while. The volume, the preparation of which has already been very costly, will contain both fine lithographs and exquisite woodcuts of the Crosses to the illustration and chronicling of which the work is devoted. The county of Somerset, we need hardly add, is richer than almost any other of the English counties in these interesting monuments, which Mr. Pooley has made a special subject of study.

WE hear that by the Méryon sale, which is noticed in another column, the British Museum Print Room has acquired another very fine example of the work of the great French etcher.

IT is hoped, we hear, that at least the best part of the pictures by Raeburn which have been exhibiting in Edinburgh may be seen in London at the forthcoming Exhibition of the Works of Old Masters and of Deceased Masters of the British School.

THE *Gazette des Beaux-Arts* for November opens with a long article on "Les Œuvres et la Manière de Masaccio," by the Vicomte Henri Delaborde, of the Institute. The article deals chiefly with Masaccio's style, and that element of *Naturalism*, as his bolder mode of viewing Nature was called, which he is generally supposed to have been the first to introduce into the art of the fifteenth century, but which, no doubt, was equally sought after by Uccello, Ghiberti, Donatello, Masolino, and several of the painters of the progressive time immediately preceding Masaccio. The Vicomte seems unaware, or at all events does not allude to, an able critical estimate of the works of Masaccio and Masolino in the Brancacci Chapel, contributed to the *Zeitschrift für bildende Kunst* last May, by Dr. Moritz Thausing, although in some of their conclusions the French and German critics, strange to say, seem to agree. They both, for instance, consider that the frescoes in San Clemente at Rome are not by Masaccio, in spite of the extraordinary circumstance of Crowe and Cavalcaselle supporting Vasari's statement to this effect. Dr. Thausing assigns them to Masolino; the French critic, who scarcely mentions Masolino in his article, is content with taking them away from Masaccio. French journals are really beginning to believe in the existence of English art, and even to admit its claims to be studied. *L'Art* constantly devotes its pages to the illustration of English artists, and the *Gazette des Beaux-Arts* has several times had appreciative articles on artists both of the past and present generation in England. This time it gives two delicate etchings by Dr. Evershed—*Views on the Banks of the Thames*—and a short sketch of that artistic physician by M. Alfred de Lostalot. The other articles of the number are "Les fragments de Tarse au Musée du Louvre," by M. L. Henzy; a third and last article by M. A. Darcel, on "The History of Tapestry; the Musée de Lille," by the Editor; "Art et Industrie au XVI. Siècle," being an account of the tomb of Gaston de Foix, fragments of which are dispersed among most of the principal museums of Europe, including South Kensington, which likewise possesses an original drawing for this magnificent tomb; and a second and last article on the "Sale of the Furniture and other effects in the Château of Versailles during the Reign of Terror," by the Baron Davillier.

THE *Portfolio* for November contains a delightful article by Prof. Colvin, entitled "On Some Aspects of Athens." To poor London-chained mortals it is refreshing even to read of that glorious "three-hours' run down the Saronic Gulf from Kalamaki to the Piræus," and the Professor manages to stir his readers' hearts with something of his own enthusiasm as he describes the approach to Athens. "You want," he says, "to shout schoolboys' quotations to yourself. You watch and watch, with snatches of Greek and snatches of English poetry ringing in your brain.

and presently you swallow something in your throat, and give one shake from head to foot, as the immortal city veers in sight." One hears so many descriptions of seats of ancient fame by wearied and dull-hearted travellers, who contrive to convey their own deadened impressions and disillusion to others, that it is desirable to have one's faith revived now and then by one who travels with the artist's sensitive mind and eye to all the beauties of nature and art. Prof. Colvin promises a conclusion to his article in another number. The other articles are a description of the Wartburg and its associations, by A. D. Atkinson; a sonnet on Westminster Abbey, reprinted from Mr. Inchbold's recent volume, accompanied by an etching by L. Gaucherel; a continuation of the Editor's Life of Turner; and Technical Notes.

THE Warden of the Standards states in his Annual Report, just issued, that it has been recently his duty to call the attention of the Office of Works to the bad condition of the ancient Pyx Chamber in the cloisters of Westminster Abbey, placed under his legal custody by the Coinage Act of 1870. This chamber is believed to be as old as the time of Edward the Confessor; the remains of an altar at the east end, and of a *piscina*, serve to show its original use as a chapel. There is, however, a tradition that what has the appearance of a stone altar is really the tomb of Hugolin, the Confessor's Chamberlain. After the Conquest, this chamber was used as one of the King's treasuries, and in 1303 the whole of the treasure was stored here. During the King's absence to fight in Scotland the northern wall was broken through by some of the monks of the Abbey, and the treasure carried off; it included four crowns, with the King's rings, sceptres, jewels, gold and silver coin and plate, &c. The booty was recovered, and the thievish monks found guilty. After the Restoration the regalia and like treasures of the sovereign were removed to the Tower, and the chamber became known as "The Treasury of Leagues," the original parchment documents of commercial leagues with foreign States being deposited here. Many of the large oak presses which held them are still to be seen there, and also several large old coffers or chests, in one of which the standard trial-plates of gold and silver for trials of the pyx were formerly kept, whence the place became known as the "Pyx Chapel." It is very desirable, as the Warden, Mr. H. W. Chisholm, points out, that this ancient historical chamber, so interesting from its associations, and so rare a specimen of early Norman architecture in this country, should at least be put into decent condition, and any further decay arrested.

M. GUILLAUME's fine statue, *La Céramique*, now standing in one of the niches in the exterior court of the Louvre, is to be cast in bronze for the decoration of the new Sèvres manufactory.

PROF. SCHILLING's monument to Schiller was recently inaugurated at Vienna with the customary solemnities.

SIGNOR LUCARDI, a sculptor of considerable reputation in Italy, died a short time ago at Ginazano. He had obtained the gold medal at the Paris Salon for his fine group of *The Deluge*, and was also decorated with the Cross of the Legion of Honour.

THE Minister of Public Instruction proposes to exhibit in the Salons of the Rue Grenelle the interesting collection of Peruvian antiquities which we mentioned some time ago in the ACADEMY as having been sent by a distinguished traveller to Paris. Fifty more cases have recently arrived.

ALTHOUGH the formal closing of the Union Centrale Exhibition took place on November 21, the tapestry galleries are still open to the public, and will remain so, it is announced, for some weeks—probably to the end of the year.

THE STAGE.

MADAME CHAUMONT.

MADAME CHAUMONT, since Saturday, has given the London public what is at the same time her most extraordinary and her most exquisite performance. And *Toto chez Tata* is not only entirely artistic, but decidedly moral, though its morality is wrung out of a theme which, in the hands of most of the actresses who would undertake it, would be gross and revolting. We are not concerned here with the question of the propriety of introducing a courtesan in a play to be acted. Shakspeare settled that with Bianca and Doll Tearsheet—as Dekker with the *Honest Whore*—three hundred years before M. Dumas raised the question, or Messrs. Meilhac and Halévy, and Émile Augier, took it for granted. Offence is really given not so much by subject as by treatment: the subject, it is evident, only the author is responsible for; but the treatment he must share with the artist; and Meilhac and Halévy, whose treatment does undoubtedly go very near to the dangerous, very near even to the indecent, owe much to M^{me}. Chaumont, who saves them in the nick of time, and gives an exquisite turn to things which any artist but one most accomplished and sensitive would have landed in disgraceful failure. Never was a task more difficult.

And it is of the first importance for us who assemble at this performance to bear in mind that the artistic triumph of M^{me}. Chaumont is not due in the least to the extra liberty and licence of the French stage, but is wholly due to the exceptional insight and keen instinct and rare tact of the actress—most of all, we should say, to her exceptional insight into character, so that it is possible to her to amplify and to realise to a degree that is positively creative, such suggestions of good as the authors have been careful to proffer for her use. Meilhac and Halévy are clever enough to know that the narrative of the visit of a debauched school-boy to a harlot in vogue would revolt and disgust even the audiences that listened calmly to the cruel exposures of Dumas' *Visite de Noces*. The schoolboy, then, however curious, inquisitive, adventurous even, must not be debauched; and so they invented a story by which the youth, deputed by his comrades, and duly furnished with money for the occasion, might legitimately penetrate into an hotel of the Champs Élysées, where he should be astounded and indignant to discover by chance with "Tata" the husband of the lady for whom he had conceived a boyish and romantic attachment. They invented this story, and laid down the bare lines of it, but left it for the actress to give, not all the piquancy, but the whole of the *naïveté* and the charm.

And the delightful thing about M^{me}. Chaumont's performance is the way in which, in half-an-hour's dialogue—nay, monologue generally—she gives us the whole boy-character, as perfectly as a keen observer in real life would get it if he watched the lad during several years. Nothing more complete—nothing juster and more accurate in the way of a portrait—has been done on the stage. The words of the part are a mere web woven over and over again by the performer. The expressiveness of a mobile but by no means beautiful face, the significance of a gesture, the revelation that can be given by a cunning and interpreting change in the inflection of the voice—these are employed, not now and then, but in the most admirable abundance, by the artist. An actress chiefly clever in the representation of things that should never be represented—and we have seen such an actress applauded, even in England—would hurry over all that is *naïve* and boyish in this part, and would concentrate herself on what might so easily be made of evil significance. M^{me}. Chaumont does nothing of the kind. She dwells on the boy's boyishness, and is never truer to nature than in the passages in which his narration of his adventure is inter-

rupted by his most lively reminiscences of games and fun. Touches almost of pathos strike across the narration. There is hardly a phase of boy-life which is not suggested, if not actually presented, by this performance; and it is the merit of the artist that she has made all this—which ordinary treatment would leave insipid—of far greater interest than the record of Toto's brief, and hardly even friendly, relations with Tata.

FREDERICK WEDMORE.

It is reported that, after a few performances of *Hamlet* or *Macbeth*, Mr. Irving will appear in *Louis the Eleventh* at the Lyceum Theatre.

A FAVOURITE Haymarket comedy, *New Men and Old Acres*, is to be played at the Court Theatre to-night.

MISS JENNIE LEE will reappear at the Globe Theatre at Christmas.

London Assurance is immediately to take the place of *The Virginian* at the St. James's Theatre.

THERE was probably never a theatrical season in which "revivals" have borne so prominent a part as they have done already in the present. Every day adds to the list of them; nothing apparently is so much wanted as a new author with a good play. On Monday—*Jo* being withdrawn—*Hunted Down* was revived at the Globe. It is a piece of Mr. Boucicault's, and playgoers hardly yet middle-aged will remember its first production at the St. James's. The part of Rawdon Scudamore was played by Mr. Irving at a time when that actor seemed destined to represent perpetually all the phases of villany, rude or refined. Mr. Irving succeeded in *Hunted Down*, but no artistic success in such a part as that of the ruined gambler would be likely to make an actor thoroughly popular; and it needed the more delicate perception of Mr. Albery—his keener observation of life—to fit Mr. Irving with a part which should give him a success not to be forgotten. Rawdon Scudamore of *Hunted Down* is a much blacker villain, and a much more unnatural one, than Digby Grant in the *Two Roses*, and the difference between the two characters is maintained in the two pieces themselves: *Hunted Down* being constructed out of materials common to many playwrights, and not here used by Mr. Boucicault with quite his wonted effect, and *Two Roses* owing much to materials of which Mr. Albery, with the zest of a new observer, had gone far in search. But the truer and more individual observation was, indeed, needed for the comedy; the commoner material sufficed for the stirring drama which it was probably Mr. Boucicault's chief object to present. *Hunted Down*, with all its faults, shows itself to be the work of a skilled and accustomed playwright. It contains more than enough to interest an audience and to keep its attention to the end. Mary Leigh, the heroine, excites some sympathy more by reason of her blameless character and of the situation in which she is placed than by the possession of any extraordinary qualities. Married to a successful painter, who is almost absurdly full of his business at "the Palace"—he betakes himself thither with ludicrous hurry sufficiently often in the piece—Mary Leigh is tortured by the importunities of an earlier husband, Rawdon Scudamore, whom she had believed to be dead, and she is only finally relieved from them on the discovery being made to the *dramatis personarum*, as it has long ago been made to the audience, that Scudamore himself had previously married a young woman who is now the favourite "model" of Mary Leigh's husband. Mary Leigh—the half-hour wife of the gambler, who had married her purely for her money—is thus free to live honourably with Mr. Leigh, the Academician, and the two children she has borne him. And Mr. Boucicault, with more indulgence than a playwright often ventures to display, refrains from punishing the bigamous gambler very severely for his sins. The

piece would profit by more finished acting than is bestowed upon it at the Globe. The very crudity of some of the situations, and the rapidity with which one follows another, demand a high intelligence and many accomplishments on the part of the actors in the play. Miss Louisa Willes and Mr. Edgar Bruce, who represent respectively the heroine and the ruffian, are free from any noticeable faults. Miss Willes is indeed simple and often natural—though she has no great dramatic power—and Mr. Bruce is invariably careful and frequently even lifelike; but the other performers—save, perhaps, Miss Louisa Howard, who is both unassuming and sufficient as a nurse—are not equal to do the most that might be done for the play. The absence, however, of gross mistakes in the acting, and the presence of an interesting story in the play, were enough to secure both attention and applause on the first night of the revival.

At the Strand Theatre there have been acted during this week both a new "farcical comedy" and a new burlesque. The burlesque is devoted to the not-unjustified ridicule of certain incidents and speeches and tricks of acting to be noticed in *Daniel Druce*, as it is played at the Haymarket. Mr. J. G. Taylor and Miss Lottie Venne do their parts with some skill, and the piece is briskly written, and ought to succeed, if *Daniel Druce* is in itself sufficiently important to induce people to take much interest in a travesty of it. The Strand comedy is entitled *Cremorne*, and in the reckless gaiety which is intended to characterise it, it bears some resemblance to Mr. Marshall's adaptation of Mr. Bronson Howard's *Saratoga*. Here, however, it is possible that the resemblance may cease.

MDME. FARGUEIL is about to leave Paris for St. Petersburg. She will play there for two or three weeks.

THE *Mariages Riches*, by M. Dreyfus, has been brought out at the Vaudeville. The *Temps* says of it that it is "cut according to a fashionable pattern—the pattern to which was due the success of *Le Procès Veauradieux* and the *Dominos Roses*"—"c'est à dire qu'il se trouve cinq ou six intrigues entremêlées, dont les incidents rebondissent les uns contre les autres et donnent lieu à un jeu extrêmement compliqué de situations imprévues." The piece is excellently played, not only by Delaunoy and Parade, but by actors of secondary importance, such as Joumard and Mdle. Kalb.

AN old vaudeville of Scribe's, entitled *Le Diplomate*, is played at the Odéon along with the *Déidamie* of M. Théodore de Banville. It has been applauded more on its own account than on account of the acting which is at present bestowed on it.

ON Saturday the Palais Royal gave, for the first time, a four-act comedy by Meilhac and Halévy, called *Le Prince*.

MUSIC.

COWEN'S "PAULINE."

THE production of a new opera from an English pen is, under any circumstances, a musical event of more than ordinary importance. There is no class of composition, unless, perhaps, it be the oratorio, in which success is so difficult, or which requires the union of more varied qualifications. In addition to inventive power and the most complete technical mastery of his art, the composer of an opera needs not only dramatic instinct, but that special knowledge of stage effect which can only be obtained by long experience. Much music which is admirably fitted for the concert room falls very flat in the theatre; while, on the other hand (as may be seen more particularly in the works of Wagner), it is no less true that a great deal may be highly effective in its proper situation, and combined with stage accessories, which would totally fail to impress elsewhere.

There is, moreover, a special danger to which composers of operas are exposed, at least in this country. Such a work involves so large an expenditure of time and labour that it would be Quixotic to expect our musicians to undertake it altogether regardless of any considerations of ulterior profit. A man will not, in the ordinary course of things, write an opera merely for glory; he not unreasonably reckons upon also making some money by it. This money will be obtained, in most cases, from the music-publisher who buys the copyright of the work; and the publisher, with whom it is a mere matter of business, and into whose mind questions of art, as likely as not, do not enter at all, looks for works which are likely to sell. It is perfectly well known that the pieces which sell best are ballads; hence the direct temptation to a composer to write at least a considerable portion of his opera down to the ballad level. The result may be seen in the works of Balfe, *et hoc genus omne*, of which it is hardly too much to say that the separate numbers might be shaken up in a bag and then put together in whatever order they happened to be drawn out without any detriment whatever to the musical effect. Let it not be supposed that these remarks are intended as an indirect advocacy of the Wagner system, in which no detached movements find a place. That such a system can be carried out with the most powerful effect has lately been proved at Bayreuth; but Mozart, Weber, and Beethoven have also left imperishable works written on a totally different plan. We by no means object to the introduction of separate songs, duets, or concerted pieces in an opera; but none of the great masters whom we have named ever wrote down to the level of their audiences; and while many beautiful songs may be found in their works, we shall hunt through the whole of their scores in vain for a music-shop ballad.

It is necessary to take these facts into account in estimating Mr. F. H. Cowen's new opera, *Pauline*, the first production of which, on the 22nd ult., we briefly chronicled last week. Before pronouncing any opinion upon the work as a whole, it may be advisable to give a brief analysis of its contents.

The libretto of the opera has been adapted by Mr. Henry Hersee from the late Lord Lytton's well-known play *The Lady of Lyons*. I am so little of a playgoer that I must confess to never having seen the original drama on the stage; and it is so many years since I read it that I do not feel qualified to pass an opinion on the way in which Mr. Hersee has performed his difficult task. This at least may be said, that he has given us a book which is interesting and coherent in its plot; and while the expediency may be doubted of incorporating, as he has done, some of the original dialogue in his work—Lord Lytton's style and Mr. Hersee's being naturally very different—the lyrics which he has introduced are smooth and flowing, well adapted to music, and certainly much above the average of those to be found in opera libretti.

Of the four acts of which the opera consists the first is, as a whole, decidedly the weakest. The orchestral prelude is good, though its meaning only becomes apparent in the course of the opera, as the themes are chiefly taken from the scene in the second act in which Claude describes to Pauline the beauties of Italy. The introductory chorus of villagers is very spirited and melodious, recalling, though without plagiarism, the style of French *opéra comique* as it is found in the works of Auber, Adam, and Hérold. In Claude's song (No. 3), "One kind glance," we find the first example in the work of the music-shop ballad, spoken of above. In all, out of twenty numbers the opera contains five which may fairly come under this designation. I cannot help wishing that Mr. Cowen had had sufficient moral courage to resist the temptation to write for the shop; because four out of these five ballads are, to my mind, unquestionably the weakest pieces in the

work. That he can do far better he shows us over and over again; but his own style is so superior to Balfe's that when he tries to write after the pattern of the *Bohemian Girl* he produces what is of little value. No doubt his publishers, and probably also a large portion of the public, will be of a very different opinion; for from a commercial, as distinguished from an artistic, point of view, these songs will probably make the success of the work. They are all pretty, full of melody, and well suited for popularity; but their real musical value is small. The two remaining numbers of the first act, the duet "The love a tender mother," and the trio "Revenge, revenge," are not particularly striking; the latter is from a dramatic point of view much the more interesting.

The second act is in every way far superior to the first; it is, indeed, admirable nearly throughout. It commences with a very graceful chorus and ballet, in which Mr. Cowen's powers both of melodic invention and of orchestration are shown to great advantage. The following sestet, "Dear Prince, thy ring shall ever be," is excellent, and shows much dramatic power in its treatment. Claude's song, "Inez was beautiful," is the one music-shop piece in the work which may be pronounced worthy of its composer's reputation; though no doubt written to some extent with an eye to popularity, the composer has here not written down to public taste. There is a freshness and grace about the song which raises it above the ordinary level. The duet between Claude and Pauline, "A palace lifting to eternal summer," is one of the very best numbers of the opera. Here, for the first time in the work, the influence of Wagner is to be clearly seen, not in the music itself, but in the connexion between it and the text. Until we reach the final movement of the duet we find no repetition of the words; and the vocal portion of the music is almost entirely declamatory, the melodies being allotted to the orchestra. The words of this duet, excepting the last few lines, are Lytton's; and it is a good omen for the composer that just where he has the finest text to set he produces the best music. At the close of the duet, with the words

"Oh tell me once again, sweet love,
Thou art mine own, mine own,"

which are quite in the ballad style, Mr. Cowen's wings seem to droop, and he comes down from his high level at once, and gives us a little bit for the "shop;" but he happily soon recovers, and the final phrase, "Ever, dearest, true to thee," brings the number to a very effective close. The succeeding piece, Glavis's song, "Love has wings," may be simply dismissed as music-shop ballad number three. That it suited the public taste was shown by the *encore* which it obtained at the first performance. In the finale to the act we find again the French style in the ascendant. We have here an elaborate and well-constructed movement, of the orthodox pattern, very pleasing, though less original in manner than some other parts of the work. The re-introduction at the close of a principal theme from the preceding duet is of excellent dramatic effect.

Act the third is, as a whole, little if at all inferior to the second. It commences, after an orchestral prelude, with music-shop ballad number four, "From its mother's nest one morning." In the following piece, however, Mr. Cowen makes full amends. The melodramatic music accompanying the dialogue when Claude brings Pauline to his humble home is admirable throughout in the truth of its expression; and the interest is thoroughly sustained in the next number, the duet "Now, lady, hear me," which has many points of affinity with that in the second act. Here, again, Wagner's influence shows itself in the absence of all repetitions of words, and in the broad melodic forms adopted. The two remaining numbers of this act (the duet between Pauline and Beauséant, and the finale), while very dramatic in their treatment, are musically hardly so interesting as some other portions of the work. Possibly the haste

in which, it is no secret, the opera was completed may have something to do with this.

The fourth act opens with an *entr'acte*, the subject of which is taken from the duet, "Now, lady, hear me," containing an effective solo for the violin, which was admirably played by Mr. Carrodus. To this succeeds the last and least interesting of the music-shop ballads, "Bright dreams." The following wedding-chorus, "Blooming and bright as the morning," is very charming; but the finale (excepting that part in which the chorus just named is repeated) is of no special interest.

The question that will doubtless be asked is, Has Mr. Cowen, in *Pauline*, satisfied the expectations formed of him, or has he not? To this question I think an affirmative answer may, on the whole, be given. The opera is an unequal work: where the composer has written up to his own standard he has mostly been very successful; the shortcomings are chiefly noticeable where he seems to have written for popularity and not for art. Instead of making concessions to a low taste, let him follow the example of Mozart, who, when told by his publishers that his music was above the popular level, replied, "I know that in this way I starve; but yet I must do it." There is no fear that starvation will be the result of a similar procedure on the part of Mr. Cowen; he has great capabilities, and the advantage of youth on his side; and it is because his work shows so much promise that we have criticised it at such length, and have not hesitated to point out freely what we think its defects.

As to the performance itself, a few lines will suffice. It was fully worthy of Mr. Rosa's reputation. Here and there a triling slip was noticeable; but such were very rare, and are quite excusable in a new work of such magnitude. The cast was a most excellent one. Both the Claude Melnotte of Mr. Santley and the Pauline of Miss Gaylord must have more than satisfied the composer. Our great baritone, however, must take care of his voice, which shows considerable signs of wear and tear—a thing by no means surprising when it is remembered how hard he has been working at the Lyceum. Miss Gaylord deserves the very warmest commendation for the good sense and good taste she displayed in the last act. At the conclusion of her ballad a bouquet was thrown to her. We are delighted to be able to record that she was too genuine an artist to destroy the dramatic effect by picking it up; she very wisely took no notice of it at all. We trust that other singers will follow her excellent example.

The rest of the cast, which was uniformly good, was as follows:—Beauséant, Mr. F. H. Celli; Glavis, Mr. J. W. Turner; Deschapelles, Mr. Aynsley Cook; Gaspar, Mr. Arthur Howell; Widow Melnotte, Miss Josephine Yorke; and Mme. Deschapelles, Mrs. Aynsley Cook. Both band and chorus were as excellent as usual, and the opera was mounted in that thoroughly satisfactory manner which is the rule under Mr. Rosa's management.

The reception of the work was enthusiastic, the principal actors, the composer, and Mr. Rosa himself, being repeatedly called for.

EBENEZER PROUT.

LAST Saturday's concert at the Crystal Palace contained more than one feature of special interest. It commenced with a Festival Overture by Mr. W. T. Best, a work which was composed for, and first performed at, the Norwich Festival last year. It abounds in melody, and its chief theme, which is treated fugally, seems suggestive of the fact that the composer is one of our greatest organists, to whom Sebastian Bach has been familiar from his youth up. The work, however, is thoroughly orchestral in style, and very effectively scored. Its reception was deservedly a hearty one. The first appearance at these concerts of Mrs. Beesley, a pupil of Dr.

von Bülow, deserves more space than we are able to devote to it. Though the lady has been little more than a year before the London public, having made her first appearance at one of the New Philharmonic Concerts last year, she has already taken a high position, which on Saturday she certainly justified. The piece she selected was Liszt's Fantasia for piano and orchestra on Hungarian airs. At commencing she was evidently very nervous, and to wonder, at making her first appearance before the most critical audience of the Metropolis; but she soon recovered, and played in her very best manner. She has an excellent touch, great power, and apparently unlimited execution; but in addition to these qualities, she has genuine enthusiasm, which shows itself in every phrase. Her success was unmistakable—to use a hackneyed phrase, she created a *furor*. We hope that a second opportunity will soon be afforded of hearing her at Sydenham. Schubert's glorious symphony in C, which is to be heard in perfection only at the Crystal Palace, and which has never been more finely performed than on Saturday, and the overture to the *Freischütz* completed the instrumental selection; the vocalists were Mme. Antoinette Sterling and Mr. Edward Lloyd.

Mrs. ANNA MEHLIG gave a pianoforte recital at St. James's Hall yesterday week. We have so recently spoken of the talented young lady's playing (on the occasion of her performance at the Crystal Palace) that it is needless to say more than that the programme of her recital included pieces by Bach, Beethoven, Haydn, Roeder, Schubert, Schumann, Chopin, Seeling, and Liszt.

The programme of the last Monday Popular Concert contained no novelties. Mme. Norman-Néruda was again the leading violinist, being supported in the quartets by Messrs. Ries, Zerlini, and Piatti. Miss Agnes Zimmermann was the pianist, and Signor Gustave Garcia the vocalist. The instrumental works performed were Mozart's quartett in D (No. 7); Mendelssohn's fantasia, Op. 28, for piano solo; Mozart's sonata in B flat for piano and violin (the so-called "Strinasacchi" sonata); and Haydn's quartett in D, Op. 17, No. 6.

On Monday last the Borough of Hackney Choral Association gave their first concert in Shoreditch Town Hall, when Schubert's Mass in F was performed for the first time in London. The chorus numbered about 120 voices, and there was a full orchestra of forty performers. The solo parts were taken by Miss Marie Duval, Miss Geddes, and Miss Pauline Featherby (all of the Royal Academy of Music), and Messrs. Henry Guy, Greenwood, and Thurlay Beale. The second part of the concert consisted of an excellent miscellaneous selection, including, among other things, the overture to the *Zauberflöte*, the Allegretto from Beethoven's eighth symphony, and the march and chorus from the same composer's *Ruins of Athens*. The conductor was Mr. Ebenezer Prout.

On Thursday afternoon next an English version of the *Alcestis* of Euripides will be produced in the theatre of the Crystal Palace. The music has been composed specially for the occasion by Mr. Henry Gadsby.

PROBABLY no persons have ever heard the effect of perfectly pure consonances involving the higher numbers 7, 11, 13, 17, and 19, in addition to the usual octaves, fifths, thirds, and sixths, and the result of putting them slightly out of tune, as in tempering, unless they have had an opportunity of working with Appunn's instruments now in the Loan Collection of Scientific Instruments. To enable those who are interested in the acoustical basis of harmony to gain this experience, Mr. Alexander J. Ellis, F.R.S., will attend at the South end of Room Q of that collection, where Appunn's instruments are situated, on Thursday, Friday, and Saturday, December 7, 8, and 9, from eleven to one each day, and give four demonstrations of half an hour each, and no more, on each occasion.

THE late Félicien David's opera *Lalla Roukh*, which was first produced in 1862, has just been revived at the Opéra Comique, Paris, with great success. The principal parts were sustained by Mlle. Brunet-Lafleur, M. Fürst, and M. Queulain, all of whom made their *débuts* on this occasion. The lady is particularly commended.

At the festival of Saint Cecilia, on the 22nd ult., a new Mass by Gounod was produced in the church of Saint Eustache, Paris. It is for solo voices, chorus, and orchestra, and is entitled by its composer "Messe du Sacré Cœur." The "Qui tollis," "Crucifixus," "Benedictus," and the "Communion" for orchestra alone are said to be particularly fine.

FROM a list that has been published of the visitors present at the Bayreuth performances it appears that Berlin furnished the largest contingent—viz., 283 persons. Next came Vienna with 212, London with 130, Munich with 127, Leipzig with 109, Hamburg with 81, Dresden with 78, &c.

Die Walküre will in all probability be performed at Vienna in February; Wagner is not unlikely to direct the final rehearsals himself.

DR. HERMANN KRETSCHMAR, a well-known writer on music, has been appointed musical director to the University of Rostock.

HURST & BLACKETT'S NEW WORKS.

- HISTORIC CHATEAUX.** By Alexander BAILLIE COCHRANE, M.P. 1 vol. demy 8vo, 15s.
- COACHING; with Anecdotes of the Road.** By Lord WILLIAM LENNOX. 8vo, 15s.
- LIFE OF MARIE ANTOINETTE.** By Prof. CHARLES DUKE YONGE. SECOND and CHEAPER EDITION. 1 vol. large post 8vo, with Portrait, 9s. (Just ready.)
- TALES OF OUR GREAT FAMILIES.** By EDWARD WALFORD, M.A., Author of "The County Families," &c. 2 vols. crown 8vo, 21s. (Just ready.)
- MY LITTLE LADY.** By E. Frances POYNTER. Illustrated by E. J. POYNTER, R.A.
- CHEAP EDITION,** forming the New Volume of HURST AND BLACKETT'S STANDARD LIBRARY. 5s. bound.
- "The whole book is charming. It is interesting in both character and story."—*Saturday Review*.

THE NEW NOVELS.

- MARK EYLMER'S REVENGE.** By Mrs. J. K. SPENDER, Author of "Jocelyn's Mistake," &c. 3 vols.
- "Mrs. SPENDER may be congratulated on having produced one of the most interesting books of this and many past seasons. It is very powerfully written, and there is a truth and energy of portraiture quite startling."—*Chart Journal*.
- "Mrs. Spender maintains the high reputation she has already most deservedly gained by means of this truly attractive novel. It cannot but be extensively approved and admired."—*Messenger*.
- ANNE WARWICK.** By Georgiana M. Craik. 2 vols. 21s.

- THOMAS WINGFOLD, CURATE.** By GEORGE MAC DONALD, LL.D., Author of "Alec Forbes," "David Elginbrod," "Robert Falconer," &c. 3 vols.
- "The gradual development of Wingfold's and Helen's characters is an interesting study, and those who can appreciate insight into human nature in its higher and lower types will find much worth noting in all the personages concerned."—*Athenaeum*.
- "Its nobility of purpose, its keen insight into human nature, and its poetry, place this book in the first rank of novels of the year."—*John Bull*.

- POWER'S PARTNER.** By May Byrne, Author of "Ingram Place," 3 vols.
- "Miss Byrne's story has vigour and style to recommend it."—*Athenaeum*.
- "A powerfully written and interesting story."—*Messenger*.
- "The character of the heroine is well conceived and original."—*Pall Mall Gazette*.

- NORA'S LOVE TEST.** By Mary Cecil Hay, Author of "Old Myddelton's Money," &c. SECOND EDITION. 3 vols.
- "Nora's Love Test" is not only a readable book, but one which keeps its hold on the reader's attention. The special interest of the tale consists in a good plot, well worked out. Nora herself is charming."—*Morning Post*.

- PHOEBE, JUNIOR: A Last Chronicle of** Carlingford. By Mrs. OLIPHANT. SECOND EDITION. 3 vols.

- MAJOR VANDERMERE.** By the Author of "Ursula's Love Story," &c. 3 vols.
- "A pleasing and graceful story."—*Academy*.

- EFFIE MAXWELL.** By Agnes Smith. "A good and well-written novel."—*Literary World*.

- AZALEA.** By Cecil Clayton, Author of "Effie's Game," &c. 3 vols.

- GLENCAIRN.** By Iza Duffus Hardy. 3 vols. (Next week.)

- A Rose in June.** By Mrs. Oliphant.
- My Little Lady.** By E. Frances Poynter.

TEXT BOOKS For PUPIL-TEACHERS and STUDENTS.

"The following will be found excellent Manuals for the instruction of Pupil Teachers and for the use of Students in Training Colleges, and in every respect EQUAL TO THOSE for which much HIGHER PRICES ARE CHARGED."

Handbook of the Analysis of Sentences. By WALTER MCLEOD, F.C.P., F.R.G.S. Extra fcap 8vo, cloth, 1s. 6d.

"The value of this work lies in the simplicity of its arrangement and the great number of its exercises, which are incorporated with the explanatory text. The pupil is led by very easy stages from the simplest elements of a sentence to the most complex."—*Schoolmaster*.

Text-Book of English Composition. With Exercises. By THOMAS MORRISON, A.M., Glasgow. Post 8vo, cloth, 1s. 6d.

"Hitherto there has been no branch of instruction which has been more systematically neglected in English schools than English Composition."—*Schoolman*.

Dictionary of the Derivations of the English Language, in which each word is traced to its Primary Root; forming a Text-Book of Etymology. 400 pp., 18mo, cloth, 1s.

"More complete than Dr. Sullivan's similar work, in that it takes account of non-classical as well as of classical sources."—*Educational Reporter*.

Dictionary of Synonyms of the English Language. 368 pages, demy 18mo, cloth, 1s.

"DICTIONARIES OF DERIVATIONS AND SYNONYMS.—These are two complete little works, and we cordially recommend them to the attention of students and teachers."—*London School Board Chronicle*.

Table Book of English History, Genealogical and chronological. By THEODORE JOHNSON. 50 pp., fcap. 4to, cloth, 1s.

"This book consists of a series of Tables illustrating the chief events of interest in each reign. It should be used, not in preference to the History of England, but rather as a supplementary handbook of dates and facts."—*Author's PREFACE*.

A Complete System of Practical Arithmetic; including Practical Geometry, Mensuration of Surfaces and Solids, Land Surveying, Algebra, and Plane Trigonometry. 12mo, cloth, 1s. 6d.

Key to ditto. 12mo, cloth, 4s.

Arithmetic, in Theory and Practice, for Higher and Middle-Class Schools. With Examples selected from the Government Papers and Public Schools in England. By HENRY EVANS, LL.D. Post 8vo, cloth, with Answers, 3s.

"This is a first-class arithmetic by a practical teacher, at a low price."—*Western Morning News*.

Algebra, to Quadratic Equations. By E. ATKINS, B.Sc. Post 8vo, cloth, 1s. 6d.

"This book is, we believe, a successful attempt to treat the subject in such a manner as that a student of ordinary ability may be enabled to thoroughly master its difficulties."—*Deedsbury Chronicle*.

Elements of Algebra, for Training Colleges and Middle-Class Schools. By EDWARD ATKINS, B.Sc. Post 8vo, cloth, with Answers, 2s. 6d.

Elements of Algebra, for Schools and Colleges. By J. LONDON, M.A., Toronto. Post 8vo, cloth, 2s. 6d.

"The whole work evinces knowledge of the subject, and exhibits, moreover, a knowledge of the difficulties beginners encounter, and a teacher's true method of helping his pupils."—*Educational Reporter*.

Euclid's Elements. Book I., with Exercises, 12mo, 6d.

Euclid. Books I.—IV., with Exercises, 12mo, cloth, 1s.

Euclid. Books I.—VI., with Exercises, 12mo, cloth, 1s. 6d.

Key to ditto, 12mo, cloth, 1s. 6d.

Euclid, Books I. to III. By E. ATKINS, B.Sc. Fcap. 8vo, cloth, 1s. 6d.

"This text-book of Geometry settles the much-debated point of how to print Euclid, by ingeniously combining two of the best systems. In the first place, each step is printed as a separate paragraph, thus ensuring clearness; and in the second place, the whole chain of reasoning is repeated in the most condensed form possible, in small type in the margin, by aid of Algebraic symbols."—*Bradford Observer*.

Elements of Euclid (Books I.—VI.), adapted to Modern Methods in Geometry. By JAMES BRYCE, LL.D., and DAVID MUNN, F.R.S.E. Fcap. 8vo, cloth, 2s. 6d.

"Euclid, it has been truly said, wrote his book not for boys, but for men, and this one fact is enough to justify a searching consideration of his adaptability as a teacher in modern schools. How essential it is, then, that the methods of teaching and the text books employed should be adapted to the altered circumstances of students."—*T. C. LOWE, in the Educational Reporter*, Nov., 1875.

Mensuration. By Rev. HENRY LEWIS, B.A., Culham College. Fcap. 8vo, cloth, 1s.

"Mensuration may be of great service to thousands of persons who will never know anything of Trigonometry or Euclid."—*Author's PREFACE*.

Long Addition Exercises: or, Separate Addition, as required by Candidates for Civil Service Examinations. By HENRY EVANS, LL.D. Fcap. 8vo, paper, 6d.

Tables of Logarithms. 12mo, cloth, 1s. 6d.

WILLIAM COLLINS, SONS, & CO.
London: Bridewell Place, New Bridge Street, E.C.
Glasgow: Herriot Hill Works, 139 Stirling Road.
Edinburgh: The Mound.

 Garden.

TO AMATEURS and COLLECTORS of
 OBJECTS of ART and ANTIQUITIES.—An Italian gentle-
 man, who, during the last twenty-five years, has been occupied in
 the study of Archaeology and Numismatics, and who is thoroughly con-
 versant with the objects of Art of the Medieval Period and the Re-
 naissance, offers his services to those who desire to have their collections
 classified, illustrated, and catalogued. The gentleman who advertises
 is able to give the highest references, having held responsible positions
 in several public museums on the Continent.—Address Dr. M. G., 23
 Cranbourne Street, Leicester Square.

THE LATE MR. GEORGE SMITH.

A COMMITTEE has been FORMED to RAISE a FUND for the
 BENEFIT of the FAMILY of the late MR. GEORGE SMITH, of the
 British Museum, the distinguished Assyrian scholar and explorer, who
 died while prosecuting his researches at Aleppo in August last.

Her Majesty the QUEEN has been graciously pleased to grant a small
 pension to the Widow of Mr. Smith, but a family of six young children
 are left almost wholly unprotected, for, and it is especially on their be-
 half that an appeal is now made to a generous public, which has profited
 so largely by Mr. G. Smith's labours and discoveries in the field of
 Biblical research.

Subscriptions are earnestly solicited, and may be paid, or forwarded
 by cheque or Post Office order, crossed "George Smith Fund," to
 Messrs. Bosanquet & Co., 73 Lombard Street, E.C.

Chairman of the Committee.
 Major-General Sir H. C. RAWLINSON, K.C.B.

GRATEFUL—COMFORTING. EPPS'S COCOA.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavoured beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—See article in the *Civil Service Gazette*.

Made simply with boiling water or milk.

Sold in packets (in tins for abroad) labelled—

JAMES EPPS & CO., Homoeopathic Chemists,

PEPPER'S QUININE and IRON TONIC

Purifies and Enriches the Blood.

Strengthens the Nerves and Muscular System.

Promotes Appetite and Improves Digestion.

Animates the Spirits and Mental Faculties.

Thoroughly recruits the general bodily health, and induces a
 proper healthy condition of the Nervous and Physical Forces.

PEPPER'S QUININE and IRON TONIC.

Bottles containing 32 measured doses. 4s. 6d.

Sold by all Chemists.

In the preparation of this Tonic the greatest care is exercised. It is
 a faithful compound of Quinine, the active principle of Yellow Cin-
 chona, or Peruvian Bark, blended with a refined trustworthy prepara-
 tion of Iron, produced in a form which the experience of many years
 has proved the best. It offers a ready means of gaining the strength
 and other benefits afforded by Quinine and Iron, without any fear of
 ill consequences.—The name of J. PEPPER is signed in red ink on the
 label.

TARAXACUM and PODOPHYLLIN.—A

fluid combination for Derangement of the Liver, particularly
 when arising from slight congestion. By gently stimulating the action
 of the liver and slightly moving the bowels, the heavy, drowsy feeling,
 with sensations of fulness, headache, pain beneath the shoulders, and
 other indications of Dyspepsia are removed. Taraxacum and Pod-
 ophyllin is much safer than calomel or blue pill, and quite as effective
 for removing bile.—Prepared by J. PEPPER, 237 Tottenham Court
 Road, London, whose name must be on the label.—Bottles 2s. 9d. and
 4s. 6d. each. Sold by all Chemists.

LITERATURE.

The Story of Sigurd the Volsung and the Fall of the Niblungs. By William Morris. (London: Ellis & White, 1876.)

THE myth of the dwarf-wrought treasure of gold that was at once the desire and the curse of hero after hero has hitherto interested ourselves less than any other branch of the great Northern stock. Our Old German and Old Norse ancestors, however, were more impressed by its beauty, and more fascinated by its mystery, than by the charm of any coeval story. Of late years the progress of the study of German literature has made most English readers familiar with the outlines of the *Nibelungenlied*, a classic poem collected from sources now but indistinctly traced, and first projected in an epical form by some anonymous Austrian poet of the twelfth century. In this famous work, however, the mythical and half-divine elements have given way to an exquisite bloom of romance, and we are no longer in the presence of the gods, or walking in the arcane world of wonder. The story is confused, the relations of the persons are obscured, the inevitable burden of the curse on the gold is inconsistently lightened or removed. It would be almost obvious, even if no earlier sources of information existed, that this was but the re-telling of a great coherent story in the mouth of a man who had lost the thread of its import. Fortunately, we are not cast upon conjecture. The storehouse of Old Northern poetry and prose, now at length being abundantly thrown open to us, presents us with the same story in its earliest perfect form, and, more than this, it gives us some of the still older material in the midst of which it crystallised. It is in the Prose *Edda* and in the *Völsungasaga* that the story is given in its full coherence and with its full mystical significance, and these narratives have been the sources of Mr. Morris's new poem. But the *Völsungasaga* in a great measure is merely a clear prosaic version of old heroic staves, and when passages of verse occur they bear an appearance of greater antiquity than the text itself; it is of the highest interest, therefore, to find in the Early or Poetic *Edda* of Saemund a great number of the original fragments from which the saga was built up. In some of these the imaginative force is so brilliant and the style so vivid—as in the *Fafnismál*, for instance—that we can hardly doubt that the original invention is before us; in others, as in the *Sigrdrífumál*—where the story of the armed woman found sleeping on

Hindfell is told, but of Sigrdrifa, not of Brynhild—we seem to have reached an antiquity in which the story of the Volsungs was not yet put together, or at least this incident not yet adopted as part of it. In other places the archaic staves present touches of emotion and of scenery so realistic and, as we are apt to think, so modern that it is hard to believe that they are not the artistic product of poets long familiar with ruder phases of the same legend. For instance, readers who are not acquainted with the Icelandic texts will scarcely believe that the picturesque description of the geese clanging out in the home-mead when all else was silent but Gudram moaning over her dead Sigurd, and that other passage in which she compares him to the garlic towering among the grass, are not effective ornaments of the fancy of Mr. Morris, but that they occur in that precise form in the earliest Eddaic staves of the *Gudrúnarkviða*.

To the outline of the story so built up by the saga-writers of Iceland in the days of the decline, out of sources dating from the period of splendid poetic invention, Mr. Morris has very closely kept. Before we leave the subject, we may point out one or two episodes which he has omitted and one or two that he has modified. But, speaking generally, he has simply poured his rich and copious language into the great mould of his Icelandic model. It must not be understood from this that the poem is a translation, or in any way whatsoever undeserving in the highest sense of the praise due to imaginative originality. Merely the framework of narrative is the old time-honoured one. The modern poet treats it in a strictly epical manner. His hero is Sigurd, and from first to last, from the ancestral glory of the house from which he sprang to the final desolation of the house that slew him, all revolves around the sole name and fame of Sigurd. The poem is divided into four books, named after the four persons who successively influence the fortunes of the hero—Sigmund, Regin, Brynhild, and Gudrun.

So familiar is the story to our readers that we need hardly retell it. Suffice it to say that Mr. Morris has treated it in a manner fully worthy of the heroic plan. The style he has adopted is more exalted and less idyllic, more rapturous and less luxurious—in a word, more spirited and more virile than that of any of his earlier works. His first small volume was full of colour and quaint form; it reproduced with unequalled brilliance the strange romantic beauty of minute mediæval architecture and ornament. But there seemed more of art than of nature, more of culture than of inspiration. In *Jason* the whole field of vision was enlarged and humanised; there was less attention paid to detail but more to composition; there was manifest for the first time a power of poetic narrative unrivalled in our time. In the *Earthly Paradise* the same delightful qualities were continued and ripened, but the chord of melancholy languor was dwelt upon almost to excess. In *Love is Enough* higher places of the imagination were reached, and the mystical sadness had a nobler bearing. In the *Story of Sigurd*, however, for the first time, Mr. Morris is no

longer "the idle singer of an empty day," but the interpreter of high desires and ancient heroic hopes as fresh as the dawn of the world and as momentous. The atmosphere of this poem is sharp and cold; a strong sense of the primal virtues, of honour, physical courage, duty to the gods and the kings, tender homage to women, interpenetrates the entire theme and gives it a solemn and archaic air. No lesser genius would have succeeded in winging a level flight through so many thousand lines without sinking to the plane of common men and common thoughts. In this poem, so steeped is the author in the records of the heroic past, so intimately are his sympathies connected with those of the mythical age of which he writes, that we walk with demi-gods to the close, and have no need to be told of the stature of our companions. In the presence of so much simplicity, and so much art that conceals its art, it is well to point out how supreme is the triumph of the poet in this respect. It is perhaps on this very account, and because the ordinary tone of the poem is so elevated and so heroic, that the passages which allow of pastoral and emotional treatment seem of unequalled charm and delicacy. Where so much is noble, but where all is rapidly-progressing narrative, it is not easy to select a passage for quotation which will not lose its peculiar excellence by being separated from its context. Perhaps the first meeting of Gudrun and Brynhild will bear extraction as well as any other:—

"So they make the yoke-beasts ready, and dight the wains for the way,
And the maidens gather together, and their bodies they array.
And gird the laps of the linen, and do on the dark blue gear,
And bind with the leaves of summer the wandering of their hair:
Then they drive by dale and acre, o'er heath andholt they wend,
Till they come to the land of the waters, and the lea by the woodland's end;
And there is the burg of Brynhild, the white-walled house and long,
And the garth her fathers fashioned before the days of wrong.
So fare their feet on the earth by the threshold of the Queen,
And Brynhild's damsels abide them, for their goings had been seen;
And the mint and the blossomed woodruff they strew before their feet,
And their arms of welcome take them, and they kiss them soft and sweet,
And they go forth into the feast-hall, the many-pillared house;
Most goodly were its hangings, and its webs wave glorious
With tales of ancient fathers, and the Swans of the Goths on the sea,
And weaponed kings on the island, and great deeds yet to be;
And the host of Odin's Choosers and the boughs of the fateful Oak,
And the gush of Mimir's Fountain and the Mid-world-Serpent's yoke.
So therein the maidens enter, but Gudrun all outgoes,
As over the leaves of the garden shines the many-folded rose:
Amidst and alone she standeth; in the hall her arms shine white,
And her hair falls down behind her like a cloak of the sweet-breathed night,
As she casts her cloak to the earth, and the wind of the flow'ry tide
Runs over her rippling raiment, and stirs the gold at her side.

But she stands and may scarce move forward, and
a red flush lighteth her face,
As her eyes seek out Queen Brynhild in the height
of the golden place.

But lo, as a swan on the sea spreads out her wings
to arise

From the face of the darksome ocean where the
isle before her lies,

So Brynhild arose from her throne and the fashioned
cloths of blue.

When she saw the Maid of the Niblungs, and the
face of Gudrun knew;

And she gathers the laps of the linen, and they
meet in the hall, they twain,

And she taketh her hands in her hands, and
kisseth her sweet and fain."

The versification will be noted as in some respects peculiar; it depends on accents and not on syllables, each line containing as many cadences as the ordinary alexandrine, but being irregularly anapaestic instead of regularly iambic. There are always six feet in every line, but these are of very varying value, the earlier ones being generally amphimacers, that truly heroic foot which Coleridge compared to the thundering hoofs of a race-horse. Speaking less technically, the measure is a lax ballad-metre, capable of very considerable variety.

While, however, commending the style of this poem, we cannot help feeling that it will present in many places grave difficulties to the general reader. In no previous work has Mr. Morris adopted so consistent an archaism in language and phrase. The long study of Icelandic literature, too, has enamoured him of the periphrases for the gods, gold, the sea, and other objects of constant reference, which are so curious a feature of that language. To meet with the same peculiarities in a volume totally unannotated will, we are afraid, give *The Story of Sigurd* an air of pedantry from which its substance is wholly free. For instance, when we read that Volsung and his sons

"Ran swift o'er Aegir's acre,"

it is not every one of us that may happen to remember that Aegir was the husband of the 'giantess Ran, goddess of the sea. It is quite another thing for a poet to say that his heroes rushed over the fields of Poseidon, for long custom has made an acquaintance with the elements of Greek mythology a necessity of ordinary culture; we are not yet so well instructed about the deities of our own forefathers. So much for phrases; the language of Mr. Morris is hardly less learned. He uses "even" for "eyes," "fowl" for "birds," and "learn" in the awkward, old-fashioned transitive sense of "teach," and this not once or twice, but constantly. Mr. Morris seems to maintain much the same attitude towards ancient speech that Spenser did when he was writing the *Shepherd's Calendar* and the *Fairy Queen*. It is an attitude worthy of a master of language, and not for a moment to be confounded with the mock-archaism of a Chatterton or a Shenstone, but it is distinctly a position of danger.

We have no space left to dwell on the points in which Mr. Morris has seen fit to deviate slightly from the original narrative. The most important seems to be the omission of that relationship which connected Atli with his victims, the Niblungs. In the poem before us, Atli's rage is an almost purposeless greed of gold; in the *Edda*, on

the other hand, he is represented as being a son of Budli, and therefore brother to Brynhild. In the short prose story of the "Drap Niflunga" it is distinctly represented that dissension arose because Atli charged the Niblungs with having caused Brynhild's death. The hand of Gudrun is, according to this version, used as a means of reconciliation, and she stirs up Atli to fresh vengeance that her own wrongs may be revenged. We are inclined to think that Mr. Morris, by casting aside this account, has deprived himself of a valuable connecting link in the chain of retribution.

EDMUND W. GOSSE.

Life of William, Earl of Shelburne. By Lord Edmond Fitzmaurice. Vol. III., 1776-1805. (London: Macmillan & Co., 1876.)

THE interest raised by Lord Edmond Fitzmaurice's volumes rises still higher in this, the concluding instalment of his ancestor's biography. Not only do the events among which Shelburne moved acquire a greater importance, but he himself grows amid them, and develops qualities which even his past services to the State hardly led us to expect.

The great historical fact of the century was the change—call it by whatever party name you will—from Whig government to Liberal government, which received the sanction of the nation in the elections of 1784. The new principles, the predominance of which was interrupted for a time by the horror caused by the atrocities of the French Revolution, rested on the substitution of popular support for the favour of an aristocratic clique, and of political and economical science for the influence of wealth and station. Of the three men who were successively at the head of this movement, Chatham, Shelburne, and Pitt, Shelburne had most distinctly grasped its tendencies, and it was probably for that very reason that he occupied a less conspicuous place than the others in its direction. Like Bacon, he saw too far into the politics of coming generations to be very successful in directing those of his own day, and as his biographer shows, his brief Ministry, magnificent as its achievements and promises were, broke down quite as much from the refusal of his own partisans to follow him as from the overwhelming numbers of the coalition which opposed him.

Shelburne's superiority of mind appears in his treatment of every subject which he handled. Even after the publication of the *Wealth of Nations*, it is surprising how thoroughly the doctrine of Free-trade had entered into the very substance of his thoughts. Such words as the following seem to have strayed out of some speech of Richard Cobden:—

"What then," he said in 1783 (vol. iii. p. 347), "is the result of this part of the treaty? Why, this: you have given America, with whom every call under heaven urges you to stand on the footing of brethren, a share in a trade the monopoly of which you sordidly preserved to yourselves, at the loss of the enormous sum of 750,000*l.* Monopolies, some way or other, are ever justly punished. They forbid rivalry, and rivalry is of the very essence of the well-being of trade. This seems to be the era of Protestantism in trade. . . . I avow that monopoly is always unwise; but if there is any nation under heaven which ought to be the first to

reject monopoly, it is the English. Situated as we are between the Old World and the New, and between southern and northern Europe, all we ought to covet upon earth is free-trade, and fair equality. With more industry, with more enterprise, with more capital than any trading nation upon earth, it ought to be our constant cry, 'let every market be open, let us meet our rivals fairly, and we ask no more.'"

Nor did he forget the claims of the poor in the claims of the commercial classes. He advocated (iii. 436) a reform of the Poor Laws, a limitation of ale-houses, the establishment of County Courts for the recovery of small debts, and the adoption of a system of unsectarian education.

Shelburne's superiority is no less manifest in his constitutional views. Indebted as he was to French thinkers for many of the opinions which he held, no man ever had less of the French fault of expecting to govern by the proclamation of abstract principles, or of the English fault, so glaring in Burke, of worshipping that which is, simply because it exists. "In grand national points" he said (iii. 13), "I shall never be directed by the opinions of lawyers, nor will I go to Westminster Hall to inquire whether or not the Constitution is in danger." For him the Constitution was based, not on a balance of powers, but on a variety of duties. He knew the weak point of every one of the component parts of the State too well to idolise it. Public opinion was not likely to be regarded as infallible by the man who told the story of the farmer who at the same time wanted peace with America and the vindication of the right to tax America; while he had little respect for a House of Commons of which the majority was composed of pensioners and contractors; for a House of Lords which remained impervious to his most argumentative conclusions; or for a King who alternately spoke of him as the vilest of scoundrels and as an indispensable Minister. But he thought that the best remedy was to urge on everyone to do his duty. The King, the House of Lords, the House of Commons, and the popular voice could each do something in the way of improvement. Having no fear of the people, he welcomed the Yorkshire petition which frightened Lord Rockingham; he supported Dunning's celebrated resolution that the influence of the Crown ought to be diminished, at the time when the King was the great organiser of corruption; while, on the other hand, he urged on the House of Lords to intervene to save the nation from a House of Commons which was in the hands of placemen and contractors; and he talked of the impossibility of treating the King of England merely as a King of the Mahrattas, nominated by a body of powerful nobles and kept aloof from affairs. Yet even when he defended the prerogative of the Crown most warmly he distinctly showed that if he did not regard the King, like the Whig potentates, as an enemy to be guarded against, he placed his respect on the barest grounds of expediency.

"The great advantage of Monarchy in the English Constitution was," Shelburne said (iii. 311), "that it trusted to the Crown the secrets which must necessarily attend all negotiations with foreign Powers. He could easily conceive,

he said, a case in which the people of this country might speak to the Crown in such language as this:—"Sire, we called in the aid of your illustrious family to save us from Popery and arbitrary power. We have for three ages reaped the benefits of their attention to our interests and welfare, but, not thinking that Monarchy is any longer essential to our security, freedom, and happiness, we are determined to do all the business of the Crown ourselves; and, therefore, with many thanks for your care and kindness, we make you our bow, and entreat you to relinquish the trust." He could conceive all this; but while the Crown did remain a part of our Constitution, and those negotiations were trusted to the prerogative, he could have no conception of their calling for the secrets of any negotiation which the King might be carrying on for the purpose of peace."

Such a speech is, perhaps, sufficient to account for King George's resolution to dispense with Shelburne's services when he next formed a Ministry. At all events, it is inconsistent with the notion that the speaker was in any way led astray by the theory of a patriot king.

Lord Shelburne's way of dealing with such questions, indeed, contrasts advantageously with that of some modern commentators. The King, Lords, and Commons of the English Constitution are simply the special forms under which the universal demands of every progressive political body are satisfied in this country. Every such body needs an expression of the popular will, and unity of executive authority, as well as some means of winning the deliberate resolve of the nation from the sudden outbursts of momentary passion. The Commons, the Crown—or the Prime Minister—and the House of Lords, are respectively entrusted by the Constitution with the fulfilment of these several duties. Constitutional principle requires that no one of their duties shall be left without a special organ by which it may be performed. It equally condemns Charles I. in trying to rule without any reference to the popular voice, and the Commons of the Long Parliament in trying to rule without any check upon their own arbitrary will. But it is mere constitutional pedantry to say that where one or more of these bodies notoriously fails to fulfil its duties, any other shall not overstep the ordinary limits of its powers; not, indeed, in order to suppress the other, but to secure its restoration to usefulness. George III. is no great authority on constitutional law, and his mode of action was tainted by the use of those corrupt means which he blamed in others. But at least it may be conceded that the House of Commons against which he contended was not a body fulfilling the functions entrusted to it by the Constitution, and that in interposing his Royal authority "to forbid the banns," as Pitt would have said, between the coalition of two turbulent and self-seeking factions he was acting on behalf of the nation, which subsequently gave its approval to his conduct.

It was this far-sighted distinction between the ends of the Constitution and the formulas of the Constitution which made it impossible for Shelburne and the Whigs to work together. The petty squabble between him and Fox, which receives new illustration in these pages, was in fact only the im-

mediate cause of the rupture. It would, indeed, have been impossible by any amount of skill to put two men in positions more calculated to breed a quarrel. But even this danger might have been overcome if there had been community of sentiments between them. The present biography shows that there was no such community, and under such circumstances the breach was unavoidable.

Lord Shelburne's Ministerial life came to an end when he resigned the Treasury at the bidding of the Coalition. It is pleasant to know that he was one of the few who kept their judgment clear and their heads cool amid the horrors of the French Revolution. When the bulk of the aristocratic Whigs, in their timidity, drew Pitt into their ranks under the appearance of enlisting under his banner, Shelburne, now Marquis of Lansdowne, upheld the Liberal standard, and gathered under it those members of the party who adhered to his old rival, Fox.

It is impossible in closing this volume to avoid expressing the hope that some one may at last be found to write fairly and impartially the history of those stirring times. It is fortunate that no author capable of the task should have attempted it before Lord Edmond Fitzmaurice afforded the means of filling up the empty niche in which Lord Shelburne's image should have stood. In that history, whenever it is written, Lord Shelburne will always occupy a commanding position. But the other great men of the day, Burke, and Fox, and Pitt, will have their places too. The writer of a biography is rather too apt to dwell on the weak sides of the rivals of his hero, and a history of the time is therefore all the more needed to correct the false impression necessarily caused by the omission to dwell on their nobler qualities. SAMUEL R. GARDINER.

Catholic Eschatology and Universalism. By H. N. Oxenham, M.A. (London: B. M. Pickering, 1876.)

MR. OXENHAM observes in his preface, which is the most * important addition he has made to the articles which he has reprinted from the *Contemporary*, that Universalists have hitherto been for the most part Unitarians. This observation has its bearing upon another equally pertinent:—"When the verdict of an 'enlightened conscience' is urged against such doctrines as that of eternal punishment we rightly desiderate some evidence that an enlightened conscience is not in this case a polite *alias* for interested self-will." Is it a fact that Unitarians are upon the whole less upright, pure, and helpful than the "orthodox"? Is it true that "orthodox" church or chapel-goers realise the doctrine of eternal punishment in proportion to their purity, their uprightness, their helpfulness? The sense of the exceeding sinfulness of sin, which does in proportion to its strength dispose to belief in that doctrine, is often

* Possibly we should except a very ingenious note intended to show that the doctrine of the Real Presence involves the theory of Transubstantiation, which ought to be almost convincing to readers who can follow Mr. Oxenham in the assumption that material things have any substance distinct from the sum of their physical and chemical properties.

stronger in those who are living in bondage to sin than in those who have always resisted it or are striving successfully to forsake it.

The author is on surer ground when he observes that the doctrine is an integral part of the traditional creed, which he is aware is held together by something deeper than logic, though he may rather overrate the closeness of its logical coherence, and certainly underrates the significance of the fact that the most elaborate attacks on the doctrine of eternal punishment or everlasting torment come from writers honestly anxious to believe everything else. Nor is it clear that his skilful attempts to minimise the doctrine really make it more defensible. The view of Saint Francis Xavier on the prison of hell shut for ever on all who died without the knowledge of Christ; the view of Massillon on the small number of the elect; the view of Father Furness on the torments of hell, have a terrible coherence of their own. They were all united till very lately in the practical popular creed of earnest orthodox Protestants and Roman Catholics. Mr. Oxenham has shown that there is high Roman Catholic authority for questioning all three; can he show that the impulse to question them is not related to the impulse to question everlasting punishment, as a ground-swell in a harbour is related to a storm outside? He appears, while maintaining that the *poena damni* will be perpetual to incline to believe that the *poena sensus* will cease: its cessation should logically include the termination of all conscious suffering consequent on the *poena damni*; it is difficult to suppose on his principles that impenitent sinners will attain the "natural beatitude" of unbaptised infants: and unless they attain it their existence would thenceforward be purely negative, and hard to distinguish from annihilation. We notice throughout that the author is rather too contemptuously indignant against the group of writers who seem to be doing a good deal to produce an unavowed impression that Protestant soteriology would be more credible if it presupposed Jewish instead of Platonic psychology. It is more intelligible that he sees only the repulsive side of Calvinism, and there is some truth in Mr. Mayor's remark that he thinks Calvinism too shocking to be scriptural, as the Universalists think everlasting punishment too shocking to be scriptural; and there is also truth in Mr. Oxenham's reply that Calvinism aggravates all the difficulties of the doctrine of eternal punishment, while a belief in Purgatory dilutes them; but the controversy seems to be reaching a point at which one disputant becomes declamatory and one, perhaps, punctilious.

Mr. Oxenham's argument from reason falls into three divisions: from the force of habit, from the freedom of the will, from the principle of resentment. The argument from the force of habit is really weighty: experience does furnish instances of people who get steadily worse and more wretched; though experience shows also that under prolonged suffering the resistance of the will generally breaks down, and that where this is not so volition and sensibility are gradually

deadened. Moreover, preachers commonly warn sinners to leave their sins instead of waiting for their sins to leave them; and, in fact, most sins do leave most sinners who wait in the course of their earthly life; is the probability very strong that the apparent exceptions will be permanent? As to the argument from freewill, the question whether a child shall obey an earthly father practically depends in most cases on the will of the father. The child is free to obey first or last; those who say that the only question is whether we will obey the Heavenly Father first or last make allowance for all the freewill there is any reason to suppose we possess. The argument from resentment is inconclusive, at best. It is quite true that in corrupted natures a desire to punish the offender manifests itself before a desire to reform him or to remedy the mischief he has done. These desires, so far as they are gratified, tend increasingly in good men to supersede the primitive instinct of resentment which is the foundation of *our* theory of punitive justice, with which perhaps *we* shall never be able to dispense altogether, because our power of reformatory and remedial beneficence is likely always to remain incomplete; but what is impossible with man is possible with God.

Mr. Oxenham is more successful in dealing with the argument from tradition: the view which he defends has always been in possession, it has always been supported by the main stream of authoritative teaching which is the unwritten common law of Christendom. The case of course would be stronger if the precise thesis of modern Universalists had been formally condemned by an authority able to speak in the name of undivided Christendom, or if, in default of this, all influential writers had maintained the general view. It is admitted on all hands that two great saints more or less followed Origen, and it is hard to show that the orthodox sense is enough for the natural meaning of the passage which Mr. Jukes quotes from Clement of Alexandria: we have to choose between holding that he hesitated on the question, or that he once said more than he meant; and, after weighing Mr. Oxenham's reply to Mr. Jukes in the October number of the *Christian Apologist*, one is still inclined to doubt whether St. Justin and St. Irenaeus had always a clear intellectual hold of the doctrine of everlasting punishment, while St. Jerome's special teaching on the subject looks very like a survival of Origenism.

Still, when we have made all allowances, the mind of the Church is clear; the well-known texts in the Synoptic Gospels always have been understood one way, and this makes the preponderance of the exegetical grounds for the common view practically decisive; though in a language which, like Biblical Greek, has only one word for secular and everlasting, exegetical arguments can hardly be decisive alone. It is hard to be sure of the preponderance of exegetical argument, because everyone is biased, either by his wishes, or by the revulsion from them; but the nearest approach to a neutral authority to be found seems to decide in favour of the orthodox view of the meaning of the Master's words, which for believers ought to be above question as they are above appeal. They

are echoed in the Apocalypse and in the Catholic Epistles; they are anticipated in the terrible last words of the Evangelical Prophet, into which He read a yet more terrible meaning. But if consistent disciples refuse to explain the Master's words away, or put a less appalling sense upon them, it does not follow that they are to get rid of the mass of texts recently marshalled in a very telling tract* by what Mr. Oxenham must permit us to call a meagre distinction "between the fact and the ultimate result of Redemption." It is the weakness of Calvinism that it preaches salvation only to the elect: it is its strength that it preaches a full and free salvation to these; it does not explain salvation away into the opportunity of doing a work easy to none, very difficult to most, all but impossible to many. It is not very easy to think that a perfectly candid and teachable spirit (if such could be found)—passing from the Scriptural warnings of the Last Judgment to interpret the Scriptural promise of the restitution of all things, when God, who worketh all things after the counsel of His own will, who will have all men to be saved, who is the Saviour of all men, especially of them that believe, who saves His people, not for their sake, but for His own Name's sake, shall be all in all—would venture to say more than "*Quam multa multitudo dulcedinis tuae, quam abscondisti timentibus te, perfecisti autem sperantibus in te.*"

G. A. SIMCOX.

Russia and England in Central Asia. By M. A. Terentyef. Translated from the Russian by F. C. Dawkes, B.C.S., Attaché to the Foreign Department of the Government of India. In Two Volumes. (Calcutta: Printed at the Foreign Department Press, 1876.)

UNLESS bluster be an efficient substitute for argument and asseveration for truthfulness, the views of "an educated Russian," as Captain Terentyef is called in his translator's preface, cannot be regarded as a valuable addition to existing literature bearing on English and Russian policy in Central Asia. Considered as history, its many inaccuracies render the work entirely useless; nor is criticism invited, for we are informed that it is not dedicated to those interested in scientific research, but is for the information of the general public in Russia. The Russian public are much to be pitied if Captain Terentyef is to be their oracle on Asiatic policy.

The first volume is devoted to an account of Russian advances in the East, and relates how Russian influence or dominion spread gradually from the Ural to the Orenberg and Siberian line, thence to the Syr Darya, and onwards, southward through Khokand, Bokhara, and Khiva, eastward through Kashgar, to the frontiers of Persia, Afghanistan, and China. Russia's first advances date from the Tartar supremacy; but it was not till the sixteenth century that Perm and Astrakhan were subdued under Ivan the Terrible. The gradual conquest of the Kirghish steppe is narrated, and

it is argued that, the Ural once passed, a geographical necessity was involved that Russian frontiers should be further advanced, so as to be continuous with those of a civilised country to which treaty obligations were sacred, since there intervened no sufficient physical boundary to ward off the continual inroads of half-barbarous tribes.

No mention is made of Perovski's expedition against Khiva in 1838. The author evidently considered that a demonstration so sudden tallied very little with the stealthy, catlike movements of the Russians. From another source we find that this expedition was purposed "not only to consolidate Russian power in the Khanates, but to prevent the influence of the East India Company, so dangerous to Russia."

As Caesar says of Gaul, all Central Asia "in tres partes divisa est:" viz., on the north, the Kirghish Steppe; then, southward, Mesopotamia between the Jaxartes and the Upper Oxus, comprising the fertile districts of the Oozbeks, with Khokand, Bokhara, and Kashgar; lastly, Khiva and the Turkoman Steppe, separated from India by Afghanistan. So we may trace Russian annexation through three phases. The first terminates with the subjugation of the Kirghish population, and the fixing of the Russian frontier at the banks of the Jaxartes. This is balanced by the English annexation of the Punjab. Could the frontiers of each nation have been preserved in a state of tranquillity at this point, no Central Asian Question need have arisen, nor would the Russians have had any excuse for their further progress. But even then there was a feeling that "the Sepoy and the Cossack would meet on the banks of the Oxus;" and that no "neutral zone" would continue to separate English and Russian dependencies. Starting from 1847, when the erection of the fort of Raimsk, for which Fort Aralsk was afterwards substituted, made the first *étape* towards further conquests, Russian advances have been continual though slow. The storming of the important fort of Ak Musjid in 1852 was the first of the series of victories over the Khokandians, and this was quickly followed by Captain Skupa's success on the occasion of their attempt some few months later to retake the fort. We are not told of the serious delay to the Russian arms owing to the revolts of the Kirghese which lasted, off and on, from 1853 to 1857. The occupation of the towns of Turkestan and Tchemkend was followed by the taking by Tcherniaieff of Tashkent in 1865. Captain Terentyef omits to tell us that General Tcherniaieff was recalled on account of this latter feat, as having exceeded his orders. Neither are we informed that, as a kind of consolation, he was presented by the Emperor with a diamond-hilted sword. The various legends respecting this officer show that he was the one Russian almost universally respected in Asia. He was succeeded by General von Kauffman. It may be aptly remarked here how wholly the history of Russia in Asia is the story of the emulous enterprises of successive generals, not openly encouraged, and yet not absolutely prohibited by the Government at St. Petersburg. The battle of Irdgar, the

* *The Doctrine of the Everlasting Torment of the Wicked Shown to be Unscriptural.* (S. Tinsley.)

storming of Khojend, the appointment of General von Kauffman as Governor-General of Turkestan, were gradual though certain steps towards the establishment of Russian rule as far southward as the Oxus. All this time, although Samarcand was occupied and Bokhara threatened, despatches and other communications to England deprecate any idea of annexation, and deny any intention to subjugate the Khanates.

Russian relations with Bokhara, Khokand, Khiva, Western China, and Kashgar, are successively recounted in separate chapters. With regard to the recent expedition against Khiva, we should have been glad to see Captain Terentyef's account of the alleged massacre of the Yomuds, but it is not mentioned. A statement in the chapter on Afghanistan, to the effect that one of the stipulations at the Amballa conference was that "Shere Ali should deport into British India some of the more influential Sirdars who were unfavourably disposed towards the British," and that he "should disarm the Afghans, and in future prohibit the carrying of arms in Afghanistan," will give an idea of the writer's historical accuracy.

We will now leave the volume of this work mainly devoted to narrative, and proceed to give some account of the second, in which our author is decidedly combative. There is not space to criticise his peculiar account of the rise and progress of "the poisonous, unnatural plant engrafted on the splendid soil of India, a parasite which saps away the life of the most fertile and wealthy country in the world," which is a euphemism by which Captain Terentyef designates the Honourable East India Company; nor can we discuss in detail his account of the relations between Russia and England, and his notices of Stoddart and Conolly. We must hurry on to the only two interesting, although at the same time most extravagant, chapters in the whole work, which are devoted—the first to the "Objects of Russia," the second to criticisms on the opinions of foreigners on Russian advances in Central Asia.

We notice at the commencement a statement that "we may boldly assert that during the whole course of our progressive advance, not so much as a thought of India has ever occurred to us." With this compare pp. 12-22, which contain an elaborate account of the Franco-Russian scheme in the time of Paul for the overthrow of English rule in India. It is also argued that "if the sole object of our conquests in Central Asia were India, we should hurry on, and not waste valuable time in long and profitless political discussions with the Khans." We need only ask, is it the habit of the Muscovite to "rush any of his fences"? The sporting term must be excused. Russia, we are told, has undergone innumerable sacrifices in Central Asia, gaining therefrom, thanks to England alone, no advantages whatever. The tone of Russian communications with England has become greatly changed in consequence of the lessening of the distance between Russian and English territory. "Anxiety for the safety of her colonies is in fact a lever which may be employed to oblige England to agree upon all possible questions." We are supplied with

an illustration of this proposition in the case of the Polish question in 1863. The English Government had threatened to recognise Poland as a belligerent power: the despatch containing this menace was cancelled before its communication to the Russian Government. This Capt. Terentyef affirms to have been due to the reception of news from New York that six of the fastest vessels in the Russian fleet had reached that port, in readiness to sail, at a moment's notice, to Australia. Really only five vessels were at New York, and whether these were intended to "capture" Australia he does not tell us, which is a "hiatus valde deflendus." He calls the move "Gortchakoff's pill."

The above, tempered with some remarks deprecative of aggression, show the "objects of Russia."

The latter part of this chapter, containing extracts from the views of Sir H. Rawlinson on Central Asia, should have been deferred to the next, in which are reviewed the opinions of a German, Hellwald; a Frenchman, Lejean; a Hungarian, Vambéry; and Schuyler, the American, whom Captain Terentyef selects as expositors of the various shades of national thought. The first-named author is cordially approved, since he holds up Russia to public view as the pioneer of civilisation; Lejean, though praiseworthy in the purpose of his work, is advised to obtain his information from Russians at St. Petersburg, and not from French "coiffeurs;" but the full vial of our author's indignation is reserved for "the double-faced, perfidious Hun," M. Vambéry, who is "essentially a charlatan," and whose "writings abound in contradictions." He thinks it necessary to elaborate a contradiction of Vambéry's figure of speech when he speaks of the dealings of the Emperor with the Asiatic Khans as those of a Khan on the Neva, and not of the Emperor of all the Russias. He even goes so far as to say that M. Vambéry never visited Central Asia, and mainly bases this opinion on an alleged error in the statement of the colour of the Ameer's throne at Samarcand, which is really given correctly. Truly Captain Terentyef is severe on the faults of his adversaries.

The two succeeding chapters are voluminous tables of statistics, which, if they are to be relied upon, show that, in spite of her "innumerable sacrifices," Russia does not lose much by Central Asia from a financial point of view.

Etiquette is next dealt with, and the system of gifts is minutely discussed, as well as other features in the conduct of political communications.

The concluding chapter is headed "Orthodoxy and Mahomedanism." Forced orthodoxy is disapproved of, and a very good excuse is given for the lack of missionary enterprise in Central Asia in the following words:—"Is it not that we have no missionaries to spare, and that some of our large governorships, having themselves fallen short of the faith, are still more in want of preachers?"

On the whole, the idea given by Captain Terentyef's two volumes on the general political question is that no imminent attack

from Russia on our Indian possessions need be apprehended; yet, notwithstanding any disclaimers to this effect, the gradual approach of their dominions to ours should be jealously watched, since it undoubtedly facilitates the machinations of Russian intriguers, many of whom are scattered through India. Should an invasion ever be attempted, the route taken will not be through Merv and Herat, but through the more northern province of Cabul.

With regard to the translation, Mr. Dawkes has rendered the Russian into free and readable English. He should, however, remember that the French Emperor's name was not spelt *Napolean*, and our sometime ambassador at St. Petersburg was Sir Andrew, not Sir Alexander, Buchanan.

T. W. CRAWLEY.

NEW NOVELS.

Joan. A Tale. By Rhoda Broughton. In Three Volumes. (London: R. Bentley & Son, 1876.)

Thomas Wingfold, Curate. By George MacDonald, LL.D. In Three Volumes. (London: Hurst & Blackett, 1876.)

Courtship in 1720, in 1860. By Hawley Smart. In Two Volumes. (London: Chapman & Hall, 1876.)

As the Shadows Fall. A Novel. By J. E. Muddock. In Three Volumes. (London: Samuel Tinsley, 1876.)

A new book by Miss Broughton is always an event in the novel-reading world, for it is sure to be full of lively descriptions, smart writing, and vividly-drawn scenes. Unfortunately, however, it is almost equally certain to contain much that is flippant and in bad taste, and in these latter respects *Joan* seems to us even a greater offender than its predecessors. The story is a simple one, for Miss Broughton never complicates her stories; the characters are few, with the chief light focused, as it should be, on the central figure, and many of the descriptions are life-like, notably that of the villas in the suburbs of Helmsley. But the whole tone of the book is utterly distasteful. There is a loving lingering over details of luxury, over kisses long drawn-out, over frequent squeezings of the hands, that quite over-matches any healthier passages. Surely the author's powers of description can be employed to better purpose than the details of a dinner, where "quiet-footed swift servants ply the guests with palate-tickling dishes." "Each dish tastes more deliciously than its predecessor," and "how pleasantly the Veuve Clicquot, daintily sipped, stirs the blood in the young veins" of the heroine! Why should the only part of a dining-room that is brought to our notice be the painted ceiling, "where water-gods and sea-nymphs are frolicking, naked and unashamed"? Is the fat and selfish Lalage a common type of womanhood? of whom the following is the coarsely characteristic remark:—"I never see a preposterously fat person that I do not instantly picture them [*sic*] in their bath." The hero, Anthony Wolferstan, "has not got it on his conscience that he ever in all his life missed an opportunity of squeezing a woman's hand."

He proposes to Joan, having told her (seriously, we must conclude, for it is repeated many times) that he has shortly before been in love with Lalage Beaumont, whom, when he last saw her, he followed round the room on his knees, weeping copiously the while. This man, who "has a broad gray eye, the clear window to such a prosperous house, the *découpé* nostril, the *débonnaire* lips, the shorn square chin," first rapturously accepted by Joan, and subsequently refused by her, because she discovers her father has been a forger, eventually marries Lalage—as might be expected, the marriage does not turn out happily—and later on invites Joan to become his mistress. On the last page it is hinted that he marries Joan, after the death of Lalage from apoplexy. The very children are not exempt from the fleshly taint of the whole book, but ask embarrassing questions as to Queen Caroline, and the relations between Lord Nelson and Lady Hamilton. No doubt children in their innocence may utter questions of the kind; but why choose such questions to perpetuate? The answer here is too obvious. There is another point that we dislike extremely, and that is the use of God's name, which is invoked more frequently than we have ever before seen it in any novel. Does Miss Broughton write in the style of *Joan* to please herself, or to please the public? In either case we trust the public will give its opinion with no uncertain voice.

It would be paying but a poor compliment to Mr. MacDonald to attempt within the limits of a short notice to enter into details concerning *Thomas Wingfold, Curate*. We must content ourselves with telling our readers the sort of book it is, and strongly advise them to read it for themselves. It is the story of a man who, suddenly brought face to face with an Atheist, is astonished to find that he cannot out of his own heart find answers to scoffs and arguments against Christianity. He therefore begins from the very beginning, praying as he never prayed before, disdaining no assistance, nor crushed by the doubts which at one time seem likely to overwhelm him. We have the whole working of the man's mind laid bare before us in his conversations, in his prayers, in his sermons, and in verses of no ordinary beauty which his soul pours forth. It is almost a necessity, when a narrative of this kind takes the form of a story of modern life, that the characters should seem strained and unreal: and Mr. MacDonald has heightened this effect by making two dwarfs the persons most concerned in bringing back the curate's peace of mind. The story, however, even in itself is not uninteresting, though of course it plays a subsidiary part to the great mental struggle which is going on throughout. It is a book that may be read by people of every school of thought, for doctrinal matters are touched upon with a very light hand, and at the end the curate is left with an immutable belief in Christ, the foundation on which all other superstructures are raised. It is the strife between Atheism and a belief in God and Christ which is depicted, not the attacks of unbelief against the Church or any particular Christian sect.

Courtship in 1720, in 1860, is a book in

two volumes, but each volume is essentially a separate book. There is nothing in common between them except the title, and the author might just as well have published them separately. Nor can they be taken as typical of the love-making of the two periods. They are, however, very readable stories, and written with the author's usual dash and spirit.

We remember that when, as children, we came upon an anecdote of a more extraordinary instance than usual of the sagacity of an elephant, the devotion of a dog, or the bump of locality in a cat, our attention was commonly arrested by an asterisk. This referred us to a short note containing the simple words "a fact." Criticism was thus forestalled, and the inherent improbability of the story passed over without a murmur. Mr. Muddock pursues a similar method in *As the Shadows Fall*. In his preface, which is perhaps the most wonderful part of the book, he tells us that it will no doubt be urged that the plot is improbable, but that the main incidents are strictly true.

"The prototype of the villain of the story," he says, "I knew in the flesh. He was the son of an old and honoured family, and a young man of high scholastic attainments; but his learning could not counteract the effects of some moral deformity under which he laboured. He actually separated a young married couple by means of a forged letter, and for this act he was exiled by his family. He went to China, and during the last rebellion closed a wasted life as he was leading a company of the rebels against the Imperialist troops. I had the melancholy satisfaction of saving his body from mutilation by the enraged soldiers, and helping to bury it decently in a lonely grave on the edge of a swamp."

What a field of speculation is here open to us! Did the unfortunate young man with the "moral deformity" become a Taeping? And on which side was Mr. Muddock that he turned up so opportunely to inter his friend? though the force of circumstances does not seem to have allowed him to make a very happy selection of a burying-place. Truth, as the author reminds us, is no doubt stranger than fiction: but it does not follow that if you bind together a number of the strangest truths you can light upon, you will thereon weave a probable or even a possible story. He tells us that the search for the lost heir of the Tintagel estates had its counterpart in real life, and we know that some years ago a young lady ran away with her father's groom; but we never heard that the groom was the lost heir of anybody, or that he has since taken his seat in the House of Lords. We by no means desire to run down the book, however, in spite of the impossibility of the story; it is exceedingly interesting, and many of the descriptions, such as the burning of the circus and the escape of the wild beasts in the Russian village, quite thrilling. There are some curious slips: what can the author mean by telling us that Caffa is a small seaport in the Crimea on the shores of the sea of Azov (we thought it was on the Black Sea), and then saying that the way to reach it is "to get on board a vessel going up the Baltic"? We also demur to the idea that a man who is described as "the soul of honour" would inveigle the daughter

of his master into a clandestine marriage; but if the reader can get over this slight "moral deformity" he will find that the hero leaves "little to be desired."

F. M. ALLEYNE.

CURRENT LITERATURE.

Hood's Poetical Works. Complete Edition. Two Vols. (E. Moxon, Son and Co.) It is something to have at last a collection of Hood's poems in two volumes, and not to have to search for them through half a dozen. The present issue claims to be complete, and in one instance certainly is more than complete, for the well-known lines "Farewell, Life! My senses swim," are printed twice in the same volume, at page 199 and page 572 of the "Serious Poems." In the preface a remark is made on the difficulty of exactly separating the serious from the comic in Hood's works. No doubt there is a difficulty, and "Miss Killmansegg," for instance, might occupy a debating society for some hours on the question of its classification. But by what conceivable process of reasoning an editor could have been induced to class the "Mermaid of Margate," the "Remonstratory Ode," and a score of other such things as "serious poems" we are at a loss to discover. Even "The Desert Born," despite the great poetical beauty of part of it, is as obviously burlesque as anything in English literature. The fact that Hood's comic poems far outnumber his serious pieces, and would make a much larger volume, may be a reason for abandoning this principle of arrangement, but can be no excuse for making a farce of it. We had rather, however, that the principle were strictly carried out. From grave to gay is a very pleasant transition when the gaiety is the gaiety of Elia or of Shakspeare. But Hood's merriment, amusing as much of it is, is too often of a definitely unpoetic kind, vulgarising instead of sublimating. It is, therefore, a really unpleasant shock to pass at once from the perfect music of "Lycus," of the "Midsummer Fairies," of the "Haunted House," to the street-melodies of the "Volunteer," and the "Lines on Pawning my Watch," though the latter are, of course, capital things in their way. There was no suspicion of shame to the poet in his assumption of the motley by which alone he could and did earn his living, but we are sure that he himself would have been the first to desire that the few and noble masterpieces of his art should be exhibited separately from his mere journey-work. The print of these volumes is small, but clear enough; of the illustrations (those in the "comic volume" appear to be the original ones) we had rather not speak.

To persons unacquainted with the frequency of literary coincidences, it may seem odd that whereas the British public have been content to go without a translation of Molière for a good many scores of years, two such translations should have appeared in the course of a twelvemonth. The first and most elaborate of these has already been noticed more than once before in these columns—of the second (*The Dramatic Works of Molière*. Translated into English prose by C. Heron Wall. G. Bell and Sons. "Bohn's Standard Library") the first volume has just appeared. It has no such splendid apparatus as M. Van Laun's sumptuous work, nor is it accompanied by extended notes or Introductions. But the comments, if few, are judiciously chosen and very much to the point, and the translator evidently possesses a knowledge of English far superior to that with which his rival is equipped. Abandoning the hopeless attempt to translate idioms literally, he has as a rule succeeded very fairly in finding corresponding English equivalents. His titles also are good: and the general style of his work is easy and pleasant to read. If there be any person who desires to make acquaintance with Molière, and is unable to do so

in the original, he will find a very fair substitute in Mr. Heron Wall's translation.

THE fifth volume of M. Van Laun's Molière (Paterson) contains *L'Avare*, *M. de Pourcœur*, *Les Amants Magnifiques*, *Le Bourgeois Gentilhomme*, and *Psyché*. In most of these plays there occurs lyrical work which does not exhibit M. Van Laun's plan of literal translation in a very favourable light. This is especially the case with that unique specimen of collaboration, *Psyché*, in which Molière, Corneille, Quinault, and Lulli each had a share. In speaking of *Les Amants Magnifiques*, which he rather depreciates (probably because of its connexion with Louis XIV., who seems to be M. Van Laun's special red-rag), the translator is within the mark in affirming that it is "borrowed from the same source as" Corneille's *Don Sanche*. It seems much more likely that Molière was directly indebted to his friend. In criticising the *Bourgeois Gentilhomme* M. Van Laun shows himself quite unable to enter into the spirit of Molièresque comedy. To describe Dorante as "sufficiently a scoundrel to pander to Jourdain's worst vices" is the merest shooting in the air, and argues anything but the sympathetic comprehension of his author which a translator should have.

The Poetical Works of Coleridge, and The Poetical Works of Shelley. "Chandos Poets." (F. Warne and Co.) Of Coleridge and Shelley perhaps more emphatically than of any English poet except Spenser, it may be said that any new editions or reprints may be at once, and without enquiry, cordially welcomed. They cannot be too much or too often read, and every new edition has a chance, which amounts to a certainty, of bringing them under the eyes of somebody who would not otherwise have known them. We are, therefore, very glad to see these two portly and handsome volumes. They appear to be as full as (not being copyright) they can be, and indeed the Coleridge is more complete than any other one-volume edition known to us, as it includes "Zapolya." It is a well-printed book, and the illustrations are fair. The Shelley is in smaller type, and suffers more from the lack of copyright—wild work being made, for instance, with the exquisite "Invitation" and "Recollection." We can see no reason, moreover, except this, why the excellent arrangement of grouping the poems under the years of their composition should have been departed from; and the retention of the old meaningless misprint *δακρύει* for *δακρύει* in the epigraph of the address to Coleridge does not argue a careful editor. Of the Introductions prefixed to these volumes perhaps the less said the better. It is not unpleasant in an idle hour to try and conceive the mental attitude of an editor of Shelley who, with an apparently honest admiration of his author, "regrets that he ever wrote 'Queen Mab' and the 'Revolt of Islam.'" But the memoir of Coleridge is much more astounding. Whether we have ever seen it before we cannot be certain, but it was apparently written not long after the poet's death, and seems to have been intended for some periodical. Its unfortunate author is pleased to inform us that "Christabel" contains "much of the ridiculous mixed up with a little of the sublime." He never mentions "Kubla Khan," or "The Ancient Mariner," or "Love." But (to make amends), amid much babble about "chastely beautiful Grecian temples," "pagodas," "coarse canvas," "appropriate metaphorical terms," and so forth, he gives us to understand that "the most correct, sublime, chaste, and beautiful of Coleridge's poems" is—"Religious Musings"!

Mae Madden. By Mary Murdoch Mason. With an Introductory Poem by Joaquin Miller. (Chicago: Jansen, McClurg and Co.) At first sight this little book looks like an elaborate specimen of the good old game "I love my love with an M," what with its author, Mrs. Mary Murdoch Mason, its prologiser, Mr. Miller, and its

heroine, Miss Mae Madden, who marries a man named Mann. A careful and carping critic might also object that Mr. Joaquin Miller's Introduction is questionably introductory. It has plenty of merit in its way, with something of Mr. Browning about it, and something more of Shelley's "Vision of the Sea;" but why the account of the appearance of a kind of human Anadyomene at Venice should be an appropriate usher to a tale of carnival life at Rome is perhaps a difficult question to answer. The novelette itself, however, is in no need of sponsorship, for a pleasanter story (considering its slightness) we never read. "Of course there were English who scowled at the Americans," says our author somewhere; but we don't think, judging from her book, that we should be in the slightest danger of scowling at her, or at her heroine.

The Maid of Stralsund: a Story of the Thirty Years' War. By J. B. de Liefde. (Hodder and Stoughton.) The author of this historical romance has selected a good theme, but has scarcely proved himself capable of making the most of it. The plot is very simple and rather heavy, but the style of warfare prevailing in Germany during the great struggle between the Protestants and Catholics from 1628 to 1632 is faithfully described. The best parts of the book are the illustrations of the characters of Gustavus Adolphus, Wallenstein, Tilly and Pappenheim. In fact, the campaigns of Gustavus Adolphus are very faithfully photographed; but the representations of them, however faithful, are wanting in spirit and colouring. They are exact, but they are without life. As to interest in the fortunes of any particular individual mentioned in the story, there is none. Even as a contribution to military archaeology, the *Maid of Stralsund* is a failure. Walter Scott would have made something of such a subject, but not the merest scrap of his mantle has fallen on Mr. Liefde. Captain Grant could, at all events, have taught the author of the book before us how to turn a turbulent period to literary account, as regards sensation, at least; but the reader of the *Maid of Stralsund* must be an exceptional personage if he is either excited or instructed by the tame account of adventures in love and war here placed before us.

From New Year to New Year, and From All the World Round. By the author of "I Must Keep the Chimes Going," &c. (Seeley.) This book is an illustrated collection of articles contributed by the author at different times to various religious periodicals. It is both avowedly and obviously intended for children, and we must say that the literary pabulum provided is suited for the feeblest mental digestions. Whether anyone with an ordinary intellect, and above the age of ten, will care to read the work before us we much doubt. It is very goody, the stories, if we may so style them, are very short, and totally devoid of interest. In short, they are simply well-diluted fragments of tracts. We suppose some people read the anonymous author's productions; but if virtue is to be rewarded by a present of *From New Year to New Year*, we imagine that vice will soon become alarmingly popular in the nursery.

The Correct Card; or, How to Play at Whist. A Whist Catechism. By Captain Arthur Campbell-Walker, F.R.G.S. (Longmans.) We have been sorely puzzled to discover the *raison d'être* of this extraordinary publication. The author professes to "follow in the wake of Hoyle, Mathews, Cavendish, Clay, and Pole," a fancy expression for using their matter; but he objects to all these worthies on the ground that to some minds "a didactic treatise is repellent," and he considers that the "catechetical form" of instruction is a novelty and an improvement. Hence, he makes up a book by taking sentences from the ordinary whist authorities and transmogrifying them into questions and answers. Suppose, for example, it is said somewhere, "suits not trumps are called plain suits," here we have it in two columns:—

1. What are called 1. Suits not trumps.
plain suits?

Or if, in the old common-sense parlance, we find a law (for the laws are here catecheticalised as well as the rules of play), "If a card be exposed in cutting, there must be a fresh cut," the new Catechism puts it:—

44. If a card be ex- 44. Yes.
posed in cutting, must
there be a fresh cut?

In this way the author has prepared a series of about 500 questions and answers, with the idea of establishing, we presume, a universal Whist Bee, in analogy with the amusement lately so much in fashion. If this sort of conundrum-making is really an improvement on the ordinary "didactic" forms, why not try it in other cases? For example, we might teach the multiplication table thus:—

1. How many are 1. Four.
twice two?

27. Are three times 27. No.
nine twenty-six?

Or we might re-write history thus:—

1. In the second cen- 1. The fairest.
tury of the Christian
era, what part of the
earth did the Empire of
Rome comprehend?

306. What is become 306. She is dead.
of Queen Anne?

Or we might inaugurate an "improved" style of poetry, thus:—

1. What is the ques- 1. To be or not to be.
tion?

15. What shall he be 15. D——d.
that first cries "hold,
enough"?

98. What ought the 98. Sing.
heavenly muse to do in
regard to man's first
disobedience, &c., &c.?

All this would, no doubt, in this author's view, be well adapted to meet the wants of those minds to whom "the didactic form is repellent," and we recommend Messrs. Longmans at once to get up an "Educational Series" accordingly.

NOTES AND NEWS.

CAPTAIN RICHARD F. BURTON is about to publish with Messrs. R. Bentley and Son *Sind Revisited*, the result of another journey into Western India.

Two Lilies is the name of the new story by Miss Julia Kavanagh, which will be published early in the new year by Messrs. Hurst and Blackett.

To the forthcoming number of the *New Quarterly* Miss Frances Power Cobbe will contribute a paper upon "Schopenhauer in his Relations to Modern Pessimism." The same number of the magazine will contain an article by Dr. F. Huefner, entitled "The Reformation of the Thirteenth Century."

MRS. ALEXANDER, the authoress of *The Wooing of Ot*, has a new story in the press entitled *The Heritage of Langdale*, to be published by Messrs. R. Bentley and Son.

MESSRS. R. BENTLEY AND SON issue this week a second edition of Mr. Wedmore's *Studies in English Art*.

THE contributions to literature of Mr. George Dawson were insignificant, but by his death, which took place last week at his country house near Birmingham, the cause of culture among the middle and lower-middle class in England none the less loses a friend. George Dawson represented liberal ideas to the townsfolk of many a midland and north-country town. His lectures, which had they been reduced to literary form might possibly have been received somewhat

coldly by the critics, as lacking in consecutive thought and in any high originality, were undoubtedly during many years a very appreciable instrument of culture. He never carried political opinions to the point of partisanship. His sympathies were generous, and in private life his manners of a homely kindness.

MESSRS. LONGMANS announce *A New Concordance to the Bible*, by Dr. Young; *The Life and Times of Jesus the Messiah*, by Dr. Edersheim; *Submarine Telegraphy*, by W. H. Preece and J. Sivewright; a translation, by W. Crookes, of Auerbach's *Anthracite*; *The History, Products, and Processes of the Alkali Trade*, by C. T. Kingzett; *The Amateur Mechanic's Practical Handbook*, by A. H. G. Hobson; *The Engineer's Valuing Assistant*; *A Treatise of Some New Geometrical Methods*, Vol. II., by D. Booth; and *English Grammar*, by J. Gostwick.

We understand that the first volume of Mr. Herbert Spencer's *Principles of Sociology* is completed, and may be looked for before Christmas. It will form the sixth volume of the Synthetic Philosophy.

It is intended to issue from the press of the University of Dublin a series of works, chiefly educational, by members of that university. It is expected that the earliest volumes of the series will be the following:—*Lectures on Physical Geography*, by the Rev. Samuel Haughton, Professor of Geology; *A Treatise on the Morphology of the Vertebrate Animals*, by Alexander Macalister, Professor of Zoology and Comparative Anatomy; and the first portion of a complete edition of the *Letters of Cicero, with a Commentary*, by Robert Y. Tyrrell, Professor of Latin.

At the sale last week by Messrs. Sotheby, Wilkinson and Hodge, of the Italian Library of the Chevalier J. Marchetti, of Turin, the following prices were fetched by the chief lots: *Cento Novelle*, Bologna, 1525, 13l.; *De Marchi, Dell' architettura militare*, Brescia, 1590, 9l. 15s.; *Barlotomeo deli Sonetti*, 1477, 4l. 1s.; Guido di Chionna, *Incomincia il prologo sopra la historia di Troja*, 1481, 7l.; Panziera, *Alcuni singolari tractati*, 1492, 3l. 18s.; ditto, *Tractato bellissimo*, 1492, 4l. 7s. 6d.; Petrarca, *Incomincia il libro degli homini famosi*, 1476, 5l. 17s. 6d.; ditto, *Libro degli Imperatori et Pontefici*, 1478, 5l.; Savonarola, *Prediche di frate Hieronimo da Ferrara*, 6l. 6s.; Ariosto, *Orlando Furioso adornato da G. Porro*, 1584, 11l. 18s.; Boccaccio, *Il Decamerone*, 1757, 4l. 6s.; *Proverbi di Cornazano*, 3l. 7s.; Petrarca con l'esposizione d' A. Vellutello, 1545, 6l. 10s.; Pistolesi, *Il Vaticano descritto ed illustrato*, 1829, 9l. 15s.; *Operette del P. Scario*, 1535, 3l.; *Tucidide*, Venice, 1545, 7l. 10s.; Vecellio, *Degli habiti antichi et moderni di diverse parti del mondo*, 1590, 9l. 12s.; ditto, *Di tutto il mondo*, 1598, 12l. 10s.; Vasari, *Vite de' Pittori*, 1759, 3l. 18s.; Bembo, *Prose della volgar lingua*, 1594, 10l.; *Canti Carnascaleschi*, 1559, 6l. 10s.; *Opere di Lorenzo de' Medici*, 1825, 4l. 9s.; Zanetti, *Nuova raccolta delle monete e zecche d'Italia*, 1775, 5l. 5s.; *Habiti d' Huomeni et Donne venetiane*, 1610, 4l. 12s.; *Descrizione del regale apparato per le nozze della serenissima Madama Cristina di Loreno*, 1589, 15l. 5s.; another copy, 12l. 10s.; *Feste nelle nozze di Don F. Medici et la Signora Bianca Capello*, 1579, 8l.; Ariosto, *Orlando Furioso*, Aldine edition, 1545, 5l. 5s.; *Aristophanis Comoedine*, ditto, 1493, 4l.; Bembi, *Petri de Aetna ad Angelum Chabrielem*, ditto, 1495, 7l. 7s.; Dante, *Le terze rime*, ditto, 1502, 5l. 7s. 6d.; Homer, ditto, 1504, 6l. 5s.; Horace, 1st Aldine edition, 1501, 20l.; ditto, 1509, 10l.; Lucretius, Aldine, 1500, 8l. 8s.; Machiavelli, ditto, 1546, 6l. 6s.; Manutius, ditto, 1501, 10l. 15s.; Melindus, ditto, 1558, 3l. 13s. 6d.; Petrarch, 1st Aldine, 1501, 6l. 7s. 6d.; Plato, ditto, 1513, 6l. 18s. 6d.; Plutarch, ditto, 1509, 6l. 6s.; Polifilo, 2nd Aldine, 1545, 18l. 18s.; ditto, first edition, 1499, 45l.; Virgil, 1545, 7l. 2s. 6d.; Theocritus, 1495, 5l.; Van Dyck, *Icones Principum Firorum*, &c., 9l. 9s.; Cervantes, *El*

ingenioso Hidalgo Don Quirote, Madrid, 1780, 7l. 7s.; Gravelot et Cochin, *Iconologie par figures*, 6l. Among the few manuscripts sold were a *Libre de Choeur*, 9l. 5s.; an *Officium Beatae Mariae*, fifteenth century, 12l. 10s.; another, 9l. 10s. The whole sale, which lasted five days, realised 1,383l. 13s. 6d.

A LIBRARY of an almost unique character will be sold at Manchester in the course of next week by Messrs. Capes, Dunn, and Pilcher. The collector of it was the Rev. Thomas Corser, Rector of Stand, near that city. Among the curiosities of it are several thousand catalogues of the most noted Collections of Books that have been dispersed for a century past, many with prices and buyers' names; the original MS. of Cavendish's *Life of Wolsey*; the Psalms in the autograph of Geo. Withers; *The Most Aunient Historie of God and Man*, a poem of about 12,000 lines, by R. C., ornamented with Indian-ink drawings, finished July 29, 1629, in the original binding; a large-paper copy of the *Bibliotheca Anglo-Poetica*, and a copy of Walton and Cotton, each copy illustrated with about 1,000 portraits; Shakspeare's *Richard the Third*, 1612, and the *Merry Wives of Windsor*, 1619, &c., &c.

M. HENRY HOUSSAYE, son of the well-known novelist Arsène Houssaye, wrote when barely eighteen a *Life of Apelles*, and a few years after a *History of Alcibiades and of the Athenian Republic*, which has just reached its fourth edition. He is now the literary critic of the *Journal des Débats*. He is preparing a volume which will be called *Athens, Rome, Paris*, one chapter of which he has just published separately in one small volume (H. Vatou), entitled *The First Siege of Paris*, b.c. 52. Neglecting all the allusions that cannot fail to present themselves to the terrible siege which Paris has recently undergone, one is struck by all the recollections which an intelligent scholar can evoke in the midst of the life of to-day. Thus M. Henry Houssaye has noted on the map and plan all the points of attack of the legions of Labienus, making them correspond to the present names of streets and quays. There was no siege, strictly speaking. Old Lutetia was set on fire by her own hands on the approach of the implacable conquerors of Gaul. The defenders, under the command of the Gaul Camulogenes, perished to the last man.

A CORRESPONDENT writes to enquire whether the *a* in *fame* and the *o* in *note* are usually regarded as simple vowels. The answer is that the majority of English phoneticians agree with our correspondent in regarding these vowels as diphthongic, although Mr. Ellis himself, the father of English phonology, still partially retains the older view that they are simple monophthongs. The table of simple vowel-sounds and diphthongs given by our correspondent, although it shows acuteness and observation, is not correct in many of its details, and we would refer him to Mr. Sweet's *History of English Sounds* (Trübner, 1874), if he wishes to make himself acquainted with the latest and most exact analysis of the English vowels.

THE edition of the *Mahāvansa*, our best authority for the ancient history of India, now being prepared under the auspices of the Ceylon Government, is getting on surely, if slowly. The Hon. George Turnour had published the first thirty-eight chapters, and a few others had been edited in different periodicals by Mr. Rhys Davids and others. The Ceylon edition begins at the thirtieth chapter, and has now been printed down to the fifty-eighth inclusive, which carries the history down to the time of Parākrama Bāhu of Ceylon. The Pali text is edited under the superintendence of the two most distinguished native scholars, the Chief Priest Sumangala, of Hik-kaduwa, and Batuwana Tudāwa Pandit. It is in contemplation to print simultaneously the commentary on the *Mahāvansa*, written by the author himself, and particularly full and valuable on

those parts of the *Mahāvansa* relating rather to India than to Ceylon.

THE Second Report to the Ceylon Government, by Dr. Goldschmidt, the Archaeological Commissioner in that colony, will shortly be published. It will contain not only a general estimate of the final results which may be looked for, but translations and translations of several important inscriptions. With one exception these are all in Elu (as the older Sinhalese dialects are collectively called), and they will give a decisive verdict on the vexed question of the history of that language, which is now ascertained to be Aryan, and not Dravidian, as well in its word-forms as in its grammar. The one exception is an inscription in Pāli, to which Dr. Goldschmidt attaches great importance for the determination of the origin of that sacred language. The Buddhists have hitherto maintained Pāli to have been the language spoken by Gautama, and this opinion was supported by Prof. Childers; Prof. Kuhn holds it to have been the dialect spoken in Mālava in the time of Asoka, while Prof. Kern, of Leyden, thinks it is decidedly later than any dialect of even that date, and that it is probably an artificial language developed entirely among Buddhist ecclesiastics. To have this question settled as decisively as that of the origin of Sinhalese has now been would be of the first importance for the religious history of India.

A COPY of the earliest known History of Dr. Faustus, from which it is supposed all the mass of popular literature concerning that hero has been derived, has recently been found in the Academy Library at Buda-Pest. Hitherto only one copy of this early work, which was printed at Frankfurt-a.-M. in 1587, was known to exist. It was preserved in the Imperial Library at Vienna. The copy now found is unfortunately in a very dilapidated condition. The title is wanting, and several of the leaves; still there seems to be no doubt that it is really the original work.

WE understand that of Captain Burnaby's *Ride to Khiva* not less than one thousand copies, in addition to the large number required by the other libraries, have been taken by Mr. Mudie alone; that the first and second editions of the work were exhausted in a week, and that a third edition is also already nearly exhausted. A fourth edition is in the press.

A NEW "humorous and critical" weekly paper is to appear immediately, under the title of *Forick*.

IN the *Fortnightly Review* Mr. Chamberlain tells a little about Lapland, and a good deal about the Gothenburg System, which is largely applied in Sweden, and is to be extended to the capital next October. It is interesting to learn that a large percentage of the cases of drunkenness in Gothenburg occur among peasants who come in on market days from villages under a régime of total prohibition. Mr. Freeman's paper on the "Law of Honour" is provokingly incomplete and one-sided. He observes that it is in its origin the rule of behaviour which the members of a military oligarchy adopt for the regulation of their behaviour within their own class, and he makes the amusing suggestion that the first conspicuous person to adopt this rule was William Rufus, who impressed his contemporaries by his "magnanimity." But he refuses to see that this rule does not lose its special character (which would have repaid closer analysis) when its application is extended beyond the class with whom it arises, and that all standards of conduct are at first applied within the narrow limits of a natural or artificial community. M. A. Ward treats of Ruiz, the archpriest, with several well-translated extracts. Mr. Harrison's article on "Cross and Crescent" is a forcible statement of the moral and political difficulties of a nineteenth-century crusade. Prof. Bryce's article on "Russia and Turkey" expounds, with such authority as per-

sonal enquiries on the spot can give, the considerations which would be completely reassuring if thoroughly reasonable politicians had complete control of affairs.

In the *Contemporary Review*, Mr. R. Bosworth Smith treats the same question with beautiful tact and candour, pointing out how Islam, in its laxest form, has redeemed the Turkish race, as a whole, from their original passion for drink. His conclusion is that, though the Turks must be made to set their house in order, the process need not and should not be a step towards turning them out of it. Mr. Gladstone's article on "The Hellenic Factor in the Eastern Question" recalls the policy of Canning for our present guidance, and shows that the Greek kingdom has made great progress in education and fair progress in trade. The most interesting point among many touched upon in Mr. Newton's article on "Greek Inscriptions" is the cost of the details of the Erechtheum. It seems, a young man guiding two horses cost nearly 10*l.*; luting a column about 16*l.* In his third article on "Automatism and Evolution," Dr. Elam gives some interesting quotations to show that Prof. Huxley's confidence in Mr. Darwin's theories seems to have grown faster than the evidence whereby they are supported. Dr. Appleton's second article on Mr. Matthew Arnold and Metaphysic seeks to show that in his later writings, *Literature and Dogma* and *God and the Bible*, this writer, by not methodically following out the idea of a social consciousness or "better self," partly divulged in his earlier works, but condescending to sympathise with the Philistines' contempt for metaphysic, lapses himself into a very bad sort of metaphysic. This result is in part "the Nemesis of his want of method." Mr. Arnold's later ideas respecting conduct and happiness, and his formula of the "Eternal Power, not ourselves, which makes for righteousness," are dissected with a view to expose their inadequacy as expressions of a correctly interpreted experience. Particularly elaborate is the examination of the doctrine of the Eternal as professing to stand for a complete religious idea, such as is illustrated, for example, in the Hebrew conception of the Deity. Mr. Arnold's fallacies are classified by help of Bacon's illusions or *idola*, the essentially verbal process by which the dominant formula of the Eternal is built up being referred to "idols of the marketplace" or illusions of language. The essay closes with a well-merited tribute to the worth of all but the logical qualities of Mr. Arnold's work.

In the *Cornhill Magazine* R. L. S. discourses with sarcastic sympathy of Charles, Duke of Orleans, and succeeds in conveying a very distinct idea of that quaint and pathetic personage, who made his castle at Blois for the last twenty years of his life one of the pleasantest places to live in that have ever been: it would have been interesting to hear a little more of the grounds of his strange political reputation among contemporaries. E. W. G. discusses Abraham Cowley rather as a predecessor of Dryden than as a continuator of Donne and Crashaw.

In *Macmillan* the Rev. C. Tennyson Turner contributes a charming sonnet on Letty's Globe. Matthew Arnold reprints the "New Sirens," whose disappearance in the suppressed volume of 1849 has been regretted by Mr. Swinburne and others. Mr. Ball calls attention to early mediæval painting in Southern Italy, which was for a time in advance of Tuscan art. A. Schwartz gives some truly delightful specimens of German cradle-songs on the Nativity. A Serbian Statesman assures us that the Eastern Christians would be quite satisfied if the Porte would delegate the administration of Thessaly and Epirus to Greece, and that of the rest of Turkey in Europe to Prince Milan and his nominees.

In *Fraser* there are some notes on the Turk, where we learn, among other things, that the "High Turk," by successive importations from

Circassia, has become nearly the purest Circassian in Europe. There is also an article on Eyes and Eye-Glasses, full of clear concrete curious observation, whence we learn, among other things, that the late Charles Dickens never used glasses except to drive through a London fog. The Chaplain of the *Discovery's* paper on "Our Arctic Voyage" contains the fullest account we have yet had of the odd discomforts and gaieties of life on the ice-bound ships.

In *Temple Bar*, beside a very good account of the eighteen thousand washerwomen of the Manzanares, headed "Toilers of the River," there is a translation from Turguenief, "How Russians Meet Death;" and a paper on George Stubbs, R.A., from sources not known or used by Redgrave in his *Century of English Painters*.

Blackwood has a *précis* of Prejevalsky's *Mon-golia and Northern Thibet*; also an ingenious ghost-story, "The Secret Chamber."—Canon Rawlinson concludes his papers on "Early Civilisation" in the *Leisure Hour*, with a recapitulation of his grounds for holding that the Septuagint chronology leaves room for all that is hitherto known of any of them.—The *Atlantic Monthly* contains a very good sketch by Mark Twain, "The Canvasser's Tale," of his uncle who collected echoes; and Lowell's Fourth of July Centennial Ode.—The *International Review* contains the "Origin of Parliamentary Representation in England," by Mr. Freeman, which sets forth the modification which his views have undergone in consequence of Prof. Stubbs' *Constitutional History*; also an account of P. G. Hamerton, which contains the fullest information which one can expect in a dictionary of contemporaries.—The *Melbourne Review* begins a series of papers, by Sir C. Gavan Duffy, on the History of Victoria. There is an article on Sir Richard Hanson, which deals mainly with his books.

We are favoured with a copy of the first part of the first volume of the *Transactions* of the Cymmrodorion Society of London, a brotherhood numbering at least 150 members, banded together for the cultivation of the Welsh language and literature, the publication of Welsh MSS., and the preservation of Welsh antiquities, as well as socially for the promotion of friendship and good understanding among the Welsh in London. This society was originally founded in 1751, and among its officers and members were Richard Morris, of the Navy Pay Office, its president, editor of two editions of the Welsh Bible; his brother Lewis Morris, poet, philologist, and antiquary; and Goronwy Owen, its appointed bard. It appears to have taken an active part in encouraging the publication of Welsh literature, and to have assisted in the original establishment of the Welsh School, which was removed in the middle of this century from Gray's Inn Road to Ashford. About the beginning of this century, after having been brought into difficulties and dissolution by over-liberal literary undertakings, it was revived for a time: but it now rises, phoenix-like, from the ashes of its predecessors, with the experience of their mistakes, and under most hopeful auspices, with a strong council, and excellent names among the corresponding members, and an editor, able, zealous, and patriotic—the Rev. Robert Jones, Vicar of All Saints, Rotherhithe; and it is a happy augury of success and continuance that the first contribution to the present volume is a touching elegiac poem by Lewis Morris, the grandson of the antiquary and bard, who was one of the original members, to the memory of the Rev. Goronwy Owen; that the poetic tribute to a fellow bard of his grandsire is one whom his compatriots will not suffer to anonymise his authorship of "Songs of Two Worlds" and the "Epic of Hades." The best articles in the part before us, after this, are Prof. Peter's on "Welsh Particles" and F. W. Rudler's, late of the University College of Wales, on "Natural History Museums," in which

latter are some very valuable suggestions as to combining a *local* with a *general* department in all such. We cannot help thinking that considerable condensation of the proceedings of the National Eisteddfod at Wrexham in 1876 (pp. 42-83) might have allowed space for another article of like value and less ephemeral interest than the chronicles of local speeches, mostly overflowing with Welsh patriotism and *amour propre*. The most practical and wholesome of these was by Mr. John Rhys, in declining for the third time to adjudicate a prize for "the best Scientific Account of the Origin and Growth of the Welsh Language." Reviews of books and notices of forthcoming books fill up the number, with the addition of a second section illustrative of the history of the Cymmrodorion (pp. 1-52). The Council are now publishing, as their first work, *The Welsh-English Dictionary of William Salesbury*, a work that throws considerable light on the Welsh and English of the period of Henry VIII.

MR. CHANDOS WREN HOSKYNs.

THE death of Mr. Chandos Wren Hoskyns, which occurred in London on the 28th ult., demands some notice at our hands. He was the second son of the late Sir Hungerford Hoskyns, Bart., and a lineal descendant of Serjeant Hoskyns, whose "too much wit" cost him his liberty, but won for him the eulogies of Selden, Donne, and Ben Jonson. Mr. Hoskyns was born in 1812, and educated at Shrewsbury and at Oxford, where he gained a second-class in classics in 1834. He then entered at the Inner Temple, sparing some time from his legal studies for general reading and occasional contributions to the periodical press. His marriage, in 1837, with the sole heiress of C. R. Wren, Esq., of Wroxall Abbey, Warwickshire, brought with it the care of a landed estate, and diverted his mind to agriculture, which thenceforth became the chief subject of his pen. His first published work was *A Short Enquiry into the History of Agriculture*, an essay displaying much research, and the same freshness of style which marked his numerous contributions to the *Gardeners' Chronicle*. This was followed by his best-known work, *Talpa: or, the Chronicles of a Clay Farm*, wherein he recounts with infinite humour his experiences of the stiff soil of Warwickshire, and the stiffer prejudices of his farming neighbours. Many of the quaint illustrations in this popular little book, although etched by George Cruikshank, were sketched in pencil by Mrs. Hoskyns, at her husband's suggestion. In 1862 Mr. Hoskyns succeeded his father in the possession of the Herefordshire estates, and in 1869 was elected M.P. for Hereford. In spite of an agreeable manner, much fluency of speech and aptitude for business, he failed to make any special impression on the House, nor, indeed, did he take a very prominent part in the debates upon land tenure which occupied so much of the attention of the last Parliament. His pen, however, was not idle. He contributed to the *Cobden Club Essays* a paper on the Land Laws of England which provoked much discussion, and in a popular pamphlet advocated with characteristic energy his views upon primogeniture and the evil results of entail. He was an active member of the Society of Arts and of the Royal Agricultural Society, an admirable lecturer, brilliant talker, and most pleasant companion. If his writings occasionally suffer from a redundancy of metaphor and illustration, they are for that very reason the more exact reflection of their author, who, had he been less clever, would have been more successful.

CHARLES J. ROBINSON.

NOTES OF TRAVEL.

A LETTER has been received by the Church Missionary Society from Mr. G. J. Clark, dated Mpwapwa, September 3, announcing the arrival at that place (200 miles from the coast) of himself

and Mr. O'Neill with the first caravan. The people of the district proved to be quiet and industrious in their habits, and the local "Sultan" gave the visitors a hearty welcome. By about the middle of October it was expected that the other parties would have all arrived at Mpwapwa, which will form an important intermediate station for the Nyanza expedition.

MESSRS. THACKER, VINING AND CO., of Bombay, have just published *Notes on the History and Antiquities of Chaul and Bassein*, by J. Gerson da Cunha. The volume is illustrated with seventeen photographs, nine lithographic plates, and a map. The ancient city of Chaul, we may mention, is now called Revadanda, and is about thirty miles south-east of Bombay, while the island of Bassein is twenty-nine miles distant therefrom.

THE Government printer at Melbourne has published, by authority, *Descriptive Notes on Papuan Plants*, in three parts, by Baron Ferd. von Müller. In the first essay the author endeavours to elucidate some Papuan plants brought from two localities, previously unexamined, by Mr. McLennan's expedition. The second deals with material furnished by the Rev. S. Macfarlane, and brought from the Baxter and Fly Rivers; while the third is devoted to specimens supplied by the same gentleman and Mr. A. Goldie.

In January will be published *Letters from Africa*, descriptive of trading life in western and central Africa, by Mr. John Whitford. These letters are, we believe, chiefly reprints from the *Porcupine*.

WE regret to announce the death of Mr. Louis A. Lucas, the African traveller, at the early age of twenty-five. He reached the Equatorial Provinces in the month of June last, but his escort proving too weak to allow him to penetrate further into the interior, he returned to Khartoum, en route to Suez, intending to reorganise his expedition and proceed by way of Zanzibar to the Congo. After repeated attacks of fever, he left Khartoum on October 26, but died on the Red Sea, near Jeddah, on his way back, having abandoned all idea of further exploration.

THE conditions of the ice in the seas round Spitzbergen appear to have been unusually favourable for navigation during the past summer, and several of the Norwegian fishers have been able to reach portions of the Arctic Basin which, as far as it is known, have never before been visited. In the *Tromsøposten* an interesting report by Johann Kjelsen, master of the yacht *Johanne Maria*, has newly been given. In July Kjelsen having reached Mollen Island, off the northern coast of Spitzbergen, steered thence due north without coming on ice. Returning southward he coasted in an easterly direction along the north side of North-East-Land, doubled Cape Smyth in 28° E. below the Storöen, and sailed round these islands on the eastern side of them. Here, at a distance of from four to five miles (perhaps Norwegian miles of 9·8 to a degree), he saw land of from 300 to 400 feet in height lying in a direction from east to south. This land was also seen by Captain Niels Johannsen, of Tromsø. From the Storöen Kjelsen returned to Cape Smyth in the middle of August, and thence, accompanied by the schooner *Nordland*, Captain Ed. Johannsen, steered straight north, and kept on this course for a day and a half. The atmosphere was foggy, but Kjelsen believes that he reached about 81° 30' N. lat.; the water was everywhere open and free of ice, the sea running high, and the current drifting strongly to eastward.

THE Verein für die Deutsche Nordpolarfahrt, in Bremen, has newly issued a bulletin continuing the publication of the reports from the German West Siberian Expedition. It contains a description of the isthmus of the Siberian tundra which lies at the eastern base of the Ural chain, between the mouth of the Obi and the Bay of Kara; this line was examined partly with a

view to ascertain the practicability of forming a canal across it, which would save the long detour into the Arctic Sea round the Samoiedes peninsula. This scheme, however, is pronounced impracticable. The report is full of interesting descriptions of the Samoiedes, the tundra landscape, limits of vegetation, and animal life.

FROM Messrs. Tinsley we have received two popularly written and very readable books of travel:—*The East; being a Narrative of Personal Impressions of a Tour in Egypt, Palestine, and Syria, with numerous references to the Manners and Present Condition of the Turks, and to current Events*, by William Young Martin, takes us over the well-trodden and familiar tourist route to Cairo and the Pyramids, Jaffa, Jerusalem, the Dead Sea, Damascus, and Beyrout. There is nothing in the narrative that is at all new, but it conveys in a pleasant way the impressions left on the mind of an intelligent British traveller who is no specialist. To justify the second portion of the title, a few pages of platitudes about the Turks and their atrocities are appended to the volume. *Curiosities of Travel, or Glimpses of Nature*, by Charles Armar Wilkins, is a series of well-chosen extracts from the works of the best travellers, describing the scenes of the Polar world, the Alps and glaciers, steppes and deserts, caverns, volcanoes and earthquakes, and the ocean, woven together into a popular account of these features and phenomena. The gems of description sometimes contrast favourably with their setting, and it is often a relief to pass from the author to his authorities, but as a whole the book is a very interesting and useful one, and its deductions are sound.

THE ARCTIC EXPEDITION.

V.

The Outbreak of Scurvy.

It would have been far better if the discussion on the subject of the outbreak of scurvy in the late Arctic Expedition could have been deferred until full information, including the Reports of the medical officers and of commanders of sledge parties, was before the public. But the reckless mis-statements that have been published make this impossible, for unless they are contradicted the most erroneous impressions will be formed. It has been alleged that the pemican was salted; that there was an insufficient supply of preserved potatoes; that there was no lime-juice on the sledges; that the allowance of salt was one ounce and a half a day for each man while travelling; that the men were expected to drag 400 lbs. each; and that the commanders of sledges neglected the instructions they received. The whole of these assertions are untrue; and some of them, such as the stories about the salted pemican, the allowance of salt, and the weights to be dragged, are too ridiculous to need refutation. The statement that the officers in command of sledges neglected the instructions they received respecting the health of those entrusted to their care, which appeared in the *Sanitary Record*, is not only without any foundation in fact, but is an aspersion on the professional reputations of able and gallant men which deserves the strongest reprehension.

While awaiting the full and complete information that will be available as soon as the official Reports are published, it seems desirable to indicate the considerations which should really have weight, and the line of argument which most probably will lead to just conclusions respecting the outbreak of scurvy.

When the Arctic Expedition was fitted out, the only experience could be derived from the work of former enterprises of the same kind; and accordingly the best precedents were carefully followed, as regards the victualling, the winter arrangements, the sledge equipments, and the diet of the travelling parties. Taking the expedition of 1850–51 as a model, it was known that extended parties had been away travelling for sixty days and

upwards, and that only one—that of McClintock, which was absent eighty-three days—obtained any fresh meat. No lime-juice was taken on the sledges, and yet there was no scurvy. It was believed, and rightly believed, with reference to the knowledge we then had, that if the precedents of the expedition of 1850–51 were carefully followed there would be the same exemption from scurvy.

Accordingly, as between the Arctic Expeditions of 1850–51 and 1875–76 the scale of victualling on board was practically identical, the system of winter routine was identical, the ventilation was as carefully attended to, the same amount of exercise was enforced during the winter, the men were kept equally happy and amused, and the sledge equipments were identical. The *Alert* and *Discovery* were, it is true, not so well adapted for wintering, owing to the space inevitably occupied by the engine-room, and to the absence of a warming apparatus, and of a drying-room apart from the living-deck; but these disadvantages were ably provided against to a great extent, and practically no ill-effects were felt from them. As regards the sledging arrangements, several improvements were introduced in 1876, so that in some respects they were better than those of former expeditions. In previous expeditions no lime-juice was taken on the sledges. In 1876 the northern division took four quart-bottles of lime juice, sufficient to supply the sick; all the later depot sledges took lime-juice, and the eastern division had a large depot of lime-juice to fall back upon in Polaris Bay. In previous expeditions rum was served out for the mid-day meal. In 1876 tea was substituted, the allowance of rum was reduced, and it was only served out at night. As regards weights, those established in former expeditions were 220 lbs. to 240 lbs. per man, on leaving the ship. By giving this subject the closest and most careful attention, the officers of 1876 succeeded in making a slight reduction.

Some deplorable nonsense has been published on the subject of the teetotallers. The facts are as follows. One teetotaller, named Malley, was very severely frost-bitten during the autumn, and consequently was unable to join any of the extended sledge-parties. He did a good deal of useful sledging-work in short trips in the spring, but was never tried by the really severe work, and consequently escaped the scurvy. Adam Ayles, another teetotaller, and as fine a fellow as ever stepped, was attacked by scurvy, though slightly. The two other teetotallers were attacked by scurvy in a very aggravated form. On the other hand, not one of the officers was a teetotaller, and not one was in the sick list for scurvy. Several men, who liked their glass of grog, also escaped the scurvy entirely. Of the three men of the northern division who, with Captain Markham, held out to the east, and dragged the sledge alongside the *Alert* not one was a teetotaller. All the men of the Expedition were temperate and abstemious; and the truth of course is that there was really no difference between the temperate men and the teetotallers.

It will thus have been seen that, in the organisation of the late Arctic Expeditions, former precedents were carefully studied and generally followed, while in a few instances they were improved upon. As in all these particulars, and especially in the diet, the arrangements were identical with those of the expedition of 1850–51, which had no scurvy, it is quite obvious that the original exciting cause of the outbreak of scurvy in 1876 must be looked for elsewhere. We must seek for it, not in what was identical in the circumstances, but in what was different.

This difference is not far to seek. The great danger to health in Arctic service, apart from diet, arises from the long period of darkness to which the men are exposed. There has never been any doubt that the prolonged absence of the sun, with the attendant damp and confined air which are inevitable, is injurious to health. The injurious effects have been warded off by attention

to diet and exercise, and by an admirably conceived winter routine; while usually those effects have been almost entirely dissipated by the influence of the sun after its return. Former naval Arctic expeditions have generally wintered in about latitude 74° or 75° , where the sun is only absent for some ninety-three days, and where there is never total darkness even on the shortest day. Moreover, the sun returned on February 3 or 4, and the extended travelling parties did not leave the ships until April, so that the men had two months to recover from the effects of the winter, before their severe work began.

The members of the expedition of 1876 were exposed to very different and far more dangerous conditions. Instead of ninety-three days they had to endure the absence of the sun for 142 days, or half as long again; while the darkness was far more intense. During three months the darkness is greater in $82^{\circ} 27' N.$ than it is during the darkest day in $75^{\circ} N.$ This prolonged darkness of course involves prolonged exposure to inevitable lamp, confined air, and extreme cold. The sun did not return until February 29, yet the extended sledge-parties started as early as their predecessors—namely, in the beginning of April. Consequently, although they had endured a period of darkness half as long again, yet they had only one month, instead of two, in which to recover after the return of the sun.

This great difference between the circumstances of the expedition of 1875 and those of its predecessors no doubt accounts for the outbreak of scurvy. Having been exposed to far more serious dangers to health during the darkness, they yet started at the same time on their long journeys, and undertook to be away as many days, and in all respects to do the same work.

No blame can be attached to anyone for having followed former precedents too closely. Like all other people, Arctic explorers can only learn by experience; and we now know that the conditions to be encountered in the Polar regions are different from those which had formerly to be provided against. In $82^{\circ} 27' N.$ the season of travelling should be curtailed, the time of starting should be in May instead of April, and the period of absence must in future be reduced. With these and other precautions, which will no doubt suggest themselves when the matter has been thoroughly considered, there is no reason to fear a recurrence of the calamity, in any future expedition, which so enhanced the difficulties of the explorers of 1876, and therefore added to the glory of their achievements.

CORRESPONDENCE.

THE BUILDING OF MYKENE.

Ventnor: Dec. 1, 1876.

In the interesting letter of Mr. Sayce on Mykene, printed a week or two since in the ACADEMY, the writer adopts what I think will be found to be an error in Dr. Schliemann's conclusions as to the building of the city—i.e., that it was built at various periods. I remember perfectly well the piece of wall to which Dr. Schliemann alludes, having photographed the ruins from that side; but it was clearly not an earlier wall, but a later reparation, and struck me at the time as probably a hasty rebuilding of a wall which had been breached, possibly in a siege, and which the citizens, unable to devote the time that restoration in the original style would have demanded, had restored with stones not faced and fitted as was the material of the original walls, but as well as the time and the circumstances permitted. This was shown, I remember thinking at the time, by the breach being wider at the top than at the bottom, whereas if it had been an old fragment the contrary would have been the case.

Dr. Schliemann seems to have missed in his examination of the walls of Mykene one great fact of its construction—that it is of the neolithic period, no trace of anything but stone-working being visible. This fact, to which I called the attention of archaeologists several years ago, is confirmed by the most valuable discoveries just made by Dr. Schliemann of bronze and flint weapons at Mykene, but none of iron.

This is, indeed, the distinguishing character of the true archaic polygonal work, and at once separates it from mere modern imitation like that on the Pnyx at Athens, in which the use of the cutting tool is clear and unmistakable. After a long and careful examination of all the polygonal work in the Argolide as well as that in Italy and Crete, I was able to say that in no case of work historically determinable as archaic—i.e., traditionally ascribed to the Pelasgi or Cyclopes—was there any use of cutting tools, and even the lion relief at Mykene is evidently done by a combination of drilling and trituration.

The enormous lintel of the treasury at Mykene, and much of the wall, which is built of conglomerate and not polygonal but parallelipedal, is still worked in the same way, the finishing being apparently done by rubbing one stone upon another. It is to be hoped that Dr. Schliemann's researches may turn up either at Mykene or the later Argos some example of the tools, doubtless of stone, by which the stonework was done. The finding only of flint arrows is certainly a most valuable archaeological indication, and it is to be hoped that this wonderful find may lead to the complete exploration of the Argolide, the cradle of Hellenic art and civilisation.

W. J. STILLMAN.

DELACROIX'S CORRESPONDENCE: AN APPEAL.

Paris: December 4, 1876.

M. G. Monod has already announced the publication by Messrs. Charpentier of the first volume of the *Memoirs* of Philarète Chasles. I return to it to-day for different reasons from those assigned by

your excellent correspondent. This volume contains an unpublished letter of Eugène Delacroix to Alfred de Musset, and a highly characteristic portrait of this great artist, who was his college friend, and with whom he kept up cordial relations till his death. Now I am myself on the point of finishing the MS. of a large work on the Correspondence of Eugène Delacroix, of which I have already given a few specimens in the ACADEMY for November 28, 1874. Before handing over this work to my publisher, who is growing impatient and is with good reason complaining of my delays, I am anxious once again to beg English amateurs to communicate any letters of Eugène Delacroix, or any information with regard to his stay in England in 1824, and thereby to do me a high service. The English school produced a strong impression upon him, clearly perceptible in his work till his visit to Morocco, which was his journey to Damascus. Did he break off all relations with the artists or amateurs who gave him a warm reception? Did some English amateur collect any of his paintings or water-colours, his etchings or his lithographs, during or after his stay in London? That is the question I would ask once more.

Philarète Chasles passed his first youth in England, where he was in hiding from the fabulously inept and barbarous pursuit of the police of the Bourbons. He was but fourteen, and was accused of conspiracy! He gives curious notes on the English society in which he moved in 1817 and 1818. I have to deal only with what relates to artists: for instance, "un artiste anglais très-habile dans l'art de graver la pierre dure, vieil ami de Fox, et, comme la plupart des artistes, radical déterminé, Thomas Brown." Thomas Brown presented him to Ugo Foscolo, whose house was the rendez-vous of many oddities and many celebrities. I would particularly commend to your notice a conversation on Chateaubriand at the table of the old publisher Baylis, between him, Thomas Brown, and the architect Porden—"Momie satirique, au corps sec, à l'esprit sec, à la culotte de soie noire, tombant en plis longitudinaux sur de petits genoux grêles; totalement et parfaitement pointu, intelligence et figure, raison et goût, habitudes et talent, paroles et génie." There is also a curious appreciation of the sentiments of George the Fourth on the arts considered as a means of government. These *Memoirs* are considered very satirical. They have above all a tone of passionate truthfulness and violent defiance to which we are not accustomed in France, but which, for my own part, I find both instructive and touching.

PH. BURY.

APPOINTMENTS FOR NEXT WEEK.

- SATURDAY, Dec. 9.—3 P.M. Crystal Palace and Saturday Popular Concerts.
 8 P.M. Musical Artists' Society (Royal Academy of Music).
 MONDAY, Dec. 11.—5 P.M. London Institution: "Weather Knowledge," by R. H. Scott.
 8 P.M. Anthropological Institute: "The Ethnology of the Germans. Part 1.—Saxons of Nether Saxony," by H. H. Howorth; "Kitchen Midden," by W. Laws; "Classification of Arrow-heads," and "On Prehistoric Objects at Portetewart," by W. J. Knowles.
 8 P.M. Colonial Institute: "Canada, as I remember it, and as it is," by the Rev. Dr. Donald Fraser.
 8 P.M. Monday Popular Concert.
 TUESDAY, Dec. 12.—8 P.M. Civil Engineers: Discussion on the Chalk Water System: "On the Testing of Portland Cement," by T. J. Mann.
 8.30 P.M. Geographical: "On the North Circumpolar Sea," by Capt. Sir G. S. Nares; "Sledge Journey towards the Pole," by Capt. A. H. Markham.
 WEDNESDAY, Dec. 13.—8 P.M. Society of Arts: "A new Process of Printing a Number of Colours at One Time," by E. Meyerstein.
 8 P.M. Randegger's *Fridolin*, Exeter Hall.
 THURSDAY, Dec. 14.—7 P.M. London Institution: "Mesmerism, Odysm, Table-turning and Spiritualism," II., by Dr. W. B. Carpenter.
 8 P.M. Mathematical: "The Orthogonal Transformation, and additional Notes on Transformation of Elliptic Functions," by Prof. Clifford; "On the Conditions of Perpendicularity in a Parallelipedal System," by Prof. H. J. Smith; "On the Condition for the Existence of a Surface cutting at right Angles a given Set of Lines," by Prof. Cayley.
 8 P.M. Historical: "On Domestic Every-day Life, &c., in this Country, from the earliest Period," II., by G. Harris; "History of the Counts of Cilly," by the Rev. A. H. Wrotteslaw.

8.30 P.M. Antiquaries.
FRIDAY, Dec. 15.—7.30 P.M. Sacred Harmonic Society, Exeter Hall (St. Paul).
8 P.M. Philological: "Common Tamil," by E. B. Swinton; "On Names of Birds," by David Ross.

SCIENCE.

ARABIAN PHILOSOPHY IN THE TENTH CENTURY A.D.

Die Philosophie der Araber im X. Jahrhundert n. Chr. Von Fr. Dieterici, Professor an der Universität Berlin. Erster Theil: Einleitung und Makrokosmos. (Leipzig: Hinrichs, 1876.)

IN 1858 Prof. Dieterici, of Berlin, published, under the title of *Streit zwischen Thier und Mensch* ("Dispute between Men and Beasts"), a German translation of an Eastern apologue. The dispute in question forms part of the 21st section in an extensive Arabic manuscript, comprising in fifty-one books a sort of encyclopaedia of what was known or supposed to be known by the *savants* of the Caliphate in the tenth century of our era. In five subsequent publications Dieterici has translated or paraphrased the contents of this huge work. The present volume is the first half of a general summary of the results thus presented in detail. An introduction of about 160 pages describes the antecedents of what is conventionally termed Arabian Philosophy; and about sixty pages follow with a *résumé* of the nine grades of emanation in which God passes from his unity into a changeable sublunary world with its elemental products. A succeeding half-volume is to present in outline the converse process of the Return—the rise to union in God by the means of knowledge and right conduct.

Amid the wild waste of words which makes up so large a portion of the German philosophical productions of the present day, Dieterici's book is a welcome contribution. Its substantial merit grows from the fact that philosophers seldom know Arabian, and that Semitic scholars are not much given to the study of philosophy. Avicenna is known from very little more than the digest given by Shahrastani, and from the barbarous versions of the Scholastic Latin; and the same is true of Averroes. Here in Dieterici we get for the first time a tolerably distinct likeness of the extent to which the Moslems of Persia had succeeded in appropriating Greek science, and manipulating it for their own ends. In such a report as his we do not, of course, look for many new truths. The materials were mostly old; what was added to the inherited stock of knowledge came at a later date than our encyclopaedia. But if the materials were well-used, the cement was fresh: and the structure, as a whole, unique. The encyclopaedia of the "Brethren of Purity," from which Dieterici has drawn his account, began with a theory of numbers, not very scientific in its character, and thence advanced to an exposition of logical matters: from these topics it proceeded to a physical, which was largely a metaphysical, doctrine of the universe, culminating in the nature of man. In human nature it dwelt especially on the rational soul, its relations to the world and to God: thus treading on the borders of theosophy,

where it dealt at length with prophecy and the moral sovereignty of the world. A concluding book discussed subjects even less susceptible of exact methods: it comprised a theory of love-potions and talismans. Throughout breathes an ethical and religious spirit. The aim of the work is not knowledge only, but also right conduct. As the authors say, if it is the work of religion to heal those that are sick, it is the work of philosophy to strengthen those that are whole.

Time would fail to tell of all that is touched upon in the introductory pages. They are suggestive and interesting, if not always carrying conviction: and open out lines of thought leading far beyond Arabian philosophy. First come in outline the theories of the end and origin of the universe held by mythologist, monotheist, philosopher, and theosophist. A chapter of much interest is devoted to the contrast between Aryan and Semite in the modes of thought and sentiment, as reflected and preserved in their several languages. A few words on Origen form the prelude to a sketch of the Eastern Church up to the days of Mohammed—a not very pleasing picture of narrowness and bigotry within the Orthodox Church which drove the more liberal and scholarly minds in some cases beyond the pale of the Empire. By the seventh century a theology based upon Judaism and a science derived from Greece had thoroughly saturated the better minds in the lands adjacent to the Euphrates. This culture retired for a little while under the dominance of Islam: but scarcely two centuries after Mohammed one of the rationalising schoolmen of Bagdad boldly proclaimed doubt as the preliminary to all true knowledge. But philosophy did not long stand its ground; the patronage of the caliphs who persecuted the orthodox for their obstinacy was scarcely the right means of making the people rationally religious; and with the collapse of the Caliphate amid the warring sultans and emirs from Turkestan, the sun of liberal knowledge set in Eastern Islam. Of Mohammed himself Dieterici gives an account which does not deal with the prophet in a very reverent spirit, and disperses perhaps too much of the nimbus which idealism has drawn around him.

Of the authors not much can be told. Their work seems to have been written between 960 and 975 A.D., and it was soon read as far as Spain. Five hands are said to have been engaged in the work. The Society of True Friends, or Brethren of Purity, to which they belonged, had its head-quarters at Basra on the Persian Gulf. It comprised four grades, marked off by the advance in age and wisdom. The Divine Law, they said, requires forty properties in one person, or forty persons with accordant minds. Hence the union of those who, under the cover of an established religion, sought by the help of an older knowledge to purify the law of Mohammed from vulgar error and superstition, and to substitute a higher purity of life and understanding of the truth.

W. WALLACE.

Keltische Briefe von Adolf Bacmeister, herausgegeben von Otto Keller. (Strassburg: Karl J. Trübner. London: Trübner & Co.)

THIS is a neatly got up little volume which owes its existence to the late Herr Bacmeister's desire to see a knowledge of *ra Keltika* more diffused among his countrymen than it at present is; but although his letters, which have been carefully collected and edited by his friend, are charming reading, his object, I fear, will not be attained by publishing them. Besides it is possible that the time is not yet come when the work of popularising Celtic philology can be done to advantage: it is true that the *Grammatica Celtica* contains the outlines of the laws which obtain in the Celtic languages, and enables us to compare them with others of the same family of speech; yet so much still remains to be done by way of filling in the details necessary to give Zeuss's outlines their full meaning and coherence, that one cannot proceed to work as Bacmeister has without exercising very great caution in his choice of instances, and this is exactly where his weakness betrays itself. Add to this that his combinations violate the rules of Celtic phonology, as when one reads, p. 17, "Ir. *fillin* gl. *tardo*, lenteo, mg. foil *langsam*, foill *Ruhe*, stimmt äusserlich zum deutschen *weilen*=ruhen, zögern; allein dieses entstand aus got. *hveila* u.s.w. altnord. *hvila* ruhen, man müsste also einen sehr frühen Abfall des *h* und Uebergang in gallisches *v*=ir. *f* annehmen." This would seem to commit him to deriving the Irish (as well as the German) forms from Gothic, or supposing that he considered Gothic *h*=an original *k* liable to be dropped in Celtic, the assumption of such a *k* which disappears in Irish is unwarranted. Similarly, p. 23, he does not seem to be aware of reasons for hesitating in connecting Welsh *ffrwd*, Ir. *sruith*, "a stream," with Sansk. *sravāni*, Gr. *ῥέω*, Eng. *stream*. P. 72, he perpetrates an etymology which is to me quite incomprehensible—namely, when he assumes the Welsh *rianed*, "ladies" (the plural of *riani*), to stand for an impossible *rig-baned*, "nubile nobles." Unfortunately the whole book contains too many *rapprochements* of the same character; nevertheless, many of the letters are highly suggestive, and cannot fail to be instructive to those who know how to control the author's treatment of details.

J. RHY.

SCIENCE NOTES.

PHYSIOLOGY.

Presence of Vaso-motor Fibres in the Vagi—It has been ascertained by Rossbach and Quellhorst (*Verhandl. der phys.-med. Gesellsch. in Würzburg*, ix. p. 13) that electrical or mechanical stimulation of those branches of the vagus which enter the abdominal cavity with the oesophagus is followed by contraction of the blood-vessels supplying the abdominal viscera and a rise of arterial pressure. When the vagus is divided in the neck and its peripheral end stimulated, the heart stops beating, and the systemic blood-pressure sinks; but the effect is transient; for as soon as the stimulus has ceased to operate, the blood-pressure rises above its previous normal level. That this added elevation is altogether independent of the heart may be shown by irritating the divided vagus after its intra-cardiac terminations have been paralysed by

atrophia. Under these circumstances, the heart's action is not arrested; yet the rise of blood-pressure nevertheless occurs. It may therefore be attributed to stimulation of vaso-motor fibres conveyed to the abdominal vessels in the trunk of the vagus; and the correctness of this explanation is proved by the fact that the phenomenon in question is no longer manifested after the oesophageal branches of the vagi have been cut.

On the Relation of the Waking State to External Stimuli.—The experimentum mirabile described by Kircher in the middle of the seventeenth century has of late years been made the starting-point of several interesting lines of research. In its original form, the experiment consists in tying down a cock to a table and drawing a straight line with a piece of chalk from the tip of his beak. The bird then remains motionless for a variable length of time, making no attempt to struggle or regain its freedom. Kircher's own explanation of the fact is fantastic: "cujus quidem rei ratio alia non est," he says, "nisi vehemens animalis imaginatio, quae lineam illam in pavimento ductam vincula sua, quibus ligatur, apprehendat." Czermak was the first to enquire into the matter in a systematic way. He confirmed the truth of Kircher's statements, and extended them to a great variety of birds. But he showed that, in order to obtain the desired effect, it was enough to hold the bird firmly down with the hands, preventing any voluntary movement of the head and neck. Bonds and chalk-line he found to be quite superfluous. In another set of experiments, the body of the fowl was fixed, while its head and neck were left at liberty; an indifferent object was then held close to its eyes; the same curious quiescence was induced, occasionally conjoined with phenomena of a cataleptic order. Czermak believed these singular results to be due to the development of a hypnotic state in birds, analogous to that occasionally observed under somewhat similar conditions in the human subject. Preyer's investigations included rabbits, a guinea-pig, and a squirrel, in addition to birds. He never succeeded in producing any condition at all like sleep. He rejected Czermak's explanation, and ascribed the immobility of the various animals experimented on to simple terror: the first impression of utter helplessness—of the futility of struggling—persisting in the creature's mind even after all restraint had ceased. Heubel (*Pflüger's Archiv*, xiv., 2 and 3) rejects the theories of all his predecessors. He gives reasons for rejecting them which tell more strongly against those of Kircher and Preyer than against that advanced by Czermak. Previous enquirers he believes to have witnessed only the first stage of the phenomenon—that stage which is most easily induced in animals of relatively high organisation. Cold-blooded vertebrates, such as the frog, may be reduced to a state of complete immobility at will; they will remain in a constrained position for hours, instead of seconds or minutes. This abolition of voluntary movement and of consciousness is nothing more than ordinary sleep. Pflüger has given many reasons for his belief that the waking state requires for its maintenance a continual stimulation of the higher nervous centres by impressions conveyed to them along the various centripetal nerve-fibres. By forcing an animal to remain motionless for a brief interval (without inflicting pain), and simultaneously excluding visual and auditory sensations from its brain, we suddenly deprive its nerve-centres of a large proportion of their accustomed stimuli. Accordingly, they are unable to remain awake, and their functional activity is only restored to them when they are roused by some impulse from without. Having satisfied himself in a variety of ways of the correctness of this explanation as applied to the phenomena exhibited by the frog, Heubel proceeds to extend his results to birds and mammals, and arrives at the conclusion that "forced sleep" will account for all the facts hitherto observed.

Spirochaete Obermeieri.—In connexion with Obermeier's remarkable discovery that the blood in relapsing fever is infested by a species of *Spirochaete*, it is worthy of note that the same organism has lately been found in considerable numbers by Manassein (*Centralblatt für die Med. Wiss.*, October 21, 1876) in the liquid exuding from a fistulous passage communicating with the antrum of Highmore; pus-cells and crystals of cholesterin were also present. The patient was in good health; examination of the saliva and the blood yielded negative results.

Termination of Nerves in Tendon.—The tendon of the sternoradialis muscle in the frog receives a nerve-trunk of some size near its point of insertion; the fibres form a network, and end in the tendon. By employing special methods of examination, Rollett (*Centralblatt*, October 21, 1876) has succeeded in demonstrating that the ultimate fibres terminate in structures which he terms "nerve-flakes," and which present many points of similarity to the motor end-plates in striated muscle. Their functional significance is doubtful. No reflex movement can be produced by stimulating the tendon; hence Rollett concludes that the nerve must consist of centrifugal fibres.

Nature of the Paludal Miasm.—Some very curious investigations on this subject have been published by Lanzi and Terrigi (abstract in *Centralblatt*, No. 40, 1876). In the endochrome of algae growing in the Campagna and Pontine Marshes, the former observer has discovered certain minute dark granules, which increase in number as the algae die and pass into decomposition. They belong to Cohn's group of pigmented sphaerobacteria (*Bacterium brunneum* of Schröter), and yield *Monilia penicillata* of Fries on cultivation. The so-called "pigment-granules" present in the liver, spleen, and blood of persons who have suffered from malarial diseases are identical with the above germs. By cultivating such granules from a human liver, Lanzi succeeded in obtaining a *Zoogloea*. On the basis of these observations, the writers construct a theory to account for the prevalence of malaria at certain seasons. The marshy pools formed in the Campagna during the winter months are found to swarm with algae, both green and colourless, in early spring. As summer approaches, the level of the water in these pools sinks, owing to evaporation, and great sheets of dead and decaying algae are exposed to the air. In these, the sphaerobacteria grow and multiply; they may be found in vast numbers in the air to a height of fifty centimetres above the surface of the marsh. Swept hither and thither by the wind, they excite malarial disease whenever they happen to penetrate into the human body. Similar theories concerning the nature of malarial infection have been advanced before, though not, perhaps, with so bold an array of experimental evidence to back them. But the experimental evidence in the present instance, even granting its truth, is insufficient to bear the weight of the superstructure founded upon it. Moreover, in view of the many fallacies that beset enquiries of this kind, the facts themselves will have to be repeatedly confirmed before they can be utilised for deductive purposes.

CHEMISTRY AND MINERALOGY.

Meteoric Iron.—An interesting paper by MM. E. Guignet and G. Ozorio de Almeida has appeared in the *Comptes Rendus*, lxxxiii., 917, describing a meteoric iron from San Francisco, Province of Santa Catharina, Brazil. The specimen is nearly cubic in form and weighs about 400 grammes; the metal is white, with a tinge of yellow, and is unchanged even in moist air. A mean of several analyses shows it to have the composition:—

Iron	= 64
Nickel	= 36
	100

This meteorite is remarkable for containing so large a percentage of nickel, and for exhibiting Widmannstätten figures when etched; these appearances are not as a rule observed in metallic masses of meteoric origin, which contain a very considerable proportion of nickel. The discovery gains interest, moreover, from the statement made in the paper that this Brazilian nickel-iron is not found in an isolated condition, but is met with, so it is asserted, in the form of a layer in a terrestrial rock. The importance of such a fact, in its bearing on elucidating the singular occurrence of meteoric iron in basalt at Ovisak, Disko Island, Greenland, is manifest, and it is to be desired that the accuracy of this report be established by further inquiry.

Pelagite.—Prof. Church has examined (*The Mineralogical Magazine*, No. 2, 1876, p. 50) some of the curious nodules of a brownish-black colour which were dredged up from the bed of the Pacific during the voyage of the *Challenger*, and which have been described by Sir Wyville Thomson as "nearly pure peroxide of manganese." On analysis they have been found to consist of:—

Water, lost in vacuo	24.55
Water, given off at temperatures over 100°	10.00
Manganese dioxide	30.22
Ferric oxide	20.02
Alumina	3.30
Sillicic acid	10.37
Chlorine	0.71
Traces of alkaline metals, &c.	0.83

100.00

While, as the author admits, it would be rash from the present data to assume that we have here a new mineral species, he has suggested the name *Pelagite* for the material, which corresponds very closely, in point of composition, with the formula:—

He alludes to the statement having been widely circulated, in home and foreign scientific journals, that these nodules consist of peroxide of manganese; and points out that it now requires correction.

Alcoholic Fermentation of Fruits, Flowers and Leaves.—De Luca has studied the changes which the various parts of certain plants undergo when preserved, for more or less time, excluded from air in an atmosphere of carbonic acid or hydrogen, or in *vacuo*, or in a limited volume of air. In each case the several parts of the plant underwent fermentation without the introduction of a ferment, and carbonic acid, nitrogen, and occasionally hydrogen, were evolved, and alcohol and acetic acid were formed. In closed vessels the change is less perfect. In atmospheres of carbonic acid and hydrogen the decomposition of the whole of the sugar and starch may take place, and considerable quantities of alcohol and acetic acid may be produced. The evolution of hydrogen is probably due to the decomposition of mannite; at least, the fact has been established that fruits, flowers and leaves containing mannite evolve hydrogen as well as the two other gases (*Compt. Rend.*, lxxxiii., 512).

Glycogen.—The products resulting from the oxidation of this substance have been studied by H. H. Chittenden (*Ann. der Chemie*, clxxxii., 206). The supply of material, obtained from the muscular tissue of *Pecten irradians*, was dissolved in water and treated, first with a large excess of bromine, and then with silver oxide; after the removal of the silver bromide and what remained of that metal by means of sulphuretted hydrogen, a strongly acid solution was obtained. The acid, which the author proposes to name glycogenic acid, was obtained in a pure state, and the characters of a number of its salts were studied. It appears to have been formed by the following reactions:

On comparing the properties of this acid with those of glyconic acid and dextronic acid, the author finds that it does not differ more from them than they do from each other, or from the products obtained by Habermann by the oxidation of starch and paramylone.

Nitroglycerin.—Some of the physical characteristics of this body have recently been examined by C. Beckerhinn (*Sitzber. Ak. Wiss. Wien*, lxxiii., 235). He has determined the heat of fusion of the frozen body, and finds it to be 33.54 units of heat. The density of liquid nitroglycerin is 1.599; that of the solid 1.735. He refers to the opinion generally held that the compound when frozen explodes more readily than when it is in the liquid state. Experience does not support this view, and it must be evident on theoretical grounds that it is highly improbable since a considerable amount of heat must be consumed in causing a change in the state of aggregation before any explosion can ensue. To decide the question the author constructed an apparatus for the explosion, by percussion by the fall of a weight, of nitroglycerin, both solid and liquid, and he has found that while the liquid detonated when the weight fell from a height of 0.78 mètre, solid nitroglycerin did not explode till the weight fell through a distance of 2.13 mètres.

The Use of the Sulphates of the Alkaline Earths for Adulteration.—The current number of the *Boston Journal of Chemistry* quotes the following paragraph from the *London Chemist and Druggist*:—"A talented American has discovered nearly 25 per cent. of Epsom salts in a cask of oxalic acid, and some people are delighted with the information because they think they will now be less likely to be poisoned when the druggist's boy gives them oxalic acid for Epsom salts in the usual course. One of the (American) journals says 'this is certainly something new in the adulteration line.' Dear, innocent America! Why we played that little game here even before they thought of wooden nutmegs over there." So much for sulphate of magnesia. Some years since, before the Adulteration Act came into operation in England, the *Lancet*, the *Chemical News* and other serials opened our eyes to the marvellous composition of articles of food and drink. When describing the nature of some of the materials which make up the condiments in everyday use we were edited to learn that a sample of mustard, purchased in London, contained so much plaster of Paris that when mixed with water it "set" hard in the pot. But the art of adulteration, like all things else, progresses with the age; it now appears that sulphate of lime has for some reason been replaced by sulphate of baryta, and "barytes" is in demand for the synthesis of mustard. This may appear alarming, but, perhaps, we ought to congratulate ourselves that a substance has at last been chosen which either the human stomach or the artificial organ exhibited at the Loan Collection at South Kensington (and described so graphically in the *Times* of the 28th ult.) is powerless to deal with.

Vienna Bread.—Prof. Horsford, of Cambridge, Mass., has recently published (Washington: Government Printing Office) an elaborate report on the methods employed in the manufacture of bread in Vienna, as illustrated at the Austrian Exhibition of 1873. He describes the characteristics of the grain, the art of milling, the making of yeast-bread, and the processes in use in the Vienna bakeries. Some of the woodcuts which illustrate his memoir, such as those representing sections of miller's bran (page 49), and others of barley, oats, rye and Indian corn (page 70), have evidently been executed with exceptional care. The unusual excellence of the Vienna bread, arising for the most part from the marked superiority of the Hungarian wheat and flour, is considered to be due, not so much to the constant care of the farmer in changing the varieties

grown when the slightest deterioration of the quality of the product is detected, as to the dryness and clearness of the atmosphere of the district where the wheat is grown, at the time when the contents of the berry are in the condition technically known as "milk." So dry is the air in the Hungarian lowlands that there is no dew during the summer night; soon after sunrise the temperature rises to 74°–77° F., and in the course of the day attains to 95°–100° F., remaining at that temperature till nearly sunset. The driest months are July and August, the Hungarian summer being uniformly very dry. For testing the qualities of the flour, the author states that the whole of the nitrogenous substances can be separated from the starch by treatment with dilute acetic acid, and their amount estimated, after the settling out of the starch, by determining the specific gravity of the solution; this appears, however, to be a facile but insufficiently accurate means of arriving at the result aimed at. In speaking of the press-yeast employed in the manufacture of the "Kaiser-Semmel," he quotes the following interesting statistics, which give some idea of the development of this branch of industry during the last thirty years. One firm alone (Mauntner und Sohn, of St. Mark's) sold in

1846	.	72,400	Zollver. lbs.
1852	.	380,600	"
1862	.	1,144,500	"
1872	.	3,170,000	"

The problem why bread becomes stale was attacked many years ago by Boussingault, who found that it did not necessarily lose weight by the evaporation of water, but he could arrive at no satisfactory explanation for the change. The author believes that the gluten of the crumb-walls of stale bread, which are stiff and brittle, is dehydrated by the heat in freshening (re-baking), and the water of hydration driven out softens the glucoid, horny starch which coats and penetrates the gluten. Thus softened, the crumb is more palatable, because it is in a condition to be dissolved by the saliva, and tasted. On cooling, the water is withdrawn from the starch, which is thereby rendered stiff, and restored to the gluten, and the bread becomes stale. The author is of opinion that by adopting the methods which he describes in his Report bread of as good quality as that baked in Vienna may be produced in America.

THE veteran Prof. Wöhler, of Göttingen, has been nominated President of the German Chemical Society in Berlin, and Prof. Kekulé, of Bonn, Vice-President, for the coming year.

THE new scientific journal, intitled *Beiblätter zu den Annalen der Physik und Chemie*, to be edited by Prof. Pogendorff, and to appear in conjunction with the *Annalen*, will be issued at the commencement of the new year.

It has been decided that an Association of Professional Chemists shall be instituted in London, and a provisional committee has been appointed.

GEOLOGISTS will hear with equal surprise and regret of the death of Mr. David Forbes, F.R.S., who had for many years been one of the Honorary Secretaries of the Geological Society. The deceased was brother to the late Prof. Edward Forbes, and like him exhibited at an early age great taste and talent for scientific pursuits, especially in the direction of geology and chemistry. Mr. David Forbes had great experience in the practical application of geology to mining, and had travelled professionally through the principal mining districts of the world. During his residence in South America he suffered from fever, which never completely left him, but returned at regular intervals. Two or three years ago he was stricken by a sunstroke while travelling in Spain, and his health was much shattered by the attack. The death of his wife also helped to impair his strength, but his friends were nevertheless unpre-

pared for his decease. This occurred at his residence in York Place, Portman Square, on Tuesday last. Mr. Forbes was a keen geologist, a good practical miner, a neat chemical manipulator, and an accomplished linguist. His death threw great gloom over the meeting of the Geological Society on Wednesday evening, and drew forth expressions of deep regret from Mr. Duncan, as President.

MEETINGS OF SOCIETIES.

ROYAL SOCIETY OF LITERATURE.—(Wednesday, Nov. 22.)

SIR PATRICK COLQUHOUN in the Chair. Mr. W. de Gray Birch, honorary librarian, read a paper on two Anglo-Saxon MSS. in the British Museum, numbered as Cotton, Titus D. xxvi. and xxvii. In the course of his account, Mr. Birch traced these two interesting relics of ancient literature to the authorship of Ælfwine, Abbot of Newminster, Winchester, in the early years of the eleventh century, and illustrated the various astronomical, ecclesiastical, and literary contents of the volumes, their art, and history, with a variety of extracts and notes from other manuscripts of corresponding antiquity and nature.

ROYAL GEOGRAPHICAL SOCIETY.—(Monday, November 27.)

SIR RUTHERFORD ALCOCK, President, in the Chair. Some papers on African exploration were read. The first paper, "Observations on the Nile between Duffli and Magungo," was by Colonel Gordon. About twenty miles south of Duffli the river begins to widen out, the current becomes less rapid, and from that point to Magungo the river is nothing more than a portion of Lake Albert, filled with islands of papyrus, the banks being difficult of approach. The country is more populous than any portion of Africa seen by Colonel Gordon. Colonel Gordon had not seen the north-west branch of the Nile spoken of by Signor Gessi, but had no doubt of its existence. He corroborated the accuracy of Baker's map, and remarked, with regard to the mouth of the Victoria Nile, that it was difficult to say where it ended and where the lake began. The second paper was on "The Victoria Nile between Magungo and Foweira," from Magungo to the Murchison Falls, the river is navigable, but from that point to the Kamma Rapids, nine miles from Foweira, the river abounds with strong rapids. Between the latter place and the Murchison Falls, a distance of from ten to fifteen miles, the river has a fall of 700 feet. The solitude of the surrounding country is described as excessive. Another paper furnished a summary of the geographical and scientific results attained by the Khedive's Government during the three years 1874–6, while another, by the Rev. E. J. Davis, gave particulars respecting Colonel Gordon's proceedings in the Lake Regions. The concluding paper was an account of the circumnavigation of Lake Albert by Signor R. Gessi, at whose disposal two iron boats had been placed. From Duffli to the lake it was 164 miles, and throughout the whole distance the river is navigable, deep, and broad. At about 100 miles from Duffli a large branch diverges to the N.N.W. in the direction of the Makraka and the Niam Niams. The country proved to be rich, the products of the soil consisting of millet, the wheat of the country, sesame, honey, tobacco, bananas, beans, &c. Cattle are abundant, and comfort and plenty appear to reign among the people. In giving a description of his cruise, Sig. Gessi states that he found the lake to be 140 miles long by 60 wide, and that he ascertained from native information that no river flows in at its southern end.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, November 28.)

COLONEL A. LANE FOX, F.R.S., President, in the Chair. An Indian hammock from the city of Mexico, weapons from Perak and British Guiana, and a Bosjeman's skull were exhibited. The President, by permission of Messrs. Bollin and Feuardent, exhibited some terra-cotta figures from Tanagra in Boeotia, and read some notes thereon. Papers on the "Laplanders," by A. V. Humboldt v. Horck, and on the "Tribes of British Guiana," by the Rev. W. Harper, were also read.

SOCIETY OF ANTIQUARIES.—(Thursday, November 30.)

FREDERIC (OUVRY, Esq., President, in the Chair. J. Fowler, Esq., F.S.A., read a paper on the decay of glass, illustrated by numerous specimens of various periods. Glass may be roughly divided into three periods—Ancient, Mediaeval, and Modern—differing from each other in the materials and method of manufacture. The line of demarcation is not solely a chronological one, as both ancient Arabian lamps and old Venetian glass belong, as far as manufacture is concerned, to the modern type. Ancient glass may be subdivided into two classes: Prehistoric, Egyptian, Phœnician, &c.—and Roman and Greek. Of these the first class is similar to Gothic or Mediaeval glass, and like it, is subject to granular decay. The latter resembles modern glass, and is subject to filmy decay, which produces the iridescent colours seen on specimens which have been long buried. In the manufacture of mediaeval glass, the materials used were impure, and the temperature not high enough, so that the melted mass never became sufficiently fluid to be homogeneous, or of even thickness, when cool. It is from these causes that the secondary and tertiary hues and diversities of colour in old windows arise. Mr. Fowler described the chemical actions of water and air in disintegrating glass, and spoke of the danger of any cleaning process as applied to windows earlier than the sixteenth century, and of the injurious effects of the present method of lighting churches by gas.

PHYSICAL SOCIETY.—(Saturday, December 2.)

PROF. G. C. FOSTER, President, in the Chair. M. Janssen made a brief communication, in French, with reference to a method which he has proposed to the Académie des Sciences for ascertaining whether planets really exist between Mercury and the Sun. After mentioning the importance of photography from an astronomical point of view, he explained his reasons for hoping that a series of solar photographs, taken regularly at intervals of about two hours at a number of places on the earth's surface, would enable us to determine this question. As it is necessary that such observations be made at several places and in several countries, M. Janssen hopes that other countries besides France will ere long arrange to have such a series of observations taken, and he considers that in a few years the circumsolar regions would thus be explored with a certainty which could not possibly be attained by any other method. He exhibited some of the original photographs taken in Japan of the Transit of Venus, and explained the advantage of placing a grating in the focus of the camera in order to eliminate distortion.—Mr. Crookes showed the spectrum of a small specimen of chloride of gallium which he had received from its discoverer, M. le Coque de Boisbaudran. The discovery of this metal is of peculiar interest, as M. Mendelief had previously, from theoretical considerations, asserted it to exist, and had also correctly given some of its chemical and physical properties. The most prominent line in the spectrum was a bright line in the blue, somewhat more refrangible than that of indium.—Mr. Lodge briefly described a model which he has designed to illustrate flow of electricity, &c., and he showed how similar considerations can be applied in the case of thermo-electric currents. The model, in its simplest form, consists of an endless cord passing over four pulleys, and on one side of the square thus formed it passes through a series of buttons held in their positions by rigid rods or elastic strings according as they represent layers of a conducting or a non-conducting substance. When considered in connexion with thermo-electricity, the buttons are assumed to oscillate on the cord, and if they move in one direction with greater velocity than in the other, the cord will tend to move in the former direction. Now, at a junction of copper and iron an unsymmetrical oscillation of the molecules must ensue, and the cord, or electric current, will advance when two junctions are at different temperatures. Mr. Lodge showed experimentally that for a given difference of temperature the maximum thermo-electric current is obtained when one of the junctions is at 280° Cent., and beyond this point the amount of deflection decreases. This fact led Sir W. Thomson to discover the convection of heat by electricity: that is, if we have a circuit composed of copper and iron, and one of the junctions be at the above temperature, the current, in passing from hot to cold in the iron, or from cold to hot in the copper, absorbs heat. This fact was experimentally illustrated by Mr. Lodge.

LONDON INSTITUTION.—(Monday, December 4.)

PROF. HUXLEY delivered a lecture upon "Some Recent Additions to our Knowledge of the Pedigree of the Horse." He began by pointing out some of the principal differentiations in the horse's skeleton, especially the total absence of the first and fifth digits, the reduction of the second and fourth to mere "splint-bones" without phalanges, the fusion of the ulna with the radius, and the rudimentary state of the fibula. It had often been objected to the theory of evolution that palaeontology afforded no direct evidence of the passage from one distinct form to another, but seven years ago Prof. Huxley had shown that there was such evidence, although imperfect, in the case of the evolution of the horse. Thus in the Upper Miocene we find *Hipparion*, in which the second and fourth toes had complete phalanges, but were too small to be of use, and resembled the "dew-claws" of a dog, while in the Lower Miocene and Upper Eocene *Anchitherium* had these toes functionally developed. Since that time an immense amount of new evidence has been obtained from an unexpected source—the so-called "Bad Lands" of America, lying between the Mississippi and the Rocky Mountains. This district had formed in Eocene times a great inland basin in which fine mud had been deposited containing a vast amount of organic remains. These have been investigated amid great dangers and hardships, principally by Prof. Marsh, of Yale College, and have completed and extended our knowledge of the equine pedigree. Thus in the Lower Eocene we find *Orohippus*, a small animal with four functional digits in its fore-foot; then *Mesohippus*, in which three toes only were complete, the fourth being rudimentary; *Miohippus* (nearly allied to *Anchitherium*), in which the fourth toe totally disappeared; *Protohippus*, with the outermost of its three digits much reduced in size; *Pliohippus*, which had no phalanges in the secondary digits of the fore-foot; and lastly, *Equus*, as we now know it. Similar modifications were traced in the conditions of the leg-bones and the structure of the teeth. The history of the horse is thus shown to be strictly in accordance with the theory of evolution, and no other reasonable hypothesis will account for the facts. And if it is true of the horse it must be true of other animals, for it is absurd to suppose that different organisms have been built up upon different fundamental plans.

FINE ART.

Discoveries at Ephesus. By J. T. Wood, F.S.A. (London: Longmans & Co., 1877.)

THE discovery of ancient treasures, which was once considered above all things a matter of chance or fate, is fast passing under the dominion of science. Year by year discoveries thicken, discoveries expected on reasonable grounds, and worked for by steady method. The harvest of antiquities rewards the digger on the site of ancient cities almost as surely as the harvest of corn the sower of seed. For eleven years—from 1863 to 1874—Mr. Wood sank pits and dug trenches on the site of Ephesus, and his results have been, if not splendid, at least solid, and of imperishable value.

From the first, Mr. Wood adopted the opinion that, if he could find the Magnesian Gate of Ephesus, and thence trace the portico of Damianus, which is mentioned by Philostratus as leading from the city to the temple of Artemis, he must needs reach the latter, the great object of his search. But a notion, the truth of which is not necessarily implied in Philostratus' words, that, this portico being but 600 ft. long, the temple must be at that distance from the city, for a while diverted his energy from the ultimately successful method. However, it is pleasanter to congratulate a discoverer on his final

success than to regret any delay in attaining it, and this delay was in the present instance of great advantage to others if not to Mr. Wood himself, for it enabled him to secure the valuable records hidden in the Odeum, the Great Theatre, and other buildings of ancient Ephesus. In 1867 he made up his mind as to the Magnesian Gate, after which his progress was steady, and, following the road which led from the gate with the utmost perseverance for a distance which greatly surpassed his expectations, he finally lighted on a corner of the Peribolus Wall which enclosed the domains of the Artemisium. Apparently bisecting the angle formed by this wall, though he does not expressly say so, Mr. Wood advanced inwards for another half-mile, where, at a depth of about 20 ft. below the soil, he found the pavement of the Great Temple.

After this his task was simple but not easy, for in addition to the usual enemies of explorers, fever and brigands, Mr. Wood's works were constantly under water in the rains, and some of his sculpture damaged by the hammers of the numerous excursion-parties, who came by train from Smyrna, and loved to carry back with them as a trophy a finger or a toe of a statue, or a fine piece of moulding. This custom cannot be too strongly reprobated, as it might in some cases destroy all the delicate fineness of sculptures and leave a mere shapeless *caput mortuum* for national museums. Patience, enthusiasm, and physical courage are necessary to the excavator, and in none of the three was Mr. Wood wanting. To have dug the Artemisium out of a plain presenting no irregularities and bearing a uniform crop of barley would bring honour to any man, and may preserve Mr. Wood's name in the mouths of the learned for a long time; nor must it be forgotten that he could never have succeeded but for the liberal grant of funds by Mr. Lowe, and the sympathetic activity of Mr. Newton in London.

One of the most interesting things about a discovery of this kind is the fresh light it throws on ancient authors and their mode of thinking and writing. Take Pliny, for example, and compare his statement with the measurements of Mr. Wood. Pliny says that the columns of the Artemisium were 60 Roman, or 58½ English ft. in height. Mr. Wood shows that their height was about 55 ft. 9 in. Pliny gives the dimensions of the whole temple as 413 ft. 2 in. by 218 ft. 9 in. Mr. Wood found them to be 418 ft. 1 in. by 239 ft. 4½ in., the measurement of the platform on which the temple stood being taken at the lowest step, not that of the building itself. Mr. Wood proves satisfactorily that the temple had a hundred columns in the peristyle; Pliny talks of "columnae centum viginti septem a singulis regibus factae." Here Mr. Wood maintains that Pliny does not contradict him, but speaks of a hundred columns of which twenty-seven were the gifts of kings. But this construction would never occur to an unprejudiced mind, and before it was accepted, some such word as *quarum* would seem to be necessary between *centum* and *viginti*. Why should not Pliny be inaccurate here as elsewhere? Besides, in the time of Alexander the Great, when the temple of

Pliny was building, it would have been very hard to find twenty-seven kings at all, and the only column which bears a legible dedicatory inscription is given by a Sardinian woman (Σαρδηνή).

Mr. Wood found, one beneath the other, three separate floors which must have belonged to three separate temples built one over the other on the same spot at successive periods. Of these the lowest floor consisted of a layer of charcoal between two of putty, and it seems most probable that this was the floor which tradition relates that Chersiphron laid with charcoal and fleeces. The two upper floors were of marble, and belonged to the temple burnt by Herostratus, and that built on its ruins shortly afterwards. A fragment of a lion's head, and a few other fragments, which must have belonged to the earlier temples, were found in the ruins. The sculptured columns, capitals, lion's head, and other objects which pertained to the later temple have already become known everywhere, and may be seen any day at the British Museum. It is strange that Mr. Wood found no statue of that Asiatic goddess of the Kybele class whom the Greek colonists, finding her in possession when they landed, named Artemis, from her close connexion with woods and wild beasts. He engraves, indeed, at page 270, a polymastic female form, from a stone found in Caria; but this figure holds bipennis and sceptre, and would seem to be rather a female form of Zeus Labrandeus, the national deity of the Carians.

Among the inscriptions found I would mention as among the more interesting No. 2 from the Odeum, which seems to embody an Imperial rescript as to the use of certain titles by the City of Ephesus. Smyrna, Pergamus, and Ephesus were constantly occupied, in Roman times, in quarrelling about precedence; and in this rescript Antoninus Pius advises the people of Ephesus to address those of Smyrna by their full titles, and to expect a like return. It has a decided tinge of the Roman contempt for "words and names and your law."

Mr. Wood's illustrations are numerous and striking; but it is almost a pity that there is not a plan of the temple on a somewhat larger scale; this would have been a boon for architects, if not for the public. His style has a simplicity and directness which are not displeasing; but his narrative has one curious fault, that he constantly, without a word of introduction, brings in a new feature, and expects people to know all about it. On page 158 is a curious instance of this trick; but I have not space to quote it.

An appendix at the end of the book contains a transcription in cursive characters of the more important of the inscriptions found by Mr. Wood, with a translation of them into English. This task has been accomplished by a number of Cambridge and Oxford tutors and professors, who seem to have worked piecemeal, and without any adequate supervision, or any concert among themselves. As might be expected, the quality of the work is very unequal. As uncials are given in but very few cases, a great responsibility rested on the editors. The student was at their mercy, and might

fairly claim from them the most minute fidelity, at all events in the transcription. Inaccuracy in his authorities causes the archaeologist infinite loss of time and annoyance. This fact does not seem to have been realised by some of the editors. It is necessary that in this matter the truth should be told. There are some among these scholars who are incapable of doing any but conscientious and scholarly work, and no doubt they executed their share of the work as well as the circumstances permitted; but, on the other hand, the most cursory glance through the pages of the appendix reveals errors such as a schoolboy might be ashamed of. I hasten to give instances. The eleventh inscription from the Augusteum is thus given letter for letter:—Νικον 'Ιούλιον Τιβεριου, Δρουσον 'Ιούλιον Τιβεριου υιον Καίσαρα, Τιβέριον 'Ιούλιον Σεβαστον υιον Καίσαρα, οί νεοποιήσαντες 'Ιούλιον Καίσαρα, &c., &c. (Here the letters not to be seen on the stone are, according to the very unpleasant practice of the book, underlined.)

The English rendering runs thus:—"The victorious Julius, son of Tiberius Drusus Julius Caesar, son of Tiberius Julius Augustus Caesar, son of Tiberius Julius Caesar the temple-builders [or curators, congratulate]," &c. It is a pity that syntax should be so violated for so small a gain in sense. Evidently Νικον is the end of the name Γερμανικόν, and Σεβαστου should be read instead of Σεβαστόν, when it will at once appear that the inscription is set up in honour of Germanicus, adoptive son of Tiberius, the younger Drusus, his own son, and Tiberius himself.

Again, it is well-known that in inscriptions Εὐριπίδης Β τοῦ Πλάτωνος or εἰς τοῦ Πλάτωνος means that Euripides' father and grandfather were both named Plato. Ignorance on this point has produced several mistranslations in the present inscriptions. Thus, in No. 2, from the Augusteum, the phrase σπονδοποιούντος Θεοπόμπου Γ. τοῦ Μενεκράτους is rendered "Theopompus making the drink-offering, Caius, the son of Menecrates, being . . . of the temple." The meaning of the Γ is that Theopompus' three immediate ancestors were named Menecrates. A similar error occurs in No. 19, from the Great Theatre, where Αὐρ. Διονυσίου Δίστου (εἰς τοῦ) Θέωρος is translated "Aurelius Dionysius Distus, son of Theo." In this last inscription, again, we find the wonderful Latin name Astatius, which is an obviously false reading of A. Statius, or rather L. Statius, the letter on the stone being really A. The mistakes last pointed out are the more inexcusable in that the whole of this inscription was published by C. Curtius, of course with accuracy, in the fourth volume of the *Hermes*. In another place ("Great Theatre," p. 3) ὁ νεοκαρὸς δημὸς is rendered "the public assembly of the Neocori," a phrase explained in a footnote by "perhaps, Meeting of the Temple-keepers." After blunders like these, which are but specimens of a numerous class, we may pass lightly over such infelicitous phrases as "the youth of the Ephesian citizens, which shall at any time succeed" ("Great Theatre," p. 39, for τοῖς

αἰεὶ ἐσομένοις 'Εφεσίων παῖσι) or such inconsistencies as appear in the rendering of the same word in various places—the term νεοποιός, for instance, being variously thus translated:—"custodian of the temple," "temple warden," "temple builder," "temple builder or curator," "curator," "temple builder (curator, shrine-maker?)." This set of various readings is capped by Mr. Wood himself (p. 154), "I suppose that the word νεοποιός here means a person who decorates the temple with a votive offering in gold or silver."

But all is not yet told. It seemed necessary to compare, in two or three instances taken at random, the cursive text of the inscriptions as given by the editors with the stones themselves. I began with No. 12 (page 22) from the Temple of Diana. Here I found that many letters not underlined were not on the stone. In line 10 this negligence in indicating what is conjectural has a serious effect, the καὶ ὁ of the cursive not appearing on the stone, but instead of it a long space which must have been filled with a phrase to quite another effect, ὅπως ἂν εἰδῶσι πάντες ὅτι ἐπίσταται ὁ, or something of that kind. In line 4 the editor reads καὶ ἀναλισκομένων σωμάτων, and translates "now lives being sacrificed." The reading of the stone is καὶ ἀλισκομένων σωμάτων, "persons being captured." Nearly the whole of line 15 is conjectural, though not underlined, and throughout the inscription the words supplied do not correspond with the vacant space they should fill.

Of the other inscriptions compared with the stones, none gave quite so bad a result as this, but not in a single instance was the all-important underlining done with accuracy. These details I was obliged to bring forward in order that foreign scholars, who have no opportunity of seeing the stones themselves, may be warned not to rely indiscriminately on the readings here given. But it should be understood that no doubt much—perhaps most—of the transcription is done in scholarly fashion, except for the unfortunate underlining. It is much to be regretted that the bad work must take away to some extent the character of the good. On the whole, it is to be feared that the work will not add to the Continental reputation of English scholars. Perhaps, if it was necessary that hasty transcripts should be made in a few months, from inaccurate copies, and without collation of the originals, a better result could not be expected. But I fail to see why these conditions were necessary parts of the problem.

PERCY GARDNER.

A LETTER OF VAN DYCK.

IN the famous collection of autographs belonging to M. Benjamin Fillon, which is shortly to be sold by the well-known expert, M. Chararay, there is preserved an interesting letter from Van Dyck, written by the great portraitist during a hurried visit to Paris in November, 1641: that is, about a month before his death, which occurred on December 9, 1641. It will be seen by this letter, which a French correspondent, M. Ephrussi, has kindly copied for us, that Van Dyck must have held some relations with Cardinal Richelieu, for he uses the occasion of asking for a passport, to express his gratitude for the esteem and honour

that the Cardinal has shown him, adding that if he can only regain his health he will make a journey expressly to Paris in order to receive the Cardinal's commands (possibly for the execution of a portrait of himself). But meanwhile his only desire seems to be to get back to his house in England as quickly as possible—or, as he puts it, *con toute diligence*, which reminds us of the little phrases in bad Italian which Dürer also liked to intersperse in his letters. His request for a passport for himself, five servants and four servants, and *ma carrosse*, shows the state in which the magnificent artist used to travel. The letter, which we give in the original French, only altering the orthography slightly in order to make it more easily understandable, runs as follows. It is not known to whom it was written.

"Monsieur,

"Je vois par votre très-agréable, comme aussi j'entend par bouche du Monsieur Montagu, l'estime et l'honneur que me fait Monseigneur le Cardinal. Je plains infiniment le malheur de mon indisposition, qui me rend incapable et indigne de tant de faveurs. Je n'aurai jamais honneur plus désirée que de servir sa Eminence et si je puis recouvrer mon salut, comme j'espère, je ferai un voyage tout exprès pour recevoir ses commandements. Cependant je m'estime extrêmement redevable et obligé et comme je me trouve de jour en jour pire je desire *con toute diligence* de m'avancer envers ma maison en Angleterre pour laquelle je vous supplie de me faire tenir un passeport pour moi et cinq serviteurs, ma carrosse et quatre servants et m'obligerez infiniment d'être votre à jamais comme je suis, Monsieur.

"Votre très-humble et très-obligé serviteur.

"ANT. VAN DYCK.

"Il 16 Novembris 1611."

ART SALE.

On the 1st inst. Messrs. Christie, Manson and Woods sold a collection of porcelain, enamels, and other curiosities from China and Japan. An incense-burner of ancient Chinese enamel, surmounted by a kylin, sold for 12*l.* 10*s.*; another, tripod form, with ornaments in colours, on light-blue ground, 11*l.*; a group of two warriors, 18*l.*; a blue and white 24 in. cistern, 16*l.*; another, with horses and waves of the sea, 16*l.* 10*s.*; a turquoise shell, 5*l.* 10*s.*; a turquoise bottle, 12 in., 12*l.* 15*s.*; another, 8*l.* 15*s.*; a turquoise vase, with flowers in slight relief, 9½ in., 18*l.*; two turquoise bottles, 8*l.* each. Of the Chinese enamels, a hexagonal basket of pierced metal gilt, 8*l.*; a dish, with foliage in colours on turquoise and white ground, 7*l.*; a pair of small two-handled vases, 11*l.*; a pair of white birds, with coloured wings, 12*l.*; a pair of birds on perches, 9*l.* 15*s.*; a pair of bottles, with fish, 7*l.* 15*s.*; a pair of two-handled vases, with lotus plants on crimson ground, 15½ *g.*s.; a pair of long-necked bottles, with birds and flowers, 12*l.*; another pair, with vases of flowers, 10*l.* 15*s.*; a pair of tall jars, with dragons and ornaments, 16*l.*; another with bats and fruits in colours, 12*l.*; a pair of incense-burners, formed as monsters, 60*l.*; a square beaker, with ribs in relief, 15*l.* 10*s.*; a long-necked bottle, with arabesques on crimson ground, 16*l.* 10*s.*; an incense-burner and cover, the handles and feet formed of elephants, and cover surmounted by an elephant, 75*l.*; a pair of ivory matchpots inlaid with birds and flowers in mother-of-pearl, 22*l.*; a large matchpot of wood, ivory, and lacquer, carved with two figures in high relief, 40*l.*; a black and gold lacquer cabinet, with panels of lacquered ivory, 18*l.*; a cistern, with kyllins on blue and white, 20*l.*; a six-leaved screen with silk panels, painted with birds and flowers, 29*l.*; another, with vases of flowers, 27*l.*; other six-leaved screens, with silk panels, embroidered with birds and flowers, ranged from 10*l.* to 17*l.*

Two magnificent Sèvres vases have been presented to the town of Philadelphia by the French Government in remembrance of the Exhibition held there this year.

NOTES AND NEWS.

MR. GEORGE BARNARD has lately completed an important and interesting series of drawings of Alpine scenery, which will shortly be exhibited in the rooms of the Alpine Club. One of the principal subjects is a view of the great Aletsch glacier from the Belalp, taken under the influence of morning light, when the vast surface of the ice field is chequered by the shadows of the surrounding peaks, that stand out with a fine distinctness in the clear sunlit air. A second drawing presents a view of the smooth waters of the Oeschinen See, a little lake in the valley of that name near Kandersteg. Here again the effect is of early morning, with the snowy summits of the Blumli Alp, Weiss Frau and Doldenhorn mirrored in the deep tones of the water. In the foreground are the ruined fragments of great larch-trees hurled down from the mountain side by an avalanche. Mr. Barnard does not attempt, like M. Loppé, whose Alpine pictures were lately exhibited in London, to realise in detail the forms and colours of Alpine scenery, with the sudden and startling contrasts of rich verdure and dazzling snow. The scheme of his art is rather to reconcile these opposite elements by sacrificing something of the distinctive force of each, and combining them in a single view. This feat is successfully accomplished in a large drawing of the Eiver Glacier, and in another, of the Gabel Horn from the Findelen Thal. The series includes, besides the works already mentioned, views of the Roth Horn from below the Riffel, the Weiss Horn from above the Riffel, the Matterhorn with the village of Zermatt, the Jungfrau from near Murren, and the Breithorn from the valley of Lauterbrunnen. Such a pleasant illustration of districts dear to mountaineers will find an appropriate place of exhibition in the rooms of the Alpine Club, of which Mr. Barnard is himself a member.

THE profession by the same individual of two distinct branches of art was more common formerly than now, and is now more common in France than in England. The current number of *L'Art* affords an excellent example of the success possible to an artist who does not limit himself to a single study, in the shape of a line-engraving by M. Gaillard of his own picture of *St. Sebastian*. M. Gaillard has long been known as an accomplished master of the burin, and the picture now so finely reproduced served also to prove his command of the painter's resources. It was one of the principal features of the last exhibition of the Salon.

REFERRING to a scheme that was lately announced in these columns to establish in London a school of sculpture under the direction of M. Dalou, we understand that one or two gentlemen interested in art have offered to provide a guarantee fund to cover the first year's expenses of the atelier. With this security there should be little difficulty in carrying the scheme into effect.

MR. HOLMES has lately secured several interesting drawings by masters of the German school to enrich the royal collection of drawings at Windsor. We may mention as one of the most interesting and less familiar features of that collection a series of very admirable pen-and-ink drawings by Canaletto of a surprising freedom and force of manner. The freshness of these sketches gives an impression of the artist's delight in nature that is scarcely supplied by his finished pictures.

We understand that M. Tissot intends shortly to publish a series of his etchings.

MR. L. ALMA TADEMA has recently finished two important pictures which are not designed for exhibition. One of these is a high narrow canvas, representing the interior of a Roman bath for women. A colossal copper sphinx in the centre, turned richly green with the moisture of the air, spouts a current of water into the pool, where several women are sporting half-immersed. Down the marble steps at the side of the Sphinx a

comely *baigneuse* walks laden with towels. In the background a circle of friends, lightly clad, huddle together in the chillier air, and gossip. A magnificent column of red porphyry suggests the nature and splendour of the supports of the roof out of sight. The accessories of this interesting work are carried out with the painter's customary care and learned labour; the colour is pearly and luminous in a high degree. It is a little poem in the manner of Martial, and at least as antique. No less accomplished, and distinctly more lyrical, is the other work we have referred to. On a marble bench, under a cloudless morning sky of Capua or Naples, a girl sits shyly listening to the ardent eloquence of a stout youth that lies at right angles to her, stretched along the bench. Her flushed face and downcast eyes betray the inward struggle; but he is plainly a lad not accustomed to denial. His robes are white and blue, hers only white; the marble is of a still more translucent white, and the sky is soft blue above. Beyond their heads lies a glistening streak of sea. The only variations in this tender harmony of white and blue are a bush of tamarisk, covered with pale-pink blossom, and the red-gold colour of the girl's shining hair. The artist has never in technical perfection surpassed this exquisite work. Mr. Alma Tadema is also completing four large works representing the Seasons: Spring, with two girls, burdened with anemones, wandering through a Tuscan field; Summer, with the same maidens lounging in a marble bath; Autumn, a Maenad clad in russet robes, whirling her thyrsus woven with ivy-buds; Winter, a group of women in the portico of a palace, warming their hands over a pan of charcoal, a snowy landscape in the background. This fine series of semi-allegorical personifications will probably be seen next year at the Royal Academy.

THE Widow Cadart, who succeeds to the business of her late husband as a publisher of etchings, announces the usual *Album* of the house for 1877. There will be thirty etchings, hitherto unpublished, by thirty artists, some of whom are distinguished etchers. The *Album Cadart* has always been notable for the care bestowed on the material of its production—paper, type, &c.—and the Widow Cadart announces that she has this year "redoublé de soins dans l'exécution matérielle et artistique de l'œuvre: papier, tirage, etc."—an effort now, indeed, more than ever desirable and necessary, seeing the immense advance in these things which on all sides has characterised French printing during the last two or three years, so that the editions of works printed by Claye, and Jouaust, and Alcan Lévy, are nearly always little works of art, which when they shall have become rare (and some of them are rare already) will be sought for eagerly by amateurs as marvels of the art of typography in our day. M^{me}. Veuve Cadart does wisely to look carefully to the material execution of her work.

No more original Christmas gift-book has appeared this season than Mr. Bentley's special edition of *The Witches' Frolic* and *The Bagman's Dog*, two of the most noteworthy of those "Ingoldsby Legends" which there is always a public to buy and read. It is a dainty public indeed that the eminent publisher has this year satisfied with the luxurious presentation of these "legends," printed at the Chiswick Press, and illustrated so remarkably. The illustrations claim to be done by "a new art;" but that is not really their greatest merit. The new art has some resemblance to the old-fashioned silhouette; but the old-fashioned silhouette gave us a black form detached on a background of white, and this gives us white on a background of black. Moreover, the surface of the white is itself drawn upon and thinly shaded: that is, you have more than the outlines—a more complete picture is presented, though without the usual gradations of *chiaroscuro*. The process, however, is not here the most interesting thing, but rather the artistic work itself, which is

full of spirit, and action, and the quaintest grace. Here are children whose gestures and whose draperies are delightful for simplicity and ease; girls who have more than a touch of Watteau's grace; young men active and muscular; old men as powerless and comical as any pantaloons in a pantomime. The "new art" itself may be of no great value, but the artist who has drawn these figures would appear to be a draughtswoman of genuine gifts.

WE hear that an effort is being made to obtain for the Winter Exhibition at Burlington House some of the fine works of Turner which, ever since they were painted, have remained in the possession of the Fawkes family at Farnley Hall, near Otley, Yorkshire.

WE understand that Mr. Arthur Lucas, the publisher, of Wigmore Street, has engaged the Chevalier J. Ballin, the eminent line-engraver, to produce an important-sized plate from Edwin Long's (A.R.A.) picture of *The Pool of Bethesda*, which was in the last Royal Academy Exhibition.

THE cartoons designed by M. Chenavard for the painting of the Panthéon are shortly to be exhibited in the Hôtel de Ville of Lyon. The municipal council of that city have just voted 1,500 fr. for the expenses of this exhibition.

THE new manufactory of Sèvres, which is re-closed during the present month for necessary works, will, it is announced, be definitively opened to the public in the first week of January. It will be opened free on Sundays and *fête* days, a privilege that has not hitherto been accorded; even the Museum having been up to the present time, contrary to the usual practice in France, always closed on Sundays. On week days visitors will only be admitted by tickets, as—the *ateliers* being open on those days, as well as the galleries and museum—some restriction is necessary in order to prevent interruption to the workmen.

UNDER the title of *Les Amateurs d'Autrefois*, M. Clément de Ris writes for the amateurs and collectors of the present day an account of the lives and labours of their distinguished predecessors. In a richly printed volume, illustrated with eight etchings, he relates the histories of those celebrated personages who are known by the names of Claude Maignis, Jabach, Madame de Verrue, le Chevalier de la Roche, M. de Julienne, Randon de Boissay, the Comte de Lassay, &c., and gives many entertaining details respecting them, as well as much instructive matter for modern collectors.

UNDER the Rospigliosi Palace, in what was one of the great halls of the Baths of Constantine, have lately been found portions of pavement, many fragments of coloured marble cornices, a statue of Mars almost entire, a head of Bacchus, a satyr, a head of Paris, and a coloured mosaic with budding foliage. Close to the same site an ancient building used as a fountain has been discovered. It is built in imitation of a water grotto, and consists of a wall with niches and pilasters, and decorated with stone slabs having representations of winged genii in chariots or riding marine monsters, surrounded by mosaics and shells on a foundation of punice-stone. The water flows down four marble steps into a basin.

THE STAGE.

MR. TOOLE has come back to London and to the Gaiety Theatre with a not very favourable specimen of the kind of drama to which he has accustomed us. The author of the new piece, *The Man in Possession*, is Mr. James Albery; but the delicate and well-applied art and the truth of observation which give charm to *Two Roses* are little to be perceived here. Nothing with smaller claim to be considered artistic has been contributed to our stage by a writer of confessed ability, who should aim higher. The piece is a farce in

three acts, *plus* a good many of the witty things which Mr. Albery knows how to say—things that may enliven a funny newspaper when it is flagging, but can hardly make a comedy. The piece is without any thread of genuine interest, without any skilful intrigue, without any vivid sketches of character, without any sequence or unity in such satire as it contains. Its witticisms are generally isolated things, rarely belonging to the individual who utters them. To this the one exception may be found in the utterances of the elderly hero, the broker's man, who is played by Mr. Toole. His convictions of the inevitable uselessness of "a lady"—a "real lady;" "she could never do anything useful"—are, it is true, appropriate to a character about whom all is Brummagem except his love for a girl. What the interest of the piece is supposed to be, it is for a long while difficult to determine, but by the time the curtain has fallen on the last act it has become pretty plain that opportunity has been sought for allowing Mr. Toole to be both funny and pathetic in the same drama. It has not been sought successfully. The talent of Mr. Toole may possibly be various, but it is not flexible; and such contrasts as he is able to present between humour and pathos are not really sharp and decided enough to be effective. He stumbles heavily, as it were, from the one into the other, and has none of the electrical quality which alone can give the vivid interest of truth itself to changes such as he attempts. Of course he is most at home where he may be unrestrainedly funny; and where that may be, he has many natural moments in which he pours, amusingly enough, certain phases of lower middle-class life. But his pathos seems to us far less successful, though the pathetic situation Mr. Albery has imagined is well conceived, and only wants, on the part both of author and actor, more careful and reasonable realisation. The theme of the almost paternal love of a common and rough old man for a girl who, by her true birth and by her nature, is worlds apart from him, is one which, though not indeed new, is still quite worthy to receive adequate treatment at the hands of author or actor endowed with the true gifts of pathos. In the new piece—which is aided a good deal by the naturalness of Mr. J. F. Young, the manliness of Mr. Edmund Leathes, and the unaffected grace of Miss Hollingshead—this theme is just suggested. But to say that it is treated with any pretension to competence would indeed be a mistake. The Gaiety public is, however, very glad to see Mr. Toole, and if it stays, as probably it does, to see the *Spelling Bee*, which follows *The Man in Possession*, it need not altogether regret its evening.

ON Wednesday, Mdme. Chaumont took her benefit, and appeared for the last time in London until June. At her benefit Mdme. Chaumont went through both of her pieces—*Madame attend Monsieur* and *Toto chez Tata*—and sang her songs. We have not spoken of her songs before, but they are worth speaking of, for they are little dramas in themselves. She has hardly any voice, yet the little thread of voice she has is a very pleasant one, and nothing was ever better used. She acts her songs, all of which are descriptive. She brings into them just that power of more than photographic accuracy in observation which gives the reality—though it does not give the beauty—to her *Toto chez Tata*. For instance, in *La Bonne Année*—the song that records the congratulations given in Paris on the "Jour de l'an"—she illustrates with amusing truth the little tyrannies of social habit and the insincerities it gives rise to—the knock at the door, the hour chosen hurriedly in the thought that the acquaintance will not be at home, the consequent hurrying on to some other visit more to be desired, then the surprise at the answer that the acquaintance is after all within; the rapidly assumed gladness; the heartiness, only half of which is make-believe; the New Year's wish, and the exit, when custom is complied with and the visitor free. All that is

indicated completely, with the fewest and most expressive touches. And towards the end of the song there is another "interior"—two old *bourgeois*, with voices thin with age, cheerful yet with good hopes and happy natures, are wishing each other, though very old, though near to the last, *la bonne année, la bonne année!* It is a bit of keenly perceived pathos, worthy of the real artist, who has given us, with such amazing flexibility, the changing thoughts and surprises of *Toto chez Tata*.

ON Saturday evening next the Lyceum will re-open, and Mr. Irving will appear in *Macbeth*, and shortly afterwards, as we announced, he will play *Louis the Eleventh*, a well-chosen part, in which he ought to succeed.

London Assurance, with Mrs. John Wood as Lady Gay Spanker, and Miss Lydia Foote as Grace Harkaway, is played at the St. James's Theatre until Lord Newry's English adaptation of *Les Danicheff* is ready.

AT the Court Theatre—*Brothers* having soon ceased to be attractive, in spite of excellent acting, bright dialogue, and sufficiency of stage appointments—*New Men and Old Acres* has been brought out. The impression made by the piece itself is certainly not less favourable now than it was originally at the Haymarket, while the conviction gains strength that the Court company is, for all purposes of modern light comedy, one of the strongest in London. As the heroine of the play of Mr. Taylor and Mr. Dubourg, Miss Ellen Terry has a fine and appropriate part. Always thoughtful and graceful, the actress is here, more than once, genuinely dramatic. The character of Samuel Brown, the Liverpool merchant who aspires to marry Miss Vavasour, in days presumably when such aspirations were bolder than they would be at present, is in all respects fitted to Mr. Charles Kelly, generally a bluff and straightforward and honourable stage-figure, but none the less various really because never seeking to make special display of variety and versatility. Vulgarer natures find good illustration through the art of Mrs. Stephens and Mr. Anson, albeit the efforts of these performers are now and then somewhat forced and obvious. Mr. Hare, as Sir Marmaduke, makes a neat sketch of character; and other parts are filled pleasantly by Mr. Conway, Mr. Ersser Jones, and Miss Kate Aubrey. The piece, though it had a good hearing on its first production at the Haymarket, is not so familiar but that it may advantageously be played for many nights in Sloane Square.

THE actors who, until the return of Mr. Toole to the Gaiety, were engaged at that theatre are now to be seen at the Opéra Comique in the plays which had been performed at the Gaiety.

MR. REECE has written a burlesque on *William Tell*, which will be produced in town in a week or so.

PLANCHÉ'S *Invisible Prince* is the piece selected for Miss Jenny Lee's re-appearance at the Globe at Christmas.

The Forty Thieves—in which the Vokes family will re-appear—is to be the pantomime at Drury Lane Theatre.

A NEW play by an American author is in rehearsal at the Haymarket Theatre.

MR. IRVING'S provincial tour finishes this week at Dublin, and Miss Bateman's will conclude at the same time.

THE Paris correspondent of the *Daily Telegraph* has telegraphed to London a glowing account of the first representation of *L'Ami Fritz*, MM. Erckmann-Chatrian's new play at the Théâtre Français. We shall later on be able to speak of the piece. Suffice it to say at the present moment that it is reported to be without distinct political allusion; that it was, therefore, received at the Français without those hostile manifestations to which the authors of the *Story of the Plébiscite*

might well have laid themselves open; and that some freshness in the treatment and much excellence in the acting caused the curtain to fall on what would seem to be a success. The scenery is admitted to be of the best; M. Perrin, the manager of the Français, having paid more attention to stage appointments than any of his predecessors. And a very pretty effect is obtained by the singing of an old Alsatian ballad with a refrain. It is Mdlle. Reichemberg who sings the ballad, and she is said throughout the piece to be better than usual. The following verse is worth giving, as noticeable for its simplicity of means and sureness of effect:—

“En entendant fuir l'ennemi,
Qui avait tué son bon ami.
Le pauvre enfant cria ‘Ma Mère!’
Et tout de long tomba par terre.
Ils ne se verraient plus:
Il est sous terre.”

And then the last lines are repeated by the chorus of reapers:—

“Ils ne se verraient plus:
Il est sous terre.”

The effect of a simple and pathetic ballad of a country-side or province, properly employed, is what the English stage has yet to learn. What have we on the modern stage to compare with this of the kind?—or with the effect in *Jean Marie*, of the Breton ballad, beginning:—

“Le brick n'eut pas sitôt sombré
Avec ses grands mâts et ses voiles,”

and having for a refrain—

“Celui que tu croyais perdu,
Sainte Azénor te l'a rendu.”

L'Affaire Française, a new drama by Georges Petit, has been brought out at the Théâtre de Cluny, but the little theatre near the Museum from which it derives its name has long lost the vogue won for it chiefly, perhaps, by the *Inutiles* of M. Edouard Cadol. An exceptionally good ingénue, named Mdlle. Marie, is said, however, to contribute much to such chances of success as the new drama at the Théâtre de Cluny may enjoy.

MUSIC.

THE ENGLISH OPERA SEASON AT THE LYCEUM.

LAST Saturday, Mr. Carl Rosa concluded his second season of English Opera in London by a performance of Cherubini's *Deux Journées*. It will be worth while to take the opportunity of briefly reviewing the chief events of the past three months at the Lyceum.

In the first place, Mr. Rosa is to be warmly congratulated on having fulfilled the whole of the promises of his prospectus. It is so general a custom, at least at the Italian Operas, to announce a number of works which never come to a hearing at all that it is gratifying to meet with an *impresario* who seems to feel the obligation of keeping faith with his subscribers and the public. All the works promised by Mr. Rosa have not, it is true, been equally interesting, nor equally successful, but there has not been one which has not been from some point of view worthy of production. Foremost in interest has undoubtedly been the *Flying Dutchman* of Wagner, which has been given some twenty times, and has been the most remarkable “hit” of the season. That it should night after night have drawn a crowded house, and have even been played three or four times a week, is indicative of the curiosity and interest felt in the music of one who is certainly the best-abused composer in Europe. The continued success of the opera can only be ascribed to its intrinsic worth. It was most admirably performed, it is true; but the far less measure of support given to some other works, which were nearly, if not quite, as well represented, proves that a good rendering is not enough to keep a piece on the stage unless it derive vitality from its own merits.

Next to the *Flying Dutchman* we are inclined to regard the production in English of *Fidelio* as the most important event of Mr. Rosa's season. As this was noticed at the time in these columns it will suffice to refer to it now; but as some strictures were made on the addition of trombone parts to Beethoven's score, we are very glad to take this opportunity of saying that the error arose from incorrect parts, which, from some omission, were not noticed before the performance, and that as soon as Mr. Rosa's attention was called to them, he (as might have been expected of him) expunged the offensive additions once for all.

Among other works produced during the season must be named Adam's *Giralda*, Nicolo's *Joconde*, and Cowen's *Pauline*. The last-named opera has been so recently spoken of, that we need say nothing more of it now; the very partial success of the other two resulted from the inherent weakness of the music. Both are extremely pretty, and both were well given; but, as a whole, neither can be considered a work of the first rank.

It is, we think, a matter for regret that Mr. Rosa did not give us an opera of Mozart's during the season, especially as *Figaro* last year was not only one of the best rendered but one of the most successful works brought out at the Princess's. Why it was not repeated this year it is difficult to see. There was a talk also of *Don Giovanni*; but though this was given during Mr. Rosa's performances at the Alexandra Palace, it never came to a hearing in London. It is to be hoped that it is only deferred, not shelved. We would also suggest to Mr. Rosa that it would be well to pay more attention to the works of Auber, the prince of French opera composers. Of the more than forty works which he wrote there are many which would well pay for revival, pecuniarily as well as artistically, and which are quite within the means of such a company as Mr. Rosa's. *Fra Diavolo* was given once, and only once, during the season; but it is easy to name at least half-a-dozen of which amateurs would be delighted to hear a good rendering. There is *Le Philtre*, one of the most delightful of Auber's scores, which was at first spoken of, but subsequently replaced by *Giralda*. There can be hardly a doubt that the former work would have proved much the more attractive. Then there are *Les Diamans de la Couronne*, *Le Domino Noir*, *La Part du Diable*, *L'Ambassadeur*, *La Sirène*, of most, if not all, of which an English version already exists, and any one of which, with such a rendering as might reasonably be looked for from the artists at the Lyceum, would be certain to succeed. We trust that in the prospectus of next season Auber will have a much more prominent place.

It is needless to catalogue the stock pieces, which, in addition to those named, have completed Mr. Rosa's repertoire; we therefore turn from the works to their performance. The “star” of the company has, of course, been Mr. Santley; his performances in the *Flying Dutchman*, the *Lily of Killarney*, *Joconde*, *Pauline*, and other works in which he has appeared have been of uniform excellence; but, as has previously been remarked in these columns, he has been overworking himself, and, towards the close of the season, paid the inevitable penalty in a somewhat worn voice. We trust that judicious rest may soon restore him to the full possession of his powers. It is a question, too, whether his co-operation has not at times been in some degree prejudicial to the perfect ensemble of the performances. To secure an entirely satisfactory result he ought to be supported only by artists of his own calibre, and it cannot be said that this was always the case.

Mdlle. Torriani has steadily gained in public favour during the season, and deservedly so. Her greatest successes have been precisely in those parts which made most demands upon her—Senta in the *Flying Dutchman*, and Leonora in *Fidelio*. The remarkable progress made by Miss Julia

Gaylord in the past twelve months deserves special mention. Her singing is steadily improving, and as an actress she is one of the very best members of the company. Another young lady should also be named—Miss Giulia Warwick, a *débütante*, who, though seldom heard, proved herself possessed of great ability, and gave evidence of very careful training. Mdlle. Ida Corani, who was heard in *Giralda* and *Joconde*, is an excellent singer, but hardly so successful on the stage as in the concert-room.

Of the gentlemen, Mr. F. Packard showed (especially as Florestan in *Fidelio*) a marked improvement on last year; his future will be watched with interest. Mr. F. H. Celli, who might have been heard oftener with advantage, fully sustained his reputation both as a singer and an actor. The rest of the company, whose names will be familiar to our readers, were uniformly good; and both orchestra and chorus were no less excellent than last year. The mounting of the various operas also left little or nothing to desire; while the energy of Mr. Rosa himself conducted, perhaps more than anything else, to the success which has attended his efforts. He may, on the whole, be heartily congratulated upon his second season.

EBENEZER PROUT.

THE greater part of last Saturday's concert at the Crystal Palace was occupied with the performance of Sullivan's cantata, “On Shore and Sea.” This work was written for the opening of the International Exhibition of 1871, and was performed on May 1 of that year in the Albert Hall. Of the four pieces composed for the occasion only one (M. Gounod's “Gallia”) has been frequently heard since. Mr. Sullivan's cantata is, like everything from his pen, thoroughly well written, and most effectively scored; but *pièces d'occasion* are seldom good specimens of their composers, and we are not inclined to consider “On Shore and Sea” an exception to the rule. The performance was extremely good; the solo parts were sustained by Mdlle. Lemmens-Sherrington and Mr. Wadmore; while the Crystal Palace choir was (as on every previous occasion of its being heard during this season), most satisfactory. We heartily congratulate Mr. Manns on the improvement he has secured in this department. Meyerbeer's interesting, but very seldom heard, overture to *Struensee* opened, and Beethoven's *Leonora* overture (No. 3) concluded the concert. Herr Wilhelmj gave a splendid rendering of Bach's Chaconne and Ernst's Fantasia on Hungarian airs; and the vocalists each contributed one song. To-day Liszt's symphonic poem “Mazeppa” is to be produced for the first time in England; and Miss Anna Mehlig is to play Hiller's concerto in F sharp minor.

AFTER our going to press last week, the production of *Alceste* at the Crystal Palace, which we announced for Thursday, was postponed. It is now fixed for Tuesday next, with the following cast:—Alceste, Miss Emily Cross; Admetus, Mr. Arthur Matthison; Phères, Mr. Edmund Leathes; Hercules, Mr. W. Rignold; Apollo, Mr. Barnes; Thanatos, Mr. Moxon; Medon, Mr. Bruton Robins. The choruses, composed by Mr. Henry Gadsby, will be sung by a choir of forty male voices, under the direction of Mr. W. Gadsby.

THE programme of Mr. Dannreuther's chamber concert, on the 30th ult., comprised Schumann's *Fantasie-Stücke*, Op. 88, for piano, violin, and violoncello; the same composer's piano quartett, Op. 47; Liszt's “Concert pathétique” for two pianos; violoncello solos by Saint-Saëns and Popper, and three songs by Hector Berlioz.

THE eighth Trial of New Compositions by the Musical Artists' Society takes place this evening at the Royal Academy of Music, Hanover Square. The programme includes two sonatas for piano and violin, by Messrs. W. H. Holmes and F.

Davenport; a sonata for piano and violoncello, by E. H. Thorne; and smaller vocal and instrumental pieces by Miss Prescott and Messrs. G. F. Gear, W. H. Cummings, F. E. Barnes, C. H. Hullett, C. E. Stephens, W. H. Longhurst, C. Gardner, H. Baumer, and D. Hume.

M. ALFRED DUBOIS DE BEAUCHESE, who was secretary to the Paris Conservatoire during the directorships of Cherubini and Auber, from 1828 to 1870, has just died in Paris at the age of seventy-two.

THE Leipzig Wagner-Verein, in order to further the acquaintance of musicians and the public with the *Ring des Nibelungen*, will hold, during the ensuing six months, fortnightly meetings, at which the work will be musically illustrated, and lectures will also be given upon it. It is said that the scheme is receiving warm support.

DR. FRANZ WITT, of Landshut in Bavaria, has offered a prize of 300 marks (15*l.*) for the best essay on Consecutive Fifths and Octaves; the reason of their prohibition by the old writers on music, and the views of modern theorists on the subject. The essays are to be sent in by Jan. 1, 1878; and the umpires will be Messrs. Albert Hahn, Witt, Reissmann, W. Rust and Tappert.

NICOLAI's *Merry Wives of Windsor* was performed in Berlin for the hundredth time on the 19th ult.

THE success of Madame Essipoff in America is said to be enormous.

MESSRS.

SEELEY, JACKSON, & HALLIDAY,

54 FLEET STREET, DECEMBER, 1876.

The ABBEY CHURCH of ST. ALBAN'S.

By J. W. COMYNS CARR. Illustrated with 5 Etchings by Ernest George and R. Kent Thomas, and many smaller Illustrations. Royal 4to, cloth, gilt edges, price 18*s.*

EIGHTEEN ETCHINGS by ENGLISH,

FRENCH, and GERMAN ARTISTS; comprising Plates by Seymour Haden, Ernest George, Brunet Debaines, &c. Notes by P. G. HAMERTON. Imperial 4to, cloth, gilt edges, price 31*s.* 6*d.*

The PORTFOLIO: an Artistic Periodical.

Edited by P. G. HAMERTON. The Volume for 1876. Cloth, gilt edges, 3*s.*; or half morocco, gilt top, 42*s.*

A CENTURY OF DISCOVERY: an Account

of the Spanish and Portuguese Navigators, from Prince Henry to Pizarro. From the German of THEODOR VOGEL. With 12 Illustrations, price 5*s.* cloth.

"Highly interesting biographical sketches of Portuguese and Spanish navigators; beautifully illustrated, and no less beautifully bound."—*Leeds Mercury*.

The LIFE, LABOURS, and TEACHING of

HAY MACDOWELL GRANT, of ARNDILLY. By M. M. GORDON, Author of "The Life of Sir D. Brewster." With Portrait. Price 5*s.* cloth.

On a PINCUSHION, and other Fairy Tales.

By MARY DE MORGAN. Illustrated by William De Morgan. Handsomely bound in cloth, gilt edges, price 5*s.*

"Genuine fairy stories of the old type. Miss De Morgan has written a little book which will be, we believe, almost as popular in time to come as the immortals of fairy lore."—*Spectator*.
"A delightful volume of seven fairy stories, full of strange thoughts and wonderful conceits. The illustrations, with their quaint decorative beauty, are admirable."—*Examiner*.

A THIRD EDITION OF

The ELIZABETHAN BIRTHDAY BOOK.

Mottos from the Great Writers of the Times of Queen Elizabeth. Cloth, gilt edges, price 2*s.* 6*d.* Kept also in various styles of leather binding.

The BATTLEFIELD of LIFE: a Tale. By

MISS GIBBERNE, Author of "The Curate's Home." Price 5*s.*

The CLAN of the CATS: Stories of the

Feline Animals. With many Illustrations. Price 5*s.* cloth.

FROM NEW YEAR to NEW YEAR. By

the Author of "Copsley Annals." With many Illustrations. Price 3*s.* 6*d.* cloth.

ONLY a DOG. By the Author of "Aunt

Annie's Stories." With Eight Illustrations. Price 3*s.* 6*d.* cloth.

"One of the most delightful acquaintances we have made among the new books is the dog Peter in this pathetic little story."—*Academy*.

A SEVENTH THOUSAND OF

OLIVER of the MILL: a Tale. By Maria

LOUISE CHARLESWORTH, Author of "Ministering Children." 5*s.* cloth.

"In some respects superior to 'Ministering Children,' the pathos is more refined. The effect sought is worked out by more delicate touches. A book of genuine worth, and full of sweet and tender piety."—*Spectator*.

A THIRD AND CHEAPER EDITION OF

ROUND MY HOUSE: Notes on Rural Life

in Peace and War. By P. G. HAMERTON. Price 5*s.* cloth.

A THIRD THOUSAND OF

LIFE'S AFTERMATH: a Story of a Quiet

People. By EMMA MARSHALL, Author of "The Old Gate-way." Crown 8vo. Frontispiece, 5*s.* cloth.

"The story is admirably told, and the interest well sustained throughout. The descriptions of English scenery are in many instances beautiful."—*Christian Observer*.

COUNTRY LIFE in SYRIA: Passages of

Letters written from Anti-Lebanon. By HARRIET RATTAY. In crown 8vo, with Engravings, price 3*s.* 6*d.* cloth.

"A curious account of country life in Syria. This is, from its unsophisticated candour, an amusing little book."—*Saturday Review*.

SEELEY, JACKSON, & HALLIDAY, 54 Fleet Street, London.

SATURDAY, DECEMBER 16, 1876.

No. 241, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Makers of Florence: Dante, Giotto, Savonarola; and their City. By Mrs. Oliphant. (London: Macmillan & Co., 1876.)

THIS pleasant book is composed of six essays—one on Dante; one on the group of architects and sculptors who joined in the building of the Florentine cathedral; one on Agnolo Pandolfini; one on the Convent of San Marco, with a notice of the artists who worked there, and Lives of Sant Antonino and Savonarola; and one on Michel Angelo—bound together in a single volume and neatly illustrated. Its chief value consists in this, that Mrs. Oliphant has confined herself to a range of subjects she understands, and to men with whom she sympathises. Each sketch is written with love and intelligence; nor has she ever bent her powers to deal with what she does not naturally like, through any mistaken desire for completeness or even-handed justice. The disadvantage of the method is that her book, when tested by its title, is one-sided. The writer so persistently keeps out of sight certain elements of political, social, and intellectual vitality with which she does not sympathise, that we are forced to ask, if her heroes really made our modern Athens, why the product of their energies was what it is. Among the "Makers of Florence" as Florence was when she ceased to have an independent life in the middle of the sixteenth century, and as we know her now through the records of her political history and through her monuments of art and literature, there are many men of first-rate importance ignored or thrust into the background by Mrs. Oliphant. Perhaps Mrs. Oliphant would say that Petrarch, the pioneer of modern humanism; Boccaccio, the poet of humorous and tender romance; Cosimo and Lorenzo de' Medici, the founders of libraries, promoters of learning, and enslavers of their city; Poliziano, the brilliant scholar and genial reviver of Italian poetry; Machiavelli and Guicciardini, the historians and philosophers of history, were not the makers but the marrers of Florence; and that all that side of life they represent, as distinguished from the ascetic ideal of San Marco, was the disease whereof Florence died. Nevertheless, he who has studied the history of Florence from 1300 to 1529 in its various branches will hold a different opinion. He will maintain that, whoever made Florence, it was Florence who made these men what they were, and that they were her children, and the makers of her spiritual city, in at least as true a sense as the Paduan prophet. Entertaining this

view of what Florence was and is for all time, he will feel it his duty to point out that the title of Mrs. Oliphant's volume is misleading, inasmuch as it professes to give her readers more than they will find in the collected essays it contains.

Having said thus much by way of general criticism, there is little left but to praise the excellences of an animated and attractive volume. Mrs. Oliphant keeps close to original and, for the most part, contemporary sources, drawing largely from Boccaccio's *Life of Dante*, Sacchetti's novels, Villani, Burlamacchi, and Vasari, and telling their incomparable tales again with lively grace. Her defence of Vasari, to whom she owes so much, against the recent school of critics, who pour contempt upon him because they have detected his inaccuracies, is both spirited and just (p. 144).

What is sure to render *The Makers of Florence* acceptable to general readers, is the ability shown by its author in presenting the men of whom she writes just as she conceives them to have been, and in the words whereby their best friends painted them. All her people are alive; and her criticisms on their works and opinions are so mingled with the details of their biographies as to form part of a continuous narrative. Without effort, and without elaboration, the story of these Florentine worthies flows on in a clear and sympathetic style; and the impression left upon our minds by each portrait is distinct and human. Perhaps the most interesting study in the series is that of Fra Angelico; the most impassioned, that of Savonarola. Luca della Robbia and Filippo Brunelleschi are delicately touched; and the companion pictures of the friends Fra Baccio and Mariotto Albertinelli stand out with a pleasant vividness. The same appreciative and sympathetic handling is shown in the study of Agnolo Pandolfini, to whom Mrs. Oliphant assigns the *Trattato del Governo della Famiglia* without a question of Alberti's claim; and in the biography of Sant Antonino, the good Archbishop of Florence. As an instance of the mood habitual to Mrs. Oliphant in dealing with Renaissance Italy, I will extract the last sentence from her *Life of Sant Antonino* :—

"The world was a terribly unsatisfactory world in those days, as it is now; and full of evils more monstrous, more appalling, than are the sins of our softer generation; but, at the same time, the gates of Heaven were somehow nearer, and those rude eyes, bloodshot with wars and passion, could still see the saints so unlike themselves going in by that dazzling way."

The account of Donatello suffers somewhat from Mrs. Oliphant's treating him too persistently as a rustic. Though he confessed in early manhood to Brunelleschi that his *Christ upon the Cross* was nothing nobler than a country-fellow, this does not justify our conceiving of the greatest Quattrocento master of style in Italy—the master of Andrea Mantegna—as a purely homely artist. It was no mere good old generous soul, no mere "frank and simple peasant," who made the *St. George* of Orsammichele, the bronze *David* of the Bargello, or the stately bas-reliefs of Sant Antonio at Padua. Nor does it seem to me that Mrs. Oliphant has reached her own level in the chapter on

Michel Angelo. This is due partly to her not having availed herself of the recent labours of Guasti, Milanese, Gozzi, and Heath Wilson. It may here be parenthetically noticed that on page 383 she speaks of the two Dukes in the Sacristy of San Lorenzo as Lorenzo de' Medici and "his brother Giulio." Now the Duke of Nemours was in truth not Giulio, but *Giuliano* de' Medici, and not brother, but *uncle* to the Duke of Urbino. She is also wrong in stating that the statue called *Il Penseroso* is "now supposed to be Giulio;" for, since the discoveries communicated to the world by Mr. Heath Wilson in March, 1875, the old tradition has been confirmed, Grimm's hypothesis has been discarded, and the *Penseroso* is known to be, not Giuliano, but Lorenzo.

These minor matters of inaccuracy are not, however, of much importance in a book that makes little pretence to learning and avoids critical questions, basing its claims on different merits from those of the Dryadust. Were it not so, a critic might venture to rebuke Mrs. Oliphant for calling Lorenzo the Magnificent "a man of superb health," when it is notorious that he died comparatively young of a lingering and painful disease of the stomach; and for airily alluding to Giovanni Pico della Mirandola, the Phoenix of his age, the recluse of arduous and all-absorbing erudition, as "this Court butterfly!" In truth, Mrs. Oliphant is not happy when she touches on the side of Florence she has not studied and does not understand, the side which she playfully and complacently thinks she "may be permitted to call the devil's side."

To remark that the practised hand of the novelist is noticeable throughout is too obvious an observation to be worth much. Yet it is true; and the book owes much of its attractiveness to the tact with which the author of the *Chronicles of Carlingford* has seized on salient details and introduced picturesque touches without straining historical probability or violating proprieties of taste. At times, however, her fluent style betrays a certain note of vernacular vulgarity, not racy enough to redeem it from commonplaceness. An example of this is her frequent use of exclamatory phrases like "poor soul!" and "good soul!" Even Gemma Alighieri is pitied as "poor soul!" because she had seven children by the greatest poet of Italy. The introduction, again, of Italian words for the sake of local colouring, where English would have done as well or better, is tiresomely frequent. Thus Guido da Polenta "was *cacciato*;" we read too, "how steep the *scale* of a stranger's bounty." The trick becomes disagreeable when the Italian name has an English plural, as in *bottegas* and *parlamentos*. It must also be observed that this superfluous Italian is very often inaccurate. We find: "gentile donne, *guidice*, ornamento poetici, disordine grandissime, grandi ali." Instances of this sort of slip are so numerous as to suggest incomplete scholarship, though some may be due to typographical errors, and some possibly to quotation from old and ungrammatical Italian.

If I had space to select passages of pleasant writing, I should like to transcribe the

narrative of the storming of San Marco (p. 315), the polemic against modern historians of the psychological school (p. 290), the pretty notice of Luca della Robbia (p. 150), and the sober criticism upon Sandro Botticelli (p. 332). It must be enough to indicate these thus in passing; for many minds will single many favourite passages from a book so likely to be popular. In conclusion, it may be said that the crowning charm of *The Makers of Florence* for English readers will be its genuine and healthy sympathy with what, according to her lights, the author sees of holy, tender, manly, loving, and God-fearing in human nature.

J. A. SYMONDS.

A Ride to Khiva; Travels and Adventures in Central Asia. By Fred Burnaby, Captain, Royal Horse Guards. With Maps and an Appendix, &c. Second Edition. (London: Cassell, Petter & Galpin, 1876.)

THE appearance of a second edition of this book almost before the first was in general circulation shows, at all events, the interest felt in any work which can throw light on the policy of Russia in the East; and there is besides in this case an interest of a more personal nature. A guardsman who spends his leave alternately in Central Africa and in Central Asia; who speaks Russian and Arabic; who possesses in an exceptional degree the personal qualities necessary to a delicate and dangerous enterprise; and who can besides write a natural, vigorous, and amusing account of his adventures, will have no lack of readers. A winter journey across the steppes to the north of Lake Aral, and over the more recently annexed deserts which lie between the great rivers Syr Daria and Amu, is looked on as a serious undertaking even by the Russians themselves; and besides the Arctic severity of the climate, and the risks from Turkoman and other marauders, our author had to encounter a system of official jealousy and exclusiveness, commonly, but somewhat unfairly, stigmatised as "Chinese." Even at the Russian Embassy in London he could obtain no information, but only polite letters of introduction for St. Petersburg. Here, again, the authorities were equally vague as to the prospects of his journey, but allowed him to proceed, only saying that they could not guarantee his safety beyond the Russian frontier. Further on he meets with General Kryzhanofsky, the governor of Orenburg, who tells him that he is on no account to go to India or Persia, and that he must retrace his steps to European Russia by the same route by which he travelled. On his arrival at Kazala, on the river Syr, the commandant of the place allowed him to proceed, as it was supposed he was going direct to the fort of Petro-Alexandrofsk, in the territory lately taken from Khiva, where his further progress would have been stopped. He, however, cleverly avoided the fort, and, crossing the River Amu into Khivan territory, made his way to the capital. But he had hardly arrived there, and paid his respects to the Khan, when he received a summons from the Commandant of Petro-Alexandrofsk to recross the river

and repair to the fort, where a telegram was awaiting him. As the Khan of Khiva—an independent sovereign, by the way—had at the same time received orders to arrest him if he tried to leave the country, there was no alternative but to obey. The telegram proved to be from H.R.H. the Duke of Cambridge, ordering Captain Burnaby to return at once to England; and we may assume that it was procured by the Russian authorities as a veil, however flimsy, to cover this arbitrary and illiberal treatment of the traveller.

From St. Petersburg to Sizeran on the Volga the journey of more than sixty hours is comfortably performed by railway, but from thence to the banks of the Syr travellers proceed by sledge, and the dangers from snow-drifts, and from the extreme cold, are considerable. Against the latter, even a panoply consisting of three pairs of the thickest stockings, a pair of fur-lined shoes, galoshes, and enormous boots over all, besides extra-thick drawers and trousers, waistcoats, coats, and furs à discrétion, was not proof. The great plain extending from the Syr Daria to the Amu is for the most part a sandy desert, interspersed, however, with low hills, and with reaches of a clayey steppe, bearing a vegetation of a peculiar type. The heat and drought of summer in these regions is as terrible as the cold of winter, and the only roads are indicated by the few and scanty wells. In winter, however, the traveller is less restricted as to his route, for he can provide himself with bags of snow, which, with a supply of fuel, and of frozen soup and meat, comprised the provision for the journey as far as the frontier of Khiva.

Captain Burnaby had procured a lean, sorry-looking little Tartar horse which, when the rider mounted, seemed so unequal to the work that his guide and servant were seen gloating in anticipation over the feast it would provide them, the prospect being only somewhat damped by the evident toughness of the fare. The various incidents of the journey are well described; the desolate aspect of the country; the difficulties with his men; the scenes by the camp fire, and the chance companions of the road, his conversations with whom are often highly amusing. At Orenburg he is greatly befriended by a Tartar professor of languages, who undertook to find him an honest Tartar servant; the article proved to be scarce, but the worthy professor at last succeeded, after some signal failures, in saving the honour of his race by discovering one, "little Nazar," who, as Tartars—and servants—go, was not a bad bargain. East and West are sometimes seen at Orenburg in curious juxtaposition, and Captain Burnaby here met with Khudayar Khan, the dethroned ruler of Khokand, who has accepted the situation with much equanimity. He mixes freely in Russian society, where he has excited much interest, especially among the unmarried ladies, and has even gone so far as to give a ball, which was pronounced a great success.

Apart from matters contained in the appendix, which we shall notice later, Captain Burnaby tells us expressly that his book is "merely a narrative of a ride to Khiva." Few such rides have been more ably and gallantly performed, or more pleasantly

described; from the nature of the case, however, it was performed in haste, and during his return journey from Khiva to European Russia he was practically a prisoner; if, therefore, his views on Russian character and conduct seem at times sweeping and one-sided, we must remember that they had often to be formed hastily and on very imperfect premisses. A favourite theme of conversation in Russia, he says, is the friendly *rapprochement* of the Russian and Indian frontiers in the interests of "Christianity" and "civilisation." Much, of course, depends on the meaning attached to these terms; Captain Burnaby, who has the habit—we are far from imputing it as a fault—of calling a spade a spade, considered it "a waste of breath to argue the question," the "Christianity" of Russia as compared with our own being, he says, "pure Paganism," and devotion and dirt, if not interchangeable terms, being found always in close mutual relation. We fear he has not gone into the merits of the "Filioque" clause, and he has but small patience for the cleanly and well-educated Anglican who, beguiled by his ecclesiastical sympathies, pines for "union" with such a Church. And their "civilisation," at all events in Central Asia, is developed, to say the least, on very different lines from our own. Socially, there is much freedom of intercourse there between the ruling and the subject race, and this has even been held up to us as a model worthy of our imitation in India;* but, besides that this free social intercourse implies a comparatively slight difference in the degree of civilisation possessed by the two peoples (and can only flourish where such is the case), its reputed results on the morals of the Russians in Turkestan are far from encouraging. As regards the political corruption and the oppression exercised there by the Russian Government, his assertions are, it must be admitted, borne out by the more judicial pages of Mr. Schuyler, while the general want of truthfulness which he describes, and the religious intolerance, the habits, in the army, of excessive drinking, and—in Turkestan at least—of gross immorality, complete a very unattractive picture, and go far to justify those who doubt the capacity of Russia to undertake the regeneration of European Turkey. But, however true these accusations, it would obviously be unfair to accept them as a portrait of the national character, ignoring the many fine qualities of the race; and fairness on this subject is doubly incumbent on English writers at the present moment. Drunkenness and religious intolerance are faults which may disappear with a few strides in a nation's progress, and even the widely prevalent corruption is in some respects a less discouraging feature in her political system than in that of her great republican sympathiser.

Captain Burnaby's hospitable and friendly reception by the Khan and people of Khiva, coupled with his summary expulsion thence by the Russians, may not unnaturally have coloured his views on the questions at issue between them. It is probable that the

* See *The Shores of Lake Aral*, by Major Herbert Wood, R.E.

Russians, as Captain Burnaby says, did persistently and unfairly blacken the character of the Khivans (just as they have latterly attempted to palliate their treatment of the Turkomans), with the view of alienating from them the sympathies of England; but the parallel with the wolf and the lamb of the fable is hardly so close as his account implies. Captain Burnaby reports that the officers of the army in Turkestan, while individually friendly to England, consider our interests so antagonistic to theirs that a war in Asia must be only a question of time. He believes that most of the recent wars and subsequent annexations are due, not to any deliberate policy of aggression, but to the ambition of the local military authorities; and that they are viewed with disfavour by an influential party at home. But, even accepting this view, the practical result, as far as we are concerned, is the same, for we have equally to reckon with this aggressive spirit, from what quarter soever it may proceed, and with the skilful and not too scrupulous diplomacy by which it is supported. It is a sound instinct which leads the cooler heads on both sides to desire a broad "neutral zone." The increased armaments which would be needed in England if the sea-barrier which separates her from the great military Powers of Europe were to disappear, give perhaps an inadequate idea of the additional force which would be required on our Indian frontier if it became conterminous with that of Russia.

Captain Burnaby has desired to give a more permanent value to his book by the addition of two useful and well-drawn maps. One of these contains the provinces on either side of the border line between Russia and China throughout its entire length, and of the borders of Kashgar and China. This will be studied with interest by those who are watching the advance of the Chinese force which has been sent to reconquer its former territory of Kashgar, and which is said to be now at Urumsai. It is believed that the astute ruler of Kashgar would accept a nominal vassalage under China, if he could thereby escape extinction by Russia, and the establishment, by this means, of a permanent and friendly barrier in that quarter between India and Russia is an object worthy the attention of English diplomacy. A number of routes across these regions are given. They are not free from mistakes: e.g., two large cities, Bai and Sayram, are entered as "mountains." The other map comprises the three Khanates of Central Asia, with the Pamir regions and the entire course of the Oxus. Here, the latest and best authorities have not always been followed. The course of the Upper Oxus is given correctly from the last edition of Colonel Walker's Map of Turkestan, but the identity of its great Pamir tributary the Murghabi or Bartang with the Aksu is not shown, and the position of another great confluent, the Surkh-ab or Waksh, also a point of considerable interest to geographers, is incorrectly laid down. Too great an extension seems also to have been given to the Kizil Kum sands along the left bank of the Syr Daria; but it is easier to criticise a map than to draw one. We should add that some of the routes published are too vague

to be of much use, while others, such as those in "Bokhara and Afghanistan" from Captain Kostenko, and in "Kashmir and Afghanistan" from M. Bektchourin, have been superseded by the labours of the Indian Trigonometrical Survey. The spelling of Eastern names, too, is inaccurate and unsystematic. Still, much of the information given has not been published in England before, and the appendix contains various other documents of interest bearing on the Central Asian question. COURTS TROTTER.

The Acre-ocracy of England. A List of all Owners of 3,000 Acres and upwards, culled from the Modern Domesday Book. By John Bateman. (London: B. M. Pickering, 1876.)

THOUGH Mr. Bateman doubtless gauges aright the Englishman's curiosity as to his neighbour's acreage and rent-roll, he has scarcely succeeded in throwing more light upon the subject of the possessions and incomes of even the "Upper Ten" than the so-called "Modern Domesday" threw upon the whole list of the landed classes in England from the highest to the lowest. And that was certainly not much—in fact, disappointingly little. Owing to the mode of collecting information, by rate- and tax-collectors with no literary idea, aim, or object, it was confused in many instances by an owner's name with only the initial of his Christian name appearing in one place, and the same with the Christian name *in extenso* in another, the result being that the acreage was divided, whereas it should have been appended to the name of one individual. Those who carried out the enquiry have, in other ways, split up into two or three properties an acreage hereditarily and necessarily belonging to a single individual: and, as might be expected of the class, collectors have often returned the names of defunct persons as still in possession. We can conceive that Mr. Bateman believed that his own idea of culling from the whole work in two large volumes a pocket volume, so to speak, enshrining the golden few who can tell up three thousand acres and over, was novel and brilliant; and yet, when it comes to be examined, it is surprising how little there is in it; how nearly *in statu quo ante* we are left, as to our great neighbours' real incomes or possessions; how many by-ways there are by which, not perhaps unreasonably, they can prevent their poverty from being averaged or interviewed, and can hold in check an obtrusive curiosity. As one instance of the liability to misrepresentation, it may be pointed out that the assessment committee's valuation of land in hand may in all probability have been taken, in which case the actual value, the rent which could be got for it, is pretty surely set too high. On Mr. Bateman's own admission, the traps in his way have been many and perplexing, and his Preface is not of a nature to encourage the hope of much accuracy—to say nothing of his error in judgment in drawing a strict line at 3,000 acres, and excluding those who fall a quarter of an acre short of it, while within eyeshot almost of squires thus excluded might be found half-a-score of proprietors above the line, half-a-score of whose

barren acres would not fetch more than the rent of that identical quarter-acre which precludes their friend over the border from their (save the mark!) acre-ocratic company! To come to particulars, Mr. Bateman's book aims at furnishing the name of every proprietor of 3,000 acres and over, with his area of acreage, according to the counties in which it is situate, and gross estimated value, with his college, his club, and a special letter S in case he is head of, or head of a junior branch of, a family noticed in Shirley's *Noble and Gentle Men of England*. This is surely not much in the way of information, especially as, when the pencil has calculated what he receives per acre, there is no clue to a man's property in other than land, and no knowing whether that land is unencumbered or not. Add to which, the omission of the rentals of London estates in the instance of some of our dukes gives them a much lower income from land than they actually enjoy, and reduces their total below other certainly less wealthy noblemen.

Judging from the statistics of this book, a fair average of land in England is 1*l.* an acre. Welsh landowners would be lucky if they could say the same. An owner in Merionethshire (p. 5) gets little more than 5*s.* an acre for his 4,365 acres. A Brecknockshire squire (p. 8) derives 295*l.* per annum from 2,076 acres in that county. Sir David Dundas possesses 3,646 acres in Radnorshire, valued at the annual value of 711*l.*, whereas his two acres in Surrey are set down at 300*l.* As he has no other property in land it is obvious that his acreage is strangely disproportionate to his rent-roll; but even his case is not so noteworthy as that of Richard Parry, of Bedgellert, whose 3,971 acres bring him in no more than 359*l.* per annum; while we suspect that many others do not realise more than 6*s.* 8*d.* an acre, which is the value in one instance of six acres in Herefordshire. Sir Watkin Wynne's vast acreage in Wales, Derbyshire, and the border counties, does not average above 1*l.* or so the acre; while, on the other hand, Lord Bradford's acreage in Radnorshire is valued in this volume at no less than 4*l.* an acre. Unless it is in some very exceptional part of the county, the figures must be wrong. And that in some cases they are wrong is made patent by one or two palpable blunders. The case of John Ellis Mace, of Tenterden, credited with 3,653 acres in Kent at the very disproportionate rental of 478*l.*, was hesitatingly admitted by Mr. Bateman himself, though he left it to his critics to investigate the blunder. It is even harder to understand how he can have passed without rectification such a strange and patent mistake as giving the identically same acreage, 5,066 acres, and not only so, but the same rental (7,595*l.*), to two baronets living near each other on opposite sides of the Wye, Sir George Cornwall, of Moccas, and Sir Henry Cotterell, of Garnons. The sole distinction he knows between them is that the former is of Trinity, Cambridge, the latter of Christ Church, Oxford. It is not, of course, to be expected that the compiler should be *au courant* with recent changes, but on page 203 occurs an instance where a sale of property in one of four counties has taken 3,923

acres from the owner's total within the last four years; and on page 91 a proprietor is named as having what would be the second largest acreage in his county, in whose case the total requires to have deducted from it all the leasehold property, when that has been settled by a commission still sitting. On the whole, it is difficult to see what good purpose this book can subserve: though, if it is worth producing, it is worth while endeavouring to make it accurate. It would have found more favour with a better-coinced "title;" and as to the four ambiguous figures on the frontispiece, we can only surmise that of those in the lower compartments that to the left represents the "imprisoned nobleman," that to the right the "infant in possession." JAMES DAVIES.

The Jesuits; their Constitution and Teaching. An Historical Sketch. By W. C. Cartwright, M.P. (London: John Murray, 1876.)

MR. CARTWRIGHT has for several years manifested a special interest in Catholic ecclesiastical questions, and his excellent work on *Papal Conclaves*, as well as some papers commonly attributed to him in the *Edinburgh Review*, displays a capacity, rare if not unique among Protestant writers, for handling them with knowledge and impartiality. It is notorious that from the first there has been a division of opinion about the Jesuit order within the Catholic body, and among its highest dignitaries. If by one party they have been regarded as the Praetorian Guard of the Papacy and foremost champions of the faith, to another, which demanded or applauded their suppression under Clement XIV., they appear as a parasitic growth detrimental to the best interests of the Church. Mr. Cartwright's sympathies are with the latter party; he seems from his concluding paragraph, which is too long to quote here, to doubt whether the Jesuits do or do not represent the genuine spirit of Catholicism, but he has no doubt at all that it is so much the worse for Catholicism if they do. And to prove this by reference to their practice and teaching is the leading object of his book. The statement of facts appears throughout to be scrupulously fair, and some serious mistakes contained in the original draft of the essay, as published in the *Quarterly Review*, have been corrected; the author even goes out of his way to expose two very inexcusable errors into which Prof. Huber has allowed himself to be betrayed in his generally accurate work on the Jesuits. But still, it must be remembered that the statement, however impartial, is almost confessedly one-sided. The proverb has often been applied to the Jesuits, *ubi bene, nemo melius; ubi male, nemo pejus*. Mr. Cartwright has set himself here to exhibit the darker side of the picture, and it is therefore important for his readers to bear in mind that there is a brighter side also, which it did not fall within the scope of the present treatise to dwell upon. To supply adequate data for a complete judgment it should be supplemented by a second treatise devoted to bringing out the real services conferred by the Society on the cause of Christianity and human culture. But so long as

it is studied for what it claims to be—a fairly and carefully drawn indictment against their teaching and practical system, in many grave particulars—it may be read with interest and profit.

The work is divided into two parts, which deal respectively with the practical system and working, and the moral teaching of the Jesuits. The first part is the most complete and conclusive; in the delicate subject of moral theology the author is less at home, and the soundness of his criticisms, therefore, cannot always be relied upon. He insists that the leading characteristic of the Jesuit system, which is exemplified alike in its organisation and history, and distinguishes it from all other Orders in the Church, is the paramount aim to secure and extend its own corporate power and influence in the world. Hence the avowed preference of Ignatius Loyola for "firmness of character and ability for business," as more essential than "purely natural goodness" in candidates for admission; hence the extraordinarily long and careful probation to which neophytes are subjected, and the deliberate rejection or discouragement of independence and originality of mind; hence the rigidly military and despotic organisation of the Society and its peculiar spirit, the comparative fewness of those members who attain by the fourth vow to a place in the "Old Guard of the Order," the exemption from ritual or ascetic obligations common in other religious Orders, and the vast dispensing power lodged in the hands of the General. So far this would not necessarily be any ground of complaint, though a community organised on so aggressive a principle would be likely to become an object of suspicion. But Mr. Cartwright traces to the same motive the general laxity of moral teaching on which he dwells (to which we shall return presently), such practices as secret affiliation—which is not, however, very clearly made out—and various more than questionable episodes in the history of the Order, such as its complicity with the Inquisition—which is quite clearly established—and the better known and very scandalous affairs of the Chinese Rites and of Bishop Palafox, for a full account of which the reader must be referred to the volume itself. It must suffice here to observe that both cases exhibit the same deliberate resistance to the authority of the Holy See—on the part of an Order specially pledged to unqualified obedience—when its own interests were threatened; the same unscrupulous employment of all means of duplicity or violence against those empowered to restrain its delinquencies, including the intercepting of letters and appeals to the secular against the spiritual power, and resulting in China in the death of Cardinal Tournon, the Papal legate; and the same persistent subordination of moral and religious considerations to the credit and influence of the Society. These strictures on Jesuit policy, it will be observed, are quite independent of the intrinsic merits of the question at issue in either case, which the author purposely refrains from discussing. But there can be as little doubt that the original position assumed by the Jesuit missionaries in China and Mexico—including, in the former case,

habitual toleration of Pagan practices among their converts—was wholly untenable, as of its emphatic condemnation by Rome, to which they were ultimately compelled to defer. And of a piece with this was their systematic evasion of the Papal decrees of suppression, in reliance on the support of schismatic and Protestant Governments. The affair of Bishop Palafox was indirectly connected with the suppression of the Order; for their subsequent opposition to his canonisation led Charles III. of Spain, who had taken it up as a personal matter, to throw the whole weight of his influence into the adverse scale by promoting the election of Clement XIV. and the friendly pressure put upon him by the Catholic Sovereigns, which led to the issue of his famous bull *Dominus et Redemptor*.

Mr. Cartwright's strictures on Jesuit moral teaching are summed up under the three heads of Probabilism, Mental Reservation, and Justification of Means by the End; and he is careful to show that by the constitution of the Order "no differences of opinion are admissible," as no work can be published which has not first received the direct *imprimatur* of the General. It is, of course, quite impossible within our present limits to reopen the great controversy first stirred by Pascal. That Mr. Cartwright has made out a very strong case will hardly be denied, but the force of his argument is somewhat impaired by his not seeming to be fully alive to the real difficulties of the question—as, e.g., in defining the precise nature and extent of the obligation of speaking the truth under those exceptional circumstances with which casuistry is concerned. That such difficulties must and do arise, whether they are dealt with scientifically or by rule of thumb, lies in the nature of things, and has been acknowledged—as Dr. Newman points out in the *Apologia*—by all writers, Catholic or Protestant, who are conversant with the subject. Nor does our author always keep clear of mistakes on points of detail, owing in some instances to his inacquaintance with the exact force of theological terms. Thus, e.g., Gury does not hold that "*explicit* belief in the mysteries of the Holy Trinity and the Incarnation is indispensable in a Christian," whence his critic, with the affair of the Chinese Rites in his mind, infers that Christians may legitimately omit to acquire, and—which is the great point—that Christian missionaries may, for interested purposes of their own, omit to communicate, a knowledge of those fundamental verities to their converts. But Gury, whose words are quite accurately quoted in a footnote, says that this explicit faith is not necessary to salvation "*de necessitate medii*." That it is essential "*de necessitate praecepti*," and therefore binding on the conscience of every Christian preacher or believer, neither Gury nor any other Catholic theologian would dream of questioning; what is meant by denying that it is "*de necessitate medii*" is simply that the involuntary, and therefore inculpable, ignorance of those who lack the opportunity of apprehending these mysteries need not be a bar to their salvation; and here the great majority of Christians, Catholic or Protestant, will probably agree with Gury. Were it otherwise, no heathen,

or Unitarian, or member of various other heterodox sects, could possibly be saved. To take another example, it was surely a mistake to make their inculcation of a belief in witchcraft a charge against Jesuit divines, as such. The reality of witchcraft was all but universally admitted, as matter of course, by Catholics and Protestants alike, till about a century ago, and is implied, to say the least, as Sir Matthew Hale declared from the Bench, in the only natural and obvious construction of the letter of the Old Testament. This is not the place to discuss the matter, but we are bound to remember that such a belief cannot, with any shadow of reason, be treated as a speciality of Jesuit teaching. It is still more unreasonable to denounce Jesuit theologians for maintaining that "by the advent of Christianity State authority has been confined within narrower limits." Their detailed applications of the principle may be open to much exception, but the principle itself is certainly as old as Christianity, and is implied in the Apostolic statement that we must obey God rather than man. In the Pagan ideal the State was everything, and a good citizen was identical with a good man. By consecrating the idea of personality and the rights of the individual conscience, Christianity "at once widened and narrowed the range of political obedience," to cite an authority so little in harmony with any peculiarities of Jesuit or Ultramontane teaching as Dr. Döllinger, in his *First Age of the Church*. It seemed right to point out that Mr. Cartwright's sketch, in its revised form, is still open to criticism in some matters of detail; but want of space alone prevents us from dwelling at greater length on its general excellences and the large amount of valuable and trustworthy information it contains.

H. N. OXENHAM.

The History of New Sweden. By Israel Acrelius. Translated from the Swedish by W. M. Reynolds, D.D., Mem. Penn. Hist. Soc. (Philadelphia, 1874.)

THERE is scarcely a State in the American Union without its Historical Society. In every one of the thirteen States which originally composed the Republic an Historical Society has been flourishing for many years, and all these societies publish periodical accounts of their proceedings. In Maine, in Maryland, and in Massachusetts Historical Societies have been in existence for very many years. The Massachusetts Historical Society has flourished for upwards of eighty-five years, and the works issued under the editorship of its officers and fellows are among the most valuable contributions to the History of America. The collections of the Maine Society are also of great value to the historical student, among which we may note the first volume of the second series on the "Discovery of the East Coast of North America," which is illustrated with facsimiles of more than twenty of the oldest known maps of that coast. Then, again, how much has been done by the State of New York. The eleven quarto volumes of New York "Documents" illustrate in the completest possible manner her colonial history from the earliest times. Turn south-

ward and we find the same eagerness in the pursuit of historical truth. In both the Carolinas Historical Societies have long been established, and in the grand old State of Virginia, the mother of the American Union, some of the citizens met on December 29, 1831, and formed themselves into a Historical Society, which has also published many works of considerable interest. Again, the Historical Society of Georgia, though of comparatively recent date, has printed many documents relative to her history, and has made very complete collections of the correspondence of her first Governor General Oglethorpe, and of Governor Wright, collections which materially help to build up the history of this the youngest of the thirteen States. The publications of the Historical Societies of New Hampshire, of Connecticut, Rhode Island and New Jersey, are all works of the same character; and lastly, the old proprietary and Quaker State of Pennsylvania is by no means behind her twelve sisters in the value of the publications of her Society. *The History of New Sweden*, by Israel Acrelius, is the eleventh volume of that Society, and fully maintains the high character of the previous volumes issued by the publishing committee. The first idea of a Swedish colony in America is due to William Usselin, a Swedish merchant, who so extolled the country about New Netherlands to Gustavus Adolphus that that king issued a proclamation on July 2, 1626, inviting his subjects of all grades to contribute to the raising a company to found a settlement in that territory. A sum of money was thus collected, and a number of Swedes landed at Cape Hinlopen, with which they were so delighted that they called it Paradise Point. Smith, in his *History of New Jersey*, says that a number of Swedes and Fins went over in the following year, 1627, but according to Chalmers there were no settlements in Delaware Bay in 1629 either by the Dutch or Swedes, although different nations traded with the Indians there. Acrelius describes the first settlement of the Swedes as taking place in 1638, and so does Bancroft, but Holm (*Provincien Nya Sverige, uti America*, 1702) says that some Swedes built a fort on the west of Delaware in 1631, and called it Christiana, one Peter Lindstrom, their engineer, having at this place laid out a small town, where they made their first settlement. It is certain, however, that a Swedish colony settled on the west coast of Delaware, near Wilmington, in April, 1638. A letter dated May 8, 1638, from Jerome Hawley, the treasurer, and a councillor of Virginia, to Secretary Windebank proves this, if other evidence were wanting. In it Hawley says that a Dutch ship had arrived with a commission from the young Queen of Sweden, and signed by eight of the chief lords of Sweden, and that the captain told Hawley that himself and another ship of his company were bound for Delaware Bay, "and there they pretend to make a plantation." And thus says Bancroft:—

"Pennsylvania was at last occupied by Europeans. That commonwealth, like Delaware, traces its lineage to the Swedes, who had planted a suburb of Philadelphia before William Penn became its proprietary. The banks of the Dela-

ware from the ocean to the Falls were known as New Sweden."

Penn himself afterwards gave the most favourable account of the Swedes. The Swedish colony was planned by Gustavus Adolphus himself, though his death (in 1632) prevented the execution of the project till the reign of his daughter, Christina. But the colony experienced many vicissitudes. The people of New Netherland, in a remonstrance to the States General, accused Minuit, or Minnewits, as they called the first Governor of the new Colony, of trickery. They said he had been Director at the Isle of Manhattan for their West India Company, and that when he arrived at Delaware he represented that, being on a voyage to the West Indies, he wished to transact some business with them, to take in wood and water, and that he would then depart. So far, however, from doing this, the Swedes made plantations, built a fort, and threw down the arms of the States which had been erected at Trenton Falls. Some six years after the date of this remonstrance, in 1655, the Dutch drove the Swedes out of their settlements, but "the handful of Swedes" whom their Governor had then left behind him had increased in 1696 to about 1,000, and Charles XI. sent them ministers and books in reply to their address. Acrelius gives a list of nearly 200 families, embracing over 900 people, as then inhabiting New Sweden. They were never neglected, and in 1712 we find the English Society for the Propagation of the Gospel thanking the king of Sweden for his care of his subjects in America. The Rev. William Smith, in a letter to Dr. Secker, dated from Philadelphia, November 1, 1756, speaks in high praise of Acrelius, who had then been several years Commissary to the Swedish congregation on the Delaware, but was returning to considerable preferment in his own country "as a reward of his faithful labours." The Rev. Nicholas Collin, D.D., was the last Swedish rector of the churches on the Delaware, and translated a considerable portion of this work, which has been published by the New York Historical Society. Dr. Collin wrote in 1823 that the Swedish descendants have totally lost their mother-tongue, and have also been mixed with several nations and religious professions, but Dr. Reynolds says in his Introduction that the descendants of the original Swedish colonists continue to cultivate the lands of which their ancestors took possession more than two centuries since; that new colonists, in still increasing numbers, yearly wend their way from every part of Sweden; and that while he writes (in 1873) a new Swedish colony is projected in Delaware, near the original starting-point of New Sweden. Acrelius' labours as a historian have been but little recognised. His controversies on the doctrinal relations of the Churches of England and Sweden to each other are noticed in Skarstedt's *Manual of Swedish Church History*, but there is no reference to this work on New Sweden. Israel Acrelius died in his native land in 1800, at the patriarchal age of eighty-six.

W. NOEL SAINSBURY.

NEW NOVELS.

Maud Blount, Medium. (London: Tinsley Brothers, 1876.)

Anne Warwick. By Georgiana M. Craik. (London: Hurst & Blackett, 1877.)

The Parvenu Family; or, Phoebe, Girl and Wife. By Percy Fitzgerald. (London: R. Bentley & Son, 1876.)

Manslaughter. By Augustus Stawel. (London: Sampson Low & Co., 1876.)

Sir Guy's Ward. By Gerald Glyn. (London: Tinsley Brothers, 1876.)

SOME ardent spiritualists, we are told, are of opinion that their opinions are being subjected to persecution. Whether this is the case we know not, but one thing we do know, that if spiritualistic novels become common the persecution is likely to be aided by a "chorus of indolent reviewers," who will have to abandon their indolence for the occasion. Spiritualism may be a likely subject for a novel in one sense, but it is certainly not so in another. If the subject is handled from the believer's point of view the result must be a novel of mystery, and it takes a very great genius indeed to make a novel of mystery anything but an insufferable bore. On the other hand, even the very greatest genius can hardly give any interest to the revelation and repetition *ad infinitum* of the same vulgar imposture and the same silly credulity. *Maud Blount, Medium*, is a well-intentioned book enough, written by some one who seems to have full information and fair intelligence; but it has all the defects of its subject, as well as a certain want of refinement which is not pleasant. *Maud* is a pretty girl, of supposed "mediumistic" powers in which she half disbelieves, and half (under the influence of a very silly mother, who makes her house a rendezvous for all the charlatans of London) believes. She at last abandons spiritualism at the instance of her husband (a Broad Church curate, whose acres and shoulders are of equal latitude with his creed), but not till she has nearly killed herself and quite killed her baby by unseasonable indulgence in "trances," "crystal-seeing," "automatic writing," and the like. It is a good-tempered book, which is something.

Anne Warwick is a new attempt in the same style which Miss Craik has often tried before, but never, we think, so successfully. It is a study of a single situation, a little prolonged and monotonous perhaps, but showing singular grasp of character and good skill in drawing. The heroine is the daughter of a country clergyman, self-willed and somewhat flighty, but affectionate rather than passionate. Her father dies after a very short illness, leaving her almost wholly unprovided for, save that she has a rich and ungracious uncle. Before Mr. Warwick's death, however, a neighbouring squire, Mr. Faulkner, informs the father of his love for Anne, a love which she does not suspect, having been accustomed to regard him (though he is really quite a young man) merely as her father's friend and, in a way, her own. When she becomes an orphan, Faulkner proposes rather prematurely, and being rejected, is soon afterwards badly smashed in a railway accident. It is thought that he

cannot recover, and, as his property is entirely entailed, he is at his wits' end how to provide for Anne. This he can only do by marrying her, when she would become entitled to jointure; and he sends an ambassador to make the proposal, of course concealing his real motive, and putting it as a dying man's fancy. In a terrible conflict of feeling she consents: they are married as soon as he is actually "given over," and then of course to everybody's consternation he recovers. Then comes the "situation." Anne does not flinch from her duty as nurse, but she is horror-struck at being tied to a man she does not love, at times furiously indignant with her husband for having as she thinks indulged a mere selfish whim at her expense, and tortured by the feeling that he loves her and she cannot return it. We shall not pursue the story to its termination, because it deserves to be read at leisure. The truth and delicacy of the character-drawing are most remarkable, and we cannot help noticing and commending a quality which is every day becoming rarer and rarer in novels, the thoroughly ladylike tone of the book. There is, perhaps, only one weak point in it. According to Anne's system of morality she should not have consented to the marriage at all. How far the confusion and agitation of her spirits at the time may be pleaded, and whether Miss Craik means to hint that after all she did love the man without knowing it, are points which may be left to the consideration of the reader. The book is in our judgment most unusually good.

We cannot congratulate Mr. Percy Fitzgerald on his last performance. His novels have never been written in a style which we greatly admire; but there have usually appeared in them some (in the case of *Never Forgotten*, very considerable) dramatic power and a certain grasp of not very elevated or refined character. In *The Parvenu Family* we are unable to find any trace of either of these good gifts. That the family themselves are odious is not of course a valid objection, because they are not intended to be anything else. It is quite possible, as *The Fatal Boots* shows, to make an effective study of the most despicable and detestable varieties of human character. Unfortunately, Mr. Fitzgerald's Pringle family are not merely odiously vulgar, but wofully unlikable and dull. The author has resorted to the luckless expedient which spoilt *Little Dorrit* and its likes. For some reason which is not clear he compares two girls to two ponies and thenceforward they are always "the ponies," "the eldest pony," "the younger pony," and so on, till the joke, if joke it is, becomes unbearable. In the same spirit a lord's humble henchmen perpetually "spur" or "gallop" across rooms to do his bidding. If anyone wishes to see the style of the book he has only to read the history of the party in Lord Garterly's house. Not merely the language and proceedings, but the whole composition and design are utterly impossible and ludicrous. The heroine, Phoebe—"our Phoebe," as Mr. Fitzgerald, in another irritating mannerism, calls her—is intended to be very charming. Her charms appear to consist in falling in love with every good-looking male being

whom she meets, in nagging continually at her husband, in demanding a Victoria and a man-servant when she knows that her husband has not a farthing in the world, and in spending fifty pounds on a ball-dress when he is driven nearly mad by duns. Another heroine, Adelaide Cross, is intended to be a mystery, and this she certainly is, but the mystery is by no means amusing. It seems strange that Mr. Fitzgerald should enter into such direct competition with *Vanity Fair*, *The Kickleburs* on the Rhine and *Cox's Diary*, but in a quotation which he himself is fond of, *il l'a voulu*.

Manslaughter is emphatically a laborious book, and with laborious books we are always loath to quarrel. There are details in it of elaborate Stock Exchange operations, which make one's head ache in the vain attempt to follow them. There are characters by dozens and scores who are all attended to and kept going in a manner. And there is a central figure, who is evidently a very painstaking attempt at a portrait of the good man in adversity, but who unluckily bears much resemblance to that more familiar figure, a fool suffering from his folly. Being a banker's clerk with three hundred a year, he not only expends "his savings," and a lump sum of 3,000*l.*, but gets into debt to the tune of another 3,000*l.* that he may build him a house. At twenty-two he marries a widow ten years his senior, because she says she thinks it would be very nice. He devotes himself in an insane manner to his step-daughter, and allows her to break his heart (whence the title) by a course of conduct which would certainly be objectionable if it were only probable. Lastly, when he is writing an account of his adventures in Queensland he gets up in the night to note down ideas that occur to him, and then "works them out till the morning rays shoot into his chamber." There are many other funny people in the book, who do many other funny things.

In *Sir Guy's Ward* we come back to human beings who act in a conceivable manner. The book is, in the scornful words of the Princess, "a mere love" tale, and Mr. Glyn has spun it out somewhat unduly. There are not wanting certain symptoms of Minerva Press sentiment and upholstery; nor can we approve the practice of calling a clock a pendule, or speaking of *première jeunesse* when "first youth" would fully meet the requirements of the occasion. But these are mere surface symptoms, of which Mr. Glyn with a little time and care may easily get the better; while his knack of telling his story in an interesting manner, and of making his characters live after a fashion, is a feature of very different importance. The main points of the plot are not very novel: an orphan girl is left to the charge of a half-young, half-elderly friend of her father's, and the guardian falls frantically in love with his ward, who does not fail to return the compliment. Unluckily, he is already married, though separated from his wife through no fault of his. It may be noticed that Mr. Glyn shows skill in the way in which he prevents the ward, without any improbability, from coming to the knowledge of this fact which everybody else knows. She only learns it from the news-

papers' announcement of the wife's death, and in a sudden revulsion of feeling accepts an unfortunate suitor whom she does not in the least love, and who is her guardian's special aversion. Of course she does not marry him, and matters finally square themselves, but Mr. Glyn has treated the unhappy suitor rather cavalierly. It is true that he makes him out a person of doubtful character. But, though it may be excellent poetical justice that A who has injured B should be injured by C, the truly moral mind refuses to approve the proceeding as a whole.

GEORGE SAINTSBURY.

CHRISTMAS BOOKS.

The Little King. By S. Blandy. (Sampson Low.) An admirable story, translated from the French, and dealing chiefly with Russian life. The Little King is a spoilt young Russian noble, who is brought to a right mind by the judicious training of a French governess, and the friendship of an intelligent Japanese boy. The illustrations are by Emile Bayard, but are not wholly worthy of the story.

Daft Davie, and other Sketches of Scottish Life and Character. By S. R. Whitehead. (Hodder and Stoughton.) These sketches have a good deal of originality about them and are pleasantly written. The first story, in which an idiot boy softens the heart of an austere father who hates him, is pathetic, and there is much quaint humour in the story of Lang Tam Tamson, who suffered so much from a scolding mother that he chose a dumb wife.

Tales and Legends of Saxony and Lusatia. By W. Westall. (Griffith and Farran.) A good set of legends. The first in the book, called "The Maiden of the Moor," is weird and well told; and so is that of "The Priest, the Fairy, and Doctor Horn." The shorter stories are rather insignificant, though they contain some curious superstitions and legendary lore.

The Ouzel Galley: Notes from an Old Sea-Log. By W. G. Kingston. (Griffith and Farran.) This is a story of ships and pirates and hair-breadth escapes, which will delight boys. We could wish that some of these healthy stories of Mr. Kingston's were brought out in yellow covers with sensational frontispieces, as that is the form of literature which seems most alluring to boy-readers, and such stories as *The Ouzel Galley* might well take the place of much of the pernicious trash with which they delight themselves. We have, by the same author, another admirable story, called *Snow Shoes and Canoes* (Sampson Low), giving an account of the early days of a fur-trader in the Hudson's Bay territory.

The Doctor's Family. From the French of J. Girardin. (G. Routledge and Sons.) A feeble story, which has either lost its point in translation, or never had any. The Doctor's sons and daughters are all very good by nature, or become so, and help him in a variety of ways when he loses his money. But the whole story is so disconnected that it is with difficulty we have gathered even this amount of plot. The French illustrations of the story are, for the most part, very uncouth.

BUT Messrs. Routledge and Sons send us, uniform with *The Doctor's Family*, two volumes by Jules Verne, *Australia and New Zealand*, being parts of "A Voyage Round the World." The first part has been already published in the *Boys' Annual* for this year, and the second part is to come out in the same magazine next year. Jules Verne's stories are always welcome.

Royal Captives. By Crona Temple. (Hatchards and Son.) This is a little book which has already reached a second edition, and so we are glad to see

that people have not been deterred by the dullness of the first story about the ancient Britons. There are stories of Caractacus, Robert of Normandy, Juana Queen of Spain, the last of the Incas, and the Lady Elizabeth. The second and fourth of the stories are best told. The subject necessitates a certain amount of dreariness, but there is much picturesque detail, and the facts are carefully worked up.

The Boy's Own Book. New Edition. (Crosby Lockwood and Co.) This has too long been a favourite to require any praise. We need only say that the more modern games, such as lawn tennis, Badminton, &c., and the last rules of cricket are added. We rather miss the riddles with which we were familiar in the first edition, and the charades for acting are very weak, and not likely to make the amusement as attractive as it might be.

A Century of Discovery. Translated from the German of Theodore Vogel. (Seeley, Jackson and Co.) A somewhat heavy book, for which both illustrations and clear type have done their best. The subject is such an interesting one that it is rather puzzling to know how the writing comes to be so heavy. It relates the voyages of the Spanish and Portuguese navigators from 1420 to 1540, and includes accounts of Prince Henry, the navigators Diego Cam, Diaz, Vasco di Gama, Almeida, Columbus, Amerigo Vespucci, Vasco Nunez de Balboa, Magalhaens, Cortes, and Pizarro. For those who want a collection of facts, *A Century of Discovery* will be valuable, but for the sake of the young readers into whose hands it is most likely to fall, we could wish that it had been written with more appreciation of the poetry of the subject.

Merry Sunbeams. (Ward, Lock and Tyler.) This is a very pretty children's annual, well printed and well illustrated. The little tunes in it are most of them old well-known airs and will make the book popular. We cannot help, however, taking exception to the very feeble charade on the word "wedlock," which we think no children would be stupid enough to act.

Sweet Little Rogues. By Elvina Corbould. (Hatchards.) This is a simply-told child's story, about a little girl living with a kind grandmother, who tells her tales of Sir Isaac Newton, Nelson, &c., and then sends her to Germany for her education. We think the descriptions of Germany and German life might have gained in force if they had been given with the same amount of graphic power which is devoted to recounting the misdemeanours of the two naughty little children, Tommy and Dora; and we are always at a loss to know who are "the sweet little rogues."

A to Z. Being Twenty-six Notes on a Soldier's Trumpet. By Surgeon-Major Scanlan. (Hatchards.) A book of comic soldiers, much resembling *Army and Navy Drolleries*, which we noticed last year. We do not think the children will care much about this alphabet, though it is brilliantly coloured. Children are growing fastidious about illustrations, and survey with grave contempt some of our attempts to be funny.

FROM the Christian Knowledge Society we have received a spirited Dutch story called *For Faith and Fatherland*, which is worth reading. The scene is laid in the stirring times of William the Silent, and the heroine is a young Spanish girl who is stolen from her Dutch relations, and gives up a chance of her own rescue to save the prince. We think William might have been a less shadowy personage, but the story is pleasantly written, and contains many pretty scenes of Dutch life. From the same Society we have had *In the North Countrie*; Three Hill-side Sketches, by Austin Clare, Author of *The Carved Cartoon*. Three pathetic little stories told in simple touching words, which might have been published in a more attractive form.

Fan; a Tale of Village Life. (S. P. C. K.) A story of a little wail, who develops noble qualities in a hard life, and overcomes evil with good. The book will be a useful present to servants and school-children.

In the Marsh. By Bessie Curteis. (S. P. C. K.) A story of fen-life which is somewhat dull, but its monotony is broken by one curious incident. A sailor son returns to his home after a prolonged absence, and finds his name inscribed upon a neat headstone. When he has made himself known to his father, the old man seems to regret the headstone, and therefore it remains, with the addition of the text, "This my son was dead and is alive again, he was lost and is found."

Bread and Honey for Young People. By Mrs. Barbara Semple Garrett. (Routledge and Sons.) We conclude that this is a reprint of a little book which has been a favourite, but it seems to us that for its size it contains a good deal of dry bread and very little honey.

From Cadet to Colonel. By Major-General Sir Thomas Seaton, K.C.B. (Routledge and Sons.) An interesting record of Indian life, which came out, we think, in Routledge's *Boys' Annual*, and was then noticed by us. The account of the Mutiny given by an officer who saw so much of it and rendered such gallant service is specially worth reading, and the naïve way in which this brave soldier describes his pleasure at being made a K.C.B. is delightful.

Household Tales and Fairy Stories. (Routledge and Sons.) An admirable collection of well-known stories and poems, well illustrated. We are specially glad to find many of Aunt Effie's Rhymes for Children in it. Every child should know "The Turtle Dove's Nest" and "The Cuckoo."

Lily's Scrap-Book and Lily's Screen, by Mrs. Sale Barker (Routledge and Sons), are two shilling books for very little children, in which many well-known pictures that have done good service before are ingeniously brought together.

Little Jack Horner's Picture-Book (Routledge and Sons) would be an exceedingly charming addition to the children's nursery shelf were it not for the vulgarity of "Gingerbread," about which we bore our testimony when it came out separately. The Nursery Rhymes, Zoological Gardens, and Robin's Christmas Song are all worth having in a bound volume.

Aladdin's Picture-Book, illustrated by Walter Crane (Routledge), contains, in addition to "Aladdin" and "The Yellow Dwarf," which we noticed last year, "Princess Belle-Etoile" and "The Hind in the Wood." The illustrations are, perhaps, a little confused, but they are decidedly graceful and clever. The *Sleeping Beauty*, a sixpenny book, also illustrated by Walter Crane, is very pretty. *King Luckieboy's Picture-Book* will also be popular, and so will *The Song of Sir-pence*, *The Three Bears*, *Chattering Jack*, and the *Marquis of Carabas' Picture-Books*, all of which contain about four favourite books, and are all beautifully illustrated by Walter Crane, who certainly does his best to improve the taste of the rising generation.

Little Maybird's and Little Blossom's Picture-Books (Routledge) may also be recommended for good uncoloured pictures and pleasant reading.

The Floral Birthday-Book (Routledge) is another of the many books for collecting the autographs of friends and acquaintances. There is something of the vegetable world appropriated to every day in the year, and very badly coloured, with quotations, for the most part inappropriate. The meanings of the flowers, &c., are curious; why, for instance, turnips should mean charity we are puzzled to know; but we have seen how much pleasure this gaudy little book gives to children, and cannot be hard on it.

MESSRS. ROUTLEDGE AND SONS have brought out nice editions of *Thiodolf, the Icelfander*, and *Minstrel Love*, by De la Motte Fouqué, which we are glad to welcome, and an excellent *Picture Primer*, with many illustrations.

We have received some specimens of a sixpenny series of Gustave Aimard's Indian works, edited by Percy St. John (George Vickers, Angel Court, Strand), *The Trappers of Arkansas*, *The White Scalper*, *The Freebooters*, and *The Border Rifles*, all of which are already popular with boys. The print of this sixpenny edition is painfully small, but young eyes will not mind that.

Rare Good Luck is scarcely the fortune of the person who, with several hours of a midnight railway journey before him, has fondly hoped to pass them amusingly with the Christmas number of the *Gentleman's Magazine*.—Seen from the *Cross of St. Pauls*, or from any other standpoint, the *St. James's* Christmas Annual would appear equally silly. The story is of the "poor but pious" type.—By our experience of the depressing effect of *Judy's Crackers and Kisses*, we are convinced of the possibility of the to us hitherto doubtful fact that Henry I., after a certain event, "never smiled again."—*Belgravia* is among the readable Christmas Annuals. Two stories, "The Confiscated Weeds," by James Payn, and "Carmagnole; or, the Wickedest Woman in France," by George Augustus Sala, are particularly good, and gain greater prominence from the general commonplaceness of the rest.—In *When the Ship comes Home* (*All the Year Round* Office), it does not clearly appear from the story which ship is meant, or what object was to be gained by its coming home at all. Apart from this, the story, the interest of which turns on proving the innocence of a convicted forger, is well-told and readable.—*Shadows on the Snow* (Tinsley) is a feeble imitation of Dickens. The number of private interviews engaged in by the host, hostess, and others, must have been very embarrassing to the guests, unless their faculties were fully occupied with the study and practice of gastronomic science. The story of "Little Liz," incidentally introduced, is "pretty and pathetic."—*Land A-head* (*Once a Week*) is the everlastingly recurring story of oppressed inhabitants of Major O'Gorman's "Tight Little Island," who better their fortunes by emigration to the Far West.

The first chapter and illustration of *The Shadow Witness*, by F. C. Burnand and Arthur A'Beckett, are devoted to the details of a ghastly murder, and the merit of the rest of the story lies in its plot.—*Punch's Pocket Book* for 1877 is full of useful and amusing information, and so, for the matter of that, but with a difference, is the *Churchman's Pocket Book*.

The Baby's Opera. A Book of Old Rhymes with New Dresses. By Walter Crane. The Music by the earliest Masters. (Routledge.) This is perhaps the very prettiest book Walter Crane has produced. The title is not altogether happy. In the old days of *Punch*, we remember, there was a real domestic opera, in which all the members and tradespeople of a middle-class family took part. The nursery-scene in that was quite a "Baby's Opera;" but this is a series of fifty-six nursery songs and rhyme-games, with illustrated borders and occasional full-page illustrations. Among so many we miss "See-saw, Marjory Daw," and "Goosey, goosey Gander," but perhaps the list does not profess to be complete. As a mere question of text, we confess that "Dr. Faustus was a good man, he whipt his scholars now and then," grates upon us. Our own childhood was taught to say "Dr. Busby;" and we fancy history in this case is with our nurse of honoured memory. Several of the illustrations are simply charming. That to "I saw three ships come sailing by" in conception, at least, is worthy of one of the great masters of the Renaissance: three large and lovely ladies bear right down upon us standing in three high-prowed

antique ships, and they give ocular proof, in the words of the rhyme, that—

"One can whistle, and one can sing,
The other play on the violin;
Such joy there is at my wedding,
On New-Year's Day in the morning."

We cordially recommend this charming book to all children, young or old.

NOTES AND NEWS.

We understand that a volume of national poetry, under the title of *Lyra Hibernica Sacra*, is in course of preparation by the Rev. Dr. W. MacIlwaine, Incumbent of St. George's, Belfast, and that already a goodly number of living authors have promised their assistance. The names of the Archbishop of Dublin, the Bishop of Derry and Mrs. Alexander, Samuel Ferguson, Q.C., and Prof. Armstrong, of Cork, are mentioned among others. The field of Irish sacred poetry has yet to be thoroughly explored, and we cannot but wish the editor all success in his undertaking. The publishers will be an Irish firm, probably Messrs. Marcus Ward and Co.

In the *Leicester Chronicle* of December 9, Mr. James Thompson offers suggestions, supported by local knowledge, in identification of the stages of Mary Stuart's journey from Burton to Fotheringhay, as given in Bourgoing's Journal. The Earl of Huntington's castle of Hastz he fixes not at Hill Hall, but at Ashby-de-la-Zouch. Following Mr. Chapman in *Notes and Queries*, he identifies Renester with Leicester, and he suggests with great probability that the "logis d'un gentil-homme nommé Mr. Roger Svith (?) au hallage de Hestymshire en Rutland" is Withcote, which was in reality the house of a Mr. Roger Smith, and which stands on the boundary between Leicestershire and Rutland. Collunwaston which follows is clearly Collyweston. Mr. Thompson concludes by saying that in showing where these places are he has given "to Dr. Bourgoing's MS. an authority it had previously not possessed."

We understand that Messrs. Macmillan and Co. have in the press, and will publish early next spring, in two crown 8vo. volumes, entitled *Commentaries on the Liberty of the Subject and the Laws of England relating to the Security of the Person*, by Mr. James Paterson, M.A., sometime Commissioner of Fisheries, and author of various legal works. In analysing the celebrated phrase "Liberty of the Subject," the author arrives at a new definition, and also at a new division of the law, and proceeding systematically he gives an exhaustive and complete exposition of the law as to the security of the person, showing how the law of England, as at present developed, protects at every point the personal freedom of man, and how far under that law the body is allowed to be punished or interfered with, whether for debt or crime or any other cause. The new arrangement, taking the "Liberty of the Subject" as the keynote, and profiting by the advance of ideas since Blackstone wrote a hundred years ago, admits of entire freshness of treatment; and while accuracy of detail is preserved for the lawyer and the student, the author seeks to make his account of the laws under which we live especially readable by all persons engaged in public affairs as well as by foreigners.

THE Rev. J. M. Capes has in preparation an *Essay on the Growth of the Musical Scale and of Modern Harmony*, in which he will show, as he believes, for the first time, "that both the one and the other are the natural development of the musical idea in the collective consciousness of musicians of successive ages, under the irresistible influence of the facts of atmospheric vibration." It is dedicated to Dr. Stainer.

In a paper on "Provincial Bibliography" read before the Manchester Library Club, Mr. W. F. A. Axon announced that at the suggestion of the

President the Council of the Club had decided to attempt the compilation of an annual bibliography which should record the titles of all books and pamphlets issued in the two counties of Lancashire and Cheshire. In this list they would endeavour to give each year references to the investigations of archaeologists and *savants* relating to this district, to the work of local societies, and to the books issued for private circulation, as well as the titles of all books and pamphlets that issue from the printing presses of the two counties.

THE widow of Dr. Gray, of the British Museum, died on the 9th instant, at the advanced age of ninety years. Mrs. Gray will be long remembered by a large circle of scientific and literary men, at home and abroad, not only as the lady who for a long series of years so cordially welcomed all who visited a hospitable house in the British Museum, but as one who, while heartily entering into her husband's pursuits, laboured independently and with great industry to advance science. She compiled a monograph on molluscous animals, which was published in five volumes, and she etched some thousands of plates with her own hand, and so rendered an inestimable service to students of conchology. Mrs. Gray was also an ardent collector of marine algae, and took pleasure in distributing collections, made and arranged by herself, with the object of encouraging a taste for this line of study. Her own set of algae, which is extensive, is presented, according to her wish, to the Museum of the University of Cambridge. The greater part of the Cuming collection of shells, preserved in the Zoological Department of the British Museum, was arranged and mounted by Mrs. Gray, as a labour of love, during her hours of leisure.

DR. GEORG BRANDES, the Danish critic, who is generally esteemed, and especially in Germany, as being one of the greatest aesthetic authorities now living, has been lecturing, with great success, before the Swedish University of Upsala. We learn, however, that a different reception has awaited him in Norway. The University of Christiania hastened to refuse the illustrious visitor a hearing in any of its lecture-rooms. This discourtesy will amuse the rest of Europe, but it must be mortifying for intelligent Norwegians.

THE second volume of *Easy Selections from Xenophon* (Clarendon Press Series), adapted for beginners, from the *Anabasis*, with Vocabulary and Notes by Messrs. J. Surtees Phillpotts and C. S. Jerram, will be published by Messrs. Macmillan and Co. early in the coming year.

ON the 5th inst., Messrs. Puttick and Simpson sold a collection of ecclesiastical and monastic histories, with several specimens of early typography, formerly in the library of Kenelm H. Digby, author of the *Broad Stone of Honour*. The prices obtained were generally low. *An Almanacke for XV Yeres, imprinted in London by me Wynkyn de Worde*, black letter, sold for 11l.; *Horne Beatae Mariae Virginis*, printed on vellum by Hardouyn of Paris, 10 gs.; *La tres elegante delieuse Hystoire du Roy Perceforest, Roy de la Grant Bretagne*, black letter, Paris, 1531-2, 22l.; Jacobus de Theramo, *Le Proces de Belial a lencontre de Jhesus*, black letter, 10 gs.; *Thoisson d'Or*, black letter, Troyes, 1530, 6l. 15s.; Goussanevart, *Martyrologie des Chevaliers de St. Jean de Hierusalem dits de Malte*, Paris, 1643, 5l. 7s. 6d.; Roderic O'Flaherty, *Ogygia, sive Rerum Hibernicarum Chronologia*, 4 gs.; T. N. Philadelpho, *De Rebus Catholicorum in Hibernia*, Cologne, 1617, 2l. 4s.; *Bibliotheca Cluniacensis*, Paris, 1614, 1l. 17s.; Raderi, *Bavaria Sancta et Bavaria Pia*, 1l. 11s.; *Sancti Victoris Opera omnia*, Rothomagi, 1648, 1l. 18s.; Gattula, *Historia Abbatie Cassinensis*, Venice, 1533, 1l. 16s.; *S. Augustini Opera*, Venice, 1729, 3l.; Catalani, *Sacrae Ceremoniae*, 1l. 10s., and *Rituale Romanum*, 1l. 11s.; Martene and Durand, *Thesaurus novus Anecdotorum*, 2 gs.; Theiner,

Codex diplomaticus domini temporalis S. Sedis, Romae, Typis Vaticanis, 1861, 2l. 3s.; Martin and Cahier, *Vitruve peint de St. Etienne de Bourges, 18l.*; Milton's *Paradise Lost*, Baskerville's edition, 6l. 17s. 6d.; Saxton's (Christopher), *Maps of England and Wales*, the first set of county maps ever engraved, coloured with portrait of Queen Elizabeth, and bound up with it; *The famous West Indian Voyage made by the English Fleet of 23 Shippes and Barkes, 1585-6, 30l.*

A NEW journal devoted to the elucidation of the customs, folklore, and mythology of France is to come out in Paris about the 20th of the present month. It is to be called *Mélusine*, the name of the serpent in the mythology of central France, and is to be directed by M. Henri Gaidoz. It will appear twice a month, and will be embellished with engravings, and occasionally with music. The publisher is M. Viaut, of Rue St. André des Arts.

M. HENRI GAIDOUZ is giving this winter a course of lectures at the Ecole des hautes Etudes on Irish Grammar and Philology.

AMONG the muniments of the Corporation of Wells is a curious series of "Convocation Books," containing the acts, &c., of the authorities of the city, under the rule of the Seneschal, by which title the head of the corporation was formerly known. The third volume of this series, referring to affairs between 1553 and 1623, is bound in three vellum leaves of a Romish Service-book, of probably the fourteenth century, containing illuminations and musical notation, elaborately executed. Among the Chamberlain's accounts entered in the volume we meet with such as this: "Item, payde for beare to make yesoldiers drynke, when they came home from musteringe at divers tymes, 12s." In July, 1575, ordinances are entered for taking measures to avoid the plague, which had then broken out in Bristol; these, however, were of little use, for the mortality in Wells was great. In 1613 Queen Anne of Denmark came to Wells from Bath, and an account is entered of the pageants displayed before her; the following is an extract:—

"The Third Companie.—The Tanners, Chaundlers, and Butchers; and they presented a carte of olde Virgines, the carte covered with hides and hornes, and the Virgines with their attires made of cow tayles, and bracelets for their necks of hornes, sawed, and hanged about their necks for rich jewells. Their chariott was drawne by men and boyes in oxe skines, and calves skines, and other skines. Saint Clement, their Saint, rode alsoe with his booke, and his frier rode alsoe, who dealt his almes out of his master's bagge, which he carried verie full of greynes verie plentifullie. Acteon with his huntsmen." The whole account of this pageant, as executed by the different trades, is of remarkable interest.

MESSRS. D. APPLETON AND Co. have nearly ready for publication the long-looked-for Autobiography of the Hon. William H. Seward, with a later memoir by his son, Frederick W. Seward, late assistant Secretary of State. The book will be sold by subscription only.

THE authorised *Life of Edwin Forrest*, by the Rev. William R. Alger, is announced as nearly ready by J. B. Lippincott and Co.

SHELDON AND Co. are about to publish a life of General Custer, by Capt. Frederick Whittikar. This book will contain a great many of the late cavalryman's letters home, and a number of fresh anecdotes illustrative of his short and brilliant career.

BRET HARTE's play, *Two Men of Sandy Bar*, has been published in Osgood's Little Classic Series.

THE story of *Helen's Babies*, written in ten days by Mr. John Habberton, to amuse an invalid wife, has already reached an edition of 40,000 copies. The story is very simple, the "babies," who are sketched from life, being its strong point.

THE library of the late Rev. W. Field, Vicar of Godmersham, was sold on Monday last. Mr. Field was well known as a collector, so that considerable interest was felt in the sale, and the prices were somewhat high. Among other books were scarce pamphlets relating to the old families of Sondes, Winchelsea, Knatchbull, and others. Of the rarer volumes were *The Kentish Songster* (1792), which sold for 35s.; *An Historical Account of Cranbrook* (the first book printed at Cranbrook), 2l. 8s.; Kilburne's *Survey of Kent* (1657), 1l. 1s.; Lambard's *Perambulation* (1576), 14s.; a large paper copy of Lewis's *Thanet*, 4l. 9s.; and Hasted's *Kent*, 12 vols., 5l. 7s. 6d. An autograph catalogue (3 vols.) of Kentish topography, &c., compiled by Mr. Field, reached the sum of 7l.; and a portfolio of maps, views, and portraits of Kentish worthies, secured a lively bidding. Altogether the books were of great interest, and showed what an amount of local and historical lore can be amassed by judicious collection; but there were still volumes wanting to complete the history of a county so rich in architectural and archaeological remains, specially of domestic mediaeval work, of which Knole, Hever, Penshurst, and Leeds, are striking examples. Several volumes were secured for the Lambeth Palace Library, and it is believed that the efforts of the librarian towards the formation of a Kentish collection there will be yet further seconded by those interested in the subject.

THE New Shakspeare Society's edition of the Parallel-Texts of the Quarto and Folio of *Henry V.*, which Dr. Brinsley Nicholson's illness obliged him to give up completing, has been most kindly taken in hand by Mr. P. A. Daniel, and is going on quickly. The book will be ready for issue early next year. Mr. Daniel has also undertaken the edition of the thirteen "Doubtful Plays" for Messrs. George Bell and Sons, which had been put into Dr. Nicholson's hands. We are glad to hear that Dr. Nicholson's health has lately improved.

THE biographical interest of Dr. Hueffer's article on Arthur Schopenhauer in the *Fortnightly Review* suffers from the appearance of Miss Zimmern's volume since the essay was written. Among other things which the writer tells is that Schopenhauer was a lover of modern Italian music, more especially Rossini's, a fact which seems to occasion a difficulty on the common supposition of there being a profound affinity between Schopenhauerism and Wagnerism. The essayist almost succeeds, perhaps, in presenting his subject in a barely novel and disagreeable light. The suggestion that Schopenhauer's animosity towards Hegel was due in part to his being too much of the nice gentleman to take kindly to the characteristic boorish manners of the German professorate is at least ingenious. Also the writer shows a certain originality in censuring the pessimist's mother for not "discerning the signs of maturing genius in the morbid symptoms of his boyish arrogance or despondency." Dr. Hueffer confidently speaks of Schopenhauer as "the greatest thinker of the present century;" yet at the close of his article one feels that one must still take this assertion entirely on trust.

MESSRS. HACHETTE are preparing a series of great dictionaries of Modern Geography and of Ancient and Mediaeval Geography, by M. Vivien de Saint-Martin; of Pedagogy, by M. Buisson; of Literature, by M. Vapereau; of Comparative Legislation, by the Society of Comparative Legislation. We may add M. Saglio's Dictionary of Antiquities, which is complete only to the end of the letter A.

FOREIGN REVIEWS OF ENGLISH BOOKS.

GARDINER, S. R. *The Puritan Revolution, &c. Sybel's Hist. Zeitschr.*, xviii., 4.
 PHILLIPS, G. *The Doctrine of Addai the Apostle. (Trübner.) Theologische Literaturzeitung*, Dec. 9. By Dr. E. Nestle.

 RUSSELL, EARL. *Recollections, &c. Sybel's Hist. Zeitschr.*, xviii., 4.

SPURGEON, C. H. *Commenting and Commentaries. (Passmore & Alabaster.) Theologische Literaturzeitung*, No. 24. By Dr. E. Nestle.
 THOMAS, E. *Records of the Gupta Dynasty. (Trübner.) Bulletin Italiano degli Studi Orientali*, October. By A. de Gubernatis.
 WARD, A. W. *History of English Dramatic Literature. (Macmillan.) Jenaer Literaturzeitung*, Dec. 2. By R. Wülcker.

NOTES OF TRAVEL.

IT is understood that the Prince of Wales has accepted the presidency of the British Section of the International Association for the further exploration and the civilisation of Africa, instituted by the late Geographical Conference at Brussels, and that immediate steps will be taken to organise the section for practical work.

DR. PETERMANN has addressed a letter to the President of the Royal Geographical Society on the subject of the Arctic Expedition, from which we extract a few sentences giving the general drift of his authoritative opinions:—

"In previous letters I strongly advocated the selection of the Spitzbergen Seas (the whole wide ocean from East Greenland to Novaia Zemlia) as the best way to the North Pole and into the central Arctic Regions, instead of Smith Sound. Nevertheless, I rejoiced to see a new British Expedition sent forth by whatever route. Now that this expedition has safely returned to your shores, I crave permission to tender my sincere congratulations on all its achievements. I always held the Smith Sound route to be the most difficult of all, but since it was decided that it should be tried by a new expedition, I felt assured that an English expedition would in every case be attended by most important results for geography and all branches of science. There has never been a more important scientific undertaking than the *Challenger* expedition; it marks an era in the survey of our globe, and the natural laws by which it is governed, and, when the commander of that expedition was called to take the *Alert* and *Discovery* to the North Pole, there was perfect certainty that it would be done in a thoroughly complete way for the interests of science. It is this pure interest for scientific progress that cannot be too much commended; whereas formerly Arctic expeditions were sent out for lucre or gain, to find a north-west or north-east passage to lands where gold or spices or other wealth might be found. Let not England grudge these noble undertakings, for if we look around, it will be found that the English nation and the English Government are the only ones in the world that have sent forth an expedition like that of the *Alert* and *Discovery*. It is very seldom that an expedition like this, however successful and lucky, can be said to have finished a task or a subject, for generally new questions and new problems are created by its researches, that require fresh work. Captain Nares' expedition, however, may be said to have finished, as it were, a great portion—say one-third—of the Arctic regions, the scene of noble English exploits for a considerable time back. From Smith Sound to Behring Strait, the region of the Palaeocrystic Sea, our knowledge is entirely due to British enterprise and perseverance. . . . If Captain Nares' expedition had done nothing else than fully to explode the pernicious views connected with Smith Sound, it would be entitled to the greatest credit. The Smith Sound route had been artificially puffed up, exploration in that direction had attained a 'power of habit,' and the predilection for Smith Sound had become contagious and an incubus on Arctic research. Sent out to attain the Pole by sledges to be drawn by fine plucky seamen along a land of fiction, it required the greatest moral courage to return home sooner than expected, and with results diametrically opposed to fallacious premisses on which the whole plan of the expedition had been founded. Had Capt. Nares, instead of coming home this year, sailed round Cape Farewell and tried the other side of the same land he was directed up, of Greenland, in the wake of Sir Edward Parry's yet unsurpassed brilliant summer trip of 1827, or Capt. David Gray's thirty years' whaling along the shores of East Greenland, I am fully convinced he would have finished the North Pole just as well as that terrific Palaeocrystic Sea. . . . East Greenland seems of all routes to the North Pole the most advantageous. It is there that the Arctic ice freely drifts away all through the summer, and also all through the winter, as has been

shown by the crew of the sailing vessel *Hansa*. Thus the central area of the Polar region is more or less cleared of its ice, and would, I am fully convinced, by an expedition like that of Capt. Nares, be navigated, the Pole attained, and the whole region as far as Behring Strait explored. . . . It is gratifying to note that Arctic research, so vigorously pursued these last ten years, is earnestly being proceeded with. Already a Swedish and a Dutch expedition are decided on, as I am informed by direct communication from Sweden and Holland. The scheme of Lieut. Weyprecht, to establish eight observatories in the Arctic regions, is also under consideration."

PART XII. of *Petermann's Mittheilungen* for this year is devoted to three papers on the exploration of the Polar regions, on Prof. Nordenskiöld's Voyages of 1876, in which he has proved the navigability of the Siberian seas between Europe and the mouth of the Yenisei, opening up a new trade-route; on the latest journey of the German expedition of Finsch, Brehm and Zeil from Obdorsk to the Kara Sea; and on the British Arctic Expedition, each illustrated by excellent maps. Writing from Hauserfest, on September 18, Prof. Nordenskiöld says:—

"My outward and return voyages through the Matoschkin Scharr, and thence through the whole of the [Kara] sea, were made without hindrance or accident. I look upon the route as now practically opened. Among scientific results and collections I may mention large portions of mammoth remains, bones of musk oxen, a rich collection of subfossil snails from the tundra, remarkable new organisms from the Kara Sea, and the discovery of an island of fifty versts in length in 73° N.; besides much hydrographic work."

THE *Geographical Magazine* for December is mainly occupied with the results of the Arctic Expedition, giving first a capital *résumé* of the sledge-travelling work done by former expeditions, and then a most interesting account of the sledge journeys of the Nares' voyage. An important paper on Hissar and Kulab, by N. Mayef, is translated from the Russian Geographical Journal, and there is an account of the progress of the Indian Topographical and Revenue Surveys from 1873 to 1875. A note on the discovery of more relics of Barents is of interest. This summer Mr. Gardiner, in his steam-schooner yacht *Glow-worm*, having secured the services of Captain Carlsen, the famous Norwegian ice-navigator, proceeded along the east coast of Novaia Zemlia, and reached the winter harbour of Barents, where he remained for three days. He succeeded in collecting a number of relics, including a MS., which has not yet been deciphered. The *Glow-worm* arrived safely in England with her treasures, and Lieut. Koolmans Beynen has recently taken them to the Hague, where they will be deposited with other relics of Barents in the Naval Museum.

THE *Cosmos* for November has for its chief paper a description of the visit of Antinori, Beccari, and Issel to the Abyssinian Coast of the Red Sea and the Bay of Assab in 1870-72. The Reports from the Italian Expedition to East Africa up to the month of July, which we have formerly referred to, are given in full.

SELECTED BOOKS.

General Literature.

GERMAN LETTER.

Gotha: Nov. 30, 1876.

A little work has just been published by Joh. Classen (Gotha: Fr. A. Perthes) in commemoration of the hundredth anniversary of the birth of Barthold Georg Niebuhr. From the year 1827 to the year 1831 the author lived in the house of the great historian as tutor to his son; and, therefore, the present sketch, though it has no claim to be regarded in the light of a biography, is especially interesting as being warmly coloured by personal recollection. It increases our wish for a complete Life of this remarkable man, more particularly remarkable in the eyes of Germans because of his having combined, in a way they were accustomed to see men in England only do, the life of a man of business with that of a scholar. It would seem that he inherited this union of the scientific and practical mind from his father, Carsten Niebuhr, the renowned Eastern traveller. His wonderful understanding of the social and political organisation of ancient Latium—an understanding which enabled him so to reanimate the shadow of the past that an Italian could say of him that he was the first man who had written the history of Rome as if it had really happened—was no doubt acquired among the free land-tillers of his native Ditmarsch. He passed straight from the university to political life as private secretary to the Danish Minister Schimmelmann, and four years later, after having been some time resident in England, to the Administration of Finance. In 1806 he entered the service of Prussia, when that country was on the brink of her fall, and in his faithful adherence to the sinking vessel of the State, freighted likewise for him with the future of Germany, showed a firmness of character truly Roman. Such a character could not get on in the long run with the Berlin Government; nor was it until he was made ambassador in Rome, and Professor at the newly-founded Universities of Berlin and Bonn, that his position became such as fully to satisfy him. Even as a statesman he displayed the irritability and stubbornness which are the distinguishing qualities of a scholar, and it is as a scholar that his fame will live, not only in the Universities of Berlin and Bonn, but also in the history of the European world of thought.

By the publication of the lesser writings of Karl Lachmann and his follower Moritz Haupt, tribute has lately been paid to two other great German scholars: Lachmann's essays on German philology were edited by Karl Müllenhoff, and those on classical by J. Vahlen (Berlin: G. Reimer). Of the former, one on the original form of the *Nibelungenlied*, written in 1816, and those on the Old High-German accent and versification, *Otfried*, and *Song and Saga* are the most striking: the second volume is devoted chiefly to the Roman lyrical writers. Among the minor works of his younger friend Moritz Haupt, of which two volumes and a half have already been edited by Ulrich von Wilamowitz Möllendorff (Leipzig: S. Hirzel), there is also a fine treatise on the gain which German philology has been to classical; the peculiar merit of both writers being that they united the two sciences, and trod the then untrodden paths of German research with the assurance which a thorough mastery of classical philology could alone have given them. These are the only German questions treated here, but the collection is of peculiar value, for the following reason. The knowledge its author

possessed of Greek, Roman, Romance, and Middle-High-German speech and literature was such as no man had ever before attained, but while labouring unceasingly at the realisation of the vast plans he had naturally formed, he was doomed to see his aims continually receding, and others bearing off and executing one or other portion of the work he had planned: so that, putting aside his critical editions of the German and Roman poets, he has left us no great work wherein to admire his intellect and learning. These lesser writings of his deal with the Greek tragedians and the Roman lyricists, the prose writers as well as the poets; the academical discourses are especially attractive: one, for instance, on Frederic the Great and his relation to the development of German literature, and another in memory of Jacob Grimm.

The directors of the Olympian excavations have conferred a great boon on the lovers of ancient art by issuing good photographs of all the sculptures newly discovered there. Nothing else has appeared in this department worthy of note but a small pamphlet by G. Schuster: *Ueber die erhaltenen Portraits der griechischen Philosophen* (Leipzig: Breitkopf u. Härtel). The author is himself a philosopher, and has therefore no intention of treating the subject historically. The portraits are photographic copies of engravings, casts, and originals, and are accompanied by short and extremely pretty descriptive sketches, especially those of Socrates and Diogenes. His theory respecting the Neapolitan marble bust which Visconti had ascribed to Zeno of Elea sounds extremely plausible. Schuster believes it to be the Founder of the Stoa, chiefly on account of its Semitic character, and he takes occasion to make the very just observation, "Antiquity may also be said to have had its Jews." It would be interesting to compare the positions the Semitic race held in ancient and in modern literature. As regards the grandeur of his views of the universe and his personal dignity, Zeno might well rank with Spinoza, while Lukianos of Samosata would be no unfitting model for the frivolous elegance of the modern *feuilleton* which Heinrich Heine introduced into Germany.

The author will not find everyone agree with his views respecting the busts of Plato. He tries to prove that the bronze head in Naples, now universally called Dionysos, is really a bust of Plato, grounding his argument mainly on the statuette published in 1839, by E. Braun, in the *Annali dell' Istituto*, and the Florentine marble head with the modern inscription. The latter might, I should think, be rejected altogether; as for the statuette, it may represent the philosopher in spite of the Dionysian hair, but whether it is like the bronze bust it is impossible to judge from the photograph before us, and no other argument could be adduced in favour of the latter supposition, so that an authentic portrait of Plato is still wanting. In one respect alone the author may be right in spite of universal contradiction—namely, that the Neapolitan bronze, notwithstanding its marked resemblance to a Dionysos, has certain features which strike one at once as strange in the head of a Greek god, and for that reason the keen eye of Jacob Burckhardt may not have been deceived when he took the bust to be a portrait of some historical personage. We trust that the author's wish will soon be realised—namely, that his work, for which great credit is due to him, may give rise to a more comprehensive archaeological enquiry.

The first part of the eighth volume of Schnaase's *Geschichte der bildenden Künste*, edited by W. Lübke conjointly with O. Eisenmann, is just out (Düsseldorf: T. Buddeus). Friedrich Pecht's *Deutsche Künstler des XIX. Jahrhunderts* furnishes a good deal of useful information about the leading masters of the modern German school. The mode of expression, and the sweeping and, in some cases, very hazardous assertions, frequently remind us of the voluminous author's slipshod

feuilleton style; if, for example, we are to make anything at all of the statement that the idealistic tendency in art is more sympathetic to the North German, the realistic to the South German, nature, we must begin by reversing the order of it. The book is, however, full of charming traits of personal recollection, and gives vivid, if not highly-finished, pictures of our modern artists. The chapters on Cornelius and Anselm Feuerbach are weak; Moritz v. Schwind, on the contrary, is drawn with evident predilection, as also Gottfried Semper, Ludwig Richter, Ernst Rietschel, Ludwig Knaus and Friedrich Preller.

"The sensations we experience on meeting some one again in his old age whom we have known in his youth are of various kinds. The features have become more marked, and the forms have expanded differently from what we should have expected," writes Berthold Auerbach in the preface to his latest work, *Nach dreissig Jahren: neue Dorfgeschichten* (Stuttgart: Cotta). He might have added, "We have changed too, and are grown indifferent to much that used to delight us." Seldom has a poet introduced a new and fresh element of intellectual life into a nation so exactly at the right moment as Auerbach did when he published his first *Dorfgeschichten*, and the whole nation greeted them with a joyful gratitude. But that was thirty years ago, and if we eagerly devour now the first story of his new series, *Des Lorie's Reinhard*, we shall find the remark above quoted from the preface confirmed. It really is as if in this sequel to the *Frau Professorin* the poet had in their recapitulation designedly strengthened the peculiar and somewhat painful features of the former story. That Lorie's husband should, after her death, return full of remorse and tired of life to the village, and immediately become engaged to a young peasant girl, is surely tasteless. Then, too, in the third story, of the two liberated convicts, whose after-life is constantly being threatened by the memory of a past disgrace, the painful features are dwelt upon again and again. The second story, on the contrary, *Der Tolpatsch aus Amerika*, is quite admirable. The "Tolpatsch" himself with his American ways and the unmistakable German nature lurking beneath, the old shoemaker, the aunt, and the sweet little daughter of Marianne are characters instinct with freshness and life, and the story is one of the genuine old *Schwarzwälder Dorfgeschichten*.

On the list of forthcoming publications is the fourth volume of Gustav Freytag's *Athen*, published under the title of *Marcus König* (Leipzig: Hirzel), and long and impatiently looked for by his host of admirers.

Among the many pamphlets to which the representations of Richard Wagner's last opera have given birth, a critical study by Gustav Engel, *Das Bühnenfestspiel in Bayreuth: Separat-Abdruck aus der Vossischen Zeitung* (Berlin: Challier), holds a prominent position. The writer dwells chiefly on the question of how far the fantastical figures of the *Rheingold* are suitable for the stage, not merely as regards their external appearance, but also their spiritual nature, and comes to the very just conclusion that there is not one of them who could lay any claim to our sympathy. So, too, in Siegmund and Sieglinde, the lovers in the *Walküre*, we have two figures brought before us who cannot awaken the highest kind of dramatic interest, because they act entirely without moral judgment or self-consciousness; Brünnhilde, on the contrary, is a grand and noble conception, but Siegfried, again, is neither a dramatic nor a very lovable character, and after drinking the magic potion in the *Götterdämmerung* loses memory and volition, and ceases to be a responsible being altogether. At all events the common characteristic of all these personages, the preponderance of feeling—the *Ethos* always yielding to the *Pathos*—is adapted for musical treatment, and Wagner's more especially, as he has a predilection for the strongest contrasts of agitated with quiet moods, avoids definite and

detached melodies, and gives the orchestra, not the voices, the leading motives. Apart from this ingenious perversion of their natural relation to each other, which is based on the fact that his music has more of the pathetic than the ethic character, the music produces far nobler and more elevating sensations than the words of the drama, and is richer and fuller of meaning than the text would lead us to expect. It is not specifically German, nor has, indeed, the whole undertaking any claim to the appellation of "national," but it represents one of the directions our nation's life has taken, and "the onward road leads not past Wagner, but through him and beyond."

This is somewhat the line of thought adopted by our Berlin critic, who has remained singularly calm and clear-sighted in the midst of the hot strife of parties; his singling out as defects the very qualities the most zealous Wagnerites laud as the merits of the new opera only goes to prove the justice of his verdict.

C. ALDENHOVEN.

BABYLONIAN ANTIQUITIES.

London: Dec. 11, 1876.

The collection of Babylonian antiquities purchased by the late George Smith, for the trustees of the British Museum, furnishes some new and important material for the study of the manners and customs of the Babylonians. During the heavy rains of last wet season the upper surface of one of the numerous *Tells* in the neighbourhood of Hillah was washed away, and the Arabs who at that period of the year search the mounds for antiquities, discovered a series of earthenware jars, resembling water-jars, which on being opened were found to contain tablets. The party or company of Arabs who found these tablets sold them to a Baghdad dealer, who at once communicated with the authorities of the British Museum, and Mr. Smith, who was then about to start for the East, received orders to go to Baghdad and examine the find, and to purchase such objects as were desirable.

The tablets purchased by Mr. Smith are about two thousand in number, and are mostly small contract tablets, containing the memoranda of sales of land, slaves, and other objects, as well as loans of money and mortgages on lands; but their chief importance consists in the fact of each bearing a date, in the month, day, and regnal year of the king in whose reign the transaction took place, thus furnishing a most important series of chronological data.

The tablets, I have stated, were all found in one place, and were arranged in jars; and the reason of this is at once apparent when their subject-matter is examined. In the reign of Nabupalassar there flourished at Babylon an important firm of bankers and financial agents, the head of which bore the name of *Egibi*, and one of the tablets, dated in the month Elul, in the fourteenth year of *Nabu-pal-uzur*, relates to a loan by this man of some money to various persons.

Early in the next reign (Nabuchadnezzar) we find that, *Egibi* having retired on his means or else departed this life, the chief of the firm is a son of his, named *Sula*, whose name appears as party to a large number of transactions; and in the fifteenth year of the reign of Nabuchadnezzar *Sula* appears to have taken his son *Nabu-akhi-iddina* into partnership, as we find the witnesses to a contract in this reign given as *Sula*, son of *Egibi*, (and) his son *Nabu-akhi-iddina*, or, as it is sometimes given, *Sula*, son of *Egibi*, and *Nabu-akhi-iddina*, son of *Sula*. These names appear in the contracts during the reigns of *Evil Merodach* (Avil Murduk), *Neriglissar*, and *Nabonidus*, and in the twelfth year of Nabonidus another son of *Sula*, named *Marduk-baladha iskun*, appears in the contracts as a party to the deeds. The tablets in the collection extend over the reigns of Darius,

Cyrus, Cambyses, and will furnish most important material for the regulation of the chronology of this period.

The short time which the collection has been in the Museum has not permitted a very full examination to be made of the contents, but I may mention some curious variations in the spelling of the royal names. Nabonidus is frequently written phonetically, *Nabu-na-h-id*; Nabuchadnezzar also, *Na-bu-ku-du-ur-u-zur*. And among the Persian names the variation is more striking. "Cyrus" appears as *Ku-ra-as*; *Kur-ras*; *Ku-ra-su*; *Ku-ur-ra-as*. "Cambyses" is written both as *Kam-bu-zi-ya* and *Kan-bu-zi-ya*. "Darius" also has many variants: we have the ordinary form *Da-ri-ya-vus*, and also *Da-ri-vus*; *Da-a-ri-ya-h-vus*. The variant readings of some of the names of witnesses furnish us with some new phonetic values; and we also have the Babylonian dialectic forms of several Assyrian words given; but these I will notice at some future time.

Besides the contracts and the commercial papers relating to the transactions of the firm of *Egibi*, there are several other important inscriptions—the most important, which is fortunately well-preserved, being a tablet containing a complete calendar of the Babylonian year, accompanied by an explanation of each day as being fortunate or unfortunate for certain events; days of lamentation, of feasting; days for going on journeys by land, and water; days for building, and performing various private and public duties. From its having been found in company with these tablets of the banking firm we may well suppose that the British Museum has thus become possessed of the office almanack of the firm. I hope as soon as I have copied this important document to send you a further communication on its interesting contents. There are also in the collection several mathematical tablets, relating to land measures and values of objects; also several small inscribed tablets, apparently pay-lists and receipts for money.

At the same time at which the Hillah tablets were discovered, a party of Arabs also discovered several early Babylonian antiquities on the mounds of Zerghoul, to the east of the river Hye, in Babylonia. These mounds mark the site of an early Babylonian city named *Zer-gul-la*, and the monuments from here are of a very early date. The antiquities from this site which were purchased by Mr. Smith consist of bricks and cones, used for ornamentation of the walls, inscribed with the legends of a king named *Gu-de-a*. The legends on these monuments read, "To Ninip (Nin-gir-zu) the king, his king Gudea viceroy (patisi) of Zergulla his temple built."

Two other most valuable relics of this king have been purchased by Mr. Smith during his visit to the East. These are two small bronze statues, of curious workmanship, representing deities. The figures are represented holding long cones, similar to those of terra-cotta; they kneel on one knee, and hold the cone point downwards with both hands; and on the cone is the above inscription of *Gudea*. The figures wear the peculiar conical horned head-dress, similar to that seen on the bulls; they are dressed in long robes reaching to the feet, and confined at the waist by a broad girdle. These statues are most valuable additions to our collections, because, with the exception of a bronze statue of *Anat* bearing an inscription of *Kudur mabug* (Kudur leomar), now in the Louvre, they are the only example of early Babylonian bronze art that has been discovered.

The collection thus obtained by Mr. Smith forms a most important addition to our material for the study of both late and early Babylonian history, and it is greatly to be regretted that he to whose wise selection and careful examination we owe its acquisition has not been spared to set forth its value.

W. ST. C. BOSCAWEN.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Dec. 16.—3 P.M. Physical: "An Experimental Contribution to the Theory of the Radiometer," by W. Crookes; "On a Capillary Electrometer," by Prof. Jas. Dewar.
 3 P.M. Crystal Palace and Saturday Popular Concerts.
 MONDAY, Dec. 18.—5 P.M. London Institution: "Light and the Eye," by Prof. Jas. Dewar.
 8 P.M. British Architects. Society of Arts: Cantor Lecture.
 TUESDAY, Dec. 19.—7.45 P.M. Statistical: "The Statistical Results of the Treaties of Commerce, and their Relation to the Balance of Trade," by Prof. Leone Levi; "The Growing Preponderance of Imports over Exports in the Trade of this Country," by Stephen Bourne.
 8 P.M. Civil Engineers: Annual General Meeting.
 WEDNESDAY, Dec. 20.—7 P.M. Meteorological: "On Observations with the Psychrometer," by Dr. R. Rubenson; "Contributions to Hygrometry:—the Wet Bulb Thermometer," by W. Marriott; "Visibility," by the Hon. Ralph Abercromby; "Description of a Meteorographic Model," by the late Commodore M. F. Maury.
 8 P.M. Society of Arts: "The Philadelphia Exhibition," by Prof. Archer.
 8 P.M. Royal Society of Literature: "On the Curiosities of the English Language," by the Rev. A. J. D. D'Orsey.
 THURSDAY, Dec. 21.—7 P.M. Numismatic: "On the Statars of Cyzicus and Lampasacis," by Barclay V. Head.
 7 P.M. London Institution: "The Arctic Expedition and its Results," by Clements R. Markham.
 8 P.M. Linnean: "Morphological Notes on certain Species of *Thunbergia*," by M. M. Hartog; "Ear-bones of Mammalia," by A. H. G. Doran; "On the commercial Cane termed Whangee," by J. R. Jackson; "Butterflies of Malacca," by A. G. Butler.
 FRIDAY, Dec. 22.—8 P.M. Quekett.

SCIENCE.

Science Papers, chiefly Pharmacological and Botanical. By Daniel Hanbury, F.R.S. Edited, with Memoir, by Joseph Ince, F.L.S. (London: Macmillan & Co., 1876.)

WE have in the present volume a reprint of eighty-one contributions communicated to the *Pharmaceutical Journal*, the *Transactions* and *Journal* of the Linnean Society, and a few other periodicals. The secret of the construction of these papers, says the editor, "is disclosed by the manuscripts he has left behind. In his library were found not only consecutive note-books beautifully written and indexed, but others, each devoted to a special subject. These contained memoranda, personal observations, letters, price-lists, scraps from newspapers, and information drawn from commercial men, books ancient and modern, travellers, men of science, maps, and missionaries. Also notes and enquiries to and from young men who had obtained foreign posts and gone abroad."

Hanbury's success was also further due to the resolute perseverance with which he prosecuted any particular enquiry or research, for, "having set before him one definite line of action, he pursued it to the unwavering exclusion of other influences." Moreover, although there is much in these papers which is founded upon information gathered by the author from correspondence and personal intercourse with men from all parts of the world, they likewise exhibit him as possessed of much originality, comprehensive grasp of his subject, a uniform tendency to converge upon some definite points, and a desire to give a practical bearing to his results.

In the volume before us the scientific papers are not arranged in a chronological order, but in a far more convenient and systematic manner for study and reference—that is, according to the subjects treated of; the only exception being in the case of his communication upon "Turnsole." A complete chronological list is, however, placed towards the end of the book, and it is to be regretted that a list of the papers, in the order in which they are arranged in the volume, together with a reference to the

source from which they were derived, had not been placed in the table of contents.

The papers are of varying degrees of interest, according to the subjects treated of and the importance of the drugs described. Hanbury himself is said to have attached most value to his essay on "Calabrian Manna," to a previous historical note on the same subject, and to his paper on "Pereira Brava." We should certainly place side by side with these as of the first importance his papers on "Storax," "Scammony," "Otto of Rose," "Balsam of Peru," "Kinds of Cardamom," and "Notes on the Chinese Materia Medica." It should be also noticed that the botanical source of Siam Gamboge was first definitely traced by Hanbury, in 1864, to *Garcinia Morella*, Desrous., var. *pedicellata*, and made known in his paper "On the Species of *Garcinia* which affords Gamboge in Siam;" also that *Savanilla Rhatany* was traced by him, in 1865, to *Krameria Ixina*, var. *granatensis*, Triana, as seen in his paper "On the Botanical Origin of *Savanilla Rhatany*;" and that Tampico Jalap was ascertained, in 1869, to be derived from a new species of *Ipomaea*, which was named by Hanbury *Ipomaea simulans*, in his paper "On a Species of *Ipomaea*, affording Tampico Jalap;" and also that our knowledge of the botanical sources of Kamala, Galangal root, and other drugs, is principally due to the researches of Hanbury, and was first made generally accessible in papers now reprinted. All the papers are illustrated by the beautiful lithographs and wood engravings which were originally executed for that purpose.

Besides the *Science Papers*, we have also in this collection many other papers of a less purely scientific character, such as those on "The Price of Medicines," "Details respecting Frangipani," "Chemist's Holiday Jottings in France," "Recollections of a Day's Botanisising on the Col de Lautaret," "Some Remarks on the Nomenclature of the *Pharmacopoeia*," "Notes on Prescribing," "Sketch of the Life of the late Jacob Bell," "The late Prof. Guibourt," "Cinchona or Chinchona," "Chondrodendron or Chondrodendron," "The Spices, Groceries, and Wax of a Mediaeval Household, A.D. 1303-10," &c., &c., &c. All these papers testify to the erudition of the author and to the versatility of his powers.

At the beginning of the volume is a Memoir by the editor, and at the end an "Obituary Notice of Daniel Hanbury," by his collaborator in the *Pharmacographia*, Prof. Flückiger of Strassburg. Both these memoirs will well repay an attentive perusal, the first being written by one whose associations from early life, like those of Hanbury himself, were connected with English pharmacy; and the other by the author's friend and fellow-worker, who bears testimony to his European reputation and to the esteem in which he was held on the Continent. Prof. Flückiger's comparison of Hanbury with three other famous workers in pharmacology—Clusius, Pereira, and Guibourt—is peculiarly happy. A beautifully engraved and faithful portrait of the author forms the frontispiece to the volume; and at the conclusion we have a very copious index.

We cannot conclude our notice of *Science*

Papers without a reference to Hanbury's great work entitled *Pharmacographia*, which fortunately for science was published a few months before his lamented death. It may truly be said of this volume that it was the crown of the edifice of which the *Science Papers* form the chief building materials, and that its publication, like that of the great work of Pereira, formed a new era in the progress of pharmacology.

ROBERT BENTLEY.

Beowulf. Edited by Thomas Arnold, M.A. (London: Longmans, 1876.)

IN spite of the large number of editions, commentaries, and translations, that exist of *Beowulf*, there can be no question that a new edition is urgently needed. In the first place there can be no sure foundation for text-criticism till the MS. text has been printed with diplomatic accuracy, line for line as in the MS., so as to show exactly what portions have been damaged by fire and what not. If the text of Thorkelin's two copies were then given for the lost portions, everything would be done that could be done in the way of giving the materials on which the text is to be reconstructed.

But, even if an editor did nothing more than avail himself of the labours of his predecessors and give us an edition embodying the results of their emendations and elucidations in a critical and trustworthy form, we should be grateful to him, although we should consider that he had omitted the most important part of an editor's duty.

It is this humbler programme that Mr. Arnold's edition seems intended to carry out. It contains Introduction, Text, Translation, and Notes, but no Glossary.

The first requisite in editing *Beowulf* is evidently a sound and accurate knowledge of the language. A great deal more is required even for the humblest style of editing, but this is the indispensable foundation. The first question is, then, Does Mr. Arnold show a sound knowledge of Anglo-Saxon? We are compelled to answer, No. In spite of the difficulty of serious blundering in editing a poem of which more than half-a-dozen translations have been published, besides a large mass of commentary, Mr. Arnold has contrived to make some blunders which seem absolutely incompatible with the most elementary rule-of-thumb knowledge of Anglo-Saxon. Mr. Arnold's notes are largely made up of such information as the following: "*beorhte*, an adverb formed from *beorht*, bright;" "*hæbbe*, pres. of *habban*," &c. All this is very true, but somewhat elementary, much as if an editor of Virgil were to make up his critical commentary of such notes as these: "*cano*, pres. 1. sg. of *canere*, to sing," &c. But what are we to say to such notes as these two? "*drugon*, from *drug*, pf. of *dreogan*" (p. 2); "*sprece*. By a singular licence, the pf. sub. *sprece* and pf. ind. *sægdest* are combined in one construction" (p. 29). It may perhaps be urged that *drug* is a misprint for *dreag*, although we do not understand how anyone who knew anything of Anglo-Saxon grammar could possibly allow such an error to stand; but the astounding blunder

of imagining *ðú spræce* not to be the indicative form parallel to *ðú sægdest* seems a deliberate one. Does Mr. Arnold imagine that the Anglo-Saxons conjugated *ic spræc*, *ðú spræcest* in the preterite? On page 5 (l. 52) Mr. Arnold prints *læste* in the text, and repeats this form in the notes, apparently in happy unconsciousness that he or his printer has dropped an *h* before the *l*. In another place (p. 10) we are informed that *gefeah* is the preterite of *gefeahan*, a verb which has hitherto been known only under the form of *gefeohan* or *gefeón*. Again, we are led to infer incidentally from a note (p. 29) that Mr. Arnold considers *wælstowe* to be a nominative case.

Not content with revolutionising our ideas of the elements of Anglo-Saxon grammar, Mr. Arnold has also ventured on the perilous ground of etymology and the comparison of the cognate languages. The soundness of his principles may be inferred from the fact that he connects *atol* with the German *toll*, *ehtan* with *hetzen*, *heoru* with the Greek *ἄop*, *hran* (whale) with the Old Norse *Rán*, and *rinc* with *regin*. He also explains *liðwæge* (cup) as "drink-ways," in apparent ignorance of the fact that the plural of *weg* is *wegas*, and that *wæge* is a perfectly distinct word, meaning "cup."

In the translation, where Mr. Arnold has simply to follow "crib," any very gross blundering is impossible. Yet he translates *wolcnu* (p. 116) by "sky," evidently inferring from the modern "welkin" that *wolcen* (cloud) had the same meaning. A few lines before (l. 1,740) he translates *oferhygða dæl* "mass of . . . pride" instead of "a portion of pride." The want of study and comprehension of the spirit of the poetic language is shown strikingly by his inability to understand the thoroughly characteristic words *dædhata* (p. 21) and *herebróga* (p. 34), for which he proposes the unmeaning emendations *dædhwæt* and *herebrego*. The note on the passage "*hé on holme wæs sunde ðe sœnra*" (p. 95) also shows a curious ignorance of the spirit of the old epic poetry.

It would evidently be a superfluous task to follow Mr. Arnold in his attempts at higher criticism. What we have seen is more than enough to convince us that the book itself is useless alike to scholar and student.

HENRY SWEET.

SCIENCE NOTES.

ASTRONOMY.

Meteors.—For the last thirty-five years Herr Schmidt has kept a systematic watch for meteors at all times of the year, and has collected the results into a catalogue which, when published, will occupy 230 pages in quarto. An abstract of the results obtained is given by him in the *Astronomische Nachrichten*, the most important conclusions being with reference to the hourly frequency of meteors observed. After reducing the observers who took part in the work to one standard—which is absolutely necessary, since it appears that while one of the five would observe 117 meteors, another would only notice 69—the hourly frequency is tabulated for different hours of the night, and for different months, and also throughout the July-August period for each day. From these tables it appears that the average number of meteors per hour is ten, and that the maximum frequency occurs about 3 A.M.; also, leaving out of account the two extraordinary No-

vember showers, the maximum of the whole year falls in August (when we pass through the well-known stream of Perseids), and the minimum in February. From January to the beginning of July the hourly number remains at about seven, increases rapidly to twenty in August, falls again in September, and then in the three following months increases to about double the number in the first six months of the year. In July and August there are several well-marked maxima, the hourly number for the whole series of years, on August 10 in particular, rising to eighty at 3 A.M. This number varies greatly in different years, the greatest displays having occurred in 1863 and 1867, in the former of which years 103 meteors were counted during a single hour. Other observers have recorded still larger numbers, but they bear no comparison to those noted in the two November showers, 2,052 meteors having been counted in one hour on November 13, 1866, and 2,777 on November 27, 1872, when we were supposed to have passed through the tail of Biela's comet. In order to get further information on changes in meteor-streams, the meteors which come from definite radiant points, in contradistinction to the sporadic meteors, have been discussed with reference to the number of radiant points above the horizon, and the results support the above conclusions, the meteors coming from each radiant being more frequent in the latter half of the year, and in the early morning hours. The brightness of the individual meteors seems also to increase with their frequency, and this is particularly noticeable in the November stream of Leonids. Herr Schmidt has also noted carefully the colour of meteors, and connected it with the average duration of visibility. As might be expected, the white meteors, for which the combustion is more intense and the velocity probably greater, remain visible for a shorter time than any others—namely, three-quarters of a second—next to them come the yellow and then the red, the green having the longest duration of all—namely, two seconds.

Change of Colour in Stars.—Dr. Klein has for several years remarked a periodical change in the colour of α Ursæ Majoris, and his observations have lately been confirmed by Herr Weber, who finds that it changes from yellow to fiery-red in a period of thirty-five days. If these variations are regular the star should appear of a fiery-red about December 19, and it is to be hoped that it will be carefully watched for a week or more before and after this epoch. Unfortunately it is very difficult to get rid of subjective effects in such cases, especially if there is any preconceived idea of the colour to be expected; but with a number of observers there is some prospect of being able to eliminate disturbing causes.

The Effect of Sun-spots on Climate.—In the November number of the *Monthly Notices*, a paper by Prof. Langley on this vexed question is published, in which the author deduces from the observations he has for the last few years been making on the radiation from the umbra and penumbra of a spot, what proportion of the sun's heat would be lost by reason of the increased area of sun-spots at a time of maximum, and what would be the consequent diminution in the mean temperature of our globe from this cause alone. After many difficulties Prof. Langley has succeeded in determining the radiation from the umbra of a spot to be about 64 per cent., or a little more than half, of that from the surrounding photosphere, while that from the penumbra is 80 per cent., or four-fifths. Thus the spots would appear to radiate a very large amount of heat, though by contrast with the photosphere they appear quite black to the eye. Further, the mean spot-area in a year of maximum appears to be, from the observations of Schwabe, Carrington, and De La Rue, about fourteen ten-thousandths of the visible disk, and in a year of minimum somewhat less than one ten-thousandth, while the proportion of

umbra to penumbra is about two to five. From these data it would follow that the greatest admissible direct effect of sun-spots is to diminish the heat we receive from the sun by nearly one-thousandth part. The next question is to find how much of the earth's temperature is due to the sun, and this is a difficult matter, though Prof. Langley is able to fix the limits within which the amount must lie, by considering that the temperature of the earth's surface would certainly fall as low as any which has been observed in the Arctic regions—namely, -56° Centigrade if the sun's heat were altogether withdrawn and could not possibly fall lower than the absolute zero, or -274° Centigrade. Thus, taking the mean temperature of our globe at from $+14^{\circ}$ to $+16^{\circ}$ C., not less than 70° of this is due to the sun, and not more than 290° . It therefore results that the direct effect of sun-spots in a year of maximum would diminish the mean temperature by not less than two-thirtieths, nor more than three-tenths, of a degree centigrade. Prof. Langley, of course, does not here deal with a possible indirect effect, or rather accompaniment, of sun-spots in an increase of the solar activity, which might cause a considerable rise of temperature by virtue of increased radiation from the photosphere.

Recent Spectroscopic Results.—Dr. Huggins has made an important advance by his successful application of photography to the spectra of stars, of which he gives an account in a communication to the Royal Society. Although he has up to the present confined his attention to the bright star Vega, which has a well-marked spectrum, and is therefore specially adapted to the purpose, there can be little question that he will before long obtain good photographs of the spectra of other bright stars, which will add greatly to our knowledge of their constitution by enabling us to examine the invisible part of their spectra in the ultra-violet, besides giving means for more accurate determination of the position of the lines than is ordinarily possible. There is one great advantage which photography has over the human eye—namely, the length of time during which the effect produced by the luminous body accumulates, a circumstance which makes up for the inferior sensitiveness of the photographic film, and it is by taking advantage of this and giving an exposure of several hours that Dr. Huggins has obtained such good results. His photographs of the spectrum of Vega appear to be capable of very accurate measurement, and, independently of their immediate value, which is sufficiently great, will doubtless prove most valuable records of the present physical condition of this star, in case changes of temperature or other causes should in course of time give rise to changes in the breadth of the strong lines in the spectrum, which extend from G to N. In course of time we may hope for most valuable results from the application of photography to variable stars, though, unfortunately, too many of these interesting objects are exceedingly faint.

THE spectroscopic results obtained at Greenwich and given in the *Monthly Notices* include observations of the approach or recession of stars in continuation of former results, as well as measures of displacement of lines in the spectrum of Venus due to its approach and recession before and after conjunction, and of the relative shift of spectral lines at the east and west limbs of the sun and Jupiter due to the rotation of those bodies, the object being to verify in cases of undoubted and well-determined motions Doppler's principle of displacement of lines in the spectrum caused by the motion of the body, on which some doubt has been cast by certain physicists. The results in each case were found to agree remarkably with the known motion, though for the observation of the sun's rotation special precautions had to be adopted to guard against the disturbing effect of the solar heat on the slit of the spectroscope, a circumstance which has given

much trouble to former observers and has afforded ground for refusing to accept their results. With a similar object in view, Prof. C. A. Young, in America, has also, quite lately, made spectroscopic determinations of the sun's rotation, using a very fine diffraction grating given to him by Mr. Rutherford, and has obtained a motion slightly exceeding that inferred from observations of sun-spots. From this result he is inclined to conclude that the solar chromosphere is really moving more rapidly than the spots, but the value found at Greenwich, which is in remarkable agreement with the received equatorial velocity, would tend to negative this idea. At any rate, further observations with improved methods would be necessary to establish such a point.

MICROSCOPICAL NOTES.

THE only paper read at the Royal Microscopical Society at its meeting on the 6th inst. was by the Rev. W. H. Dallinger on *Frustulia saxonica*, *Navicula crassinervis* and *N. rhomboides*, which, according to various authorities, he assumed to be one species. The paper was illustrated by exquisite drawings, showing that large and small specimens all exhibited precisely the same system of dots arranged in the same patterns.

THE *Proceedings* of the Royal Society, No. 173, contains a preliminary report by Dr. Gwyn Jeffreys on the "Biological Results of the Cruise of the *Valorous* to Davis Strait in 1875," in which a few microscopical matters are noticed. In lat. 58° 59', long. 34° 13' W., between 200 and 300 miles east of Cape Farewell, floating masses of a pulpy green matter, looking like a sponge, were obtained, and proved to be a diatom named by Prof. Dickie *Synedra Jeffreysii*. This diatom is remarkable for the great quantity of colloidal matter in which the frustules are embedded. It was extensively found in the part of the North Atlantic referred to. It has

"frustules greatly elongated, straight, in front view linear, ends subcapitate, no pseudo-nodule, in side view linear rectangular, striae marginal. The total length varies from one-ninth to one-tenth of an inch, the front view has a diameter about one four-thousandth of an inch. The striae are forty to fifty in a thousandth of an inch."

In the same region a curious parasitic mite, only to be detected with a microscope, was found in large numbers feeding on seaweed and spawn. Some globigerina, brought up from a depth of 1,750 fathoms, in Davis Strait, had their segments so compressed that they might have been taken for another species than *G. bulloides*, and an unusual number of polycystina were met with. Among the foraminifera Dr. Carpenter found many objects of interest, including some *rhaddammina*, exhibiting a transition from a triradiate to a single rod form. This is effected by imperfect development of one ray, and very great angular obtusity in the position of the two others. Before quitting this subject we may remark that the way in which specimens obtained in these national expeditions are kept in a few hands is a matter of just complaint. When abundance of microscopic material, for example, is brought home, how is it that none is ever sent to the Royal Microscopical Society, or to similar societies in the provinces? Is the Royal Society responsible for what becomes of these things?

THE *Proceedings* of the Royal Society, No. 174, contains an important illustrated paper by Dr. P. Martin Duncan on "Some Thallophytes Parasitic within recent Madreporia." Some of these parasites seem referable to *achlya* and *suprolegnia*.

THE vitality of the eggs of that vine-pest the phylloxera, and the difficulties in the way of destroying them, have been investigated by M. Balbiani, and his researches will be found in *Comptes Rendus* for November 20 and 27. The structure of their eggs is peculiar, and adapts them to develop under water or in wet places. First, there is a super-

ficial pellicule, and then three membranes, the exchorion, the chorion, and the vitelline membrane, and, below these, two tunics known as the serous envelope and the amnios, which clothe embryo. These last are very thin and fragile. They are wanting in eggs in which the development has not commenced, and no longer exist in those containing a well-formed embryo. The other envelopes are found in different eggs of phylloxera, both in those of the aerial and subterranean larvae, of the winged insects and of the sexual ones, but with certain modifications. The superficial pellicule of the subterranean eggs is a sort of varnish exhibiting fine granulations. It is completely insoluble in water, slightly soluble in sulphide of carbon, and easily dissolved in absolute alcohol and concentrated alkaline solutions, pure acetic acid, or sulphuric acid. In the winter-eggs, the chorion, of chitinous material, is traversed by fine canals with exterior orifices, which when seen in front view appear as dark dots surrounded by a clear areole. M. Balbiani says that the porous canalicules of these eggs, which in some insects are highly developed, constitute, so to speak, a pneumatic apparatus for the passage of the air required for the respiration of the embryo. We may also see that a little appendage—in shape of a peduncle—to the posterior pole of the egg, and by which it is fixed to the bark of the plant, is formed by a prolongation of the chorion and exchorion. At the anterior pole these two membranes exhibit a micropyle in the middle of a little circular depression, the trace of the insertion of the cord which fastened the egg to the germinal chamber. In newly-laid eggs it is not uncommon to see filiform spermatozooids attached to this opening, but this is not the case with eggs that are fertile without coupling, and in which the micropyle is soon obliterated. An adaptation to aquatic conditions is possessed by all the phylloxera eggs. They can all be hatched under water, and in air that is dry they perish. The young ones born under water can continue to live in that fluid, but their powers of vital resistance depend much upon temperature. Eggs which have not advanced to the formation of an embryo develop very well if placed under water, but if they have proceeded some way in an aerial development the water often kills them. There is a similar difference with regard to the insect; those born in water can live in it for ten or fifteen days after hatching, while those born in air perish under water in from twelve to forty-eight hours. These facts arise from the different states of the membranes of the eggs and of the bodies of the insects, which in defect of gills can breathe, like many aquatic articulates, through their skin.

A VERY curious account of the habits of mites of the genus *Ixodes* is given by M. Mégnin in *Comptes Rendus*, Nov. 20. The females of these well-known pests of dogs and other animals stick their barbed rostra into their prey and suck their blood, growing from a very small size to rounded masses like big peas. Sometimes M. Mégnin found little males attached to the females in copulation, and he was fortunate enough to obtain from an ox of African origin a large female ready to lay eggs. These were deposited on May 22 and onwards till June 23, and amounted in all to 1,200. Between July 25 and August 9 these were hatched, and during the process the gradual formation of the internal organs was observed, including the stomach with its symmetrical caeca enveloping and containing part of the vitellus which served for the nourishment of the embryos during their development. During three months for which he kept these larvae they would not take any sort of food. Some changed into males, some into females; the former seeking for females and perishing after fecundating them without taking in any nourishment, which, indeed, was impossible, as their rostra were transformed into accessory coupling organs. The females, after fecundation, fix themselves upon animals, and absorb an enormous

quantity of blood, which multiplies their dimensions tenfold, and serves, not only to feed their numerous progeny in their early stages, and themselves for the greater part of their lives, but all their male offspring for their entire existence.

MEETINGS OF SOCIETIES.

MUSICAL ASSOCIATION.—(Monday, December 4.)

JOHN HULLAR, Esq., in the Chair. Mr. Cummings read a paper on Purcell. Purcell's family was musical for four generations. The allusion in Pepys' Diary, which is said in one of Lord Braybrooke's notes to be to Purcell (February 21, 1659), was certainly not so, as Purcell was only a year old at the time; it must have been either to his uncle, Thomas, or his father, Henry, both of whom were musicians. A short account of Purcell's life was given; and certain stories about his dissipated habits, and the circumstances of his death, were examined and rejected. The portrait exhibited was known to be authentic, having passed through the hands of Purcell's son and grandson, and then been presented to the Royal Society of Musicians by Mr. Redmond Simpson, a member of that body. Purcell's works were voluminous; he wrote 47 operas, 28 odes, and 202 fugitive pieces, vocal and instrumental. He died at the age of thirty-seven. It is nearly certain that the music commonly known as Locke's Music to *Macbeth* is by Purcell. He was original both in melody and harmony; in the latter point his music is full of anticipations of the music of Schumann and Beethoven. Stress was laid on the desirability of publishing the MSS. that exist, before they become lost. After a few words from the Chairman, Prof. G. Macfarren said that much was owing to Mr. Cummings in this matter, not only for his own investigations, but as the founder of the Purcell Society for the publication of these works. Prof. Macfarren did not agree that Purcell was the originator of English melody, as the old English songs would bear comparison in this respect with any national music; but his harmony was wonderful. His great novelty, however, was the excellence of his musical declamation; and this was the more wonderful on account of the strong prejudice started by Dryden against singing in drama. Mr. Cummings performed his illustrations himself—a few selected passages of Purcell's works. A vote of thanks was passed to Mr. Cummings for his paper.

SOCIETY OF BIBLICAL ARCHAEOLOGY.—(Tuesday, December 5.)

S. BIRCH, Esq., LL.D., President, in the Chair. The following papers were read:—"On some recent Discoveries at Aboosimbel," by Miss Amelia B. Edwards.—"On the Babylonian Cylinders discovered by General di Cesnola in the Treasury of Kurium," by the Rev. A. H. Sayce, M.A. The writer, after describing these three cylinders, came to the conclusion that of the three inscribed Babylonian cylinders found by General di Cesnola in the temple-treasure of Kurium, the oldest was the smallest, of haematite, which belonged to the early Accadian period. The next oldest was a larger one, also of haematite, which was referred to the Semitic epoch and the sixteenth century B.C. It gave evidence of the deification of the Chaldean kings. The largest cylinder, of rock-crystal, was a spurious antique, Mr. Sayce believed, of the time of Nebuchadnezzar, or a little later. The legend was written in Accadian, like a modern inscription in Latin, but mistakes occurred in it. Two sphinxes engraved upon the cylinder showed Egyptian influence.—"Notes on Assyrian History," by W. St. Chad Boscawen.—"On an Aramaean Seal," by Lieut.-Col. W. F. Prideaux. This seal is formed of very pale blue chalcedony; it is of a conoidal shape, and about one inch in height. The upright side of the stone forming the seal represents a four-winged monster of Babylonian type, apparently with the face of a man and the body of a bull, rearing on its hind legs; its head is surmounted by an ibex horn, in front of which is a crescent; before the lower part of the body is the ank cross, or *crux ansata*, the Egyptian symbol of life. On the base of the conoid or the seal proper is an inscription in Phoenician characters of high antiquity, surmounted by a border, the translation of the same being, apparently, "Belonging to Bakkashath bath Abol-Yrkl," this last word being the Sabaeen name of a Chaldean Lunar Deity Sin.

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, Dec. 5.)

DR. E. HAMILTON, V.P., in the Chair. The Secretary read a report on the additions that had been made to the Society's Menagerie during the month of November, and called particular attention to four Brazilian Cormorants (*Phalacrocorax brasilianus*), purchased, and a Hooded Crane (*Grus monachus*), received on deposit.—A letter was read from Count T. Salvadori, announcing that a new species of Paradise-bird of the genus *Drepanornis*, had been discovered near the most inland point of Geelvink Bay, New Guinea.—A communication was read from Mr. Andrew Anderson, containing some corrections of and additions to previous papers on the "Raptorial Birds of North Western India."—Mr. Francis Day read a paper on the Fishes collected by the Yarkand Mission, in 1873, to which the late Dr. Stoliczka was attached as naturalist. The paper gave an outline sketch of the Freshwater Fishes of Hindustan, Afghanistan, Western Turkestan, Yarkand, Tibet, and Cashmere. The author showed that the principal Fishes of Yarkand belong to a local group of Carps, termed "Hill Barbels, or *Schizothoracinae*," by McClelland: that this group is almost restricted to cold and elevated regions, spreading to the most eastern portion of Western Turkestan, Afghanistan and along the slopes of the Himalayas to China; and that these forms are entirely distinct from the Carps of the plains to the south of the Himalayas.—A communication was read from Mr. Martin Jacoby, giving the descriptions of new genera and species of Phytophagous Coleoptera.—A communication was read from Dr. A. Günther, F.R.S., containing the description of a new species of Lizard from Asia Minor, which he proposed to name *Zootoca Danfordi* after Mr. C. G. Danford, its discoverer.—Dr. Günther communicated a paper by Mr. W. Ferguson, of Colombo, containing the description of a new species of snake of the genus *Aspidura* from Ceylon, for which the name of *A. Guentheri* was proposed.

SOCIETY OF ANTIQUARIES.—(Thursday, December 7.)

FREDERICK OUVRY, Esq., President, in the Chair. Mr. J. C. Robinson exhibited a wooden mould for the making of ornamental candles of the time of James I. and a mould from Nuremberg for stamping cakes with an *Agnus Dei*. Mr. C. Brett exhibited a fragment of a twisted gold torc and a silver coin of Alexander the Great, both found at Canterbury, and a small gold arm-ring from Ireland. Dr. Johnson, of Shrewsbury, sent an account of some objects discovered during excavations for the foundations of a new post-office in that town. These include glass and porcelain bottles; a Dutch drinking-cup; tiles, one of which is stamped with a fish; a shoe of the sixteenth century; horns of oxen, red and fallow deer and roebuck; tusks of wild boars, and bones. Mr. Everard Green exhibited a rubbing of a brass to the memory of Joan Harvey, mother of the discoverer of the circulation of the blood, in the church of Saints Mary and Eynsworth, Folkestone. The Rev. J. Beck exhibited some flint implements from Denmark; and Mr. E. P. Shirley, some from Heath Farm, in Warwickshire.

CHEMICAL SOCIETY.—(Thursday, December 7.)

DR. J. H. GLADSTONE, F.R.S., Vice-President, in the Chair. After the usual business of the Society, Prof. A. H. Church read a paper on "Colein," the red-colouring matter existing in the leaves and stems of the *Coleus Verschafflii*. It is prepared from the stems, and when pure is an amorphous substance of a brilliant crimson colour, unalterable by exposure to light or by the action of dilute acids; alkalies, however, alter it rapidly. Its alcoholic solution, when freshly prepared, is of a bright red colour, but, in common with that of some other red-colouring matters, it rapidly fades until it becomes almost colourless. This is due to a combination of the colein with the alcohol, the red colour being immediately restored on the addition of a little acid.—Dr. Otto Witt then made a short verbal communication on "Phenylenediamine," obtained from dinitrobenzene by the action of reducing agents, after which the Secretary read a paper by Mr. J. B. Hannay on "Calcium Sulphate," describing some double salts and some of the hydrates.—The last paper was "Additional Notes on Potassium Triiodide," by Mr. G. S. Johnson, giving the specific gravity and atomic volume of the substance.—The

meeting was then adjourned until Thursday, the 21st, for which "A Further Study of Fluid Cavities," by Prof. W. N. Hartley, is announced.

LINNEAN SOCIETY.—(Thursday, December 7.)

G. BENTHAM, Esq., Vice-President, in the Chair. The botanical papers read were "New British Lichens," by the Rev. W. A. Leighton, and "A General Systematic Arrangement of the Iridaceae (the Iris family)," by J. G. Baker, of Kew. The latter highly important though somewhat technical contribution the author summarised, illustrating his remarks by specimens of the plants. Nearly all the Iridaceae inhabit temperate regions, and may be grown successfully in the open air in this country. Some are among our most familiar garden-flowers—for instance, the crocus, the iris, and the gladiolus. Altogether about 700 species and sixty-five genera are now recognised. Quite half a century ago Mr. Gawler (better known as Ker) published a synopsis and list of the genera and species; and, although others have since studied the group, much has been left undone. As regards their distribution, 312 genera are found at the Cape, ninety-four in Europe and North Africa, eighty-nine in temperate Asia, eighty-two in tropical America, fifty-six in tropical Africa, thirty-four in South America, thirty-one in Australia, twenty-five in temperate North America, and only one in Polynesia. Three primary divisions are adopted by Mr. Baker in the present classification—1. Ixiaceae; 2. Irideae; and 3. Gladiolaceae; the above-mentioned garden-plants serving as types, and the perianth being the main character of their separation. Four subsidiary divisions are again instituted—viz., bulbous, with free or united stamens, and those wanting bulbs, with free or united stamens. They are a very natural group as a whole, only one genus, *Campylopus*, bearing doubtful characters.—Dr. Francis Day read a paper "On the Geographical Distribution of the Fresh-Water Fishes of India." He states that out of nine families of spiny-rayed fish (Acanthopterygians) only two are likewise found in the African region; but one of these is in Madagascar, therefore doubtfully African, the other is also found in the Malay Archipelago, which possesses representatives of eight out of nine families. The fresh-water fishes of Ceylon, the Andamans and Nicobars, he believes, are strictly Indian, while, as these fishes cannot be spread except by line of fresh-water communication, it thus appears highly probable that these islands were at one time connected with the Continent of India. Moreover, certain forms exist in Malabar which are absent from the rest of India, but reappear in the region of Chittagong or Siam. The evidence derived from his data shows that the fauna of Hindostan preponderates towards the Malayan, and not African, region, as many aver.—Mr. Christy exhibited and made remarks on specimens of the so-called Black Coral (*Antipathes*) from the Philippines.—Thirteen new Fellows were balloted for, and duly elected.

NEW SHAKSPEARE SOCIETY.—(Friday, December 8.)

F. J. FURNIVALL, Esq., Director, in the Chair. The first paper was by Mr. H. B. Wheatley, on Ben Jonson's *Every Man in his Humour*. Mr. Wheatley gave an account of the alterations made in the Quarto of the play by the second edition in the Folio. He showed that these changes were only in names, scenes, and lines—though with large and judicious cuttings-out in the last act—but did not affect the scheme and motives of the play. He contended that the first Quarto was not surreptitious, but plainly genuine. Mr. Furnivall, recurring to the point of the date of the Prologue, which Dr. B. Nicholson had originally intended to treat at the meeting, argued that the only lines which could allude to Shakspeare were the "York and Lancaster's long jars" (*Henry VI.*), and "chorus wafts you o'er the seas" (*Henry V.*)—he did not believe in the "storm" and "monsters" referring to *The Tempest*. As the play was produced in 1598, and *Henry V.* not till 1599, either the Prologue was written after the first cast of the play, or it did not allude to *Henry V.* He could not allow that the Prologue, if after 1598, must have mentioned the revision of the play.—Mr. Doggett then proposed to read "by holy" in l. 313 of the *Passionate Pilgrim*, as an exclamation, "by the Holy," like Foxe's "by roode" for "by the roode." Mr. Furnivall proposed to read l. 302, "As

well as Fancy's partial might," taking "might" as a substantive. Lastly, Miss Eleanor Marx read her translation of the Second Part of Prof. Delius' Paper "On Shakspeare's use of Narrative in his Plays." The paper dealt with the English Historical and the Roman Plays, and showed how the poet's skill in employing the narrative element in his dramas improved as he advanced from his first period to his third.

FINE ART.

Studies in English Art. By Frederick Wedmore. (London: R. Bentley & Son, 1876.)

MR. WEDMORE'S volume of *Studies in English Art* contains thirteen short critical biographies of English painters, beginning with Gainsborough and Reynolds, and ending with George Mason and Frederic Walker. The name of Morland stands second on the list, and is followed by those of Wheatley, Stothard, and Flaxman; the Norwich school is represented by Crome and Cotman; and a second phase of English landscape is illustrated by the lives of Girtin, Turner, and De Wint.

Each of these thirteen notices shows signs of having been indeed a "study," an object of interest, of liking, of careful attention. In each instance Mr. Wedmore has been attracted by and has steadily observed the peculiar merits and qualities of the works which he describes. Some of the masters of whom he treats, such as Reynolds and Gainsborough enjoy wide and long-established popularity, while others, like Wheatley, after a period of almost complete oblivion, have become the subjects of a modern revival; a turn in taste, which may be but momentary, has secured for them a small band of admirers, and presents a favourable opportunity for making known the nature of claims to notice which may shortly be again forgotten. The book is addressed, not so much to the specially qualified as to the general public; and the work both of appreciation and analysis is directed mainly to questions of sentiment, of general style, of points of success and failure which can be fully seen and comprehended by the many. It is a volume of criticism which may be called, in short, literary rather than artistic—criticism of the subject-matter rather than of the modes and methods of its exposition. This branch of criticism—literary criticism—of which Diderot was, and perhaps will always remain, the greatest master, and which always lies somewhat under the displeasure of artists, to whom, as has been said, it is not indeed in the first place addressed, has its proper function to fulfil. Let us take, for instance, the work of De Gax: it might possibly be maintained that this clever painter's only original contribution to art consisted in his daring rejection of the usually accepted point of view for the perspective of his pictures, in the intentionally startling way in which he seizes on some object immediately within reach (such as the keys of the violoncello in the picture exhibited by M. Deschamps during the past year), and refers to its scale all the other objects in the scene. This choice for the picture plane of a point of intersection all but at the base of the field of vision, and other kindred questions of practice, can have

but little interest for the public which turns to De Gaz attracted by the experiences of "behind the scenes" which he vividly sets before them. Their interest lies chiefly in the actual drama presented, in the story which might perhaps be as effectively stated in words, in the literary context; the more cultivated will pass a little beyond this, and may enquire concerning the patterning of space and choice of colour, and may be interested in tracing the correspondence of sentiment which exists between choice of subject and choice of means; some, by the constant looking at and handling of fine work, may even have come to recognise for themselves the value of style and the marvels of certain supreme achievements, may have come to know where is the success and where the failure; but, of these last, are they enough to form an audience? Or, again, if we turn to the theory of art, to the side on which this science is carried into the circle of philosophical speculation, we find that the writer is alike cut off from artists and from the general public. He must, therefore, if he is to find readers, select that *point de vue moyen* which Sainte-Beuve considered the only safe road to popular success. While assuring himself that he says no word that professional experience can contradict, he must check the expression of aught that the non-professional public cannot appreciate. The teacher must consent to remain but a step in advance of the learner.

This is the position which Mr. Wedmore has chosen, essaying not so much to destroy old creeds, or arouse a novel enthusiasm, as to deepen the impression which may have been already made on his audience by the works of which he speaks. He endeavours to render the blind admiration intelligent. In each instance he tries to show what is the peculiar character of the qualities which specially distinguish the given work, and in writing of the life of the worker he brings into prominence those points of his character which are expressly related to the manner and choice of his art. This is done with a most commendable discrimination; no attempt is made to catch attention by undue emphasis and exaggeration; the language is always reserved and carefully balanced. There is, perhaps, a slight tendency to give a turn to the style in the direction of that elaborately pretentious simplicity which seems to be a mode of the more recent school of English criticism, and against which it is, indeed, difficult to be sufficiently on guard. But Mr. Wedmore writes of subjects which are so near our own day, and so within the domain of social talk, that this manner is felt to be less manner than it seems when assumed on questions which imply the exercise of scholarly learning; the conversational affectations (if any there are) become piquant rather than unpleasant.

"The omission of certain great names," says Mr. Wedmore in his Preface, "will suggest to the reader that my little book makes no attempt even to sketch completely the development of English art;" and the fact that certain of these conspicuous omissions (as, for instance, Hogarth and Blake) belong to the period embraced by Mr. Wed-

more's *Studies* further shows that, though "those [articles] which have been printed in serials were meant from the beginning to be chapters of a book," that book was not intended to present a complete picture even of the era with which it deals. "Our art," says the author, "is of too late a birth for its development to be orderly, simple, and easy to trace. Its development is from many sources and strangely irregular." This is to some extent true, but not absolutely so, and perhaps Mr. Wedmore loses something both of power and of instructiveness by not looking for the signs of a cohesion which a closer examination might detect, by accepting too unreservedly the popular "spasmodic" theory.

Very little has hitherto been done by competent workers in this field of English art and archaeology. We have detached biographies, the *Lives* of Cunningham, the useful *Dictionary* of Redgrave, and other works of like and varying merit; but has anyone even attempted to trace the line which should connect the exhibitions of to-day with the illuminated MSS. of the past? Until some such attempt has been made we scarcely do well to be content with the theory of "exceptional solutions of continuity." The art activity of England, both throughout the sixteenth century and in years preceding, was far greater than is usually supposed. The Court-painters of Henry VIII. were not all foreign: some at least were undoubtedly Englishmen. Who was Bernard Bush? and what was his work? Does anyone know anything about him? Yet this man, "peintre du roi d'Angleterre," is liberally rewarded in 1532 for the execution of "certains tableaux et autres peintures" by no less honourable a judge than Francis I. of France. The Reformation, it is true, dealt a deadly blow to the interests of English art. Work which was not destroyed was largely exported. Throughout the month of August, 1550, Corrozet mentions that public sales took place on the "Quai de la Mégisserie" of "images, tables d'autels, peintures, et autres ornements d'église qu'on avait apporté, et sauvez des églises d'Angleterre." But something, if not much, survived in spite of almost fatal discouragement. Cooper and Dobson succeeded Hilliard and Oliver, and Riley carries us on to Reynolds. Diverse as are the merits and the manners of these men, there are certain points which unite them and proclaim a family unity, as well as others which separate them into groups and distinguish the different periods which they represented. It is true that in characterising the different epochs we cannot point, as in France, to the open organisation of conflicting and successive influences, but their action in England is none the less powerful and general. There are signs which mark, in the main, each period, as there are signs, such as choice of colour, which connect the English painters of to-day with the illuminators of Anglo-Saxon MSS. It is for us to seek or to neglect their guidance.

To make a complete survey of English art in this sense would demand the devotion of many years to wearisome, and not always fruitful, labour. Mr. Wedmore himself may have neither the time nor the inclination for

such a task. But, for whomsoever it may be reserved, its drudgery will be greatly lightened by the concurrence of independent students who work with the conscientiousness and taste shown by the author of these *Studies*.

E. F. S. PATTISON.

THE WATER-COLOUR SOCIETY.

THE "Fifteenth Winter Exhibition of Sketches and Studies by the Members" was opened to the public by this Society on the 4th instant. The display is so far agreeable that the eye ranges with pleasure round the walls—pleasure which hardly, however, reaches the higher level of satisfaction after a more deliberate examination. But at any rate there is a good deal to like, and not much to denounce. It suits our convenience on the present occasion to take the pictures simply according to their place on the walls.

Clarence Whaite, *Fern Harvest, Cumberland*. Mr. Whaite is a painter of refined perceptions in landscape, who comes near to having ideas as well: like other artists of the same class, he is rather too fond of attempting difficulties which it is scarcely in the power of art to conquer; for instance, he is particularly prone to painting rainbows. There is one in the present picture, covering a large space; and a very respectable one it is, looking luminous enough from the opposite side of the room. Numerous sketches are also contributed by this painter: direct, forcible memoranda for future use, worthy of preservation on their own account as well. J. D. Watson, *Friends in Council*, a mediaeval Jester with his bauble; he addresses it as if he were telling a good story, the action of his hands emphasising the words; painted with much solidity, in a warm rich tone of colouring. North, *Moonlight*, fine, but rather too slaty in the sky; a certain influence from Mr. Alfred Hunt is apparent, besides the very sweet quality of Mr. North's own style. Gilbert, *Free Lances*, a small company of mounted men crossing a shallow ford in a rainy daybreak: a subject quite in the painter's true line, and to which he here does full justice. He contributes also *Convocation of Clergy, a Study for the Picture now in the Royal Academy*, an admirable composition, as many who saw the oil-painting exhibited will remember, and on several grounds a really powerful performance, only a little lowered in calibre by the rather excessive ease with which Sir John Gilbert has worked on this as on all occasions. George Fripp, *Study of a Hillside and Cavern on the Coast of Cornwall*: a good drawing, realising the "common-sense" aspect of a grand natural scene. Shields, *"By faith Abel offered unto God a more excellent sacrifice than Cain"*. This is a chalk-design, by far the most important example in the gallery in point of elevated style and fine-handed draughtsmanship. Abel, a naked figure save for a hide that hangs loosely about him, has been slain beside his altar as he knelt. Still on his knees, he has drooped backward; the pose has evidently been very carefully worked out in the artist's mind so as to express the three things needed—worship, the collapse of sudden death, and the protest to Heaven of the righteous blood crying from the ground. An apple, one of the fruits that Cain had unacceptably offered to God, lies on the soil behind Abel's altar. It seems to us that the ram on the altar is rather small; also the hands of Abel, more particularly the right one raised to his brow. However this may be, Mr. Shields here proves—not certainly for the first time, but more conspicuously than with any of his other works of nude form, or of recent years—that he ranks among our artists qualified to treat large subject-matter on a large scale. Basil Bradley, *Feline Affection—Study of Lion and Lionesses born in the Gardens of the Zoological Society of London in 1872*. One of the lionesses is licking the lion's massive head just below the mane; the other snoozes with her chin against his flank. The colour is good and

simple, and the whole thing a genuine piece of observation and portrayal: the legs of the animals, however, strike us as rather weak. By the same artist is *Tired Playmates—a Study of Young Tigers at the Zoological Gardens*—the four terrific beauties lying well packed into their box, with protrusive tails and paws, a very satisfactory work; also *Young Tigers at Play in the Zoological Gardens—a Chalk Study for Drawing of the same Subject*—not less commendable than the others, but losing by the absence of colouring. Brewtnall, *Beaching the Boat*: five mariners working the capstan, and another busied with the boat itself, in a grey afternoon, with greenish sea and brown sands; very successful in tone, and hence in generally appropriate sentiment. Albert Goodwin, *Arab Life in Cairo*: a bazaar with its population in pallid sunlight; there is not much business doing, nor much seeming inclination on the part of the traders to do any that might offer. A *certain Street in Cairo* forms a companion-subject, the careful and natural perspective effect of the whole being perhaps its leading merit. Alfred Fripp, *The Quarry-path*. The foreground lies in broad shadow, the rest in mellow but not glaring sunlight. A sheep-dog is chasing the flock away across a dip in the downs towards the sea-cliffs. A bright and pleasant work, one of the best examples we have lately seen of Mr. Fripp's characteristic gifts, but, as usual, not quite substantial enough. Hale, *Coigach*. This artist is doing really fine work, and promises to be soon one of our most advanced and elevated landscape-painters—not blameably imitative, but influenced no doubt by the style of Mr. Alfred Hunt, a very good master from whom to learn some of the subtler secrets of art. Small as it is, this *Coigach* may well be termed grand—both in the composing of the broad and dignified forms, and in the colour-elements; a windless lake, slate-purple in tint, at the foot of the crags, coppery hard-by, and slaty in the distance, with a greenish-yellow opening of sky to the left. *Low Tide, Sunset*, is a larger work, fully as fine. The hills, swathed in a golden light-mist, are reflected in the moveless shallows of the sea, a space of total calm detached amid the other gently rippled waters. In the leftward foreground the grass is also gold-tinted; some sheep are straggling upon it, close to the sea-margin of broken rocks. The sky has a large amount of varied and enjoyable detail, more remarkable, in total impression, for harmony than for luminousness. Powell, *The Sea Belle*. This is a very noticeable study of light—whiteish, clear, yet visionary; the sky pale blue, spotted with fleecy clouds and vapour-drifts; the sea calm but not still, the barques on its surface floating with languid regularity. It is a scene which leads the eye on and on, and brings it to no determinate pause: space is excellently expressed, and the ear of fancy can only catch a faint hush, more soundless than silence. Marsh, *Cinderella*: a bold, solid, broadly simple study, on a considerable scale of size. The much-snubbed kitchen-girl, with her hand up to her cheek, is looking out wistfully just after the departure of her bedizened half-sisters for the ball: she is more heavy-jowled than beseems a well-born maiden who, though artificially depressed to the scullery, is soon to figure as the authentic belle of the palatial fête. A landscape by this artist, *Evening*, has a striking and almost majestic fusion of rich dark tone. Down the front stretches a road, with a waggon lumbering along it; a woman is seated on the low roadside wall, and a man is courting her; behind this comes rising ground, topped by trees which show in dusky solemnity against the uniform but delicately-graded yellow light.

This notice does not carry us so much as half through the exhibition: we shall return to it on a future occasion. W. M. ROSSETTI.

ART SALES.

MESSRS. CHRISTIE, MANSON AND WOODS will sell this year the important and varied collection of works of art gathered by the late celebrated Robert Napier, of West Shandon, Dumbartonshire, of which an elaborate *catalogue raisonné* was drawn up, in 1865, by J. O. Robinson, and privately printed for circulation among Mr. Napier's friends.

MESSRS. CHRISTIE, MANSON AND WOODS sold on the 8th inst. another consignment of modern enamels and porcelain received from China. The principal object of attraction was a pair of elephants of white enamel, with trappings and vases of turquoise enamel on their backs, 4ft. 9in. high, which sold for 205*l.*; a pair of large cisterns, with landscapes on white ground and fish on turquoise ground inside, 85*l.*; a tall fluted jar, with dragons on turquoise ground, 25*l.* 10*s.*; a pair of monsters, with birds on their backs, 20*l.*; a clock case, the top surmounted by a bird, 20*l.*; a pair of large pilgrim bottles, with white medallions of birds and black-and-turquoise ground, 48*l.*; a pair of large beakers, with ornament on turquoise ground, 31*l.*; blue-and-white porcelain square vase, with landscape and figures, 33*l.*; a ditto tall bottle, with equestrian figure, 25*l.*; and a blue-and-white beaker, with figures, 15*l.*

AMONG the Handel relics sold by the same auctioneers on the 24th ult., was a finely embroidered cambric ruffle, which formerly belonged to Handel, and is the same he wears in his portrait by Hudson. It sold for 8*l.*

NOTES AND NEWS.

THE Byron Memorial Committee have now definitely decided to open a second competition for the proposed monument. They announce a public exhibition of the competing designs, to be held on June 1, 1877, upon the same conditions as those which regulated the exhibition recently closed. In regard to the failure of the last competition, we understand that several artists whose names have by some means been made public are not pleased at what they are disposed to regard as an infringement of the terms upon which they consented to become competitors.

M. TISSOT, who will be among the contributors to the new Grosvenor Gallery, has lately completed several very interesting pictures intended for the exhibition. One of these is a large portrait study of a lady placed amid a wilderness of chrysanthemums in bloom. She is stooping down to arrange one of the plants, in such a manner that the face is surrounded by the rich and varied tints of the flowers, whose delicate forms are everywhere precisely rendered. It is a bold experiment in colour that depends for its success upon the faithful realisation of a single effect of light controlling and harmonising the different tints. A second composition is called *The Widower*, in which the father is represented with a child in his arms standing amid the long grass of an orchard in spring time. The sentiment of the picture is rather suggested than expressed by means of a grave and tender arrangement of colour. The light is a spring day, over which the sun has not yet gained full power, and the contrast between the darkly clad figures and the lush green of the grass and foliage is further subdued by the tints of violet iris that spring up in the foreground. M. Tissot is also engaged upon an allegorical picture intended to represent *The Triumph of Will*, but it is as yet too soon to speak of the composition in detail. We may add that among the etchings he is about to publish will be found several plates already exhibited either in the Royal Academy or the Black-and-White Exhibitions.

THE collection of works of art lately brought together by the members of the German Athenæum presented several features of especial in-

terest, including some original sketches by Horace Vernet and an admirable portrait by Romney, besides a number of studies and pictures contributed by the artist-members of the society.

MR. C. E. HALLÉ has lately finished a very interesting portrait of Lady Lindsay.

IN the course of the important restorations now in progress in the chapel in the Tower some interesting discoveries have been made of the remains of celebrated persons buried within its walls. History does not always supply the precise information needed to identify all the bodies that have been exhumed, but in certain cases, notably in that of Anne Boleyn, it has been possible to fix precisely upon the place of burial.

THE long-talked of change in the prints selected for public exhibition in the table-cases and on the screens of the King's Library at the British Museum is being gradually effected. The early Italian prints, from the first impressions on niello to the masterpieces of Marc Antonio, the great Dürers, and the magnificent selection from the work of Rembrandt—all of them a part of the munificent bequest of the late Mr. Felix Slade—have already disappeared, and their places are being gradually filled by a collection of historical portraits, as to which we may on another occasion have something to say. The principle admitted by the change of prints on public view is an excellent one, and one which has been more than once advocated in these columns and in those of the *Athenæum*.

AT a Council Meeting of the Royal Archaeological Institute of Great Britain and Ireland, held in New Burlington Street on the 5th inst., Albert Hartshorne, Esq. (son of the late Rev. Charles Hartshorne), author of *The Recumbent Effigies of Northamptonshire*, and William Brailsford, Esq., were unanimously appointed joint secretaries of that Society.

PROF. LUIGI MALVEGGI, by a process of his own, has lately been restoring a grand fresco of the Semini brothers in Vercelli. He has treated many similar works successfully in Mantua and Milan. But his crowning achievement has been wrought at Monza, where he was invited to try the success of his invention on the famous chapel of Teodolinda, in Monza Cathedral. Two of the most blackened compartments were assigned to him, on which not the faintest traces of painting could be seen. After eight days of patient labour, the whole composition came out, all the figures with their accessories and much ornamental gold work. By this process the original force and colour of the painting is retained, which the progress of time increases rather than diminishes. Signor Malveggi worked in the face of many obstacles; the painting was in parts so smoke-blackened, in parts so impregnated with nitre, which had displayed all the potency of its corrosive action, and in parts considerably damaged by cuts and cracks, that it required all the skill and knowledge of ancient art that he possesses so truly to perfect it as he has done.

WE have received from the publisher, Mrs. Nosedá, a line engraving by Joubert after Greuze. The engraver is an artist of unequal talent, but, as the good side of his talent is shown in this print, its inequality will not distress those who may become possessed of the present work. Greuze himself has thus far little engaged the attention of English amateurs, with one or two notable exceptions; it is, of course, matter of notoriety that in one or two of our English private collections Greuze is represented in an unparalleled fashion—for instance, by this particular picture in Mr. Cholmondeley's possession, and by the whole assemblage in the possession of Lord Dudley. The girl's head before us is one of those upon which the reputation of this facile eighteenth-century painter will undoubtedly rest, and on which, moreover, it may be content to rest. For while the humble interiors of his earlier years

—derived, as it were, from Chardin—and the painful moralities of his latter years may be forgotten without loss, there will always, among amateurs of any wide appreciation, be a place reserved for those heads, half-girlish, half-womanly, and wholly seductive, which Greuze painted in his best time. Quite among the prettiest of these is the picture now engraved from the collection of Mr. Cholmondeley. Without being great, it is sure to be popular, for nothing can be more characteristic. And, moreover, modern line-engraving has rarely reached the success with which the engraver in the present instance has caught the true expression of the original, the softness of modelling, the seductiveness of the face. One may like it or not, according as fashions change, and according as taste in Art leans to the severe or relaxed—to the century of the Van Eycks or the century of Fragonard—but it is an exquisite thing in its way—it is entirely a Greuze.

THE first stone was laid last month of a grand national museum for Amsterdam, in which the collections, hitherto dispersed, of the Trippenhuis, the Van der Hoop Museum, and the Stadthaus, are to be united, to the great convenience of visitors and students. The need of such a museum has long been felt in Holland, and its accomplishment, according to the Amsterdam papers, was so welcome that even private houses were decorated with flags on the occasion of the ceremony of stone-laying. The site of the new building is on one of the quays of the new quarter near the Vondelspark, a foundation which has only recently been won from the water of the old Singelgracht. The building, which is designed to be the largest in Amsterdam, is to be constructed of stone, glass, and iron, in a style that is called Dutch Renaissance. Herr Cuypers is the architect, who is very favourably known already by his restoration of the cathedral at Mainz, and of many private houses and churches in Amsterdam. As a specimen of the difficulties against which builders in Holland have to contend, we may mention that it is stated that 6,000 piles will need to be driven to assure the foundation of the new museum: nevertheless it is hoped that it will be finished in about five years. It will contain, besides large galleries for the reception of masterworks of the old Dutch painters, a library, a cabinet of coins, studios for restoration and copying, and two large covered courts to be used as museums for monumental works and architectural remains, either original or casts.

A REMARKABLE new picture by Prof. von Gebhardt is at present being exhibited at Düsseldorf, and is creating a great sensation among the art-loving public in Germany. The subject chosen by the painter is the well-worn one of the disciples at Emmaus, but Gebhardt has not treated it at all in the conventional or traditional spirit. The picture is divided, after the manner of a mediæval altarpiece, into a large painting in the centre, and a smaller one as a lunette, separated by heavy architectural framework. The elaborate framing of this strange work is, indeed, not the least curious thing about it, only, unfortunately, it distracts attention from the striking effect of the painting. In the chief compartment the disciples are seen at the very moment when their Master has disappeared from their sight. One of them, a dark, powerful man, stands up holding out the bread which he was about to break with his Lord, and gazing with incomprehensible amazement at the empty place where a moment before the divine Host had been sitting. The other, an older man, sits quietly with his glance directed above, where Christ is seen in the upper portion of the picture stretching forth two large hands, in the act of blessing, but with a countenance full of grief and compassion for the sins and sorrows of the humanity that He has now for ever cast off. The great fault of this arrangement of the subject is, that the one division of the picture is not clearly connected

with the other. The Christ of the small semi-circular lunette is of the ordinary weak, dismal type, and has none of the glory that might be supposed to be made manifest at such a supreme moment of His existence. The disciples, on the other hand, are conceived with the utmost realistic power, are full of life, movement, and character. When we add to this a noble harmony of colour, a deep poetic feeling, and great skill in execution, it is not surprising that in spite of its many glaring faults this picture exercises a powerful fascination over the mind, and charms even its severest critics into an acknowledgment of the great talent of its painter.

THE STAGE.

THE fire at the Brooklyn Theatre has given rise, naturally, to many reflections on the part of the London papers as to the condition of our own playhouses—their risks of flame, and the dangers to life and limb through the panic that in a crowded house, with small and sometimes half-concealed means of egress, would certainly ensue upon the slightest alarm being given. Many questions have been raised, and little comfort has been given; but one re-assuring correspondent has written to the *Times* to suggest, not that any alteration should be made in the means of exit, but that notices should be posted in every theatre calling upon people to pass out quietly and not to give way to alarm. He adds that few persons know how short a time it takes to empty a London theatre, and he has little doubt that if any accident occurred through fire at all it would be through the obstinacy of some young men who would be desirous of seeing the conflagration. The correspondent is decidedly an optimist; and he omits to tell us, in black and white, the number of minutes it would really take to empty any one of our theatres. Some of our theatres are approached by high flights of steps: others by narrow gas-lit tunnels; others by a descent into the bowels of the earth. The stalls in several theatres are reached by labyrinthine passages only less puzzling than the Maze at Hampton Court. And we are safe in saying that some of the more recently-constructed playhouses are in these respects more dangerous places than any of the older ones. There are London theatres, we admit, where doors not generally used are in existence and are supposed to afford ample means of exit in the event of alarm of fire. But a door not generally used is, in all probability, a door that nobody would think of. If we are to be told that it would be of practical service, we must be told also that there is one servant of the manager whose sole business it is to stand every night in readiness to open it. Again, the Lord Chamberlain did no unnecessary thing when he lately called upon managers not to block up the playhouses with extra chairs, not only to the discomfort of the audience in time of safety, but of additional danger in times of alarm. The managers have been obliged to discontinue that practice, which had been fallen into, doubtless, through thoughtlessness rather than greed. But is it true that at any theatre, regular stalls have since been added, permanently blocking the way which the chairs blocked only temporarily? Or is it true that the arrangement of fixed stalls in at least one or two theatres—whether made before or after the warning of the Lord Chamberlain—is such as to produce exactly that barrier to freedom of egress of which the Lord Chamberlain complained not a moment too soon? We shall be glad if these questions can be answered satisfactorily; but meanwhile we shall venture to say with all respect, that the time has come for a searching examination by the proper official of the means of egress from each theatre in London.

AN immediate change of programme is announced at the Olympic Theatre, from which *No Thoroughfare* is to be withdrawn.

THE *Pantomime* promised at the Adelphi will be acted by children only, and will be played only at day performances.

LAST Saturday, Mr. Irving received from the graduates and undergraduates of Trinity College, Dublin, an address of congratulation on his performances of Shakspeare. Mr. Irving bade farewell to the Irish public the same evening, in a performance of *Hamlet*, which was witnessed by an audience exceptionally brilliant and influential.

THE benefit of Mr. D. McKay, the acting manager of the Vaudeville—appointed to take place to-day—will be interesting, not only for the variety and excellence of some of the pieces or parts of pieces chosen for performance, but for the opportunity of seeing how far *Our Boys'* run of six hundred nights—the most dangerous trial that can occur to the art of an actor and actress—has affected the members of the Vaudeville company when they come to present themselves in other work.

THE series of readings by Mr. F. C. Burnand at the Westminster Aquarium—the same given by him about three years ago in another part of London—is now about to conclude.

A NEW public reader, of whom rumour said good things were to be expected, gave a reading in St. John's Wood on Tuesday night. Miss Cowen is almost a *débutante*, and has the failings inseparable from a small experience. But she has also a talent sufficiently individual and peculiar for it to be safe to consider her as distinctly promising. She laboured, we thought, under the weight of a somewhat ill-advised selection of passages. There were too few standard things, and of the few that there were she was persuaded to omit one in favour of a piece more immediately fitted, we allow, to tell upon a miscellaneous audience, but also rather tiresomely full of petty surprises and sensations which a good public reader should be able to dispense with. The piece omitted was the *Poor Traveller* of Dickens: a thing which the great master alike of novel writing and of dramatic reading used to read himself as a sort of *lever de rideau* to his stronger scenes. It is a capital test-piece, for the very reason that it is without obvious effectiveness: it is simply a charming piece of quiet and terse narrative; and if Miss Cowen is as intelligent a reader as we take her to be she did unwisely in omitting it. A piece by Mr. Francillon which she read further on is distinctly and legitimately dramatic, and in much of it Miss Cowen displayed her undoubted powers in pathetic acting; but she did not seem to have fully mastered all the intricacies of the scene. The absence of complete execution of her dialogue, so that not *some* words but *every* word shall tell; the occasional monotony; and the deficiency of heartiness in humour, are all that the severest criticism can urge against the reader at present. To the good side of the account may be set that real and rare gift of pathos which we have mentioned already; some instinct of true and significant gesture—shown notably in *The Bridge of Sighs*—and a neat and pointed delivery of scenes of gentle comedy. What pleased us best on the whole was the reading of Thackeray's *Cane-Bottomed Chair*—a piece of dainty and pathetic, and also humorous, reverie, to which Miss Cowen did more justice than one often ventures to hope for. She read it with unforced variety, and with a refined understanding of its delicate charm.

THERE is nothing whatever in *L'Ami Fritz* of Messrs. Erckmann-Chatrian—brought out last week at the Théâtre Français—that need have given rise to the polemic which had filled French newspapers for the previous fortnight. *L'Ami Fritz* is a simple idyl, of which the otherwise refinement is relieved a little by that parade of the pleasures of the table which is always so popular on the English stage, but which at the Théâtre Français has also the advantage of novelty. The tale is entirely simple, and it was,

we hear, at first the intention of the management that *L'Ami Fritz* should form but the first half of the evening's entertainment; but as the subject got talked about in the papers, the importance of the piece assumed larger proportions. The characters of David Sichel, a philosophic Jew, of Suzel, the heroine, and of Fritz, a good fellow of five-and-thirty, who is unnecessarily hesitating in his desires to espouse the *ingénue*, are well contrasted; and Got makes an excellent stage figure of the Jew—a character studied as if from the life. The scenery and the appointments—those especially of an Alsatian farmhouse, with its store of pottery, fine linen, and furniture—are admirable; but there is nothing in the piece itself to ensure a very long run; and it is pretty plain that the political friends of MM. Erckmann-Chatrian, grateful for the obtrusive Republicanism of *The Story of the Plébiscite*, have by their talk done the authors a service which is only equalled by that less willing service rendered by the trenchant criticisms of the opposite party.

MUSIC.

"ALCESTIS" AT THE CRYSTAL PALACE.

It was a bold venture on the part of Mr. Henry Gadsby to follow in the steps of Mendelssohn, and attempt a musical illustration of an ancient Greek tragedy. The risk that he ran was twofold. On the one hand, by too close a copy of the style of the music to *Antigone* and *Oedipus*, he might easily lay himself open to the charge of mere servile imitation; while, on the other, the forms which Mendelssohn has adopted are musically so perfect, and dramatically so suitable, that it is not easy to see how they could be, to any considerable extent, deviated from without detriment to the effect of the work. Moreover, Mr. Gadsby almost of necessity challenges a comparison between himself and Mendelssohn; because, with the exception of Eduard Lassen's setting of the choruses to the *Oedipus Rex* (in completion of the musical illustration of Sophocles' trilogy), a work entirely unknown in this country, no other attempt has, so far as I am aware, been made to adapt music to any of the old Greek plays. Under these circumstances, it would have been no discredit to the composer had he failed; it is the more gratifying to record that the first production of *Alceste* at the Crystal Palace on Tuesday last was a complete and well-deserved success.

The tragedy of Euripides is so familiar, at least in the outlines of its story, that any detailed analysis would be superfluous. It has not the attractiveness of the *Antigone*, nor the tragic power of the *Oedipus*; with the exception of the devoted wife, and the jovial Hercules, it is impossible to feel much sympathy with the characters of the drama. Admetus himself is a contemptible coward, who abuses his father in no measured language for not dying in his place, and allows his wife to lay down her life for him without compunction. Calzabigi, the librettist of Gluck's opera of *Alceste*, has with much tact altered this incident, by making the wife volunteer to die for her husband, he not knowing of the sacrifice till it was too late to prevent it. The happy end of the work, Alceste being rescued from the arms of Death by Hercules, entitles the drama to be called a tragi-comedy rather than a tragedy.

Mr. Gadsby's music consists of an overture and nine choral and melodramatic numbers. To a certain extent it was of course impossible for the composer to avoid imitating the Mendelssohn forms; because the choruses of Euripides, like those of Sophocles, mostly consist of strophe and antistrophe, and the structure of the poetry necessitated a correspondence in the musical settings of the words. But that Mr. Gadsby should so far have followed his illustrious predecessor is not only no discredit, but is positively commendable, because no other form would have done equal justice to his subject. It is high praise for him that in no

one passage of his work do we find a trace of reminiscence or plagiarism. As in *Antigone* and *Oedipus*, the choruses in *Alceste* are written for a double choir of male voices. There is a large proportion in the work of what may be termed choral dialogue—passages, that is, in which the chorus, mostly in unison, answers the remarks of a single speaker; there is also a considerable amount of melodrama. In this portion of the music the composer has shown a dramatic feeling and a truth of expression which deserve high commendation, while in the more purely lyrical numbers we find a pleasing flow of melody and an artistic treatment which entitle the work to be considered one of the best that its author has yet produced. If he nowhere rises to such a height as that attained by Mendelssohn in the "Hymn to Bacchus" in *Antigone*, or "Thou comest here to the land" in *Oedipus*, Mr. Gadsby, on the other hand, is never dull; and though, as might be expected, some numbers are superior to others, there is not one which fails to interest. The orchestration, too, is excellent, clear, and "well-nourished" (to translate a French idiom), without being overwrought. It would have been easy to overpower the voices, especially as the chorus numbered only about forty; but by the judicious employment of his resources, the composer has skillfully avoided this too common fault. It would take us too far to specify all the noteworthy features of the score; but mention ought certainly to be made of three of the most important choruses, which are particularly good. These are "Immortal bliss be thine," "Yes, liberal house," and "My venturous foot delights." The melodramatic music accompanying the death of Alceste is also of great excellence. Mr. Gadsby may be warmly congratulated on this, so far as we know, his most ambitious work.

The performance was, as usual at the Crystal Palace, most satisfactory. The part of Alceste, which is by no means one of the most important in the work, was well declaimed and acted by Miss Emily Cross, while the Admetus of Mr. Arthur Mathison was in all respects worthy of praise. The special feature of the acting was, however, the Hercules of Mr. W. Rignold. This is certainly the best "acting part" in the drama: the other characters have little to do but to recite their verses; but Hercules, in the scene with Medon, where he discovers the affliction that has befallen Admetus, has an opportunity for the display of a warm heart beneath a rugged exterior, of which Mr. Rignold availed himself well. The subordinate parts were well filled by Miss Emily Vining (Iole), Mr. J. H. Barnes (Apollo), Mr. Henry Moxon (Thanatos), Mr. Edmund Leathes (Pheres), Mr. Bruton Robins (Medon), and Mr. W. Holman (Chorus Speaker).

The chorus was the same which, under the direction of Mr. W. Gadsby (the composer's father), had previously distinguished itself at the Crystal Palace in *Antigone* and *Oedipus*. The singing was on this occasion again of a high order of excellence, and was the more praiseworthy because the whole of the unfamiliar music was necessarily sung from memory. In no one instance did we notice an entry missed, or a point taken up with indecision. The instrumental portion of the work was played to perfection by the Crystal Palace band; and Mr. Manns conducted the performance with that special care which he always takes in the production of any new composition. EBENEZER PROUT.

Liszt's *Mazeppa*, which was the special novelty of last Saturday's concert at the Crystal Palace, is the same work which was recently played in the composer's transcription as a duet for two pianos, by Mr. Walter Bache and Mrs. Beesley, at St. James's Hall. It was impossible for those who heard it in that form to obtain an adequate idea of the music, as so much depends upon the colouring. It was therefore well that an opportunity should be afforded of hearing the composition as originally designed, and Mr. Manns has

laid musicians under an obligation by bringing it forward on Saturday. It is the sixth of Liszt's "Symphonische Dichtungen," and, like the rest of the series, is strictly "programme music." The composer has selected as his subject for illustration the poem of Victor Hugo, which, together with a German translation, is prefixed to the score. The work is in three movements, the first of which, an *allegro agitato*, depicts the terrible ride of Mazeppa; in the *andante* we see him lying exhausted on the back of the dead steed; while the final *allegro marziale* paints (to quote the programme of Saturday's concert) "glory and greatness achieved through suffering and adversity." Though it is in parts very wild, and by no means readily appreciable, we are disposed to consider *Mazeppa* one of the best of the Symphonic Poems. Like much of Liszt's work, it is at times laboured, diffuse, even eccentric; yet there is a massive grandiose power about the music to which it is difficult to remain insensible. This is especially noticeable in the chief theme of the first movement, and in the final march. The performance of the work, which is of truly extraordinary complexity and difficulty, was a veritable triumph for Mr. Manns and his orchestra; there is probably no other body of performers in the country that could have done even tolerable justice to the music. The remainder of the programme included Bennett's symphony in G minor, Schumann's overture to *Genoveva*, Hiller's piano concerto in F sharp minor, played by Miss Anna Mehlig, and vocal music by Miss Ida Corni and Mr. F. H. Celli. To-day being the anniversary of Beethoven's birth, his Choral Symphony will be given, and Madame Arabella Goddard will play his concerto in E flat.

THE last Monday Popular Concert before Christmas took place on Monday evening last, when Mr. Chappell afforded his subscribers a genuine treat by bringing forward Schubert's great quintett for strings in C major, Op. 163. This beautiful and most characteristic work is much less frequently heard than it deserves; it is one of the latest and most mature of Schubert's compositions. By the employment of a second violoncello instead of the more usual second viola, the author has imparted a new colouring to the work. The quintett was very finely rendered by Messrs. Straus, Ries, Zerbini, Piatti, and Pezze. We trust that it may shortly be followed by the same composer's still more neglected (and still finer) quartett in G major, Op. 161, which has only once, eight years ago, been heard at these concerts. The pianist on Monday was Miss Anna Mehlig, who played as her solo Schumann's very trying Toccata in C major, and also took part with Messrs. Straus, Zerbini, and Piatti in Brahms's piano quartett in G minor, and with Signor Piatti in Chopin's Introduction and Polonaise for piano and violoncello. Miss Redeker was the vocalist.

A PERFORMANCE of Randegger's *Fridolin* was given on Wednesday evening at Exeter Hall, in aid of the Church Schoolmasters' and Schoolmistresses' Benevolent Institution. The solo parts were sung by Mrs. Osgood and Messrs. Henry Guy, J. L. Wadmore, and Pope; and the chorus and orchestra numbered about 600 performers. The composer conducted.

Mlle. FRANCHINO has made a very successful *début* at the Opéra Comique, Paris, as Marie in *La Fille du Régiment*. At the same house Bazin's *Maitre Pathelin* is shortly to be revived.

AN early one-act opera by Hérold, *Les Troqueurs*, which had not been played since its first production in 1819, has been revived with fair success by M. Vizentini at the Théâtre Lyrique, Paris.

Mme. LUCCA is at present the great musical attraction at Brussels. She has been singing at the Théâtre de la Monnaie in *Les Huguenots*, *La Favorite*, *L'Africaine* and *Faust* with brilliant success.

At the eighth Gewandhaus concert at Leipzig, Mdme. Schumann was the pianist, playing her husband's concerto in A minor, and solos by Mendelssohn and Chopin. She appears to have completely recovered from the effects of her late illness; and the German musical papers speak of her as being again in the full possession of her powers.

HERR JAUNER, the director of the Opera at Vienna, has issued his programme for 1877. At least three novelties are to be given—Wagner's *Walküre*, Saint-Saëns' *Samson and Dalila*, and Delibes' ballet *Sylvia*.

HERMANN GOETZ, whose opera *Der Widerspänstigen Zähmung* has within the last few years gained him a European reputation, died on the 3rd inst., after a long illness, at Hottingen, near Zürich, in the thirty-sixth year of his age.

In the *Deutsche Rundschau* Louis Ehler gives us a gracefully written appreciation of Schumann and his school. Of Schumann's early piano compositions he well says:—"Half pen-and-ink, half water-colour sketches, these miniatures have from the former art the charm of the impromptu, from the latter the rapidly fixed colouring. Schumann created this art of musical diminutive poesy." Schumann became the leader of a school, which contains, or has contained, more than one half of living German musicians, just because of his marked individuality. "It is the deviations from the ideal mean in which art-colonies settle themselves." But Schumann's ideal—his Romanticism of moon-light and bosky gloom—no longer answers to the popular. "As we have entered on our summer politically, so we desire also in art after the love-spring of Schumann's music a more positive and a fuller life-sense of our musical blood-circulation."

EDWARD STANFORD'S
NEW LIST.

55 CHARING CROSS, S.W.

STUDIES IN ENGLISH LITERATURE. By

JOHN DENNIS, Editor of "English Sonnets, a Selection from 1517," &c. Crown 8vo, cloth, 7s. 6d.

CONTENTS: Pope—Defoe—Prior—Steele—The Warton—John Wesley—Southey—English Lyrical Poetry—English Rural Poetry—The English Sonnet.

CANOE and CAMP LIFE in BRITISH

GUIANA. By C. BARRINGTON BROWN, F.G.S., Associate of the Royal School of Mines, late Government Surveyor in British Guiana. Demy 8vo, cloth, with Map and 10 Coloured Illustrations, 21s.

Whilst engaged as Geologist on the Government Geological Survey of the West Indies, it fell to the lot of the Author to visit and explore much of that portion of British Guiana lying between the rear of the sugar estates and the confines of the colony known as the Interior, and which consists of swamps, wooded rising ground, and finally mountains and savannah stretching southwards, all lying in a state of nature, the haunts of wild animals and various Indian tribes. In these pages he has recounted the incidents that occurred during those explorations.

The EMIGRANT and SPORTSMAN in

CANADA: Some Experiences of an Old Country Settler. With Sketches of Canadian Life, Sporting Adventures, and Observations on the Forests and Fauna. By J. J. ROWAN. Large post 8vo, cloth, with Map, 10s. 6d.

This Work contains Practical Hints for Emigrants and Sportsmen, written by an Emigrant and a Sportsman. Also information specially written for a class of emigrants for which Canada is a particularly suitable country—people of small fortune, whose means, though ample to enable them to live well in Canada, are insufficient to meet the demands of rising expenses at home.

The NORTHERN BARRIER of INDIA: a

Popular Account of the Jummoo and Kashmir Territories. By FREDERIC DREW, F.R.G.S., F.G.S., Associate of the Royal School of Mines, Assistant-Master at Eton College, late of the Maharajah of Kashmir's Service. Author of "The Jummoo and Kashmir Territories: a Geographical Account." Large post 8vo, with Map and numerous Illustrations, cloth. [Shortly.]

The JUMMOO and KASHMIR TERRI-

TORIES: a Geographical Account. By FREDERIC DREW, F.R.G.S., F.G.S., Associate of the Royal School of Mines; late of the Maharajah of Kashmir's Service. Medium 8vo, pp. 568. Illustrated by Six Coloured Folding Maps, numerous Plates and Folding Sections, cloth, 42s.

"One of the most valuable additions to our knowledge of Indian geography which we have been called upon to notice. . . . We are able to speak of the author's work in terms of unqualified praise." *Geographical Magazine*.

"The importance and value of the work in a scientific point of view are very great, and the five maps, which are arranged respectively as the General, the Snow, the Political, the Faith, and the Race Maps, are the most complete within our knowledge." *Spectator*.

The TRUSTEE'S GUIDE: a Synopsis of the

Ordinary Powers of Trustees in regard to Investments, with Practical Directions and Tables of Securities. By BERNARD CROFT. Twelfth Edition, fcap. 4to, cloth, 7s. 6d.

"As a useful office book of reference, the Guide is one sui generis." *Monetary Gazette*.

"The most complete work of its kind yet presented to the public." *Railway News*.

BRITISH MANUFACTURING INDUSTRIES.

A Series of Handy Volumes by Eminent Writers. Edited by G. PHILLIPS BEVAN, F.G.S. Post 8vo, cloth, each 3s. 6d.

Twelve Volumes of this Series are now ready.

Prospectus on application, or by post for One Stamp.

THE INDUSTRIAL CLASSES and INDUS-

TRIAL STATISTICS. By G. PHILLIPS BEVAN, F.G.S. 2 vols. post 8vo, with Maps, cloth, each 3s. 6d. Uniform in size and price with "British Manufacturing Industries." [Shortly.]

London: EDWARD STANFORD, 55 Charing Cross, S.W.

SATURDAY, DECEMBER 23, 1876.

No. 242, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Life of Robert Frampton, Bishop of Gloucester, Deprived as a Non-Juror, 1689. Edited by T. Simpson Evans, M.A., Vicar of Shoreditch. (London: Longmans & Co., 1876.)

WE have here presented to us, for the first time in a complete form, a biography of "that famous preacher, Dr. Frampton," whom Evelyn sat under at St. Giles's one Sunday in October, 1672, and whom Pepys describes six years earlier as a young man of mighty ready tongue, discoursing "the most like an apostle that ever I heard man," so that "it was much the best time that I ever spent in my life at church." What gives additional value to this biography is the fact of its being the work of a contemporary, the volume entitled as above being, in fact, a literal reproduction of a manuscript memoir which came into the hands of Mr. Evans about fifty years ago; a chest of drawers which had originally belonged to the Bishop was its first place of discovery.

The language and manner of thought displayed by the anonymous author of this memoir have at times a quaintness which will arrest the attention of many readers of purely literary tastes; but it is unnecessary to criticise the style of a work brought to light for the first time so many years after completion. The true value and proper justification for the appearance in print of such memoirs at the present time must be sought for in the new illustrations of social and political history they contain. That from such a point of view alone Frampton's Life is well worth notice we hope to prove even in the brief space necessarily accorded to us here for its consideration.

Robert Frampton, born at Pimper, near Blandford, in February 1622, was the son of a small farmer, a man described as of great industry, strict virtue, and eminent piety. The eagerness for learning he displayed at the free school of Blandford led to his being transplanted when but fifteen to Corpus Christi College, Oxford. His tutor there, however, showed little desire to impart such knowledge as he possessed to the promising pupil placed under his care, for we are told "he read but twice to this Robert in three terms;" so his friends procured his migration to Christ Church. Frampton took his bachelor's degree in a manner creditable enough; but the later period at which he hoped to be admitted Master of Arts proved a troublous one. The Covenant had become a test, so, rather than make the violation of his oath of allegiance a step to his advancement, he left the university and re-

turned to his parents, "where, if there was less of learning, there was yet piety and content."

In the country, Frampton supported himself for a time as a tutor and schoolmaster; but, says our chronicler, inoffensive as man can live, enemies will rise. The enemy in this case rose in the person of one Gage, a tailor advanced to the degree of an officer in the Parliamentary army, a man of resolution in a battle, but of small personal valour, it would seem, in a detached quarrel. The description given of the fights between the future bishop and the ex-tailor—for blows had as large a share in their enmity as words—is very ludicrous, but far too long for insertion here. Having taken holy orders, Frampton accepted the post of domestic chaplain to the Earl of Elgin, at Amptill, "a house built by the famous Sir Philip Sydney, upon the model of that of Falander in his as famous Arcadia." In this family, we read, he had the opportunity of conversing with the then greatest men for wit and parts, as "Waller, Denham, and the famous Hudibras;" while at the house of Lord Elgin's sister, the great Countess of Devonshire, he met the "famous Thomas Hobbs, a tutor in that family, and a constant auditor of Mr. Frampton." A curious story, marking the Protector's position at this time, is best told in the words of the biographer himself.

"During his residence in that noble Lord's family, he, as hath been before said, had the happiness of being known to and respected by the noble Countess of Devonshire, who frequently consulted him not only as a divine but in matters of consequence of other kinds, as particularly in the case of her paying a visit to that monstrous villain Oliver Cromwell, then at the height of his glory, to which he made his way not only by the blood of his Sovereign, but by the murder of his stout opposer Charles Cavendish, the Countess's own son, who scorning quarter from a rebell fell by the hand of Oliver himself; yet as that lucky rebell had his eyes about him, so he could not but see the then Earl of Warwick, a grandson of the Countess, to be, if not a fit, yet a proper match for his daughter, . . . he being politically set upon, if not preserving the government in his family, yet of setting their posterity near the crown as matching into the noblest families of which Rich must be one, and the grandmother be invited to Hampton Court by his highness.

"Now tho' she abhor'd both the acquaintance and the alliance, yet by the politicks more sway'd than by her inclination she must accept them both. Upon this she one day finding Mr. Frampton in her gardens, who was withdrawing upon her Ladyship's approaches, she desir'd him to stay and in their walk she communicates the whole to him and asks his opinion how she should behave in such an untoward conjuncture. He with modesty refers to her Ladyship's wisdom and honor as more likely to direct her than his experience of the world; but after he had recounted all that traitors villainy, supposed he had said enough; but she pressed him to speak clearly what he thought she ought to do, who modestly reply'd that as a divine he should resolve her Ladyship in the words of St. Paul with such a one no not to eat. But however the visit was made and the match succeeded but did not answer the end proposed, the gentleman dying not long after his marriage. However this frankness of Mr. Frampton, added to his other good qualifications, begat a lasting esteem of him in the mind of that noble lady."

The last mark of her ladyship's attach-

ment was to appoint him to preach her funeral sermon at Chatsworth, bequeathing him to that end the usual reward of forty pounds and mourning.

Frampton's frequent and very successful preaching in London soon attracted notice in high quarters, and, the boldness of his expressions offending the ears of the rulers of the Commonwealth, his friends sought means to remove him from a scene where his great gifts were likely to prove at such a time rather a hindrance than a help to him. The kindness of an eminent Levant merchant procured him the post of chaplain to the company's factory at Aleppo. In Syria Frampton must have lived nearly fifteen years; but there being a sad lack of dates in this memoir, we can only make a guess at the time. The experiences of the factory chaplain among the Turks, Greeks, and Arabs by whom he was surrounded fill some sixty pages, and these by no means the least entertaining; we must pass them by, however, to trace the latter part of his life. In 1666, a short visit to London just after the great fire led to an invitation to preach on the great calamity. Such fervour and earnestness did he show on the occasion that the notice of the King was attracted, and a command to officiate one day at Whitehall brought about a personal interview with Charles, not without its fruit in after days. It was not till 1670, however, that Frampton finally gave up his duties at Aleppo, circumstances connected with his marriage two or three years before rather than the spur of ambition driving him to settle once more in England.

Two months after landing he became preacher at the Rolls—when Sir Harbottle Grimston was Master—and, shortly afterwards, chaplain to the Lord Keeper, Sir Orlando Bridgman. In 1673 he was made Dean of Gloucester, notwithstanding his having given offence to King Charles by two very plain-spoken sermons, and having been personally rebuked by him for them. He was advanced to the bishopric of Gloucester in 1681. Numerous instances are given us in these pages of the boldness with which he attacked "Papists and Fanatics," even in the reign of James, a boldness which "wrought the Bishop much trouble from the Bigots and less advised of both sorts, the one by sending a sackfull of canting books with as canting letters conjuring him in the name of the Lord to disperse them for the good of souls, and many such like ways." Frampton, we read, spent most of his time with his seven brethren in the Tower, though under no confinement there, as they were; and, when withdrawing at night, his coach was pressed by multitudes of people for his benediction. The regard in which he was held even by the King is well told by the following, referring to the time when the bishop was often commanded to preach at Whitehall, though James was celebrating mass within the precincts of it:—

"The Princess [of Denmark] that Sunday dined with the King, who asked her, who preached at his chapel? Says she, the bishop of Gloster; why then, says the King, Nanny (which was the tender appellation the King always used to her, he being a most indulgent Father, let the world asperse him as they will) thou hadst, I am sure, an ex-

cellent sermon, and then, speaking to the Queen, said, Mad^m, I take that Bishop of Gloster to be as good a man and as excellent a preacher as ever I knew; I have heard him often with great satisfaction, I think never any man with the like."

Frampton's language partook occasionally of the freedom of the times, for when he refused to take the oath of allegiance to William and Mary, and was attacked in consequence by Thomas Firmin—still remembered for his liberal benefactions to the distressed French Protestants—in a speech beginning "My Lord, I hope you will not be a non-conformist now in your old age," the Bishop thus replies, "I am growing old, 'tis true, but did never think I should have been so old as to be upbraided with non-conformity by you that are a non-conformist to all Christendom besides a few lowly sectaries in Poland," an allusion to Firmin's Socinian views.

The circumstances attending the deprivation of his see, and the touching account of his life during retirement must be sought for in the book itself. We may fitly conclude this notice of the memoir in the words of its editor:—

"Were it only for the narrative of his deprivation and of his subsequent life, I do not doubt that this volume would be welcomed by all who can appreciate the spirit of cheerful self-sacrifice, which, as his biographer says with truth, constitutes the great glory of his character. In his honesty, his sense of humour, his generosity, his personal bravery, his readiness in moments of danger, his eagerness to aid the suffering and the oppressed, in his broad charity, and in his abiding sense of duty to a higher than human law, Robert Frampton is an Englishman of the best type; and I believe that his countrymen of a later generation will be glad to make his acquaintance in these pages."

J. J. CARTWRIGHT.

New Lands within the Arctic Circle. Narrative of the Discoveries of the Austrian Ship "Tegetthoff" in the Years 1872-74. By Julius Payer, one of the Commanders of the Expedition, with Maps and Illustrations from Drawings by the Author. Translated from the German with the Author's Approbation. Two Volumes. (London: Macmillan & Co., 1876.)

In nix beguzaed was the soothing Arabic proverb inscribed on the cabin wall of the ice-imprisoned ship of whose fortunes these two handsome volumes are the narrative. "This too will pass away" must have been the consolation of the *ennuyé* reviewer who, for the last two years has had to wade through the weary, dreary, silly piles of *réchauffé* travel, oft-told tales of adventures, badly-compiled picture-books, and the endless small-beer chronicles of the Arctic regions which the public interest in Captain Nares' expedition had brought prematurely into the world. *In nix beguzaed*—this too has passed away. Our gallant countrymen have returned, and have told us enough to whet our curiosity to hear the fuller tale on which it is understood their accomplished commander is engaged. The Bremen Polar Society's expedition to Siberia is home or homeward bound; Messrs. Seeböhm and Brown are in labour with their Petschora Researches of 1875; and now we have at last in English the narrative of the ever-memorable

expedition commanded by Lieutenants Weyprecht and Payer. At once, let us say that it is one of those books in presence of which the reviewer's occupation is gone. To criticise it would be almost impertinence, and would certainly be ungenerous. The deeds of which it is the record are almost unparalleled in the annals of Arctic adventure, and the mere language in which they are related is of very minor importance. Even on these grounds, however, Herr Payer's narrative requires no apology at the hands of its friends. It is quite as interesting as either Kane's or McClintock's, and has the redeeming advantage of having none of the tall-talk so abundant in the first, and of being told with even more literary grace and skill than the latter. In scientific importance there is nothing which in any degree approaches it in our Frozen-Sea literature at present. To attempt an analysis of what is an analysis itself within anything like the space we can afford would be out of the question; nor shall we attempt it. Luckily the main facts of the expedition are already known to most of our readers. They appeared fully in this and other journals when the expedition returned to Europe more than two years ago. They were also published by Lieutenants Weyprecht and Payer, in the *Journal of the Royal Geographical Society* (vol. xlv. pp. 1-33), on the occasion of their receiving the Society's medals last year. They have also been incorporated into a variety of popular books, such as Mr. Markham's well-known volume. We may, therefore, take for granted that our readers know that the *Tegetthoff* left Bremen on June 13, 1872, to explore the region to the east of Novai Zemlai, and, if possible, to penetrate to Behring Straits; that, on August 20, it got fast embedded in the ice, from which it never got free; that it drifted north in the floe, enabling the expedition to discover Franz-Josef Land, and that, finally, after staying by it two winters, the adventurers, twenty-two in number, deserted their ship, and after terrible hardships succeeded in reaching Tromsøe on September 3, exactly 812 days after they had left it.

Every section contains something on which it would be easy to comment for pages. But it is necessary to exercise self-denial in the midst of such an *embarras de richesse*. We may, therefore, select a few points on which to remark. The cold experienced either in Franz-Josef Land or in the pack was scarcely so great as that recorded in the higher latitude, in close vicinity to land, in which the *Alert* wintered. The minimum monthly mean in the ice was 36°·9 Reaumur. The coldest day in Franz-Josef Land was on March 14, 1873, when the thermometer on the Sonklar Glacier fell to 40°·5 of Reaumur below zero. They had taken some rum with them, and as each took his share he knelt down and allowed another to shake it into his mouth, without bringing the metal cup in contact with his lips.

"This rum, though it was strong, seemed to have lost all its strength and fluidity. It tasted like innocent milk, and its consistence was that of oil. The bread was frozen so hard that we feared to break our teeth in biting it, and it brought blood if we ate it. The attempt to smoke a cigar

was a punishment rather than an enjoyment, because the icicles on our beards always put them out, and when we took them out of our mouths they were frozen; even the shortest pipes met the same fate. The instruments I used in surveying seemed to burn when I touched them, and the medals which my companions wore on their breasts felt like hot iron."

Cold is depressing and enfeebles the power of the will. At first it stimulates to action, but this undue vigour is followed by a reaction, torpidity ensues, and exertion is soon succeeded by a desire to rest. This alternate action and torpor induces a feeling in those exposed to it as if they were intoxicated. Their jaws get stiff and trembling; they speak with great effort; they display an uncertainty in all their movements, and the stupor of somnambulists in their action and thoughts.

"Most of the circumpolar animals escape, as much as they can, the horrors of the frost: some migrate; others, burying themselves in holes, sleep throughout the winter. The fish which are found in the small pools of sweet water on the land are frozen in when these pools freeze, and awake to life and movement again only when the pools are thawed."

As there has been some dispute regarding the extreme cold endured by man, the following list may be interesting. Back recorded at Fort Reliance January 17, 1833—44° R.; Hayes, March 17, 1861,—44° R., Néverov, in Jakutzk, January 31, 1838,—47°·3 R.; Kane,—45° R.; Maclure,—47° R.; John Ross,—39° R.; and Parry,—38°·6 R.; Nares' and Rae's observations of 72° below zero (F.) are so recent as to be familiar. There can be little doubt that the Tundras of Siberia and Arctic Russia and the Barren Grounds of North America are the coldest regions on the face of the earth. Payer found on Franz Josef Land terraces. These have also been found in Smith Sound, and something similar has been observed around the whole Polar Basin, and they have been regarded as certain proofs that the extreme northern land is slowly rising. That is probably true. Still, at the same time, the terraces are not a proof of this fact, and we are rather surprised to find so accurate and logical an observer as M. Payer falling into this "vulgar error." No one has ever lived long enough in the Polar regions to be certain that the coasts are rising, probable as this may be. We also find similar "terraces," containing remains of recent animals, in South Greenland, in the Danish possessions. Now, the whole region, south of at least 72° north latitude, we know to be sinking. Accordingly the only safe deduction to be drawn from the terraces in Franz-Josef Land, in Grant's Land, and in Greenland, is that they are proof of an *old* rise of the land, not of one going on at present. We are also equally disinclined to coincide with the distinguished author when he describes (vol. ii. p. 78) West Greenland as a high glacier plateau, and East Greenland as

"a magnificent Alpine land, with a comparatively rich vegetation and abundant animal life. How and when the transition between these opposite characters takes place in the interior is as yet utterly unknown."

M. Payer never visited West Greenland, and though he wintered on the opposite

coast seems, like other of his distinguished companions with whom we have conversed, utterly unable to grasp the nature of the great "inland ice" which covers, so far as we know, the whole interior from north to south in the form of a great "ice-cap." Lieutenant Payer penetrated up Franz-Josef Fjord, and saw no inland ice; he ascended some of the East Greenland elevations, and equally saw no sign. Hence, he concludes that the inland ice is a phenomenon of the west coast. However, if he had penetrated some of the long West Greenland Fjords, he would equally have seen no ice; and if he had climbed some of the elevations in Mid-Greenland, he would also have witnessed "a magnificent Alpine land, with a comparatively rich vegetation and abundant animal life." In reality the inland ice is often distant from twenty to sixty miles from the west coast, but invariably whenever the "outskirts" have been passed over—and in these "outskirts" are mountains 2,000, 3,000, and even 6,000 feet in height—the inland ice is reached. And so it would, in all likelihood, be if anyone had penetrated sufficiently far from the coast of East Greenland. We regret to see M. Payer, through a misunderstanding of the real nature of the physical geography of Greenland, perpetuating an error which in another form has been long enough in print. In a second edition we trust to see it corrected, or, if he still persists in it, explained and defended. We might also have wished him to more clearly explain the nature of the different colours of the Arctic Sea. This alteration of hue is not due to ice alone. It is, as we long ago pointed out, caused by the presence of an enormous quantity of minute diatomaceæ in certain portions of it. This observation the reviewer would not have thought worthy of narrating, though it ought to have been known to M. Payer, as it was published in Petermann's *Geographische Mittheilungen*, a work on board the *Tegethoff*. It was, however, confirmed by his old commander, Karl Koldevey (*Die erste Deutsche Nordpolar-Expedition*, 1868, s. 24), by the Swedish expedition to Spitzbergen, and by Nordenskjöld on his Greenland expedition (*Redegörelse för en Expedition till Grönland år 1870*, p. 15, and *Geol. Magazine*, vol. ix. pp. 9–10), and M. Payer himself refers to similar observations being made by Sir James Ross in the Antarctic regions. We have, perhaps, exhausted our friendly criticism if we venture to doubt whether the sound supposed once to attend a display of the *Anorora Borealis* is so "universally discredited" by scientific men. We confess, after knowing the gist of the whole controversy, and guarding against every cause of error, that we believed that we had heard, both in 1861, off the mouth of Frobisher Strait, and in 1867, off South Greenland, the peculiar sound like silk crackling, or a bullet whistling through the air, as described by Lient. Hood, of Franklin's first expedition. These faults, are, however, of very little importance in a narrative which abounds with valuable facts in almost every department of science—though the scientific treatises on the expedition are still in preparation. We are further

lost in surprise at the valuable work done, when we remember how badly manned the vessel was, and how, with the exception of the surgeon, the commanders and the ordinary officers, there were no scientific men on board, and that what they rescued in their terrible escape is only a moiety of what was achieved. The whole expedition cost but 18,000*l.* sterling. It demonstrates anew, what Nares has only proved anew, how utterly useless ships are for Polar exploration, except to convey the expedition to the scene of action, and as storehouses to fall back upon. Sledges and boats will be the future *matériel* which must be relied on. M. Payer is not, however, sanguine of this generation reaching the Pole, unless by means of balloons, and thinks small ships are better for exploration than large ones. Autumn he prefers to spring for sledging purposes. He thinks that if the commander sees that any further attempts would be useless that season, it would be better to come home, and again to tackle the fies another year. In this he confirms the wisdom of Sir George Nares' course, and we only hope that the gallant commander of the *Alert* and *Discovery* may again have an opportunity of profiting by his experience of 1875–76. Indeed, the whole of M. Payer's section on fitting and conducting Arctic expeditions is of the greatest value to those whose duty it may be to superintend such work, but is also of interest to that pariah of literature, "the general reader." Neither is M. Payer by any means sanguine of the "Gulf Stream route," and if ballooning is to be the future of Polar exploration, then Smith Sound is as good as, if not better than, any other route. Weyprecht, however, believes that Polar stations at which simultaneous observations are to be made, and from which pioneer parties well hardened to the "north wind's breath" could set out, will be the most profitable method in which for long to come the Polar region can be explored. On this, as on all other points touching the Far North, these volumes abound with suggestions. We only wish we could have quoted from them at greater length. Enough has, however, been said to indicate their great value and the esteem in which they must ever be held. No such work on the Arctic regions has been published within the memory of this generation, and until we have Sir George Nares' official narrative *in extenso*, it is impossible that we can have anything fit to place alongside of M. Payer's *New Lands*.

ROBERT BROWN.

First Platform of International Law. By Sir Edward C. Creasy, M.A., Professor of Jurisprudence in the Hon. the Four Inns of Court, late Chief Justice of Ceylon, &c. (London: Van Voorst, 1876.)

THE author has added another name to the list of our Indian and Colonial Judges whose minds have not become cramped by judicial routine and disabled from resuming, on their retirement from the Bench, the study of law in a larger sense than that in which they have had to administer it. Sir Edward Creasy was Professor of History in the University of London before he undertook

the duties of the Chief-Justiceship of Ceylon, and we consider the breadth of his juridical teaching to furnish an example of the great value of historical studies as a preparation for the study of jurisprudence, more especially when jurisprudence is to be applied to determine the measure of right between independent political communities. There is no country, indeed, where that jurisprudence ought to be more studied than in England, "for there is no country," as Sir Edward has aptly observed in the Preface to his work, "which can do more than England can now do and must do to influence the currents of International Law in many of its most important branches." We consider the publication of Sir Edward's work to be well timed, and that it is likely to be highly useful in popularising the study of the science. The title of it is attractive, and somewhat novel, although Mr. Hallam has inaugurated the phrase, in describing the great work of Grotius as "being as nearly original in its general 'platform' as any work of man can well be in an advanced stage of learning and civilisation." Sir Edward, however, states that he has selected the title of his book as believing it to represent accurately its design, which, while not professing to be a full and elaborate treatise on International Law, is something more, he hopes, than a mere preliminary sketch, to be discarded by the advanced student.

"It is meant," he writes, "to supply a sound foundation and a duly-arranged framework, to which much must be added from further materials and other architects, but which will facilitate the acquisition, the orderly grouping, the perception, the retention, and the right employment of continually increasing stores of knowledge."

Without disputing the fitness of his work for the purpose contemplated by the author, we think that he has rather underestimated its value; but the vastness of the science of which he treats, which seeks to unite nations together in peaceful submission to the empire of Law, justifies modesty, not only on the part of the neophyte who stands at the door of the temple, but also of the advanced worshipper and even of the priests of the sanctuary, among whom an Emeritus Chief Justice of Ceylon may fitly claim a place.

Sir Edward has after mature reflection adopted the title of International Law in preference to that of Law of Nations. We are not quite certain that he has made out a case for preferring the phrase introduced by Jeremy Bentham to the old term which jurists used to employ before Bentham's time, unless it be on the ground that the term "International Law" is of less extensive import than the term "Law of Nations," and that it includes all which the author's "first platform" is intended to discuss. Sir Edward, however, is careful to explain that by the term "International Law" he means something more than "Positive Law," and that his work is designed after the model of the writings of the great jurists of the seventeenth century, who fully recognised "International Moral Law" as well as "International Positive Law," the standpoint of the former being Reason, while the standpoint of Positive Law is Power. To us it seems open to doubt whether the majority of writers who have

treated of International Law since Bentham's time have not encroached too much on the proper domain of International Morality, and whether the persistence of Mr. Nassau Senior (*Edinburgh Review*, April, 1843, No. clvi.) in retaining the use of the phrase "Law of Nations"—of which International Law and International Morality are treated by him as subdivisions—has not been justified in point of convenience to a greater extent than Sir Edward is disposed to admit. There is at least one eminent advantage in retaining the ancient nomenclature, that it is less likely to bring the reasoning of jurists into apparent conflict with the decisions of courts of law, which are occasionally called upon to adjudicate upon questions of international right. For instance, in the recent case of the Queen against Keyn (the *Franconia*) the Lord Chief Justice of England (we quote from the *Times* report of November 14, 1876) has laid it down that the only sources of International Law which courts of law can regard as authoritative are treaties and established usage—a dictum which is in apparent conflict with our author's conception of International Law, as comprising Moral Law by the side of Positive Law, but which is in harmony with Mr. Nassau Senior's classification.

There is, unfortunately, a poverty in English law-phraseology, which Sir Edward has done well to endeavour to remedy, by the use of the adjective "jural" to signify rights and obligations resting on Moral Law, as distinguished from rights and obligations resting merely on Positive Law. He does not claim to be the inventor of the term, which is, as it were, an American coin struck from a German die, Dr. Francis Lieber having first given currency to the term in his legal writings published in the United States. Dr. Whewell, however, has also adopted the term "jural" in his translation of Grotius *De Jure Belli et Pacis*, so that the credit of Dr. Lieber's coinage is well established. It happens, however, that hardly any two jurists agree in the distinction which they draw between *jus* and *lex*, so that the adjective "jural" will not be exempt from an uncertainty of meaning corresponding to that which attaches to the substantive "jus."

Sir Edward in his second chapter discusses the moral obligation of international law, more especially with reference to the maxim, "*Pactum serva*," which is inscribed on the tombstone of England's greatest king, Edward I., and he justly deprecates the opinion, which seems to be gaining ground in the present day, that there is nothing morally wrong in the breach of a treaty, if the State which breaks it has been unfairly and hardly bound by it. His observations are valuable at the present moment, and he adheres with good reason to Mr. Nassau Senior's view, that the principle of general utility distinguishes the obligation of treaties on the part of States from the obligations of engagements on the part of private persons, inasmuch as, if the obligations entered into by a nation under constraint were not binding, wars would only terminate by the subjugation and utter ruin of the weaker party. In

illustration of his position he contrasts the conduct of the Allied Powers in 1815, who relied on the faith of the treaties which they concluded with France, with the conduct of Prussia in 1871, and he deprecates the example of Russia in 1871, who, in substance, repudiated her treaty obligations of 1856, which debarred her ships of war from navigating the Black Sea, although she went through the formality of acknowledging, as a general principle, that a State cannot nullify a contract with other States except with their consent. Sir Edward has touched upon most of the striking events of the present century in their bearing upon International Law. The Monroe doctrine as announced in 1823, the French Intervention in Spain in the same year, the Pritchard Affair at Tahiti in 1844, the Declaration of Paris in 1856, the French Intervention in Mexico in 1862, the Geneva Arbitration, and the Brussels Conference, are all very fully treated by him. He has also not omitted to discuss the applicability of European Public Law to Asiatic States, and, among other burning questions of the day, the proposal that nations should agree to abandon the exercise of belligerent right in capturing private property on the high seas. Sir Edward passes in review all the chief authorities in favour of the maintenance of the right of capture, and the advocates for its abandonment, and avows himself to be unable to adopt the new rules proposed by Mr. David Dudley Field in his *Outlines of an International Code* on the subject of the status of private persons in time of war, and on the immunity of private property from capture on the high seas. In his "Epilegomena" Sir Edward discusses the Report of the Royal Commissioners on the Fugitive Slave Question, as well as the Privileges of Public Ships in Foreign Ports. In a word, his work ranges over a large field of useful subjects, and he has enriched his text with copious historical notes, and his book, which is furnished with a good index, is well calculated to serve the twofold purpose of a useful manual of International Law for youthful statesmen, and of a storehouse of sound principles for students of juridical science.

"I follow," he says, "President Woolsey (of the United States) in writing for all who are cultivating themselves by the study of historical and political science, and who by that study are qualifying themselves to do their duty as members of a free State, which is itself a member of the great Commonwealth of Nations."

TRAVERS TWISS.

Etruscan Bologna. By R. F. Burton. (London: Smith, Elder & Co., 1876.)

WHAT English tourist in northern Italy is unacquainted with Bologna? The leaning towers, the art-galleries, the churches, the arcades, and above all a comfortable hotel, have their praises too loudly sung in the guide-books not to attract the crowd of wandering sight-seers. Few among them, however, are aware that under their feet lies another Bologna as well worth exploring as the Bologna of to-day. Far away in a past of which the very memory has perished, the site of Bologna was occupied by

Umbrians whose huts have probably been found at the Pradello within the modern gate of S. Isaia, and their tombs at Villanova, "about eight kilometres E.S.E." of the town. This primitive population had already entered upon its Iron Age, and since the Italian Aryans do not appear to have been acquainted with iron before their separation from their European kinsfolk, a long period must have elapsed since their first entry into Italy. The Umbrians were displaced by the Etruscans, in whose hands Felsina or Bologna became a flourishing city. The remains of the Etruscan population have been discovered in abundance, and three distinct epochs of civilisation can be detected in them. At Villanova we may see the Etruscan emigrants still practising a rude ceramic art; there are no bas-reliefs, no inscriptions, no goldsmith's work, while iron is scarce, and the pottery is for the most part black, like the antique ware of Chiusi. But a little beyond the walls of modern Bologna, below the sumptuous church of the Madonna di S. Luca and within the courts and endless corridors of the huge Certosa, now the burialplace of the Bolognese dead, the enterprise of Sgr. Zannoni has uncovered a necropolis which belongs to the best period of Etruscan Felsina. The tombs have yielded objects which may fitly compare with those found in the cities of Central Etruria, and, as a large number of the dead have been buried and not burned, the anthropologist and craniologist are allowed ample opportunity for essaying their solution of the Etruscan problem. One of the most interesting points connected with these tombs is the existence of tombstones of horse-shoe shape and adorned with bas-reliefs. They are generally surrounded with a pattern which represents the waves of the sea, and the sculptures not unfrequently relate to the native Etruscan mythology. The tombstones bear a striking resemblance to those recently found by Dr. Schliemann at Mykenae.

The third and latest epoch of ancient Bologna is represented by Marzabotto and Misanello, about fourteen miles from the modern town. The interments here seem to have extended considerably beyond the period of the Boian invasion, and specimens of archaic art are met with by the side of others which belong to a time of advanced civilisation. Misanello is situated just above the site of an Etruscan city over a small portion of which Misano now stands. Several important discoveries have been made here, among others that of a temple, the first yet exhumed in Etruria. The streets of the old town can still be traced, and what are apparently the pebble foundations of the houses which ran along their sides have been unearthed. The rubbish, as might have been expected, contained quantities of broken animal bones, besides such other objects as "a long iron sword and scabbard, votive arms and legs, an *aes rude*, bronze and iron fragments, tiles and pottery, bits of coloured glass, worked stones and bones." In the neighbouring necropolis two charming bronze statuettes were found, one of Ares and Aphrodite, the other of a negro with an amphora on his shoulders. Inscriptions, both Greek and Etruscan, have been dis-

covered at Marzabotto, as well as gold and silver ornaments.

Captain Burton gives an excellent account of the discoveries, as well as of the inferences that may be drawn from them, and his book is written with his usual liveliness and vigour of style. The reader will be prepared, however, for occasional statements which show more haste than counsel. Thus it is somewhat startling to find him taking the "time-honoured names" of Romulus and his kin under his protection, and declaring that "M. F. Max Müller's theory has successfully been proved a solar myth." One is tempted to ask, by whom? Pelasgians and "Pelasgo-Tyrrhenians," again, figure in his pages as if they were well-known historical characters, and it is to be hoped that he does not intend to refer the Sanskrit *eka*, the Greek *εἰς*, and the Latin *unus* (p. 212), to one and the same origin. Count Giovanni can scarcely be said to have "pointed out the thoroughly Aryan words *mi* (I), *eka* or *ekka* (hic), *suthi* (sum), and *cerus manus* = *Creator Bonus*" in the Etruscan tongue, since *mi*, "I," would not and could not be Aryan, *suthi* is not "sum," but "sepulchre," as it is rightly rendered p. 234, and *cerus manus* comes from the Latin *Carmen Saliare*. It is ungenerous, however, to pick out small slips like these in a book so full of interest and instruction, and it is only the general merit of the work that tempts one to do so.

The book itself is divided into three parts, the first dealing with Bologna and its collections of antiquities, the second with the finds made in its neighbourhood, and the third with the "Etruscan Man." Under the last heading we have chapters on the various traces of man that have been found in Italy from the Glacial epoch downwards, on the craniology of the Etruscans and other inhabitants of Italy, on Prof. Calori's theories—especially his attempt to connect the Etruscans with the Phoenicians—the Etruscan language and its decipherers, on the inscriptions discovered near Bologna, and on the modern Bolognese dialect. Here is a rich feast, and one in which anthropologists and craniologists will take a special interest. Prof. Calori's craniological conclusions are of considerable importance. The dolichocephalic Etruscan skull is "pronounced to be different from all the Italic crania, Ligurians, Pelasgians, Oscans, Umbrians, and Romans." It is—

"distinguished by a superior cranial capacity, by a somewhat longer form, by less disproportion between the pre-auricular and post-auricular halves, by increased length of face, by more frequent prognathism, and finally by greater disproportion between the transverse diameter of the lower frontal and the inter-zygomatic lines—peculiarities which make the true Etruscan skull a well-marked type."

The skeletons of the women in the necropolis of La Certosa show certain analogies with the negro, "as the proportional length of the forearm to the whole arm and the thigh to the leg, together with a higher degree of prognathism."

The most interesting inscription met with in the excavations is one from La Certosa, which fixes the Etruscan character of the

place. A photograph I have before me confirms the accuracy of the facsimile given by Captain Burton, but the translation he appends is not quite correct. It should be "I am the tomb of Thankvilu (Tanaquil), daughter of Titla (Titlalus)." The ordinary *suthi*, "tomb," is here written *suti*, a pronunciation probably peculiar to the North Etruscan dialect.

The modern Bolognese dialect is a curious variety of Italian, and differs widely from the classical speech. Who, for instance, could be expected to divine the meaning of "A n'vuoi t' m' in parl, S'gnor" (I won't have you speak to me about it, Sir), when rapidly spoken? Captain Burton gives an account of three volumes written in this dialect, one of which is a kind of modern Song of Solomon, another a humorous narrative of the deliverance of Vienna from the Turks, and the third a collection of short poems by a modern Bolognese writer. I gather that *me* or *mi* and *ti* are used instead of *io* and *tu*, an interesting illustration of the process which is driving *I* and *thou* out of popular English. *A*, or *ai*, is employed for the first person only where it would be emphatic.

Captain Burton's book lacks but one thing to make it complete, and that is a map of Bologna and its neighbourhood. We have a "Synoptical Table of the Paleolithic Remains of Central Italy;" the reader would have been grateful had it been accompanied by a plan showing the position of the various localities mentioned in the volume.

A. H. SAYCE.

Histoire de Bertrand du Guesclin et de son époque. La jeunesse de Bertrand (1320–1364). Par Siméon Luce. (Paris: Hachette, 1876.)

If criticism may not call an author to account for his choice of a subject, it has certainly the right to discuss the manner in which the subject has been conceived. We shall therefore express our regret that M. Luce, divided, doubtless, between the fear of undertaking a task which he judged above his powers and the desire of utilising former and extensive researches in the history of the fourteenth century, has thought fit to write the history of Du Guesclin at the same time as what he calls his epoch. However brilliant, however fertile in results the Constable's career may have been, however popular his name, he played his part too exclusively on battle-fields to entitle him to be made the pretext for tracing a picture of the time. We may speak of the epoch of Charles V., of Henry IV., of Richelieu, because the influence of these great men extended over every branch of human activity, but we cannot speak of the epoch of Du Guesclin. The principal fault of the book of which we are about to speak springs from this conception of the subject. The hero does not occupy enough space in it, and what does not immediately concern him has either nothing whatever to do with him or is not connected with him by a sufficiently close link. Thus the book has two very distinct parts—the Constable's biography, and the digressions

for which he is the pretext. We will examine each part successively.

The first period of Du Guesclin's career is enveloped in an obscurity which M. Luce has not been able entirely to dissipate. He has, however, enriched his hero's biography with a considerable number of new facts, and fixed the date of many others already known. He places his birth in 1320 or 1321. Relying on Froissart, who seems here to deserve full confidence, he places him among the defenders of Rennes against the English at the end of 1342, or the beginning of 1343. He places the taking of the Château du Fougeray in the first half of 1350. An unpublished chronicle furnished him with the proof that Du Guesclin organised a tournament at Pontorson in 1354. Though we know already through D'Argentré of his participation in the battle of Montmuran and his elevation to the rank of chevalier, we have to thank M. Luce for having confirmed the authority of the Breton historian on this point. It is from the same source that he has taken the account of the single combat of Du Guesclin and Guillaume Trussel, but he augments the value of this information by restoring the event to its true date. It is again after the same historian that he relates the mission of Du Guesclin to England and his sojourn there, and here again he impresses a personal stamp on what he has borrowed by assigning to 1354 an event to which his guide had fixed the date of 1351.* Learning from the same author the names of Du Guesclin's companions at the time of the siege of Rennes (1356), he applies to his hero the information furnished by a judgment of the *parlement* upon two of these companions, and determines from it his base of operations during the siege. He is the first who has pointed out the date of the nomination of the future Constable to the post of captain of the garrison at Pontorson. Thanks, too, to M. Luce, we know now that the affair of Pas d'Evran took place towards the end of 1359, and not, as Hay du Chastelet had said, in 1351. Before the work of which we are speaking we did not know either of the taking of Sablé and of Saint-Brice, or the battles of the Bridge of Juigné and of Briouze, or the part which belongs to Du Guesclin in the capitulation of Brézolles, or the reduction of Saint-Martin-de-Seez, of Saint-Remy and of Cormeilles, nor the defeat of Jean Jonel at Pas de Breuil. The occupation of Saint-Pol de Léon, the reduction of Aulnay, the assault and evacuation of Vandry, are so many new facts which the author has established by help of unpublished documents, and which testify to the activity of Du Guesclin in 1363. M. Luce has also discovered and brought to light two documents, one of which reveals to us the presence of Du Guesclin at Goulet with the king on April 17, 1364, and the other informs us that the brave captain obtained in reward for his services at the

* Let us notice, however, one contradiction. M. Luce tells us that the sons of Charles de Blois were brought as hostages to England by the Breton *députés* who went there in 1354, and further on we read that they were hostages in that country in the early months of 1353 (pp. 133–134).

siege of Mantes the confiscated property of a certain number of the inhabitants. In short, the decisive part he took in the battle of Cocherel is henceforth placed beyond doubt.

Such are some of the novel results at which M. Luce has arrived by his researches in the history of Du Guesclin. They would have been still more fruitful, perhaps, if they had been extended to the public and private archives of the country where the youth of his hero was passed. We cannot help thinking that the archives of the departments of La Manche and L'Ille-et-Vilaine, for instance, would have allowed him to add some features to a biography which still has so many gaps.

It remains for us to criticise the part of this book which has nothing to do with Du Guesclin, or which is only connected with him in a very indirect way. From this point of view three chapters especially invite our attention: one is devoted to private life in the fourteenth century, the other to the battle of Poitiers, the third to the *Compagnies*.

The first seems to have been written in order to introduce many features of the manners of the time, collected from the registers of the Trésor des Chartres, but, numerous as they are, these curious details are not numerous enough for a collection of them to form the broad, and at the same time detailed, picture which M. Luce intended to trace. It would have been necessary for that to add all the facts furnished by inventories, by bills, above all by literary works.* From this insufficient number of authorities the author draws conclusions which are too general. The texts cited to prove that the use of baths was common in towns, and even in the country, do not justify that opinion; one part of them relates to the use of baths as a therapeutic measure, and a single one applies to a village. The statistical documents which we possess as to the population in the Middle Ages are not abundant enough to justify the assertion that it was at least as large in the first half of the fourteenth century as in our own time. M. Luce estimates the number of villages which disappeared during the Hundred Years' War at a hundred, but, supposing that as many or more were not founded since the end of that war, the diminution of the number of inhabited places is only one side of the question. How was it that the author before expressing so decided an opinion did not think of the constant increase of the urban population, which always augments in proportion to its misery? The enumeration of the objects composing the furniture of the peasant in the fourteenth century makes one smile. This property, restricted at all times to what was strictly necessary, could not have been very different from what it is at the present time. Lastly, without noticing all the disputable assertions which this chapter contains, let us content ourselves with adding that the use of shirts was already common before the fourteenth cen-

tury, as passages of Beaumanoir and Joinville prove.*

This chapter on private life is as far away from the object the author wished to attain as the one he has written on the Battle of Poitiers is novel and profound. M. Luce sees in the constant successes of the English the effects of their military institutions. No doubt the measures by which Edward III. organised the English army were known, but no one had turned them to account in the way that M. Luce has known how to do. If accidents played their usual part at Crecy and Poitiers, the English owed their victory above all to the armament and composition of their army. It is an advantage for science each time that an event hitherto attributed to chance is explained by general causes, for the logic of history, which is only the predominance of these general causes over particular circumstances, receives in that case fresh confirmation.

Quite different, although equally remarkable in its way, is the chapter on the *Compagnies*. It is a picture of manners, like the chapter on private life; but this time the subject is much less extensive, and does not offer that variety which makes generalisation so hazardous, for the proceedings and habits of all the *Compagnies* resembled each other. A thousand curious facts, cleverly distributed, evoke the image of this cosmopolitan society, organised and disciplined, dragging with it its purveyors and brokers, standing in connexion with the regular authorities, and devouring the substance of the country to whose side it clings, and it is therefore evident that it offers hardly any analogy to the Commune, with which M. Luce has compared it.

Besides these three chapters, which are, as we have shown, real *hors d'œuvre*, there is a multitude of other less far-reaching digressions, among which many are distinguished by the justice and novelty of the points of view. Such, for instance, are those which concern the mutual relations of the different classes of society in the Middle Ages, the multiplicity of pilgrimages, the interview of the dauphin and the Emperor Charles IV. at Metz, the character of Innocent VI. and the part he played. If the abundance of these digressions takes from the unity of the composition, the book gains an interest from them which the mere biography of Du Guesclin would not have offered. They show a deep knowledge of the fourteenth century. It is easy to see that the author did not begin to study it the day he conceived the idea of writing a history of Du Guesclin, but that, on the contrary, he was already perfectly acquainted with it when the idea occurred to him of choosing this framework in which to insert in part the results of his former researches. His prolonged contact with the men of that epoch enables him to speak of them with a precision, a minuteness and colour which make them live again before us. The historical sentiment which he has imbibed in this long intercourse has kept him free from rhetoric and has given him a frank and

familiar style which preserves for things their true character. Only M. Luce will do well to be on his guard against the two rocks towards which it is precisely his elevated idea of history which attracts him—premature generalisations and forced comparisons between the past and the present.*

G. FAGNIEZ.

CHRISTMAS BOOKS.

IN her new book, *Chaucer for Children: a Golden Key* (Chatto and Windus), Mrs. Haweis introduces old fourteenth-century England and its great poet to young nineteenth-century England and its juvenile readers. The artist-authoress has drawn the Canterbury Pilgrims of 1388 from the best manuscripts and designs available to her—except Lord Ellesmere's and the Cambridge University MS., both in the hands of the Chaucer Society—and has given, in Chaucer's words and modern rhyme, his description of his fellow-travellers, together with five of his tales best suited for young readers: the Knight's Tale of the fight between Palamon and Arcite for Emilié's love; the Clerk's Tale of Grisilde and her uncomplaining sorrow; the Friar's Tale of how the wicked Summoner was carried off to hell; the Franklin's Tale of the magic moving of the rocks, of Dorigen and Arviragus; and the Pardoner's powerful Tale of how the three Rioters met Death. Eight full-paged coloured drawings, thirty woodcuts—including that of London in the fifteenth and nineteenth centuries—directions for the pronunciation of Chaucer's English, and versions in modern rhyme of all passages quoted from him, a Life of Chaucer, and a steel engraving from his pupil Hoccleve's portrait of him in the Harleian MS. 4868, make the book attractive as well as workable. It must not only take a high place among the Christmas and New Year books of this season, but is also of permanent value as an introduction to the study of Chaucer, whose works, in selections of some kind or other, are now text-books in every school that aspires to give sound instruction in English. Mrs. Haweis has tried the experiment of teaching Chaucer to her own little boy; not only telling him the Tales in ordinary mother's talk, but reading him extracts from them in the pronunciation that our highest authority, Mr. Alexander J. Ellis, has decided must have prevailed among educated Englishmen in the fourteenth century. She now asks other mothers to try the same plan with their boys and girls, and feels certain that they will be able at once to interest and teach their children on her plan; while the drawings of the old dresses, the description of the old English pilgrims and their ways, will stir the young folk's interest in the history of their homes and land, in a way which catalogues of Kings of Israel, or details of battles, statecraft, and the like, can never do. And surely those who know Chaucer, his roguish fun, his love of nature, birds, and books, his fresh boy's heart, his care to teach Lewys, his "lytel sone," must feel that there is in him very much to draw children to him; and they will be glad at least to try whether Mrs. Haweis's pretty book—from the daisies on its cover to its "Notes on the Pictures" at the end, a labour of love—will not bring their little ones some of the sunshine and pleasure that the old poet has so often given to themselves.

Floral Poetry and the Language of Flowers. (Marcus Ward.) To those who still retain the conventional round table adorned with elegant

* The *Ménagier de Paris* is the only literary document which the author has made use of.

* The operation mentioned in the same chapter (pp. 71-72 and note) is not for stone, but the operation for hernia.

* The list of the strongholds occupied by the Anglo-Navarrese from 1356 to 1364 which the author has added to his book offers the double advantage of throwing a great and melancholy light on the general situation of the country and furnishing valuable elements to the local history.

volumes in the centre of their drawing-rooms this book with its gorgeously-coloured illustrations may possibly be welcome; but we imagine that the taste for the kind of art and literature that it offers has for the most part departed with the round table. The poetry, however—we can say this for it—is *not* original, as sometimes happens in books of this kind, but is “selected from the best authors,” and the pictures, as the writer of the Preface truthfully remarks, “speak for themselves.”

Mildred's Mistake. A Still-life Study by A. Levien. (Marcus Ward.) This is a book that young maidens will delight in who have not yet reached the advanced period when they like sauces with their food, and a spice of sensation in their novels. This period, unfortunately, arrives at the present day very early, and to juvenile readers of Miss Braddon, Ouida, Rhoda Broughton, and others, such a book as *Mildred's Mistake*, which deals simply with the well-regulated loves of four very nice and well-behaved young ladies, will doubtless seem rather tame; but those who, like fair Amoret have been carefully—

“trayed up from time to time.

In all chaste virtue and true bountied,”

but who yet are beginning to find that there are questions for them to answer of even deeper consequence than those set by the Local Examiners will be likely to find much to interest, and even guide them, in their budding womanhood in this “Still-life Study.” Even the little gilt medallion of a pair of modern lovers on the cover is a model of respectful courtship.

Memoirs of a Poodle. Translated by Mrs. Sale Barker. (Routledge.) A very intelligent poodle, whose memoirs are fully as interesting as and less scandalous than those of many human poodles who have left us similar autobiographical records. Our present specimen tells us that he is not learned, that he cannot add up a difficult sum, or play a game at dominoes; but he adds, “I am faithful, obedient, devoid of ambition, and my conduct is not guided by self-interest”—altogether, it will be seen, a very estimable and praiseworthy member of poodledom.

The First Christmas; in Fifteen Pictures for Our Dear Little Ones. (New York and Ratisbon: Frederick Pustet.) Families in whose homes a mild religious atmosphere prevails, and who celebrate Christmas chiefly as a high festival of the Church, will doubtless find this pretty gift-book, wherein the story of the Nativity is told in simple verse, and by means of softly coloured illustrations, in thorough harmony with their sentiments. The pictures, which are executed, it is stated, in xylography from the paintings of L. Diefenbach, are weakly reminiscent of the Early Italian masters.

Kaspar and the Seven Wonderful Pigeons of Würzburg. By John Goddard. (Marcus Ward.) A pleasant German variation of the theme of *Alice in Wonderland*. Instead of the usual parodies on well-known verses, children are here given a translation of Rückert's tender little poem “The Stranger-child's Holy Christ.” But the sympathetic tears that this may bring into their eyes at starting will soon be dried by the delightful fun that follows—fun without any furtive attempt at imparting useful knowledge. The “Ancient Grofulus” is of the genus Bandersnatch, but the Spinning Princess is of the genuine old fairytale stock, and so beautiful that plenty of little boys, we imagine, besides Kaspar will fall in love with her. Wise Little Linda, with her firm belief in her brother's marvellous adventures, is also very charming. “Thank you, good pigeons, for the pleasant hours you have given us,” is what many other little dreamers besides Kaspar and Linda will say this Christmas.

Annie's Pantomime Dream. By Ellis J. Davis. (Moxon.) This is one of the numerous stories to which *Alice in Wonderland* has given rise. It is,

in fact, a remarkably close copy of that now classic work, only in the present book a “pertidious counsellor,” named Knowledge, is ever present among the *dramatis personae*, whispering, and insinuating scraps of moral advice and scientific information. Clever children will quickly find out and resent his presence, as they do that of the powder artfully concealed in jam. The complaints of the coinage are amusing, but we do not wonder that the other coins “seemed bored and worried by the speeches of the paper currency.” They, no doubt, preferred “The Song of the Sixpence”—

“Sing a song of sixpence,
A pocket full of tea,
Four-and-twenty listeners
Listening to me;
Prices now are doubled.
Things are dear, you see,
So a sixpence isn't
What it used to be.”

But even this, it will be perceived, savours somewhat of the School Board.

The Clan of the Cats: True Stories about Feline Animals. (Seeley.) *The Clan of the Cats* includes not only the familiar members of cat-land proper, but such distant foreign relatives as the leopard, the lynx, the panther, the jaguar, the ounce, the ocelot, the tiger, the puma, and the lion, the acknowledged chief of the clan, so that an acquaintance with Pussy really involves a considerable knowledge of natural history. The book is illustrated with thirty-five woodcuts, many of them very good, and the stories are simply told, and are sure to please intelligent children.

Public and Private Life of Animals. (Sampson Low.) Translated from a French work, published some ten or twelve years back, which owes its popularity to the admirable illustrations of Legrand, which are here reproduced. His spirited groups of animals and the human expression he has contrived to give to their faces are perfectly inimitable.

Fairyland Tales and Legends from the German of Villamaria. (Marcus Ward.) The story of the “King's Daughter” derives its source from the fate of Pharaoh's Host, which, according to Scandinavian legend, found no rest in the depths of the Red Sea, but were changed into seals and sent to the cold waters of the North. The superstitious reverence in which the lady-bird is held in Germany and the Tyrol is told in the story of “Holda's Paradise.” And many other popular legends gleaned from old chronicles will prove a welcome Christmas offering in their English dress, accompanied by numerous graceful illustrations.

Starlight Stories, by Fanny Lablache (Griffith and Farran), is another collection of pretty tales of Fairyland, with numerous illustrations.

Where the Rail runs now, by F. Moore (Marcus Ward), is a startling tale of the old coaching days, a robber and murderer who entered the coach in female disguise being recognised by the coachman after the lapse of nine years.

Grey Tones, or Aunt Hetty's Will. By M. Pollard. (Griffith and Farran.) Aunt Hetty's will is forged by an unprincipled nephew, who is dispossessed of his ill-gotten property, which devolves on a humble and meritorious clergyman.

The Little Folks' Picture Album. (Cassell.) A book full of pictures of children and animals, admirably drawn, with about four lines of description to each, sufficient to illustrate the subject without tiring the juvenile readers impatient to turn over to the next page.

Bracebridge Hall. By Washington Irving. Illustrated by R. Caldecott. (Macmillan.) It is pleasant to see an old favourite in new dress, and illustrated with such refined appreciation as Mr. Caldecott has shown. *Bracebridge Hall* is uniform with *Old Christmas*, which has been already noticed in the ACADEMY. Mr. Caldecott combines keen humour and graceful feeling in most of his

illustrations. Master Simon is represented exactly in the way we should have expected, and the pictures of the Housekeeper, of Lady Lillycraft, of the General asleep over the *Fairy Queen*, and of pretty little Phoebe in trouble, are some among many which have charmed us. We propose to deal more in detail with this book hereafter.

Boy Mill. By Captain Rice, R.E. (Hatchards.) A story for people from sixteen to twenty years of age. The beginning is dull, but the tale, though an improbable one, improves as it goes on. It is the history of a young man who runs away from Woolwich in the mistaken belief that he has killed his opponent in a duel. The hero becomes a cabin-boy and goes out to Australia, where he meets the daughter of the “Governor of New South Wales,” to whom he was engaged in happier days. She faints as he, in his capacity of cabin-boy, hands her a bowl of strawberry ice, &c., &c. The book is crudely written, but well-intentioned and well-printed, though it looks too much like a book for children, which it most distinctly is not.

Through Picture Land. By C. L. Mattheux. (Cassell, Petter and Galpin.) This is certainly one of the prettiest of the Christmas books for little children. Both pictures and letterpress are delightful, and there are two or three capital silhouettes in it.

Bright Rays for Dull Days, and Pictures for Happy Hours (Cassell, Petter and Galpin), are also bright little books, full of pictures and short stories which the children will like.

Tom Thumb's Picture-Book (Routledge) is full of coloured illustrations, and contains, as well as Tom Thumb, Blue-Beard, Aladdin, Ali Baba, and Jack the Giant-Killer, and the Sleeping Beauty. The illustrations are vivid, but the effect of putting letterpress on the back of the pictures has been somewhat to confuse the print.

A Night and a Day, by Hesba Stretton (Henry S. King and Co.), is a touching little story of a pitman who ventured his life to rescue his friends in danger. Hesba Stretton writes with strong human interest, and gives a certain amount of charm to every subject she touches on.

The Two Bartons. (J. Clarke.) A little book for village boys, which has drawn its chief inspiration from the teaching of the late Prof. Maurice. The story shows the influence which a thoughtful young schoolmaster acquires over two brothers of opposite characters, developing all that is best in both. The book has so much that is good and healthy about it that we wish the class for whom it is written had been more carefully considered. Village lads will not know what “sang froid” means—nor will they much appreciate quotations from “In Memoriam” at present—but little stories like *The Two Bartons* are a great improvement on those of the “goody” order, and an author who can write with so much sympathy will, with increasing thoughtfulness about those written for, do good and useful work.

The Little Hunchback. Translated by Clara Mulholland from the French of Countess de Ségur. (Dublin: Gill.) A pretty little French story, which is valuable as setting the moral beauty of a deformed boy before children—a possibility which should be more frequently shown to them than it is. The cruelties of the nurse Mina to little Christine, and her parents' neglect, are not very profitable subjects, and sound to English ears somewhat unnatural.

Myra's Annual Album (Hobard and Son) contains a wonderful mass of information relating to Fashions, Proverbs, Plays, Rhymes, and Recipes, to which is added a Calendar with all the usual particulars. It is essentially a lady's book of reference, for which it is well adapted. The Fashion and Nursery Rhyme illustrations are very suitable, while the latter are decidedly amusing.

NOTES AND NEWS.

THE Council of the Camden Society at their last meeting adopted the handsome offer of Mr. Horwood to reprint Milton's *Common-Place Book* at his own expense, in consequence of the discovery of numerous errors in the edition issued to members of the society. They also resolved on including in their list of future publications *A History of the Divorce of Henry VIII. and Catharine of Aragon*, by Nicholas Harpsfield, to be edited by the Rev. N. Pocock.

MAJOR F. S. RUSSELL, Instructor at the Royal Military College, translator of Major-General von Mirus' *Cavalry Field-Duty*, has written an important summary of the various wars that have occurred between Russia and Turkey in the last 150 years. It includes a detailed account of the campaigns of 1828-29, together with Count Moltke's views on their strategy. Major Russell also devotes a section of his work to the consideration of the present political and strategical situation. The work will be published early in the new year by Messrs. Henry S. King and Co.

MESSRS. PUTTICK AND SIMPSON announce for sale on January 23 and three following days a most extensive collection of autographs and manuscripts, chiefly foreign, formed by a collector at Dresden, and containing specimens of the greatest interest.

THE Zürich papers notice that the Swiss poet Gottfried Keller has been nominated a knight of the Bavarian "Maximilian-Order of Science and Art." The same honour has been conferred at the same time on the novelist Auerbach. It should be mentioned that the members of this Order have the privilege of filling up the gaps which occur in their society, the King merely confirming their choice. Keller was proposed about a year ago, but further prosecution of his election was stopped on the ground of his political standpoint; this objection has now been overcome.

THE *Russische Revue* contains the first part of an interesting article by C. Gruenwaldt on domestic industries in Russia, dealing with the workers in metal and the producers of textile fabrics. The account of the proceedings of the Oriental Congress at St. Petersburg is brought to an end. W. Fabritius contributes a paper on "Baku as the Central Point of the Overland Route to India," the result of a journey made to that city in 1875. And among the reviews is given a very interesting and valuable summary of the great work by Dr. E. Pelikan, published this year at St. Petersburg, on the Skoptey, the Russian imitators of Atys—a work which, from its size and cost, is not likely to become generally accessible.

MRS. BEAVINGTON ATKINSON writes to us respecting the announcement of her husband's decease in last week's *Athenæum*:—

"The art of making paragraphs, in which your distinguished contemporary the *Athenæum* has long taken the lead after a certain doubtful fashion, has just reached what may be called a tragic climax.

"Mr. Beavington Atkinson, the well-known art-critic, has been dangerously ill for some two months or six weeks. He has lately slightly mended. But the *Athenæum*, on some froth of gossip, chose that Mr. Atkinson should have died on the first of December, and accordingly buried him under a memorial paragraph. Daily and provincial papers followed suit.

"I beg to deny the whole statement, as under the circumstances a cruel fabrication and a scandalous abuse of literary prerogatives."

MR. SWINBURNE'S *Note of an English Republican on the Muscovite Crusade* (Chatto and Windus) cannot of course be discussed by us from any but the literary point of view. As invective it seems to us to be good and worthy of preservation. What can be finer, for instance, than the following passage? (the writer is speaking of Mr. Carlyle):—

"Cruelty in Ireland, cruelty in Jamaica, cruelty in

the plantation, cruelty in the jail, each of these in turn has naturally provoked the stigmatic brand of his approbation, each in turn has deservedly incurred the indelible condemnation of his praise."

But the writing is not all so good as this: many sentences are too long and too much involved to be understood at one reading, and the superlative degree dominates the whole writing too exclusively for it either to be weighty as a political pamphlet or quite satisfactory as literature.

MR. A. BISSET THOM is compiling a work which may not inappropriately be termed the "Indian Book of Dignities." It will contain the fullest information obtainable as to the titles, parentage, marriages, offices, public services, &c., of all members of the Civil Service, of the Judges of the various Courts, of the higher grades of the Army and the P. W. D., of the Star of India, of members of the Legislative Councils of the three Presidencies, &c., and also of all the native princes and leading native statesmen of India. Messrs. Henry S. King and Co. have consented to take charge of all letters sent to the editor on the subject.

MR. MACKENZIE WALLACE'S *Russia* is so far forward that the publishers hope to have it ready early in January.

THERE is great probability that the merits of Endowment of Research will soon be put to a practical test. The Government has offered to the Royal Society a grant of 4,000*l.*, to be applied towards the advancement of science during the next year. The management of this Government fund is to be in the hands of the Council of the Royal Society, and arrangements have been made for the due representation of the claims of different branches of Physical Science in carrying out the details. It is to be hoped that, in addition to larger or smaller grants in aid of particular researches, the opportunity may be taken to ascertain the advantages and disadvantages to be derived from enabling one or more competent investigators to devote their whole time to original research, without their attention being diverted by any other occupations, necessary for their maintenance. It is also to be hoped that, if any of the fund is thus employed, every care may be taken to avoid such abuses as might at this early stage bring the entire system into disrepute. It would depend on the character of the individuals selected whether such pecuniary aid led to a successful result or were a total failure; but there is very little doubt that, if a few suitable men could be found thus enabled to devote their whole time and attention, certain branches of science could be more successfully advanced than by making a number of smaller grants sufficient only to pay the expenses of the investigations themselves.

MESSRS. MACMILLAN AND Co. will shortly publish the first volume of a *Treatise on Chemistry*, by Henry E. Roscoe, F.R.S., and Carl Schorlemmer, F.R.S., Professors in the Owens College, Manchester. The aim of the work is to furnish a concise but complete treatise, which, it is hoped, may serve as a standard work on Chemical Science for the use of those who desire to obtain a more extended knowledge than can be derived from the excellent smaller manuals with which our language fortunately now abounds. With this view the authors have endeavoured to give a complete and accurate account of purely chemical phenomena, and a clear description of the chief chemical processes. Much care has been bestowed upon the illustrations, in the hope of making the descriptions more intelligible than they would otherwise be. The first volume will contain:—(1) Historical Introduction; (2) General Introduction to the Science; (3) Chemistry of the Non-Metallic Elements and their Compounds; (4) Crystallography; (5) Spectrum Analysis.

THE first part of Mr. William Chappell's edition of the *Roxburghe Ballads* is now reprinting for the Ballad Society. This is the third of its volumes

that the Ballad Society has had to reprint. Mr. Elsworth's edition of the *Bagford Ballads* is kept back by the want of a fresh supply of the cream-tinted Whatman paper that is hand-made specially for the society at the Maidstone mills; but all the "copy" is ready.

MR. SMALL, of the University Library, Edinburgh, has contributed to the Society of Antiquaries of Scotland some more "Sketches of Later Scottish Alchemists," and has written some Notes to *An Account of an Alchemical Roll on Parchment*, presented to the Royal College of Physicians, Edinburgh, by the Earl of Cromarty, in 1707; the *Account* itself being written by W. Moncrieff, M.D. The most interesting sketch is that of the celebrated John Napier of Merchiston, the inventor of logarithms and of those "bones" of which Sir Walter Scott had such a remarkably hazy idea. The discourse that passed between "Markestone" and a certain German *savant*, by name D. Muller, on November 7, 1607, is given in the very words of Napier himself. Napier adds that, in the following year,

"the Doctor gaue me secretly ane smal portioune bothe of the one and of the other [i.e. minerall mercurie which neuer had fealte fyre, and some unfyned mercurie, easie to be wrunge out from his owre]; as also ane verie smal parte of Luna minerall [silver] unfyned, but I purchased more bothe of Scotcs and German Luna [silver]. As for Sol minerall [gold], wee haue enoughe in Scotland. Rests tyme and opportunitie to enterpris the worke with the blissinge of God, to performe the samen [same] to his glorie and comforte of his servants, which the Almighty grant to ws."

His son, Robert Napier, wrote an alchemical treatise, called the *Revelation of the Mystery of the Golden Fleece*, wherein he is careful to warn the reader against confiding the secrets of alchemy to "the impious, the garrulous, or the imprudent." The following is a remarkable passage:—

"Whoever divulges these sacred mysteries shall be held guilty of betraying this secret, and responsible for all the ills that may emanate therefrom. A mad-man must not be armed with a sword. Divulge this secret, and the hind would become greedy of gold to his own destruction. The earth would be deluged with iniquities. Agriculture and the other arts of civilization would no longer exist. Mighty in their gold, nations would rush to causeless war. The worthless would wax proud, and scorn their rulers. The reins of civil power and legitimate government thus relaxed, a fearful convulsion would follow. Oh! I say, reveal this secret to the vulgar, and the darkness of chaos must again brood on the face of the waters."

Fortunately for society, it does not appear that the secret was ever divulged; and again, unfortunately, it would seem that nations sometimes "rush to causeless war" without always ascertaining that they are "mighty in their gold," as they should do.

A GENERAL index has been issued to the back volumes of the *Leisure Hour* on the completion of its twenty-fifth year. It includes nearly 15,000 references.

WE have been favoured by Mr. Francis Fry with a copy of his collation of "The Three New Testaments of William Tyndale." The work, which occupies thirty-two pages quarto, is beautifully executed, and is only a first instalment of a larger treatise which the author is preparing, and which will contain a description of the various editions of the New Testament of Tyndale's Version. Mr. Fry is known as being the possessor of a unique collection of English Bibles and Testaments, and probably no one living knows as much as he does of the various readings of different editions of the same version. The present *brochure* contains only the collation of the Antwerp edition of 1534 with 1535, and another which has two dates, and is called that of 1535-4. This last is the copy which is almost always followed in Matthews' folio of 1537, and Mr. Fry, on this and other grounds, which we shall probably see stated

in his larger work when it comes out, considers that this edition is "the last corrected by Tindale." He does not profess to have quoted *every* misprint, though he has erred on the right side in printing many readings which are manifestly mere errors of press. His own account of the matter is as follows:—"Some of the differences are obviously typographical errors, but even these sometimes assist in tracing the relations of one edition to another. A few only of the errors in the edition of 1535 are given."

THE Council of the Royal Historical Society has resolved to offer a prize of ten guineas for an essay on "The Influence of Art History on General Education," to the students of the Art-Training School at South Kensington, and a prize of five guineas for an essay on "The Necessity of the Study of General History," to the students of the Birkbeck Literary and Scientific Institution.

MR. ELIOT STOCK has sent us a second and cheaper edition of his *facsimile* edition of the *Pilgrim's Progress*, published two years ago (see *ACADEMY*, Feb. 20, 1875). The illustrations from the earlier editions, and the conversation between Christian and Evangelist, which were added to the first issue, are now omitted. The present edition has been very carefully re-read, and is believed by the publisher to be an absolute *facsimile* of the *editio princeps* published in 1678.

A CORRESPONDENT writes from Delft:—

"In the second part of *Tamburlaine the Great*, act I., scene i., we find the line:

'Scavonians, Almaines, Rutters, Muffs, and Danes.'

Mr. A. Dyce, whose edition I possess, explains the word 'Rutters,' but does not say a word about 'Muffs.' Who were they? A tribe of that name I never heard of, but here in Holland we generally give to a German the nickname of 'mof.' I think the word 'Muffs' has the meaning of 'Germans' here, and perhaps the familiar expression 'Muff' has the same derivation."

THE *London and China Telegraph* of the 18th inst. writes that the Chinese in Hong Kong were greatly excited on October 26, on the arrival of the river-steamer from Canton. On enquiry it was found that "the interest arose from the receipt of the list of successful candidates at the Triennial examination held last month, the results of which were only made known early this morning in Canton, and were consequently expected here in the afternoon. The chief interest the Chinese take in the results is in connexion with the Wai Sing lottery, prizes in which are determined by the names of the successful candidates. The competition must be very severe, as out of more than 10,000 Siu tsai who came up to contest the honour of Chu-jen only eighty-nine were selected, being only a little more than eight in 1,000. The best scholar at this examination was a man named Wong Yin Cheong, a native of Sun-on, aged thirty-five." In the city of Wuchang, according to the same authority, only sixty-nine candidates passed out of a total of 11,400.

WE are indebted to the *Manchester City News* for the following summary of the results of the Corser sale at Manchester, to which we have already alluded:—

"The keenest competition was that for the *Bibliotheca Anglo-Poetica*, a descriptive catalogue of early English poetry compiled by A. F. Griffith, which fell to Mr. Hayes for 85*l.* This particular copy had been illustrated with 900 engravings, many of an extreme rarity. George Wither's *Psalms of King David* brought 50 *gs.*; Marlowe's *Hero and Leander* (1617), 15*l.*; and Milton's *Maske at Ludlow Castle* (1637), 45*l.* The original autograph manuscript of Cavenish's *Life of Wolsey and Metrical Visions* was knocked down to Mr. Quaritch for 60 *gs.* For the quarto copy of *Richard III.*, published in 1612, the bidding was remarkably keen, the lot being finally knocked down to Mr. Quaritch for 16*l.* 5*s.*, the title-page, which was beautifully inlaid, being as follows:— 'Tragedie of King Richard III., conteyning his treacherous plots against his brother Clarence, the pitiful murder of his innocent Nephewes, his tyran-

nical usurpation, with the whole course of his Detested Life and most deserved Death, newly augmented by William Shakes-peare.' A similarly inlaid copy of *The Merry Wives of Windsor* was bought by the same purchaser for 10*l.* 2*s.* 6*d.* The collection altogether realised about 1,500*l.* Mr. Quaritch was the largest purchaser."

NOTES OF TRAVEL.

WE understand that Bishop Kestell-Cornish has just returned to Tamatave, after having made a four months' tour in the interior of Madagascar. In the course of his journey he has visited many places in the northern half of the island where no foreigner, it is believed, has ever set foot before. His account of his explorations, which is shortly expected in this country, will, therefore, doubtless contain much information of considerable value from a geographical point of view, and we look forward with interest to its publication.

PROF. J. D. WHITNEY has just published in a separate form, from the Cambridge (U.S.) University Press, his two Essays, *Are We Drying Up?* and *Plain, Prairie, and Forest*, which appeared in the *American Naturalist* for September and November last.

A GEOGRAPHICAL Society has just been started at Copenhagen, of which the King of Denmark is Patron, and the Crown Prince President.

SIR RUTHERFORD ALCOCK, Sir Bartle Frere, and Commander V. L. Cameron have been elected honorary members of the Imperial and Royal Geographical Society of Vienna.

At the Council meeting of the Royal Geographical Society, held on December 11, H. M. Dom Luiz I., King of Portugal, was unanimously elected an honorary member; and on November 27, Mr. Eugene Schuyler and Prof. Giglioli, of Florence, were elected honorary corresponding members of the same society.

Two handsome photographic albums have just been published by the South Australian Government. The one in large quarto, entitled *Views in South Australia*, contains fifty photographs, seventeen of which represent different parts of the Botanical Gardens at Adelaide, and the remainder various scenes near that city, including waterfalls, parks, mines, bridges, cattle, sheep, &c. The photographs are all taken by Mr. H. Davis. The other volume, in extra large quarto, contains twenty *Views in the City of Adelaide*, most of which bear the name of Messrs. Freeman and Wivell.

IN his report on the trade of Canton, which has just been issued, Sir D. B. Robertson gives some interesting information about opium. Towards the close of the Ming dynasty (A.D. 1644) it had the name of *Ya Fu-yung* (Cantonese, *A-fu-yung*; Arabic, *Afyun*). At that time it was not known that the drug could be used for smoking purposes, but its properties were cooling and astringent, and it was used for diarrhoea and fevers, but with what admixture is not known. Subsequently it was made into paste and smoked, the effect being also, to some extent, astringent and antifebrile. At first the only sort was Patna, followed afterwards by Malwa, then Benares, and finally Persian, which last tradition describes as hot and acid, and liable to cause dysentery. When China first began to cultivate the poppy, it was called the *Yung-su-hwa*, jar-shaped flower, or capsule, and when the juice was extracted, it was called "white smoke," or "white tobacco" (*pai yen*). It is grown very extensively in Yunnan, where it covers the whole country; hence the name "Yunnan white."

THE *Peking Gazette* in a recent issue contains a curious memorial respecting a winter hunt which it appears to be customary to hold in Kirin (Central Manchuria) for the purpose of exercising soldiers and supplying dried deers' flesh for the Imperial table. The Acting Governor-General begs that, in view of the costliness of the expedi-

dition and the impoverished state of the exchequer, the hunt may be allowed to lapse this year; at the same time, he undertakes that the required deers' flesh and tails shall be obtained by smaller hunting parties.

MR. ALEXANDER MURRAY, F.G.S., has prepared a new geological map of Newfoundland.

A JAPANESE newspaper states that corals are obtained from the seas of Iyo, Tosa, and Bungo, those from Tosa being the finest. A large piece of pink Tosa coral, a very fine specimen, was lately found, measuring five feet in height, with a spread of six feet.

A CURIOUS confession is made in an official document recently published in the *Peking Gazette*. The military governor of Jehol reports the dispersion of a band of silver-miners who had congregated at a place about thirty miles north-east of Chêng-tê Fu, known as Yao-kow, where veins of silver ore had lately been found. The lawless silver-hunters having been dispersed, a trader, holding a Government licence, has been authorised to prosecute the workings by way of experiment, as it is found that the *feng-shui* of the neighbourhood is not interfered with by mining operations at this spot. Now that *feng-shui* has shown signs of giving way, hopes may surely be entertained of the commercial regeneration of China.

It is said that the Russian traveller, M. Miklucho Maclay, whose explorations in the Malay Peninsula have several times been referred to in these columns, has gone to New Guinea.

SELECTED BOOKS.

General Literature.

PARIS LETTER.

Paris: Dec. 11, 1876.

We announced already in 1875 to the readers of the *ACADEMY* the good fortune which led M. Capmas, Professor of Law at Dijon, to discover a manuscript of M^{me}. de Sévigné's, containing a large number of unpublished letters. This manuscript has just been published in two volumes by M. Capmas himself, as a supplement to the edition of M^{me}. de Sévigné brought out by M. Ad. Regnier in the *Collection des grands Ecrivains de la France* (Hachette). We have in it 170 letters or fragments of letters, which, like every-

thing that has come from the pen of the charming *Marquise*, delight us by their animation, talent, and good sense. M. Capmas has fulfilled his duties as an editor with a conscientiousness which may be thought exaggerated, and the interminable Introduction, filling more than the half of the first volume, seems a little heavy beside the easy and unstudied prose of M^{me}. de Sévigné; but lovers of literature will pardon what is only an excess of zeal, in consideration of his happy discovery, and his profound knowledge of his subject.

Another publication which will delight literary men is the splendid edition of the works of Clément Marot, the first volume of which M. G. Guilfré has just brought out. Printed with unexampled magnificence on the most beautiful paper, enriched with reproductions of the engravings which adorn the old editions of Marot, each of these volumes is sold at 50 fr., and there are six of them. Thanks to the notes, the commentaries, the indexes, vocabularies, and what the learned editor will add to it, this publication will be of the first importance for the literary history of the sixteenth century, and more than 5,000 unpublished verses will be added to it.

The sixteenth century is one of the richest mines for discoverers. On every side something hitherto unpublished may be gleaned. M. Paillard has just published the fourth and last volume of his excellent *Histoire des Troubles de Valenciennes* (Fischbacher), and M. J. Delaborde gives us, by the same editor, a touching history of *Eléonore de Roye*, wife of the first Prince of Condé. Nothing is more beautiful than the life of that simple and heroic woman, who had but two thoughts—to serve her faith and her husband—who faced every kind of danger in the accomplishment of her duties, was mixed up with war and negotiations, and finally died of overwork, having had the misfortune to find herself abandoned by a husband unworthy of her. M. Delaborde is a fervent Protestant, and his book has not the calmness and impartiality of history, but it is written with feeling, and, above all, it is based on very careful researches in the libraries and archives of France and foreign countries. He has brought into use a mass of original documents.

It is also owing to the archives that M. Gregorovius has been able to paint the strange and seductive figure of Lucrezia Borgia. Thanks to the rehandling and additions of the author himself, the French translation of his work just brought out by M. Regnaud (Fischbacher) has a value of its own, and will be read with more pleasure than the German original. Lucrezia Borgia, thanks to M. Gregorovius, is divested of her crimes and the tragic poetry hitherto attaching to her, and becomes a creature inoffensive rather than otherwise, passing half-innocently through the midst of every kind of crime and impurity.

The eighteenth century has not so many surprises and discoveries for us as the sixteenth, but there are still many new points of view to be brought to light, many details to be elucidated. M. Desuoiesterres, with his volume on *Le retour et la mort de Voltaire* (Didier), completes his great work on Voltaire, which may without exaggeration be called a literary history of the eighteenth century. In a recent thesis for the degree of Doctor of Letters M. Foncin has studied the short, noble and futile ministry of Turgot in a much more complete manner than had been done before. While exaggerating, perhaps, the qualities of Turgot as a statesman, he shows how he conceived, without any revolutionary ideas, all the useful reforms that the Revolution was to bring about; this *Essai sur le Ministère de Turgot* (G. Baillière) is one of the best books of history that have lately appeared. M. Semichon's work, *Les Réformes sous Louis XVI.* (Didier), cannot be eulogised in quite the same terms. Neither the composition nor the writing of the book can be favourably spoken of. It rests on a false idea—namely, that Louis XVI. had a great mind and a great character, that all necessary reforms had been already accomplished in

1780, and that consequently there was no reason for the Revolution. Nevertheless, there is a portion of M. Semichon's book which is new and interesting—that which is devoted to the provincial Assembly of Normandy, and its struggles with the *Parlement*. We learn from it that these assemblies of notables invested with the most extensive powers had come in contact with the old institutions of the monarchy, and found themselves reduced to impotence. Thence the rage and impatience which brought about the Revolution. We are brought back to the same subject by the book of M. Bardoux, Deputy of the Second Chamber, on *Les Légistes et leur Influence* (G. Baillière). M. Bardoux follows them from their origin in the Middle Ages down to the epoch of Napoleon. He shows, not without reason, the predominant influence they exercised on French society, and how they gave it its double character of an administrative centralisation and a levelling *bourgeoisie*. The legists destroyed the privileges of the nobility and also the provincial and local franchises; they created in France good administration and justice, but they never understood or served the cause of liberty. M. Bardoux, who is an *avocat*, regards the part they played a little too favourably, and pardons them too easily for having been the founders of monarchical despotism, but his elaborate study, full of facts and ideas, deserves to be carefully read.

The spirit of the old French legists is to be found still living in the politicians of contemporary France, the chief of whom come from the bar. It is found even among those who have broken most completely with the traditions of authority and centralisation, and even in Odilon Barrot, the famous head of the Opposition under Louis Philippe, who became Minister of the reaction in 1849. We have already spoken in this paper of the first three volumes of his *Mémoires*. The fourth and last volume has just appeared (Charpentier). It offers, perhaps, a less lively interest than the preceding ones, as Odilon Barrot was no longer playing any important part during the period to which this volume is devoted, 1851. At the same time he has the merit of being very impartial, and he shows clearly how the misunderstandings and parliamentary disagreements arose which were to end in the Second of December. This great political crime is related without any new details, but his recital of it in its simplicity has the power to rouse indignation and passion. In a conclusion and epilogue he relates the attempt at a Liberal Empire in 1870 and the catastrophe of September 4. The impression left by these memoirs is a melancholy one; they show that in a country so divided into irreconcilable parties as France, all understanding between the honest people of different sides with a view to the common welfare is impossible. And the principal obstacle is religious passion, the struggle between clericals and non-clericals, which corrupts all political questions.

How much healthier, how much happier, are the struggles of English politics! M. Laugel, in a little book written with liveliness and talent, sketches briefly the career of two of the most original political characters of contemporary England—Lord Palmerston and Lord John Russell (G. Baillière). The picture of Lord Palmerston is much the most successful. He is painted in no very flattering colours, with hostility and exaggeration even; but, this once understood, the passionate feeling gives life to the sketch. In the picture of Lord John Russell, M. Laugel has been restrained by personal relations which imposed reserve on him and forbade sarcasm.

The literary movement, as we have shown, is active in the domain of history, and we must pass over in silence many other works of less general or less present interest, as, for instance, the book of M. l'Abbé Delarc on *Léon IX.* (Plon), or the study of M. Ance on the *Conseil d'Etat* (Didot). We must, however, specially mention the *Charlemagne* of M. Vétault (Mame), which, though not

an historical work of the first order, and conceived in a narrow Catholic spirit, has been notwithstanding studied with care, enriched with learned notes, and above all is printed and got up so splendidly that it makes a magnificent book for a New Year's gift. We have already noticed in former years the increasing tendency to publish works of a scientific character as New Year's gifts. This tendency is still showing itself, and this year the firm of Didot is completing by a final volume the series of beautiful publications of the bibliophile Jacob (pseudonym of M. Paul Lacroix), the *Mœurs du Moyen-Age et de la Renaissance*.

And what more charming present could be offered to a lady of artistic tastes than the *Chansons du XV^e siècle*, words and music, published by MM. G. Paris and Gevaert for the Société des Anciens Textes Français (Didot)?—not to mention the splendid historical and archaeological publication, *Paris à travers les Ages* (Didot), in which the history of every quarter of Paris is related by scholars well versed in Parisian antiquities, and illustrated by engravings collected from the best sources.

Among the auxiliary sciences of history there is one which has become, since the last war, the object of special attention—geography. The Frenchman has been defined as a polite gentleman who is unacquainted with geography, and the French defeats have been by many persons imputed partly to that ignorance of geography. So since then we have seen geographical publications increasing, atlases, manuals, &c., and the number of members of the Geographical Society is doubled. Two Reviews have been started, *L'Explorateur* and the *Revue Géographique Internationale*. The first, notwithstanding its real success, has perished through bad management, but reappears under a new name as *L'Exploration*; the second is of no value; but the *Revue de Géographie*, which M. Drapeyron is going to publish with Thorin, promises to be both serious and attractive. Special works, too, are not wanting. M. E. Desjardins of the Institute—well-known by his fine edition of Peutingier's map—who is both an epigraphist and a geographer, has just published the first volume of the *Géographie historique et administrative de la Gaule Romaine* (Hachette), which will furnish historians with a solid foundation for works on the history of France. Very fine maps serve to explain the text. M. Himly has also just brought out his *Géographie historique des États du Centre de l'Europe* (Hachette), the résumé of work begun many years ago, and forming a real political history of Germany from a geographical point of view. M. Himly, like M. Desjardins, has the gift of enlivening erudition and making it animated and attractive. It is true he has made his task easier by only giving in his work the result of his labour, and concealing all the preparatory work of proofs and researches; while M. Desjardins has preserved in his book the whole learned apparatus. We might place by the side of this *Geography of Roman Gaul* M. Bertrand's book, *Archéologie Celtique et Gauloise* (Didier), which gives us some very interesting studies on the geography, ethnography, and archaeology of Gaul before the Roman period. Director of the museum at St. Germain and one of the most active members of the commission for preparing a map of Gaul, M. Bertrand elucidates numerous points of detail with great knowledge mixed in one point with some amount of paradox.

Paulo minora canamus. The *Revue des Deux Mondes*, always in quest of romance writers, tired of always translating English novels, and having turned to Russian authors, has lighted upon one. It is true that he bears an English name, Henry Greville, and that he writes about Russia, but in reality this Russian Greville is a young lady of the very French name of Durand. Her first two romances—one a terrible one, *L'Expédition de Savak*, the other humanistic, *Dusia* (Plon)—made a sensation. Unfortunately, M. Greville or M^{me}. Durand has a marvellous fertility. Four journals

are publishing at this moment novels from her pen. Of course the originality of each one suffers in consequence. There are, however, imagination, sensibility, and style in the writings of this new novelist. She is a little wanting in taste; but never mind, we must wait and hope. We have no longer the right to be particular.

G. MONOD.

CONGRÈS INTERNATIONAL DES AMÉRICANISTES.

THE following are the subjects which will be brought before the International Congress of Americanists at their second session, which is to be held at Luxemburg from September 10 to 13, 1877:—

"*Histoire*.—Législation civile comparée des Mexicains sous les empereurs aztecs et des Péruviens à l'époque des Incas.

"Examen critique des sources de l'histoire des peuples de l'Amérique centrale.

"Découverte et colonisation du Brésil.

"A quelle époque et pour quels motifs le nouveau Continent a-t-il reçu le nom d'Amérique?

"*Archéologie*.—Des caractères généraux de l'architecture maya dans le Yucatan.

"De l'emploi de cuivre dans l'Amérique précolombienne.

"Les Mound-Builders; leur origine, leur antiquité, leurs ouvrages, leur état de civilisation, leur histoire.

"*Linguistique*.—Caractères particuliers de la famille Tapi-Guarani.

"Des langues américaines comparées au point de vue grammaticale avec les langues dites ouralo-altaïques.

"Des dialectes esquimaux comparés avec les langues de l'Amérique proprement dite et de l'Asie.

"*Paléographie*.—Déchiffrement des inscriptions et des manuscrits réputés Mayas.

"De l'élément phonétique dans l'écriture Mexicaine.

"A quelle période de la civilisation américaine appartiennent les peintures dites *Hiéroglyphes américains*? Indiquer, dans la mesure du possible, la date des plus anciens documents connus dans cette écriture; exposer quelle a été l'influence exercée par l'arrivée des Espagnols sur le développement et sur l'emploi des peintures figuratives de Mexique.

"*Anthropologie et Ethnographie*.—De l'antiquité de l'homme en Amérique.

"De la tradition du déluge dans l'Amérique du Nord et particulièrement au Mexique.

"Classification ethnographique des indigènes des Guyanes."

APPOINTMENT FOR NEXT WEEK.

THURSDAY, Dec. 28.—3 P.M. Royal Institution: "The Chemistry of Fire," by Prof. J. H. Gladstone.

SCIENCE.

Itala und Vulgata: das Sprachidiom der Urchristlichen Itala und der Katholischen Vulgata unter Berücksichtigung der Römische Volkssprache, durch Beispiele erläutert von Hermann Rönsch. 2^e berichtigte und vermehrte Ausgabe. (Marburg: Elwert, 1876.)

WE must confess to a certain amount of disappointment in finding that this is not really a second edition of Dr. Rönsch's very useful book, but a reissue of the first with an additional sheet at the end, and a short preface at the beginning. We may, however, take the opportunity of recommending it again very heartily to our readers, having proved its usefulness by con-

stant reference to its pages, since its publication in 1868. It is a methodical analysis of the language of the old Latin and Vulgate versions of the Bible, of great value to the study of Biblical and patristic literature, and hardly less to the history of Latin and the Romance languages. To those interested in the latter subjects we recommend the section headed "Kurze Charakteristik der Sprache der Itala," pp. 471, foll. It would be difficult to find in so short a compass a better *résumé* of the first steps towards the formation of the Romance languages. The use of long and well sounding and emphatic forms, of adjectives for substantives, of vulgar or archaic words for classical, and of analytical for synthetical constructions are, perhaps, the most significant elements in this process. The course of phonetic decay, and the loss of terminations are visible in a far less degree, though very interesting as far as they go. With respect to the points first mentioned, especially the use of longer for shorter and simpler forms, the evidence of these versions is important as correcting a natural misconception. These forms occur in books written for the people and in the common language of the people, and we must, therefore, acquit those who use them of the affectation and bad taste which we frequently associate with them. The whole complexion, in fact, of the language had changed since the Augustan age, and Minucius Felix and Tertullian in their day, and Ammianus and Symmachus in the fourth century, wrote as was natural to them, and pretty much as people spoke around them. Such terms came as glibly from their tongues as "long-tailed words in -itude and -ation" do from ours. With respect, too, to the archaisms of the African writers, many of which are found in the old Latin and even the Vulgate, the same remark seems to hold good. It is probable that many plebeian words kept their ground in the provinces long after they had become obsolete at Rome, just as we find is constantly the case in America. The "Plautinus sermo" was less affected in Apuleius and Fronto than it would have been in contemporary Roman writers. Somewhat similar causes may perhaps account for the popularity of Chaucer in some parts of the United States.

The value of this book for Biblical and patristic studies is still more evident. It is much to be wished that Dr. Rönsch would crown his labours by giving us a portable edition of the old Latin version, at least in the New Testament, since few persons can hope to possess the folios of Sabatier and Bianchini, and the scattered publications of Tischendorf, Ceriani, Lagarde, Ranke, &c. The difficulty, no doubt, would lie in the selection of the MSS. which should be followed, as they differ very widely in character, but this might safely be left in the hands of Dr. Rönsch, who has already edited the New Testament of Tertullian. Again, though St. Irenaeus has been edited better than most of the Fathers, the old Latin version of the Bible has been hardly used sufficiently as a source of illustration, though used, no doubt, to a certain extent. In both we have a translation somewhat slavishly following a Greek original, but the Greek of

St. Irenaeus is for the most part lost, and can only be restored by a comparison of the method of interpretation followed in other cases. A few words from the Vocabulary (pp. 305, foll.) will show what is meant. Thus, from a comparison of the Latin Bible, *transductio* is seen to be the same as *ἐλεγχος*, *conspectio* as *φύραμα*, *confundi* as *ἐπαισχύνεσθαι*, *bene sentire* as *εὐδοκεῖν*, *advocare* as *παρακαλεῖν*, *capit* as *ἐνδέχεται*, *colligere* as *συνέρχεσθαι*, *incipere* as *μέλλειν*, &c., &c. *Conditio*=*κτίσις* is interesting as showing that there were two words, *condicio* and *conditio*, with different derivations, which have become confused, just as *perniciēs* and *pernitēs* seem to have been. *Cena pura*=*παρασκευή* is quoted by Dr. Rönsch, p. 307, as a proof of the African origin of the old Latin (which is, no doubt, most probable for other reasons), but its appearance in the Latin of St. Irenaeus seems rather like a wider usage of the term.

Enough has been said to show the great interest and importance of the book. On the matter in the additional sheet we may make the following remarks. The instances of *humanus* = *homo*, *mortalis*, may perhaps lead us to reconsider the emendation *homonem* or *hemonem*, usually substituted for *humanum* in the fragment of Livius' *Odyssey*, ap. Fest. p. 352. *Cocinare* in Lament. ii. 21 appears only to be found elsewhere in Plautus and Nonius, and *senicis* = *senis* only in a quotation of Plautus in Priscian. Of the words *interaestuar* and *repansare* Dr. Rönsch would find additional instances in Quicherat's *Addenda Lexicis Latinis*, a book he might well add to his authorities, as it is in many ways cognate with his own. In the additions to the section on Accidence we notice further instances of forms like *distineam* = *distineo*, and *plangebo* = *plangam*. *Aufers*, *offers*, as an imperative, is very like the curious "*sins* incurrere in pleores" of the Arval hymn, which in that place seems to be a future or optative *sines*, used imperatively. *Castra* = *castrum* goes naturally with such feminines as *serta*, *arva*, *ecta*, &c. The additions to the Syntax do not call for much remark. In the last section, on "Pronunciation and Phonology," the material might be very much increased by reference to inscriptions, the modern books on which do not seem to have fallen much in Dr. Rönsch's way. He mentions and uses De Rossi's *Inscriptiones Christianae Urbis Romae*, but not his *Bullettino*, and for his general knowledge of inscriptions seems to depend on Gruter. It is much to be regretted that an author who makes such good use of his materials should not be within reach of a better library. It is not, we feel sure, from any neglect of his own that he makes no reference to the Berlin *Corpus*, nor to Le Blant's and Hübnér's collections of Gallic and Spanish Christian inscriptions. What is still more remarkable is the absence of the name of Vercellone from his pages, a defect pointed out in our notice of the first edition. It is unfortunate that Dr. Rönsch should not be able to use that monument of patient and accurate scholarship, the *Variae Lectiones Bibliorum Vulgatarum Editionis*, left unfinished, indeed, by its lamented author, but, as far as it goes, most valuable and

complete. We can, perhaps, hardly wonder at the absence of references to English books, such as Dr. Westcott's article in Smith's *Dictionary of the Bible*, and Mr. Scrivener's *Introduction to the Criticism of the New Testament*.

JOHN WORDSWORTH.

KARL ERNST VON BAER.

THE great naturalist whose name stands by the side of that of our countryman Charles Darwin, in the front rank of the philosophical zoologists of this century, died in Dorpat on November 28 last, in his eighty-fifth year. Von Baer was a Russian subject, born at Piep, in Esthland (Esthonia), not 150 miles from St. Petersburg, on February 28 (17th old style), 1792. His father, Magnus von Baer, was a small landed-proprietor claiming descent from certain Baehrs of Bremen, and married to a first-cousin. Three of the offspring of this marriage died in childhood; the remaining five, including Karl Ernst himself, reached a great age, and were all healthy and vigorous, without defect of mind or body. The history of Von Baer's life is one of great interest in relation to the influence of education and other circumstances upon intellectual development. Strangely as Baer himself appears to have been perturbed by his questionable nationality, ardently as the Germans claim him for their own, we must yet allow that, while his reputation and scientific character were solely due to the German universities, it was to Russia he looked as "fatherland," and from Russia that he gladly chose to accept honour and position when his reputation was achieved. From Baer's own account of his father and mother it is clear that neither of them had much influence on the growth of his tastes or character. His father had "a happy nature of mingled earnestness and gaiety." He was a man of untiring industry, rising at four in the morning, superintending his estate and reading with avidity such books as the *Conversations-Lexicon* for the sake of mental occupation. In early childhood Baer was given over to the care of a childless uncle and aunt; returning to Piep at seven years of age, he was instructed together with his brothers and sisters by a series of governesses and private tutors, until at the age of fifteen he went to the cathedral school in Reval. Here he passed three years very happily, and, as he himself considered, profitably, and then at eighteen entered on a four years' course, terminating with the Doctorate of Medicine in the Russo-German University of Dorpat. Dorpat appears to have been in those days a very chaotic and feeble institution: Baer learned little or nothing, but narrowly escaped death from typhus when, with other medical students, he volunteered as a surgeon to assist in attending the wounded and sick with whom Napoleon's expedition to Moscow filled the line of that disastrous march. On becoming "Doctor medicinae rite promotus," Baer went to Vienna to pursue his medical studies, but after spending a year there found that his scientific scepticism produced in him an utter aversion from clinical study as there conducted. Botanical excursions with his friend Parrot to the Schneeberg and surrounding country were his sole delight, and at last he made his way to Würzburg with an introduction from Martius, of Munich, to Döllinger, Professor in Würzburg of Physiology and Anatomy. This was the critical point of Baer's scientific life. Döllinger was not only a single-minded and devoted teacher and student, but a man of wide philosophical views. Embued with the teaching of Kant and Schelling, he set himself like the "Natur-philosophen" to the task of forming, if not for others, yet for himself, a true "cosmic philosophy" based on actual knowledge of natural things whether organic or inorganic. He received young Baer, who then had no claim upon his attention but

that of the desire to learn, into his own workroom, and at once set him to dissect a leech. Such zootomical work was a revelation to Baer. He now felt his spirit satisfied; day by day he found himself gaining a kind of knowledge and experience which utilised and ennobled, instead of outraging, the "sceptical" or, as we now say, "scientific" habit of mind which had driven him from medicine. Specimens of all the accessible higher and lower forms of animal life were thus worked through by Baer under Döllinger's superintendence, who placed in his pupil's hands the monographs and descriptions of such forms then extant, to be consulted while the dissection was progressing.

While Baer was at Würzburg, in 1816, his fellow-student, Christian Pander, from Dorpat, came also to work with Döllinger, and commenced those studies on the development of the chick which resuscitated, on the one hand, the little-known work of Caspar Wolff, and, on the other hand, stimulated Baer to occupy himself with embryology. Döllinger instructed Pander in the method of examining the hen's egg, and was with Baer a witness of his observations, but the work was entirely Pander's. D'Alton, who afterwards assisted Pander in palaeontological work, was as artist constantly associated with these three in the investigation. After eighteen months thus spent in Würzburg, in which, besides zootomical work, the attendance at courses on cryptogamic botany and other subjects much engaged and stimulated Baer, he received an offer to become Professor in Human Anatomy to Burdach, his former teacher in Dorpat, who was now appointed to Königsberg. At Würzburg, too, Baer had discovered himself to be possessed of a gift of eloquence, which strongly influenced him in rejecting practical medicine for the professorial career. In the winter of 1816-17 he was at Berlin studying Human Anatomy and wasting his time, as he afterwards thought, in dallying with clinical study. In Berlin his disgust for medical practice was increased by his experience of the so-called animal magnetism—the "spiritualism" of the period—which was then seriously occupying the attention of the faculty. At the end of 1817 we find him installed as Professor at Königsberg; not without some patriotic misgivings as to his desertion of his Russian fatherland, and much exercised by the ineptitude of his official superior, a certain Prof. Cichorius. In 1819, at the age of twenty-seven, he married a Königsberg lady, Auguste von Medem, who died in 1864, having borne him a family of five sons and one daughter. During the next ten years he remained in Königsberg, being appointed Professor Ordinarius of Zoology and director of the Zoological Museum, in addition to his post as Professor. The fixed salary which these offices brought him did not exceed 120*l.* a year. In 1830 an offer was made to him to come to St. Petersburg as member of the Academy (for Zoology) with a salary of 120*l.* a year, which he refused on the ground of the smallness of the salary, and when it was raised to double the official amount, accepted. The eleven years spent at Königsberg (1819-1830) had seen the creation of Von Baer's scientific reputation. It was not until he was thirty years of age that Von Baer published anything worthy of note. His was not a rapid, scintillating genius, but one of overbearing power and concentration, satisfied with no superficial result, but in the last degree tenacious, critical, and comprehensive. In 1821, on the opening of the Zoological Museum in Königsberg, he published *Two Words on the Present State of Natural History*; in 1824, *Lectures on Anthropology*; in 1824-26, *Contributions to a Knowledge of the Lower Animals* (Aspidogaster, Distoma, Cercaria, Nitzschia, Polystoma, Planarians). This work, portions of which were translated in 1853 by Prof. Huxley, in *Taylor's Scientific Memoirs*, stamps its author as the keenest intellect of his day among those engaged in solving the problems

of animal morphology. No writer on these subjects of whom we know has surpassed Baer in the personal qualities of judgment without arrogance, scepticism without exclusiveness, capacity for comprehensive generalisation with rigid adhesion to facts and abhorrence of the fantastic. The anatomy of the sturgeon and of the porpoise also occupied him in these times, and on them he published, but dating from the stimulus given by Döllinger and Pander at Würzburg, embryology had become his favourite study. It was in 1827 that he made his famous discovery of the ovarian ovum of mammals, which formed the subject of a communication to the Academy of Sciences of St. Petersburg in that year, and for which in 1831 he received the prize-medal of the Paris Academy. Haller had held that the mammalian embryo was formed by a sort of crystallisation of the fluid escaping from a Graafian vesicle of the ovary, by contact with the sperm in the uterus. An Englishman, Cruikshank, discovered in 1797 the eggs of the rabbit in the oviducts, and these were rediscovered by Prevost and Dumas in 1824. In 1827 Baer told his friend Burdach in Königsberg that he was convinced that the eggs of the mammalia must come from the ovary ready formed, and Burdach allowed him to sacrifice at once, for the purpose of testing his hypothesis, a pregnant bitch which inhabited his house. Thereupon, under a simple microscope with triplet lens, Baer demonstrated to Burdach the ready-formed ovum floating in the Graafian vesicle. This discovery was at the first not taken up, and neither contested nor admitted, with the amount of attention which Baer thought it to deserve; but he avoided all controversy with those who ignored or slighted his observation, and at the end of two or three years found it admitted as a first-rate step in the progress of embryological knowledge. In 1828 the first volume of his ever-celebrated *Entwicklungsgeschichte der Thiere: Beobachtung und Reflexion*, appeared; the second volume, though finished soon afterwards, did not appear until nine years later, when the publisher had abandoned hope of any further relations with the author, who had by that time settled at St. Petersburg.

Von Baer's first settlement in St. Petersburg as a member of the Academy was a *fiasco*. He found no opportunity there for carrying on the embryological study which had become the passion of his life. In other respects, such as the management of the Zoological Museum and the publications of the Academy, things were most disheartening. Lastly, his wife objected to leaving Königsberg, so he returned, and spent another four years in the Prussian University, with increased stipend, facilities for work and honour. He actively studied and wrote upon the cholera epidemic which shortly broke out in Königsberg, but always steadily devoted himself to embryology, publishing on this and on matters pertaining to comparative anatomy. But now, at the age of forty, his health began to give way. His brain was in a constant state of intense activity; at night he dreamt of far-reaching embryological laws—all day he spent in his study working with the dissecting microscope. He conceived the idea of himself working through and establishing the laws of development in all organisms, both animal and vegetable. He suffered terribly from indigestion, and at last determined, seeing that he had a wife and children dependent on him, as well as for the sake of his own physical comfort, to abandon this close study. He tells us in his Autobiography that it suddenly occurred to him that, after all, embryology would progress in the hands of other men, and that he should only be wise to leave it henceforth to the care of others. He needed a life with plenty of exercise and fresh air, and saw the possibility of this in the position he had rejected four years before in St. Petersburg. On his application an Academical post was again placed at his disposal by the generous and appreciative Government of

his fatherland, and in St. Petersburg he finally settled in 1834.

Here Von Baer's activity took an entirely new direction. His patriotism, which was always strong and genuine, was called into play, not only in promoting and lecturing on his favourite studies in connexion with the Academy, but in improving its administration, in advising the Government on such questions as fishery-inspection and sanitary arrangements, in remodelling school and university education, and what was especially congenial to him after his years of close study and abstinence from air and exercise, in exploring expeditions to Novaya Zemlia, to the shores of the Caspian and other places—where his acumen and erudition enabled him to indicate natural sources of wealth and industry likely to benefit his countrymen. Numerous and large publications attest his energy and industry in these pursuits.

Baer tells us that he considers himself to have "followed scientific interests more than was good." He would seem to have wished that he had cultivated other interests early in life. His favourite reading in younger years were the English and German classics; among French writers only Molière appealed to him. While he laboured rather under an excess of the gift of eloquence than from any deficiency of power of expression or imagination, he yet had no "Lust am Fabuliren," and expresses himself as quite unable to conceive how anyone could ever spin out a story over two sheets, or a romance through several volumes. This he connects with the fact that he never wrote any but the shortest letters to even his most intimate friends. This want of sympathy with baseless flights of fancy is what gives a special character and value to his scientific writings and the generalisations which they contain.

Von Baer has left his name in the history of knowledge, not so much by the number of facts which he accumulated or made known, as by the profound criticism which he brought to bear on those which did come within his reach. He was not an artist, but a philosopher; probably he observed slowly and with difficulty, not only by reason of his mental constitution, but on account of short-sight. The close of his embryological career when he was forty years of age cannot be regretted, since it would hardly have been possible for him to avail himself duly of the doctrine of Schleiden and Schwann—the cell-theory, which necessitated a new point of view in such enquiries. In these later years the chief merit in embryological research still centres round St. Petersburg—having but temporarily passed to Berlin.

Von Baer received the highest distinctions from the chief scientific Academies and Societies of Europe. He was also a knight of the Prussian Order "pour le mérite." E. RAY LANKESTER.

SCIENCE NOTES.

ANTHROPOLOGY.

NEARLY six millions of German children, in schools distributed throughout the Empire, have recently been subjected to ethnological examination, so far at least as relates to the colour of the hair, of the eyes, and of the skin. The enquiry was instigated by the German Anthropological Society, which was moved to take up the question by Dr. Virchow. Although the enquiry is still incomplete, returns from several quarters not having yet been received, the results of the investigation, so far as it has proceeded, were submitted by Dr. Virchow to the Society at the general annual meeting at Jena. The proceedings of that gathering are fully reported in the *Correspondenz-Blatt* of the Society for September, October, and November; and from that source we learn Dr. Virchow's conclusions. It is well-known from the evidence of classical writers that the true old German race was characterised by possessing light hair, blue eyes, and fair skin; yet it is equally well known that a dark element is conspicuously

present in the existing population of many parts of Germany. The great object of the present enquiry is to trace the distribution of these ethnic elements. At the time Dr. Virchow prepared his report 5,619,728 individuals had been examined, and of this number Prussia had furnished 4,127,766. An analysis of the returns shows that the pure German type forms on an average 32.11 per cent., or nearly one-third of the population. North Germany appears to be purer than the South; thus in Prussia the blond population forms 35.47 per cent. of the whole, while in Bavaria the percentage is only 20.36. The highest percentage of blonds is in Schleswig-Holstein, where it reaches 43.35; then comes Pomerania with 42.64 per cent., and Hanover with a percentage of 41. Of all places the purest appears to be Cöslin, in Pomerania—and this, curiously enough, was Virchow's birth-place—where the old German blood is so strong that not less than 47.37 per cent. of the existing population belongs to the fair type. Valuable as these statistics unquestionably are, they are evidently open to the objection that they refer only to school-children, and it is a well-known fact that the hair often darkens as the child grows to manhood. In fact, the proportion of fair-haired children under fourteen years of age was on an average 11.46 per cent. greater than among children above fourteen. Another disturbing factor is introduced by the Jewish element in the population. It is an unexpected result that among the Jews there are 11.2 per cent. with light hair, blue eyes, and fair complexion; thus agreeing with our notions of the primitive Germanic stock.

Among the relics reputed to have been obtained from the now-famous Kesslerloch, a cave of the reindeer period near Thayngen, in Switzerland, were two pieces of fossil bone, one engraved with a figure of a bear, the other with that of a fox. When Mr. J. E. Lee published his translation of Herr Merk's monograph on the cave, he judiciously added an appendix in which, after giving Prof. Rüttimeyer's figures and description of the two engravings, he explained the suspicious circumstances under which they were found. In a recent number of the *Archiv für Anthropologie* Herr Lindenschmit points out the striking similarity between the Kesslerloch engravings, and two figures given by Herr Leutemann in an article entitled "Die Thiergärten und Menagerien mit ihren Insassen," published in Spamer's popular *Welt der Jugend* in 1863. "Sonderbar, ja wunderbar!" is Lindenschmit's exclamation, as he places the reputed drawings of the prehistoric artist by the side of the modern figures. So close, indeed, is the resemblance in the positions in which the animals are represented that there seems little doubt that the engravings on bone are nothing more than rude copies from the 1863 publication. How they got among the *débris* dug out of the cave is another matter, but one whose explanation is probably not far to seek.

An interesting report of the proceedings of the late meeting of the International Congress of Anthropology and Prehistoric Archaeology at Buda-Pest has been contributed by M. Cazalis de Fondouce to the recent numbers of the *Matériaux pour l'Histoire primitive et naturelle de l'Homme*. We regret to learn from a notice prefixed to one of these numbers that the editor, M. Cartailhac, is no longer officially connected with the Natural History Museum of Toulouse—a museum rich in objects of interest to the anthropologist.

EVERYONE knows that the ancient Mexicans made great use of obsidian, or volcanic glass, as a material for knives and similar objects, the obsidian being capable of receiving a fine cutting edge, keen as that of a razor. During the meeting of the Anthropological Congress, attention was directed to the occurrence of obsidian implements in Hungary. Prof. Szabo pointed out that it is only in the chain of mountains of Tokaj-Megyer, in the north-eastern part of Hungary, that obsidian

is found in quantity, and it is there, too, that we find these prehistoric objects. Dr. Romer has obtained from the neighbourhood of Tokaj numerous obsidian nuclei from which flakes have been struck for conversion into cutting instruments. The conchoidal fracture of the Hungarian obsidian is more strongly curved than that of the Mexican lava, and the knives formed from it are not generally so long or so straight as those of Mexico. The age of the Hungarian implements may be left an open question, but it is said that in the isle of Bodrog they have been found in association with bronze.

AMONG the trachytic rocks of Milo, Prof. Szabo has found obsidian in the form of thick beds which have been systematically quarried for the sake of the raw material for cutting implements. Objects wrought in obsidian have also been discovered, we are informed by M. Bellucci, in Central Italy and in the Lipari Isles.

ACCORDING to M. de Pulszky a certain proportion of the so-called bronze implements found in Hungary consist of unalloyed copper, and he was therefore led to argue at the recent Congress in favour of the existence of a distinct Age of Copper, intermediate between the Neolithic and the Bronze Ages. Nine specimens in the National Museum at Buda-Pest have been analysed, and found wanting in tin: some were of pure copper, like the native metal, while others contained a small quantity of silver, such as is often found in some of the Hungarian copper-ores. It was asserted that the copper implements belong to types distinct from those of the bronze period. Mr. John Evans argued, however, that the types were not such as to indicate a transition from the Neolithic to the Bronze Age, and that the fabrication of a small proportion of implements in copper was probably due either to temporary want of tin in the locality or to the preference of copper to bronze for special purposes.

Petit Album de l'Age du Bronze de la Grande Bretagne. Par John Evans, Membre de la Société Royale, etc. (Longmans.) At first sight it may seem strange that Mr. Evans should have gone out of his way to write this little work in French. His fine volumes on the *Coins of the Ancient Britons* and on *Ancient Stone Implements* were naturally written in English; and English readers have long been expecting a work on the Bronze Age from the same pen. The International Congress of Anthropology and Prehistoric Archaeology recently held a meeting at Buda-Pest, and Mr. Evans tells us in the Preface that this Album was put forth as a contribution to the discussion on the Bronze Age at this meeting. Now, it has been decreed by the Congress that to secure uniformity in the proceedings they shall always be conducted in French wherever the session may happen to be held. Hence we see why a book written by one of our countrymen, and published in Paternoster Row, should be dressed in French fashion. As a contribution to the study of the relics of the Bronze Age, Mr. Evans's admirable little Album is most acceptable. Here are six-and-twenty plates, comprising nearly one hundred and fifty figures and illustrating the various types of implements, weapons and ornaments in bronze. We pass from the plain flat celt to celts with stops, flanges, sockets, and loops; then to knives, daggers, swords and spear-heads; and finally to torques and other ornamental objects, all wrought in bronze, or what is generally believed to be bronze. The objects have been selected with much judgment, and the engravings are faithful representations, giving in most cases side-views, end-views, cross-sections, or whatever is needed to fully illustrate the form of the object. The letterpress is extremely scant, and does not enter on the discussion of any of the vexed questions pertaining to the bronze-using period. No one is better qualified than Mr. Evans to speak with authority on these questions, and we shall anxiously look forward to

the appearance of his great work on this subject. The preliminary publication of the plates in this Album gives us a foretaste of what is to follow; but we hope that their issue will tend to hasten rather than retard the completion of the larger and much-expected work.

Prehistoric Man: Researches into the Origin of Civilisation in the Old and the New World. By Daniel Wilson, LL.D., F.R.S.E., &c. Third Edition. (Macmillan.) In 1862 Prof. Wilson gave to the world the first edition of his *Prehistoric Man*. It was then published in two volumes, running to about a thousand pages. Three years later he issued a new edition, carefully revised in accordance with the advance of our knowledge; but the revision was accompanied by condensation, so that this time the work formed only a single volume of some six hundred pages. Now that a third edition has been called for, it has reverted to its original form, and comes before us in the shape of two handsome and well-illustrated volumes. During the decade which has passed since the appearance of the last edition, anthropological studies have been rapidly growing, and Prof. Wilson has made good use of the information thus accumulated. Much of the original part has been re-written, several chapters have been replaced by new matter, and others have been re-cast. The work draws its special characteristics from the author's American researches. Indeed, Prof. Wilson's long residence in Canada, and the good use which he has made of his opportunities of observation, entitle him to speak with some authority on the ethnology and archaeology of the New World. Although we may fairly object to some of the author's conclusions, it must be admitted that he has produced a valuable work pleasantly written and well worthy of attention both by students and general readers. It should not be forgotten that we are indebted to Prof. Wilson for originally introducing the term "prehistoric," now so largely and loosely applied:—

"Man may be assumed to be prehistoric," says the author, "whenever his chronicle of himself are undesigned, and his history is wholly recoverable by induction. The term has, strictly speaking, no chronological significance; but, in its relative application, corresponds to other archaeological, in contradistinction to geological, periods. There are modern as well as ancient prehistoric races."

MEETINGS OF SOCIETIES.

BRITISH ARCHAEOLOGICAL ASSOCIATION.—(Wednesday, December 6.)

THE Rev. S. M. Mayhew in the Chair. The Chairman exhibited several objects of much interest found recently at Moorfields, and among these were two shepherd's crooks of Saxon date in fine preservation. Several examples of early (Norman) pottery were exhibited in fine preservation.—Mr. Syer Cuming spoke of the early relics which had from time to time been exhumed at Moorfields, and described several of prehistoric date which had been met with in Long Alley.—Mr. Bailey sent for exhibition several curious iron fetters and instruments of torture.—Mr. Isaacs exhibited a Romano-British drinking-cup of a material not unlike Upchurch ware, found at Southfleet.—Mr. Loftus Brock, F.S.A., described a collection of personal ornaments, mostly of Roman date, found in London, and Mr. Cuming identified some of the beads exhibited as of Egyptian manufacture for Roman use.—Mr. R. N. Philipps, D.C.L., exhibited some curious carvings, part probably of an ornamental distaff, recently found at Guelderland, New Holland. They were identified as being of German workmanship, and were probably brought to England by some of the Flemish settlers in the sixteenth century.—Mr. John Brent read an elaborate and exhaustive paper on "Ancient Canterbury." He remarked upon the small amount of work of Roman date now above ground, the Roman level being about eight feet below that of the modern city. He adduced carefully collected evidence in proof of the small extent of the original Roman settlement, and challenged the statement recently made as to the exist-

ence of a large lake on the west side of the city, and showed, from recent discoveries, that this never existed. The lecturer exhibited a large collection of Roman ornaments, mostly of bronze, some being enamelled and inlaid, and also many examples of prehistoric implements.

ROYAL SOCIETY.—(Thursday, December 7.)

DR. HOOKER, C.B., President, in the Chair. The following papers were read:—"On the Mechanical Effects and on the Electrical Disturbance consequent on excitation of the leaf of *Dionaea Muscipula*," by Dr. Burdon Sanderson and F. J. M. Page; "On the Electromotive Properties of Muscle," by Dr. Sanderson; "Preliminary Notice of Investigations on the Action of the Vaso-Motor Nerves of Striated Muscle," by W. H. Gaskell; "Note on the Photographic Spectra of Stars," by W. Huggins.

ROYAL ASTRONOMICAL SOCIETY.—(Friday, December 8.)

DR. HUGGINS, President, in the Chair. Father Perry gave an account of some experiments by M. André, of the Paris Observatory, on irradiation in telescopes and its influence in producing the appearance of a black drop or ligament in transits of Mercury and Venus. The results appeared to agree with those deduced by former observers from occultations of stars at the dark limb of the moon, and from eclipses of the sun, as well as from measures of the spurious disks of stars.—Dr. Huggins exhibited a drawing made from a photograph of the spectrum of the bright star Vega, which he had succeeded, after many trials, in obtaining. The spectrum extended from the Fraunhofer line G in the blue to N in the ultra-violet, and showed five or six strong, well-defined lines which could be compared very accurately with those in the solar spectrum, the photographic plate having been left in the instrument all night and exposed on the sun the next morning, using a different part of the slit. In this way a photograph of the solar spectrum was obtained above that of the star, and a comparison of the two rendered very easy. Dr. Huggins has devoted much time to this work since his earliest attempts in 1866, and has now obtained most successful results, which are of the more importance as the greater part of the spectrum on the photograph is beyond the range visible to the eye.—A paper by Mr. Stone "On the Black Drop in the late Transit of Venus," was then read, the author's main point being that the black drop was really seen by several skilled observers, and in particular by M. Janssen, although they had described it in different terms, leading some writers to the conclusion that this appearance was entirely due to want of skill in the observer, or to defect in his instrument.—Mr. Christie described some photometric observations of the gradation of light on Venus, the result being that the middle of the disk appeared to be about seven times as bright as the limb, which would support Mr. Brett's conclusion that the surface of Venus is smooth and reflects light specularly. Mr. Neison pointed out that there would be a slight gradation towards the limb, even with a tolerably rough surface, though it would not approach that found by the observations of the preceding speaker.—After this, Mr. Mattieu Williams read a paper criticising some remarks of Prof. Langley in a paper read at the last meeting, on the effect of sun-spots on climate; and Mr. Marth exhibited a diagram of the orbit of the remarkable binary star α Centauri, urging strongly on astronomers in the southern hemisphere the importance of making repeated observations of this double star about this time, at intervals of a fortnight or less, with a view to an accurate determination of its period, as the two components are now in conjunction. It appeared that the orbit of this interesting binary rests almost entirely on the measurements of Jacob and Powell, at Madras, and the exact length of period is of the more importance as the parallax is so well determined (this being, so far as is known, the nearest fixed star) that the mass of the revolving system could then be found very accurately. There are now so many observatories with large telescopes in the southern hemisphere that there ought to be no difficulty in securing a large number of observations.

ANTHROPOLOGICAL INSTITUTE.—(Monday, December 11.)

COL. LANE FOX, President, in the Chair. The following paper by Mr. H. H. Howorth was read:—

"On the Ethnology of the Germans. Part I: The Saxons of Lower Saxony." The author contended that the Saxons North of the Elbe were immigrants, and of the same race as those south of that river, and that the Saxons were not indigenous to Hanover or Westphalia, but colonists or invaders. This he proved by the topography of those districts, and by the names of men, things, &c. He pointed out also the strong differences between the Old Saxons and the Saxons who invaded England. He referred to Spruner's Historical Atlas for the definition of the ancient limits of the Saxon peoples.—A paper on the Javanese by M. Kiehl, who had resided in Java for some time, was also read, and interesting accounts of the religion, customs, agriculture, &c., of the Javanese were given.

SOCIETY OF ANTIQUARIES OF SCOTLAND.—(Monday, December 11.)

THE first paper read was by Dr. Angus Smith, Manchester, being the concluding portion of his account of the antiquities on the shores of Loch Etive, Argyshire. This paper was specially devoted to the vitrified fort of Dun Mac Nisneachan, of which a plan and photographs, showing the result of Dr. Smith's excavations, were exhibited. He had found that it was only the great enclosing wall of the fort that was vitrified, that the vitrification did not extend to the whole of this wall, and was in some places confined to its upper parts alone, and that there were foundations of houses of dry-built masonry, and heaps of food refuse, in the enclosed area. This is the first time that remains of dwellings have been found within the enclosure of a vitrified fort.—The second paper, by Mr. Gilbert Goudie, gave an account of the recent discovery of two monumental stones with Ogham inscriptions in Shetland. One of these was found by Mr. Goudie in the ancient burying-ground on St. Ninian's Isle, Dunrossness; the other was dug out of a peat bank in Lunnasting. The latter shows some peculiarities in the mode of using the digits of the Ogham alphabet. Casts of both inscriptions have been sent to Samuel Ferguson, LL.D., of the Record Office, Dublin, and it is to be hoped that a critical account of these and other Scottish Oghams may ere long be communicated to the Society by Mr. Ferguson. The stones themselves have been placed in the museum at Edinburgh.—The third paper was an account of an interesting little burying-ground of an early date, now known as Cladh Bhlàir, near Loch Killisport, in Argyshire, by Mr. Galloway, architect. Full-sized drawings made from rubbings of its sculptured stones were exhibited by Mr. Galloway.

LONDON MATHEMATICAL SOCIETY.—(Thursday, December 14.)

LORD RAYLEIGH, F.R.S., President, in the Chair. The following communications were made to the Society:—"On the Conditions of Perpendicularity in a Parallelepipedal System," Prof. H. J. S. Smith; "On the Condition of the Existence of a Surface cutting at Right Angles a given Set of Lines," Prof. Cayley; "The Orthogonal Transformation, and Additions to former Paper on Transformation of Elliptic Functions," Prof. Clifford; "On the Simplest Continuous Manifolds of Two Dimensions and of Finite Extent," Mr. F. W. Frankland; "On the Theory of Electric Images and its Application to the Case of Two charged Spherical Conductors placed Opposite one another," Mr. W. D. Niven; "On Viscous Fluids and Quaternion Forms of some general Propositions in Fluid Motion," Mr. J. G. Butler; "An Easy Method of finding the Invariant Equation expressing any Poristic Relation between two Conics," Prof. Wolstenholme.

SOCIETY OF ANTIQUARIES.—(Thursday, December 14.)

OCTAVIUS MORGAN, Esq., V.-P., in the Chair. The Rev. W. D. Macray exhibited a very perfect specimen of a British drinking-cup, which was found at Hardwick, in Oxfordshire.—Mr. E. Peacock contributed an account of the life of Colonel Thomas Rainborow, one of the most energetic and upright of the officers of the army of the Long Parliament, and a man of great influence among the Independents after their rupture with the Presbyterians. His name, however, is not inserted in any biographical dictionary. His family was probably of Dutch extraction, and his father was a member of the Long Parliament, and a naval officer, in which capacity he distinguished himself in an action

against the Saltee pirates. The Colonel at first followed his father's profession. In 1640 he was M.P. for Droitwich, but three years later he was serving as vice-admiral in a fleet whose object was to protect the English coast from Irish Royalists, and succeeded in capturing a body of recruits for Newcastle's army. In October, 1643, he was taken prisoner at the siege of Hull, and his wife successfully petitioned Parliament to exchange him. By this time he had the rank of colonel in the army. In 1644 he took a prominent part in the siege of Croyland, which had been more than once taken and retaken, and contributed greatly to its final surrender by taking some important out-works by means of guns mounted on boats. In the two following years he was engaged in most of the important actions. He was present at the attack on Gaunt House, near Oxford, at the battle of Naseby, the taking of Leicester, Bridgewater, and Bristol, and was one of the commissioners to treat for the surrender of Oxford. In the spring of 1647 he undertook to take the island of Jersey; but, while making preparations in London for the expedition, his regiment, which was quartered in Hampshire, mutinied and marched towards Oxford, whither he was sent to reduce the troops to order. He presented a petition from the disaffected soldiers to Fairfax, for which Cromwell wished to expel him from the army and from the Parliament. Subsequently to this Colonel Rainborow was again engaged in naval service. Being appointed to succeed Sir W. Batten as Vice-Admiral, he was sent to guard the coast of the Isle of Wight after the King's attempted escape from Carisbrook Castle. One of his letters, about this time, contains an account of a person named Cornelius Evens, who pretended to be the Prince of Wales. The impostor was well received at Sandwich and hospitably entertained, going to bed drunk every night; but, fearing detection, he escaped with 100*l.* and a horse which had been given him. Rainborow's naval command was terminated by the sailors declaring for the King and preventing him and the other Parliamentary officers from coming on board their ships. On this he went to London and thence to the siege of Colchester. His last service was as commander-in-chief of the forces in the north, which were besieging Pontefract Castle. Colonel Sir Henry Cholmondeley strongly opposed his appointment, on account of his own seniority, and wrote to ask Cromwell to take the command himself. Meanwhile, Rainborow was residing in Doncaster, at an inn on the north side of the market-place, subsequently known as Alderman Walker's house, where he was killed by a party of Royalist horse from Pontefract. Discipline in the besieging army was suffering from the dissension among the officers, and Captain William Pauldon managed to get through the lines with a small party of men. His intention was said to have been to carry off Rainborow and exchange him for Sir Marmaduke Langdale, who was then a prisoner. Access was gained to the colonel's room by the pretence of bringing despatches from Cromwell. He was taken prisoner, but afterwards offering resistance was killed. The accounts of his death differ materially, the Parliamentary writers representing it as a premeditated murder, while the other party assert that Pauldon merely intended to take him prisoner.

FINE ART.

REMBRANDT'S "FLIGHT INTO EGYPT."

The print which has long been known as the *Flight into Egypt*, in the style of Elzheimer, has given rise to more debate than any other work in etching or drypoint which is assumed to have come from Rembrandt's hand; and, although amateurs are now agreed in attributing a considerable part of the composition to another, the exact history of the print is known, I believe, to very few. A few notes upon it may be acceptable. It is a print interesting not only for its beauty, but for its peculiarities of composition and execution, and, I might also add, for its rarity. Both in design and in technique it stands alone; and while some have believed that in his design for this print Rembrandt drew his inspiration from a scene which he himself had witnessed, resorting to perhaps novel yet simple means to produce the results he desired, others again see in this *Flight into Egypt* the effort of one who in

this instance was content to be an imitator, and, charmed with the etchings of a younger engraver, laid aside his own to assume the style, and—by unusual and not easily explained means—copied the technique as well as the composition before him, and, satisfied with the result, completed the plate by the only additions which could really be called his own, the group of the Holy Family and the foreground and foliage to the right. The scene represented is a very charming one. Its main features are a valley stretching away in the centre, bounded on either side by hills clothed with hanging woods, which, opening as they recede, disclose a distant plain, with a winding river and buildings and towers almost lost in the haze. Far away in the horizon the plain is bounded by a chain of mountains, whose outlines are only faintly seen against the sky. In the near foreground on the right the Holy Family are perceived, Joseph leading the ass upon which the Mother and the Child are seated. They come from the right and are about descending into the valley below them. The extreme unlikeness of the whole of this beautiful landscape to every other picture which has been preserved to us as the work of the master at once strikes the observer. "It certainly was not in Holland" (writes Charles Blanc) "that Rembrandt, who drew his inspiration from Nature, could have met with such a scene." There is a rising ground to the right in the landscape called *The Three Trees* (W. 209). The background of the *Canal and the Cow Drinking* (W. 234) presents a rocky elevation, but it is put in only as a background, and exhibits a configuration of rock and slope which would satisfy a mediæval artist rather than a modern painter. The elevation behind the *Cottage with the White Palings* (W. 229) is a dyke. All Rembrandt's own landscapes are intensely Dutch. To this day the traveller in Holland may in every direction remark similar scenes to those which Rembrandt has depicted. Two hundred years have not obliterated them. *Sir's Bridge*, *The Goldweaver's Field*, the canals, the mills, and the haybarns pictured by Rembrandt are repeated over and over again; *The Obelisk* yet stands; a cupola is replaced on the *Ruined Tower* (W. 220); but the valley with its steep sides and hanging woods, and the distant mountains which bound the well-watered plain, *dans le goût d'Elzheimer*, are entirely wanting.

In the manner of its execution, again, this landscape is unlike Rembrandt's usual work, and what, until now, has made it even more perplexing is the widely different effects upon the right and left sides of the plate, produced of course by as widely differing methods. The work on the boldly drawn foreground which, sloping from the right edge of the plate, crosses the centre before it reaches the lower margin, the roughly sketched groups of figures on the right passing in front of the dark-foliaged trees which rise nearly to the top of the plate, are in singular contrast to the lighter and softer tones of the rising ground and woods which border the valley to the left, and to the broad plain and far-away hills in the distance. The work in the foreground and on the right bears the unmistakable sign-manual of the Master. Sketched with great spirit and boldness, every stroke has its purpose, and beneath it all is a certain grey tone or tint whose presence has been explained by assuming that the ground was prepared for the engraving by being roughed with pumice-stone, the traces of which may be distinctly seen, not only beyond the outlines of the foliage above and to the left, but in the clear spaces left between the lines in the work itself. The prevailing colour of the work on the other side is a soft grey. The foliage instead of being boldly executed is hardly drawn in at all: it consists of dots more or less thickly spread, differing in their form and tone, while the few strokes that can be discovered appear rather to have been added as an afterthought than to have formed part of the original design. Whether Wilson's conjecture as

to the process by which this part of the landscape was produced is correct or not, it will at any rate show the difference between the character of this work and that which we recognise as Rembrandt's usual style. He says:—

"If in spreading the varnish on a plate prepared for etching, we bear hard with the dabber we shall find on removing it that the varnish has been penetrated, producing an infinite number of minute holes, particularly if it has begun to cool. . . . We may imagine that Rembrandt resorted to this manoeuvre with effect, and that the masses of foliage were expressed, in the first instance, in the greater part by the movement of the dabber, and completed by a second operation, preserving the lights from the corrosion of the acid by a brush dipped in liquid varnish."*

Whatever may have been the means adopted, the result is admirable, and as we regard the whole composition, we are struck with the poetic fitness of M. Charles Blanc's idea that the painter meant to represent the effect of morning and sunshine coming forth to greet the exiled family at the moment when they are issuing from a forest traversed in the midst of perils, and in the profound darkness of night.† But, alas for all speculations as to the processes by which the result was attained! We now know that only a small part of the plate was engraved by Rembrandt; that the group of the Holy Family and some part of the foliage behind them are his; and his, too, is some of the work upon the foreground. But the whole of the left and centre of the piece are by another hand. Both English and foreign amateurs have long suspected this: a few only know the whole facts of the case. It is not, as some have thought, that Rembrandt has here largely borrowed from another: he has taken an already engraved plate which had come into his possession; has burnished out and erased with pumice-stone the principal figures upon that plate; has in their place sketched in his own *Flight into Egypt*, filling in the background where it was needed with new work. The grey undertone seen under the work on the right of the impression is caused by the rubbing with pumice-stone, which has only partially, however, removed the original figures: the landscape on the left and centre owes nothing to Rembrandt's hand, but is the best work of an artist of far inferior merit.

In the Museum at Amsterdam is an impression from a plate by Hercules Seghers. The subject represents Tobit and the Angel in their journey into Media. These two figures are placed to the right—just where the Holy Family appears in the *Flight into Egypt*. But they are on a much larger scale—too large in proportion to the size of the print. Tobit is in advance: the Angel, walking behind, grasps Tobit's arm, while he leans over him with an air of protection: they are travelling towards the left. To give the rest of the description would only be to repeat what I have written of the *Flight after the manner of Elzheimer*, for the same plate has produced both impressions; and, guided by the figures in Seghers' group, we can reproduce many of their outlines under the work of Rembrandt. The angel's wing is clearly apparent in the upper foliage to the right. The outlines of the angel's left leg and foot are seen behind the near hind leg of the ass, and in front of the ass Tobit's left knee and foot can be discovered. The head of the angel comes to within $1\frac{1}{4}$ inch (.035 mils.) from the top, the upper outline of his wing to about $\frac{1}{16}$ inch.

This Hercules Seghers, or Zeghers, born in 1625, was an artist of some repute in Holland. In the inventory taken of Rembrandt's effects in 1656, six paintings by Seghers are enumerated. Some of his engravings, peculiar in their style, are enshrined in the British Museum; but the impression of *Tobit and the Angel* is not among them. It will not, however, be necessary to make the

* Wilson's *Descriptive Catalogue*, p. 21.

† Charles Blanc's *L'Œuvre Complet de Rembrandt*, vol. i., p. 127.

pilgrimage to Amsterdam to become acquainted with the character and attitude of the group erased by Rembrandt, for Seghers borrowed these figures and a great part of the composition from an earlier artist.

There is an engraving by the Count Henry de Goudt, after a picture by Elzheimer, of which Seghers' print is so far a reproduction that he must have had it before him when he made his drawing on the copper. The Count de Goudt was born in 1585, he was the friend and patron of Adam Elzheimer, and engraved several of his pictures; among them this of *Tobit and the Angel* (Utrecht, 1613). The impression is on a different sized plate, and in a reversed direction to Seghers' print; and there are many differences in detail. But the group of Tobit and the Angel is the same: behind them rises a mass of dark foliage; the distance in the centre, failing in the Count's engraving in aerial perspective, shows a broad plain with towers; on the opposite side are hills clothed with hanging woods; and, as if to show that the similarity in composition was designed and not accidental, there are two little figures—a cow, and a man leaning upon a stick—which, appearing in the Count de Goudt's copy of Elzheimer, are accurately reproduced in Seghers' print, and can be clearly seen on the bank to the left in Rembrandt's *Flight into Egypt*.

I do not suppose that Rembrandt ever intended to pass off this *Flight into Egypt* as his own composition. He was, as we know, well acquainted with Seghers' pictures, and would certainly have seen, probably possessed, every one of his etchings: the very plate of this one was in his hands. It is the most pleasing of all Seghers' etchings, but it fails from a too great sameness and uniformity of tone, and from the disproportionate size of the figures. The alterations which Rembrandt made in the plate were only such as could have come from a great master, and one can almost hear the rasping of the pumice as he erased the over-sized and weak figures which Seghers had copied, and watch his vigorous hand dash in the spirited work which takes their place. Assuredly we have no cause to regret the alteration, for, though we prove that so little of the work in this print is by Rembrandt, that little has drawn out the beauty of work which might otherwise have been entirely forgotten, and the fortunate owners of fine impressions will yet retain their admiration for this *Flight into Egypt*.

CHARLES HENRY MIDDLETON.

THE WATER-COLOUR SOCIETY.

(Second Notice.)

IN concluding what we have to say about this gallery, we will take first a group of figure-painters—Messrs. Tadema, Shields, Walter Duncan, and Watson, and Mrs. Allingham.

Mr. Tadema's two single figures—*Balneator* and *Balneatrix*—are among his choice productions; particularly successful in preserving that balance between natural solidity and flat spacing-out of colour which results in a decorative and pleasurable effect on the eye. The *Balneator* is a Nubian—not strictly black, but brown-skinned: some details in this picture remain to be completed. The *Balneatrix* is a blonde woman, large and robust, holding a trayful of towels. In each example, as usual with the artist, there is abundance of rich and pure painting of surfaces—marbles, pavements, &c. Mr. Shields has two domestic subjects executed in red chalk. The first is a game of street-children, "*Tick-tack-toe, my first go*;" the second an interior, "*Children's children are the crown of old men*." Both of these are excellently designed; more especially the latter, which possesses in a remarkable degree the fine quality of being a work of style, finished and homogeneous in all its parts, without anything peculiar in method or prepossession. An old man, seated in a cottage with his hat on, is gently rocking the cradle of his grandchild; a cat dozes

hard-by, and the grandfather's book has been set aside, with his spectacles laid to mark the page. A framed silhouette-portrait of the infant's mother hangs against the wall. Mr. Duncan's chief performance is named *In the Stocks*: an elderly village sot undergoing his punishment, with his fuddled senses slowly clearing up to the distasteful facts. One of the urchins who make merry over his penance protrudes his tongue; another affects to drink out of a leaky tin can; a third "takes a sight" at him, as little boys now do, and perhaps did at the date here indicated, which is about 1620; a fourth, a boy of gentle nature, aims an apple at the culprit's head; a dog barks, and a pig crunches a refuse cabbage-leaf. The figures—there are five others besides those we have described—stand well, and the handling of the whole is easy and decisive. Another painting by this artist, named *A Romance*, represents a young man of quality, habited in red, of about the time of Henry VI., lounging on a large coffer as he reads. Mediaevalism, that character so often aimed at and so hard to hit, is very cleverly caught here. Mr. Watson, highly prolific as usual, treats *The Sonnet* with singular and felicitous zest: an academic youth of a somewhat Miltonic type pacing an old-fashioned garden with quaintly-clipped shrubs in the early morning, as he composes. *Summoned to the War*, *The Spring*, *The Nightingale* (a faggot-gathering girl who listens in a wood to the unseen warbler, very well conceived for the sentiment of the subject), and *A Pastoral* (sheep under a spreading oak, with no human figure), are all superior specimens. To Mrs. Allingham we can hardly award more praise than is her due, according to the scale and purport of her productions: their exquisite sweetness and simplicity, refined taste, and fineness of handling, afford the keenest pleasure. They delight one on the instant, and stand the test of minute scrutiny. *Little Johnny*, looking out of his cottage-window, with the colour of bricks and weather-stains precious as jewels; *On the Shore*, a small girl seated, full of grace and loveableness; *Over the Hill*, another rustic maiden carrying her father's mid-day meal in a basket; *Spring*, a rather anxious and browbeaten-looking cottage-girl holding a sprig of hawthorn—have more of the figure-element than of landscape or still-life. The reverse is the case with *On the North Downs, near Titsey Court, Surrey*, very green and pastoral—a few sheep afield on an ordinary afternoon; *The Sand-Martin's Haunt*, two little girls looking at the ruddy sand-bank and its numerous perforations, the tint of the cumulus-clouds repeating, with less intensity, that of the bank; and *Spring-Sketches*, three small and delicious scraps of ferns, primroses, and other wild flowers. Mrs. Allingham is one of the comparatively few female artists who can execute with perfection whatever she chooses to undertake in painting: as yet she confines herself, in colour, to compositions of a less trying kind than several of those which she has treated in woodcut-designing, and treated with marked ability.

Mr. Radford is a very careful painter, but rather too tame both in the invention of his pictures and in their working. *The Convalescent*, a gentleman of the middle of the seventeenth century who presents a nosegay to a young lady still too weak to rise from her chair, is a nice example. Mr. Smallfield is, as usual, unequal. His *Dr. Johnson in Mrs. Thrale's Music-room* shows a feeling for the uncommon in arrangement, but is not carried far: the *Study of a Youth of Colour* is fair enough: "*Cats!*"—a little girl in an old-fashioned house holding a young dog—is quaint and enjoyable; and the same may be said of the small picture of a white cat out on a nocturnal prow, named "*Hickory Dickory Dock, the Clock struck one, and down she came*." *The Bellringers* is a clever work by Mr. Lamont—men and youths ringing a peal in the open air, outside a public-house—an unhackneyed-looking group. *See Me*, by Mr. Robert Barnes, is very

creditable to the artist's sense of natural expression, and to his conscientious care in workmanship; were there but a little more ease and light-handedness in the smiling face of this little girl with a daisy necklace, we could praise the result unreservedly. Mr. E. K. Johnson sends various single figures of women, with some pleasant or dainty adjunct, such as a robin-redbreast on the outstretched hand, or a sulphur-crested cockatoo conversing from overhead—all of a popular and attractive sort, neatly and precisely handled, but not on the whole much to our taste. The face is always the same: to criticise it in any other respect were ungallant, as we must assume that Mr. Johnson paints constantly from one living original. *Friends* (the redbreast subject) is perhaps the best example; *July*, with a young lady in white muslin reclined upon a verdant bank under dappled sunshine, is also agreeable. Another subject with a redbreast is contributed by Mr. Parker, *The Old Dairy-door*: both this and the *Study of a Head* (of an old woman), by the same painter, deserve commendation. We do not find much to say in praise of the two *Sketches for Decoration* by Mr. Marks, *The Months from January to December*. All the months are embodied in figures of children, mostly boys—or rather a boy, for it is always the same face, and that of a rather artificially-trained unchild-like type. On the other hand, the landscape-bits contributed by this painter are truly able—simple, direct, solid, manly, rightly felt, and faithfully done—excellent examples, in their unobtrusive way, for students to keep before eye and mind.

We need hardly dwell in detail upon the other landscapes. Two of the exhibitors, Mr. Albert Goodwin and Mr. North, were discussed in our previous article, and it will be enough to say that each of them sends various works not less attractive than those which we have already spoken of. Miss Clara Montalba, Mr. Moore, Mr. Thorne Waite, Mr. Brierley, and the late Mr. Whittaker, are well represented: and the cattle and horses of Mr. Weber should not pass without a word of eulogium. Mr. Alfred Hunt and Mr. Boyce are absent from the walls, leaving a gap which none of their colleagues can exactly fill in.

W. M. ROSSETTI.

THE NEW BRONZE SATYR IN THE BRITISH MUSEUM.

THE trustees of the British Museum have recently purchased from MM. Rollin and Feuermann of Paris a bronze figure of a Satyr, remarkable for its beauty and fine condition. The Satyr is represented drawing back in an attitude, apparently, of surprise. The weight of his body has rested principally on the great toe of his left foot; the right heel is raised; the toes of this foot just touch the ground. His left arm and hand are stretched in an oblique direction; his right arm is bent, the hand raised towards the head. He has a flowing beard; behind his right ear is a small budding horn, but no trace of a corresponding horn can be seen behind the other ear. In the hair are small holes in which a wreath has been fixed. The attitude and type of this figure at once remind us of the Satyr in the Lateran Museum at Rome, which Brunn supposes to be part of a group representing Athens and Marsyas as they are represented on an Athenian relief, and a coin, also of Athens. This group was the subject of a work in bronze by Myron. (See Brunn, in *Instit. di Corr. Archæol.*, Rome, 1853, pp. 374-383, and *Monum.* of the same work, vi. Pl. 23.) It will be seen, on comparing the new bronze with the statue and group engraved in the plate of the *Monumenti*, that in the Satyr recently acquired by the Museum the position of the right arm and of both legs does not correspond. But the arms of the Lateran statue are restorations, and it is quite possible that their original direction may have been the same as in the bronze. The variation in the relief and the coin is no more than might be expected when a group in the round is care-

lessly repeated in relief on a much smaller scale. The style of the modelling in the new bronze, and the length and wiriness in the type, remind us of the Satyrs in the frieze of the Choric Monument of Lysikrates, and of the male figures in the frieze of the Mausoleum, much more than of any extant sculpture of the age of Pheidias. We are, therefore, justified in saying that the new bronze presents the characteristics of the school of Skopas rather than those of the school of Myron. The hair and beard of this bronze are very delicately wrought, and the muscles of the body, and especially of the back and shoulders, admirably rendered. The spirit and vigour in the general motive and in the expression of the countenance recall to us the epithets *viridis* and *animosa*, by which Roman critics characterised the works of Myron and also of Lysippus. The right foot exhibits so marked inferiority in the modelling to the rest as to suggest the notion that it was anciently restored by an inferior artist. The bronze is in admirable condition, having only lost the great toe of the left foot and part of the forefinger of the left hand. It is two feet six inches high, about the same height as the Towneley Hercules. Nothing certain is known of its *provenance*, but it is said to have been found in an ancient *cloaca* at Patras.

ART SALES.

On Wednesday last week Messrs. Sotheby, Wilkinson and Hodge sold a good collection of coins and medals. Among the coins the following were the most valuable:—Anne halfpenny, 2*l.* 6*s.*; Edward the Martyr, struck at Lewes, 2*l.* 6*s.*; Harold II., struck at Winchester, 1*l.* 1*s.*; William the Conqueror, Malmesbury, 3*l.* 7*s.* 6*d.*; Ditto, Taunton, 2*l.* 5*s.*; Stephen, 5*l.* 5*s.*; Edward I., head in triangle, 1*l.* 8*s.*; Edward IV., Durham penny, 1*l.* 10*s.*; Richard III. groats, 1*l.* 11*s.* and 2*l.* 12*s.*; Edward V. groat, 2*l.* 12*s.*; Henry VIII. pattern shilling, 5*l.* 10*s.*; Edward VI. crowns, 1*l.* 13*s.* and 2*l.* 11*s.*; Charles I. Pontefract Siege shilling, octagonal, 2*l.* 2*s.*; Ditto, Aberystwith shilling, 1*l.* 16*s.*; Ditto, Weymouth half-crowns, 4*l.* 6*s.* and 2*l.* 3*s.*; Commonwealth crown, 1653, 2*l.* 10*s.*; William and Mary crown, 1691, 1*l.* 17*s.*; George IV. proof crown, 1822, 2*l.* 9*s.* Among the Roman silver coins, a young head of Nero, 1*l.* 15*s.*; and a Pompey, 1*l.* 10*s.* Among the Greek silver coins, one Alexander Aegus, 4*l.* 10*s.*; another, 3*l.* 4*s.* Among the gold coins was an early British Addedomaros, 2*l.* 8*s.*; a Richard III. angel, 4*l.* 15*s.*; an Elizabeth milled half-sovereign, 2*l.* 11*s.*; Ditto, rose royal, 4*l.* 2*s.* 6*d.*; Mary, similar type, 4*l.* 12*s.*; Scotch unites, James I., 2*l.*, Charles I., 2*l.* 2*s.* Among the medals sold were Archbishop Sancroft, *rect.* Seven Bishops, 1*l.* 16*s.*; William III., by R. Bettier, 4*l.* 18*s.*; Laud, 2*l.* 3*s.*; Eugene and Marlborough, 1*l.* 10*s.*; William III., 1689, 2*l.* 11*s.*; Ditto, on the capture of Limerick, 2*l.* 2*s.*; Ditto, of Drogheda, 3*l.* 6*s.*; Peninsular, with bars for Pyrenees, &c., 2*l.* 7*s.*; Waterloo medal, with Hanoverian ditto, 4*l.* 4*s.*; enamelled star of United States "Chasseurs," 1*l.* 7*s.*, &c.

MESSRS. CHRISTIE, MANSON AND WOODS sold on the 14th and 15th inst. miscellaneous collections, mostly Oriental. In the first were some carvings in jade: an oval-shaped beaker, of pale green jade, with ornaments in relief, 5½ in. high, sold for 12*l.* 10*s.*; a small bright green vase, 4 in. high, 11*l.* 10*s.*; a pair of pale green cups, with dragons and birds in low relief, 15*l.*; a flat vase and cover of white jade, with handles in the form of birds, the surface covered with ornaments in relief, 8 in., 17½*l.* 10*s.*; a square-shaped vase and cover of lapis lazuli, carved with flowers and foliage in relief, 113*l.* 10*s.*; a pair of turquoise pilgrim bottles, 20*l.*; a pair of bronze vases in the form of junks on tortoise stands, 35*l.* In the sale on the 15th, a pair of Japan jars, with coloured dragons and flowers, 41*l.* 10*s.*; four Derby figures of the Seasons, 16*l.*; a Persian suit, he met, shield, steel plates and armpiece, chased

and inlaid with gold, 16*l.*, and a similar suit, 14*l.*; a Venetian cabinet of wood, carved in high relief, with masks and children, supported by a frame in the form of monsters, 48*l.*; the companion, 41*l.*; An old English clock, with musical movements, in tall mahogany Chippendale case, 40*l.*

At the Salle Drouot on the 1st, a silver soup-tureen, Louis XVI. period, sold for 6,300 fr.; two Chantilly flower-pots (cache-pots), 1,100 fr.; a Louis XVI. clock, 1,830 fr.; a Dresden cabaret, 1,315 fr.

THE suite of fine tapestries belonging to M. Jourdain, among the finest products of the Flemish looms exhibited at the Union Centrale this year, were sold on the 12th. They represent a well-known episode in the history of Vulcan, and were probably after the designs of Giulio Romano. They were purchased for 35,500 fr. (1,420*l.*). In the same sale, a small Louis XIV. tapestry, after the designs of Van der Meulen, sold for 1,780 fr. (71*l.* 4*s.*), and an embroidered screen of the same period, for 1,700 fr. (68*l.*).

NOTES AND NEWS.

THE proposal to establish in Paris a museum of decorative art is rapidly gathering strength. The scheme has already been warmly approved by the Minister of Fine Arts, and a vigorous effort will be made to secure the definite establishment of the institution before the opening of the International Exhibition in 1878. The utterances of the public men and of the journals of France in regard to this project ought to be interesting to ourselves, as showing the respect that is felt abroad for our own establishment at South Kensington. The South Kensington Museum will be the model upon which the proposed French institution is to be formed. "We cannot hope all at once," remarked M. de Chennevières, "to bring together such treasures as are to be found at South Kensington, but, with a firm desire for the development of native industries, each one will bring what he can." It is not a little remarkable in connexion with this project, which is put forward under the auspices of the Union Centrale des Beaux-Arts appliqués à l'Industrie, that it will form, if successful, the only permanent art institution in Paris established by private enterprise. At present, although the Government gives its approval, it does not accept the responsibility of the undertaking; and the experiment is, therefore, interesting as evidence of a new spirit in the affairs of art administration. This fact is all the more remarkable, seeing that South Kensington—the institution which is to form the pattern for that now proposed in France—is the result of a movement in precisely the opposite direction. It is the one English institution which is directly under the control of Government, differing in this respect both from the National Gallery and the British Museum, where official responsibility only extends to the grant of supplies.

WE have said our say more than once, we hope, against the modern abuses of the fashion for etching—the abuse especially that consists in the offhand and careless execution of etched work either by painters of repute or by almost amateurs who may pose as artists in virtue of the fewness of the impressions they are pleased to take off, and of the price they are pleased to set upon quite commonplace work. So that, great as is our admiration for good etching, for the work of accomplished and recognised masters, we welcome the appearance from time to time of art work in black-and-white done by some other process than that the mere mania for which will eventually tend to discredit much of what is really great in etching, and does already result among the half-informed in these things in the acceptance of much fourth-rate work on which high money value is coolly set by its producers in dainty studios which the "spider" has furnished for the "fly" to walk

into. Mr. E. W. Cooke's just published sketches (*Leaves from My Sketch-Book*: John Murray), whether of Venice, or of the Dutch waters, or of Paris, or of Nuremberg, are not done with the point of the etcher, but are reproduced by lithography. Some of them, when compared of course with fine etchings, are wanting in tone; and, when compared with fine line-engravings, are wanting in precision. Yet the forms of many a landscape and building are well seized and portrayed: there are pleasant records of places which have been familiar ones to Mr. Cooke; and sometimes, as in the view of Florence from near San Miniato, the looker-on who has not seen the city itself may be made pleasantly aware of certain of the characteristics of its surroundings. The traveller knows that the situation of Florence, beset with its peaked hills, is not quite unlike that of Verona. Mr. Cooke's volume is agreeable to turn over; but to artistic merit of any very striking kind it makes no claim. It has a quiet pleasantness.

THE South Kensington Museum has just made the acquisition of two of the finest Limoges enamels out of the collection of Mr. Danby Seymour. One is a large oval portrait of Cardinal de Lorraine, by Leonard Limousin. He wears the red dress and cap of a cardinal; the background is blue. The frame is ornamented with eight plates of enamels similar to others which apparently formed one set; the whole measures nearly 2 ft. 6 in. high. The other is a triptych composed of nine plates, forming a centre and two wings. It is painted in rich colours, with a few "paillettes" of foil. The subject in the centre is the Annunciation. On the left wing is Louis XII. kneeling at a prie-dieu, with St. Louis behind him; on the left wing is Queen Anne de Bretagne, and, behind, her patroness, St. Anne. Both these enamels were exhibited in the Loan Collection of 1862.

WE learn, with great regret, the death on Sunday morning last, the 17th inst., of Mr. Joseph Burtt, of the Public Record Office, for so many years the active and invaluable honorary secretary of the Royal Archaeological Institute. After a severe and trying illness of some three months' duration, during the latter part of which but little hope could be entertained of his final recovery, the fatal hour has come. Mr. Burtt's valuable services as principal editor of the *Archæological Journal* will with difficulty be replaced, as his kindly greeting will be missed by all who knew him.

MESSRS. DICKINSON, of No. 114 New Bond Street, have again opened an exhibition of water-colours. There are several agreeable specimens, chiefly landscapes, in this gallery, though the general level of performance, and the professional status of the contributing artists, are not exceptionally high. Mr. Donaldson is one of the best.

L'Art has this week a charming illustration of Du Maurier's, called *The Dancing Lesson*—seven demure little maidens of the usual Du Maurier type advancing, pointing their toes towards an elder sister, who is instructing them in their figures.

AMONG the Christmas books that are offered to the German public this year is an edition of Tennyson's *Enoch Arden*, charmingly illustrated by P. Thumann, an artist who seems to walk closely in the footsteps of the genial depicter of German life and manners, Ludwig Richter. This loved old master of wood-engraving is now, unfortunately, too feeble to devise new enjoyments for young and old this Christmas, but we see among the announcements of the firm of Alphonse Durr, of Leipzig, a collection of his popular illustrations, under the title of *Deutsche Art und Sitte: Ernst und Scherz*. Many of the old favourites from the *Studenten-, Kinder-, and Volkslieder* reappear in this work.

LOVERS of Albrecht Dürer who are not able to indulge in the expensive taste for collecting his

original engravings will be glad to learn that both Germany and France offer this Christmas most excellent reproductions from his engraved work. The French book entitled *Œuvre d'Albert Dürer*, with text by M. Georges Duplessis, is published by M. Amand-Durand, and the reproductions are executed by his admirable process of printing on copper. They are, in fact, actual facsimiles of the originals. The work contains 108 plates, which can be had either as a whole in a rich portfolio, or separately in ten different series, divided as follows:—1. The Passions; 2. The Christs; 3. The Virgins; 4. Saints; 5. Saints; 6. Profane Subjects; 7. Nudes; 8. Costumes; 9. Animals and Coats of Arms; 10. Portraits. Each series costs 30 francs. The German work, which is published by Herr Soldan of Nürnberg, is also published in ten parts, consisting of 104 plates, excellently reproduced by one of the numerous light-printing processes by J. B. Obernetter of Munich. Herr Lübke writes the Introduction.

The engraving offered *en prime* to the subscribers to the *Gazette des Beaux-Arts* this year is not, as heretofore, an etching, but a true burin-worked plate, executed by M. Jean de Mare, who gained recently the *prix de Rome*. Titian's celebrated *Eatonment* in the Louvre is the picture engraved. Subscribers for 1877 receive it for 15 francs, while to the general public it costs 45 francs.

THERE will be shortly on view in the South Kensington Museum a selection of about a hundred pictures from the extensive gallery of Mr. W. Fuller Maitland, consisting of fine specimens of the old and modern masters. Raffaele is represented by the well-known picture, *The Agony in the Garden*, styled the "Gabielli" Raffaele; of Sandro Botticelli, *The Adoration of the Shepherds*, a magnificent work, formerly in the Ottley collection; *A Virgin and Child, with Angels*, by F. Guarnaccio; *A Coronation*, Filippino; *Adoration of the Magi*, F. Lippi; *Virgin and Child*, Francia; *A Crucifixion*, Giotto, on a curious forked or Y-shaped cross; with various examples of Ghirlandajo, Kollermaans, Memmi, Holbein, and others. But perhaps the most interesting part of the collection consists of specimens of the early English school. The Old Crome pictures are of the highest interest; *A Barge, Wood Scene with Deer, Slate Quarry, Oaks on a Shady Bank, A River Scene*, and the gigantic *Thistle* are among them. T. Barker, of Bath, has *A Clover Field*; Constable, the *Chesil Beach*; Bonnington, two charming pictures, *View of St. Valéry*, and *Château of the Duchesse de Berri*; Eddy, *Battersea Bridge*; and Phillip, the beautiful study for his picture called "*La Gloria*," which was exhibited at the Royal Academy.

ON Monday week a paper on the various stages of Irish Architecture was read before the Academy by the secretary for Miss Stokes. A collection of the photographs taken under the direction of the late Earl of Dunraven, which will appear in the second volume of his posthumous work, was also exhibited. Miss Stokes' paper, which will appear as an Introductory Essay to the second volume of that work, contains an original theory of the development and stages of Irish architecture. Rejecting the Pagan origin of anything in Ireland but the oldest stone forts and raths, she denies all Scandinavian influence and all Norman influence, and holds a natural development in Irish art, following a path of its own, and growing in power and beauty up to about the year 1170, when the English invasion stopped its progress. On the date and object of the Round Towers the paper was peculiarly interesting. Miss Stokes holds that they all arose as defences against the Northmen invaders from the eighth to the tenth centuries, and showed evidence that these invaders came not merely for plunder, but as crusaders against Christianity, and peculiar enemies to churches. The round towers coincide with the times of their invasions, and stand beside the

churches exposed to their attacks, as was shown by a map.

THE Municipal Council of Angers have decided upon erecting a statue of the sculptor David.

THE Italian Government are adopting measures to ensure that the National Exhibition of Art and Industry, announced to take place at Naples on April 1, 1877, shall be the richest and most complete ever exhibited in Italy. It comprises both ancient and modern art, and the municipalities, churches, public buildings, and a number of amateurs will contribute their art treasures for the occasion.

THE commission formed to organise the *fêtes* to be given at Antwerp in honour of Rubens, on the occasion of the 300th anniversary of his birth, has just assembled under the presidency of the burgomaster. It has nominated two vice-presidents and formed five sub-committees charged with the arrangement of the different ceremonies. On one devolves the architectural part of the *fête* and the purchase of the house of Rubens; another organises the music, another the decoration of the streets, and to one section is confided the task of arranging the different exhibitions, comprising one of the old masters, another of Rubens' contemporaries, and a third of the productions of the Belgian painters from 1830.

It is announced that an exhibition of fans has been arranged to be held in Munich in November, 1877. Already several remarkable specimens have been sent in; among them a fine collection from the town of Gratz, in Styria, lent by the Johanneum. After China and Japan, France is the country that is most productive in fans. According to the *Chronique des Arts*, there was, even before the Revolution, a corporation of fan-makers in France, which numbered 130 masters or patrons. At the present day the fan-industry employs over 3,000 workpeople simply for mounting. The principal district in which this manufacture is carried on lies in the department of the Oise, between Méru and Beauvais. The wood for the framework is prepared in the villages around.

THE *Portfolio* for this month gives an admirable reproduction by M. Amand-Durand's process of a curious old print signed with the initial "L." but not belonging, as has been supposed, to Lukas van Leyden, but to an unknown master who also used this signature. The print, which is conceived somewhat in Dürer's manner, would seem to belong to a Death Dance. It represents the death-skeleton showing his fatal hour-glass to a mediæval German dame taking a walk in the fields. In "Brief Notes on Art" some good and unfortunately much-needed advice is given as to the proper manner of holding loose engravings. It is astonishing how many people will take up prints with one hand only, thereby inevitably producing creases, if not breaks, in the paper. Prof. Colvin finishes in this number his pleasant description of Athens, and the editor continues his life of Turner, which he promises to conclude next year, with more illustrations from the master's sketches.

THE STAGE.

"MACBETH" AT THE LYCEUM.

THE performance of *Macbeth* with which the Lyceum reopened on Saturday evening was in many ways very encouraging. Miss Bateman has made material advance since we saw her in the play a year ago. She is not, indeed, altogether pleasant to us. Her voice, in passages of strong emotion, fails to be sympathetic; and she is apt even now to rely somewhat too much on violence of gesture for the expression of intense feeling. Thus Lady Macbeth's greeting of Macbeth, with the sound of the prophecies still as it were in her

ears, and some sign already of their fulfilment, is made still too noisily demonstrative for many tastes; but it is beyond doubt in the opinion of others a fair occasion for theatrical display, and among the audience there are not a small number who welcome it with applause. But it is not really here, nor in one or two kindred passages of which we should make the like complaint, that Miss Bateman's merit is seen. Her merit, summed up in a word, is her entire comprehension of the character and its requirements as an acting part; so that no word of the text loses its due effect, and nothing is done without mature thought, very ably applied. Whether we are among those to whom Miss Bateman's much-praised acting in emotional passages is wont to give great pleasure, or whether we are among those who think they see in it some notes not true to the life, we must allow freely that her performance of Lady Macbeth is one that is remarkable for thorough understanding of the Shaksperian text, and able delivery of it.

Mr. Irving's *Macbeth*, played on Saturday with the utmost of the actor's vigour and care, is at least undeniably the best that has been seen in England any time these twenty or thirty years. We doubt if *Macbeth* can ever in the hands of any tragedian make the same mark as *Hamlet*. *Hamlet*, as far as the opportunities for the display of the one actor are concerned, might almost have been written by an actor's playwright of our day, bent on securing prominence for the "star." *Macbeth* claims little of our sympathy. Most of us wonder more at his wife, and care more for Macduff. But it is a great point in Mr. Irving's art, as displayed in this particular play, that he brings into such high relief all that *Macbeth* had of noble or of the remains of noble: reverence and awe; indignation at crimes that seemed to him baser, because they were done for pettier ends than his own; admiration of courage in another and of character more resolute than his; hesitation, having gone so far, to go yet further in the taking of innocent blood. *Macbeth's* attitude before the prayer of the grooms; his righteous satire—"your spirits shine through you"—on the hired murderers; his invocation to his wife; his almost tender and pitying warning to Macduff—

"But get thee back: my soul is too much charged
With blood of thine already"—

all these things show one or other of the qualities that are good in him. But other things of course showing the quite other qualities that have given *Macbeth* a name are more conspicuous and abundant: at all events are more upon the surface; and the art is great that knows how to dwell on the sympathetic and worthy, and that in doing so gives a fresh turn to the popular conception.

It may be true, of course, that the main thought of Mr. Irving in *Macbeth* is to shew the deterioration of character through one crime that brings another; but such deterioration is after all generally a gradual process, and there is time, while it is proceeding, to show something of the higher nature with which the character began. We think we note also in Mr. Irving's *Macbeth* a now added emphasis, not only on his belief in the supernatural, but in the power of the supernatural over him. The prophecy of the weird voices is more than ever a destiny. His crimes are done under a spell. He is moved to them from without, by a something not himself, making for Evil.

And the hold that this force from without, this supernatural power, this sense of destiny, this something not himself, making for Evil, has upon him, divides him until the very end of the action of the play, from such as his own hired murderers. Not that these, indeed, are set before us as quite voluntary cut-throats, rejoicing in their profession, but as men rendered desperate: the one

"Whom the vile blows and buffets of the world
Have so incensed, that I am reckless what
I do to spite the world:"—

the other, less revengeful yet more weary,

"So weary with disasters, tugg'd with fortune,
That I would set my life on any chance,
To mend it or be rid on't."

Of course no commonly intelligent actor could fail to indicate—for the play itself indicates it a hundred times—how much Macbeth is separated from these, originally; but it does need some such a deep understanding of the character as seems to be Mr. Irving's, to indicate, as time goes on, the gradual sinking to that level of theirs—the fact that the distance that divided the one from the others at the time that the one would ponder regretfully that he "could not say 'Amen'" when the grooms "said 'God bless us,'" had shrunk to well nigh nothing by the time when his first greeting to an arriving messenger must needs in his desperation be no milder than—

"The devil damn thee black, thou cream-faced loon;" words which recall the purposeless and exaggerated angers of impending frenzy, and when his final and bloody resolution—

"Yet I will try the last,"

is spoken to his foe with a savage hopelessness akin to the murderers' own. And it is at least a suggestive and worthy, if not at every point a complete, stage performance that can indicate the half-repenting pathos of the first and the savagery of the last, and the passages from crime to crime by which the transition is made.

FREDERICK WEDMORE.

WITH reference to the paragraph in our issue of last week, and many other notices of the subject in many other journals, we hear that the Lord Chamberlain's department has the question of danger from fire in theatres now under grave consideration.

MR. BYRON has added nothing to his reputation by the production of *Old Chums* at the Opéra Comique on Saturday, unless, indeed, it adds in a sense to his reputation to show that there is a certain public which so much believes in his name that it will applaud his work when it is entirely unworthy of applause. A slighter story than that of *Old Chums* has rarely been told on the stage, and it is voted by common consent that there is not here what often there may be—so skilful a treatment of the slight materials that the slightness ceases to be a ground of complaint. Most things are conventional about *Old Chums*, and whatever vitality it may have will be due to the smart things which, if there are only enough of them, some playgoers are willing to accept as a substitute for a comedy. The best of the smart things in *Old Chums* are delivered dryly by Mr. Byron himself, with his hands in his pockets, and his habitual indifference to anything that may happen. It is now some years since this delivery and this attitude were discovered to be effective. And effective they still remain. But it is a pity that a writer who can give us such good work as is most of that in *Married in Haste* and much of that in *Cyril's Success* should be content to save a piece from absolute failure by the simple expedient of saying sharp things to an audience pretty sure to welcome him.

A PERFORMANCE of *Much Ado About Nothing* was given on Saturday at the Queen's Theatre by, among others, Mr. Ryder, Mr. William Rignold, and Miss Edmiston. The lady, we are told, was until lately an amateur of repute. We were not able to attend the performance.

AN excellent representation of the great scene from the greatest eighteenth-century comedy was given at the Vaudeville Theatre on Saturday afternoon, on the occasion of the benefit of the acting manager, Mr. McKay. The scene from the *School for Scandal* served to show that Mr. Farren, as Sir Peter, has by no means forgotten his cunning. We saw him four times during the great run of

the comedy at the same theatre; but he was never better than on Saturday; nor is it, perhaps, a mistake to say that a certain freshness and *entrain* were perceptible in the delivery of the familiar things to a degree that could not be possible during a prolonged run. The contemporary stage has no more picturesque figure than Mr. Farren in the *School for Scandal* or in the *Road to Ruin*. We take exception to one thing only in his performance of the screen scene, and that is the violent delight which he manifests when he hears that "a little French milliner" is behind Joseph's screen. The violent delight, and all the "click-clack" traditional gestures with which the later manifestations of it are accompanied, are not true to the character of Sir Peter; and more than that, they are not even as effective as they are imagined by the actor to be. They are not true to the character of Sir Peter, because Sir Peter was a man of the world—whom the world reproached with only one weakness, that of having married so girlish a wife—and a man of the world is not so astounded when he hears that there is a woman in the case as to feel that he must go into a boyish ecstasy over the discovery. Sir Peter should moderate his raptures; he should "scant this excess." Mr. Sinclair's Joseph Surface was a little too weighty. He avoided, however, the common fault of representing Joseph as a quite obvious humbug. The Charles Surface of Mr. Warner was genial and sunny, and there is of course something to be said for the view according to which Charles Surface is not at all an accomplished scapegrace who reforms, but an impetuous and rollicking youth who one day becomes a man. The glimpse of Lady Teazle which the screen scene affords is of course brief, but the scene, for all its brevity, shows most of the range of her character; there are lines with Joseph Surface in which she shows much the same humorous observation as she shows at greater length in the earlier dialogue with Sir Peter. She "sounds" Joseph as she has sounded the rest. And there is of course for her in this scene all that is gravest in the comedy. Miss Roselle's Lady Teazle, in this brief scene, was a well-judged and capable performance. The actress exhibited Lady Teazle as a humorous analyst of other people's motives and of social philosophies, and also (and the one almost follows from the other) as a young woman of genuine good feeling, and not entirely crushed by a discovery more annoying than disastrous. Lady Teazle had committed not a great wrong, but a great blunder. Accordingly the expression of repentance was not exaggerated by Miss Roselle, who gave, nevertheless, by gesture and delivery, its due importance to everything in the text. With so good a Sir Peter and so good a Lady Teazle, and so good a general company, the managers of the Vaudeville would do well to offer the public some morning performances of the whole of the comedy, the excellent representation of which, some years ago, did more than anything else—even more than *Two Roses*—to give a standing to their theatre.

Si Stocum—the new piece at the Olympic—is acted by a bear, a dog, the Frayne family, and some performers of "general utility." It is received with great applause—or was so on the night we saw it, but it is hardly a drama. The most striking instance of ability which is displayed in it is in the performance of more than one dead shot. The stage resounds with rifle-shots and glitters with bowie knives. The dog is amazingly intelligent; the actors are not very dull. But why the whole performance has been given at the Olympic instead of at a spectacular circus, we are at a loss to know. The dialogue and story count really for nothing; but the piece has attractions for a certain public to which the Drama proper has probably little to say.

MUSIC.

RANDEGGER'S "FRIDOLIN."

IN our last number the performance of Signor Randegger's dramatic cantata *Fridolin* was briefly chronicled. As the work had not before been heard in London in a complete shape, though it has been given at the Crystal Palace, and also (without orchestra, we believe) by the Brixton Choral Society under Mr. Lemare, its rendering at Exeter Hall under the direction of the composer is an event of sufficient musical importance to render any apology unnecessary for returning to the subject this week.

Fridolin, as many of our readers will be aware, was composed expressly for the Birmingham Musical Festival of 1873. The text has been adapted from Schiller's ballad "Der Gang nach dem Eisenhammer" by M^{me}. Rudersdorff. In its general outline, the libretto adheres pretty closely to the original, the chief modifications being that the scene in the church is abridged, and that the count and countess follow Fridolin to the forge, arriving just in time to save him from sharing the fate of the treacherous Hubert—the Robert of Schiller's poem. That for musical purposes the changes are improvements can hardly be questioned. M^{me}. Rudersdorff's long experience both in the concert-room and on the stage has enabled her to furnish a libretto which is in all respects admirable, and which offers its composer abundant opportunities for contrast of colouring and for musical and dramatic effect.

Signor Randegger's music is, to our mind, particularly interesting as showing the influence of an intimate acquaintance with the masterpieces of German music on an Italian temperament. In saying this, let it not be supposed that any conscious imitation of the German style is meant to be implied; but it is obvious that the trains of thought and the nature of the musical ideas which would occur to any composer must to a considerable extent depend upon the style with which he is most familiar, and with which he feels most sympathy. It is as impossible to imagine Auber or Rossini writing Beethoven's symphony in C minor as it is to conceive of Beethoven composing *Fra Diavolo* or *Il Barbiere*. The musical nature of the French, German, and Italian nations is absolutely different, as may be seen at once by comparing the works of the three composers just named; though the line of demarcation is by no means always so distinct as in these cases. In many works of Meyerbeer, Gounod, and Verdi (especially his last) we see, so to speak, a fusion of nationalities, the influence of some foreign school acting upon the original style, and producing what may be termed a composite order of music. Something of this kind may be found in *Fridolin*. We have a true Italian vein of melody, but combined with a solidity of workmanship and a finish of detail which savour of the German school. We find none of what have been well described as "songs with guitar accompaniment;" the instrumental portion of the music is as carefully treated as the vocal. There is, also, it is pleasing to add, nothing written for the "shop." Signor Randegger has evidently thought only of his art; and, as a consequence, he has succeeded in producing one of the best works that have been brought out in this country for a considerable time.

The chief strength of the music lies in its strong dramatic feeling. With comparatively slight modification, it might, we think, be adapted to the stage, and would make an excellent opera. The characters of the "pious youth" Fridolin and of the traitor Hubert are well contrasted throughout; and in the expression of strong feeling—as, for example, in the scene where Hubert instils jealousy into the mind of the Count—the composer has been most successful. The one point that, both in reading the score and in hearing the music, strikes us as susceptible of improvement is that some of the movements for solo

voices (especially the first two songs) are rather long. It is not that they are "spun out" in the ordinary sense of the term; but that they contain a superabundance of material, though it is not easy to see how they could be curtailed. Still two songs immediately following each other, each of which occupies nearly ten minutes in performance, are rather trying to the patience of an average audience. Fridolin's first air, "None but holy lofty thoughts," is of great beauty, and most delicately accompanied; while Hubert's *scena*, which in feeling, though not in its themes, somewhat resembles Lysart's great song in the second act of *Euryanthe*, is full of power, albeit slightly long. The song of the Countess, "No bliss can be so great," is one of the gems of the work.

In the choral movements Signor Randegger has been no less successful than in the solos. The spirited Hunting Chorus, the graceful Chorus of Handmaidens, the Dance and Chorus of Villagers, and the scene at the Forge are all specially good. Some of these numbers are by no means easy, and require careful and finished singing, but when adequately rendered are highly effective.

The performance on Wednesday week was in many respects of high excellence. The soloists, Mdme. Osgood, and Messrs. Guy, Wadmore, and Pope (all, we believe, pupils of the composer), sang admirably, though Mr. Wadmore seemed at times overweighted with his part. The orchestra, too, which included most of the best members of the Crystal Palace band, fully satisfied all requirements; while the chorus was good, but hardly first-rate. In accuracy it left very little to desire, but it was deficient in delicacy and finish, especially in the *piano* passages. This was more particularly observable in the female Chorus of Handmaidens, and in the prayer "Guardian angels, sweet and fair," and it doubtless arose chiefly from the size of the choir, which was announced as numbering 600 voices. A chorus of six hundred suits well enough for the oratorios of Handel, which from their breadth of outline will bear any increase of strength, and in the choral portions of which marks of expression are very rarely met with; but for more modern music, we are convinced that in general a smaller choir is much more effective. Look, for instance, at the overgrown chorus of the Sacred Harmonic Society. At its performances we have often heard the two extremes of a shout and a whisper—very seldom anything between. The finer *nuances* on which so much of the effect of modern choral music depends are all but impossible with so large a mass of tone, and more is lost in finish than is gained in force. That the chorus under Signor Randegger did quite as well as was to be expected under the conditions, we readily admit; at the same time, we cannot but think that a picked body of half the number would have produced a more satisfactory result.

We have dwelt in some detail on *Fridolin*, because its intrinsic merits are quite sufficient to entitle it to more than a passing notice; and it is as yet so much less known than it deserves that it is worth while to direct to it the attention of our various choral societies. EBENEZER PROUT.

THE last of the Crystal Palace Saturday Concerts for the present year took place on Saturday. The day being the anniversary of the birth of Beethoven, the entire programme was selected from the works of that composer. The pieces given were the overture to the *Men of Prometheus*; the great concerto in E flat, played in her most brilliant and finished manner by Mdme. Arabella Goddard; a solo and chorus from the *Praise of Music* (the cantata written as *Der glorieiche Augenblick* for the Congress of Vienna in 1814, and afterwards adapted to a more generally available text); three songs, and the Choral Symphony. This programme was only open to one objection; but that was a serious one. It was far too long. It is little less than absurd to place so elaborate a work as the Choral Symphony at

the end of such a concert as this. It is true that on this occasion the performance did not suffer, though it would have been by no means surprising had players and singers shown signs of fatigue; but it is impossible that any audience can fully enjoy and appreciate music which makes such demands upon the attention as this symphony unless they come to its hearing comparatively fresh. It will, of course, be replied that it must be put at the end of the programme, because nothing could be played after it with effect. This is perfectly true; but the answer is that the preceding selection ought to have been very much shorter. As will be inferred from what has been said above, the rendering of the symphony on Saturday was extremely fine, the Crystal Palace choir in particular attacking the very difficult music with much spirit and precision. The concerts will be resumed on another anniversary, that of the birth of Mendelssohn, February 3; on which occasion an exclusively "Mendelssohn" programme will be given, including the Scotch symphony, the overtures to the *Wedding of Camacho* and *Ruy Blas*, and the violin concerto, to be played by Herr Joachim.

A PERFORMANCE of the *Messiah* was given at the Crystal Palace on Tuesday evening, under the direction of Mr. Manns, the solo parts being sung by Miss Jessie Jones, Miss Mary Davies, Miss Annie Butterworth, Mr. Dudley Thomas, Mr. Charles Abercrombie, and Mr. H. A. Pope.

At the Angell Town Institution on Monday last the Brixton Choral Society brought forward two works for the first time in London. These were the oratorio *Mount Moriah*, by Dr. J. F. Bridge, organist of Westminster Abbey, and Mr. F. H. Cowen's cantata, the *Corsair*. Of the latter work we spoke on the occasion of its first performance at the recent Birmingham Festival. Dr. Bridge's oratorio, which consists of nineteen numbers, is a very interesting work, very melodious in style, with here and there a very slight trace of the influence of Mendelssohn on its composer, and thoroughly musicianly in its workmanship, the choral writing being especially good. Among the most successful numbers on Monday were the unaccompanied quartet, "O tarry thou the Lord's leisure," and the chorus, "Unto the godly there ariseth up light." The solo parts were sung by Miss Joyce Maas, Mdme. Suter, Mr. J. Merrington, and Mr. Thurlay Beale. The chorus was supported by a small but well-balanced band, the performers in all numbering about one hundred. The composer conducted his own work, and Mr. J. G. Boardman presided at the organ.

THE last of Mr. Dannreuther's musical evenings took place on the 14th inst., at his residence, 12 Orme Square. The programme included Schubert's trio in B flat, Op. 99, Brahms's piano quintet in F minor, piano solos by Liszt, and vocal music by Schumann, Wagner, and Berlioz, the specimen of the last-named master being the great duet from the third act of *Les Troyens à Carthage*. These concerts, which will be resumed in February, are given in a specially-erected music-room, seating nearly two hundred, and far better adapted for chamber-music than the majority of rooms in which such performances take place. The programmes also, to which we have more than once referred, are remarkable for their variety and research; it may safely be said that few entertainments are given at which so many novelties are to be heard.

AN appeal, to which we have much pleasure in giving publicity, has been forwarded to us on behalf of two elderly ladies now living at Buda-Pesth, grandchildren of Joseph Haydn, who are in destitute circumstances. It is proposed to raise a fund sufficient to ensure them against want for the remainder of their days. Subscriptions will be thankfully received by Messrs. Augener and Co., 80 Newgate Street.

AN interesting series of papers on the text of Beethoven, and the variations of the different editions, from the pen of M. Charles Bannelier, is at present appearing in the *Revue et Gazette Musicale*.

TSCHAIKOWSKY's overture to *Romeo and Juliet*, recently produced at the Crystal Palace, was given at Padeloup's Concerts Populaires at Paris on the 10th inst., but was coldly received.

THE death is reported from Paris of Mdme. Alida Marchand, formerly a *danseuse* at the Opera. The *Revue et Gazette Musicale* states that she made her first appearance in 1775, and that at the time of her death she was 111 years of age.

THE Quartett Society of Milan has offered two prizes, of 1,000 and 500 francs respectively, for the best quintetts for piano and stringed instruments. The compositions are to be sent in not later than October, 1877.

A NEW opera, *Der Kuss*, by the Czech composer, Fr. Smetana, was produced at the end of last month with great success at Prague.

BRAHMS's new symphony in C minor is to be performed early in the new year at the Gewandhaus concerts in Leipzig, under the direction of the composer.

HERMANN GOETZ, whose death we chronicled last week, has left his second opera, *Francesca da Rimini*, very nearly completed. It is said that the first and second acts are entirely finished, but that of the third, though fully sketched, the orchestration is still wanting.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Lettres inédites de Madame de Sévigné à Madame de Grignan. Par Charles Capmas. (Paris: Hachette, 1876.)

THIS publication is an event of some importance to the little world to which it is chiefly addressed. It is to be feared that that world, or the sect of "Sévignistes" proper, has much diminished of late years. For reasons good or bad *Mdme. de Sévigné's* reputation is on the decline in France, and M. Capmas cannot expect to meet with the welcome he would have had fifty years ago. Still all who care about French literature at all will prefer an authentic text of a famous author to a garbled and imperfect one, and this boon M. Capmas offers them. By the lucky discovery of an old manuscript he has been able to do more for the text of *Mdme. de Sévigné's* letters than all her previous editors put together.

In a long and somewhat prolix Introduction, M. Capmas gives an account of his manuscript, and how he became possessed of it. He accumulates ample, even redundant, proof of its trustworthiness, and of the probability, nearly amounting to certainty, that it is a transcript from the originals. It is on this point sufficient to say that it contains 320 complete letters (all but two are addressed to *Mdme. de Grignan*), of which about twenty have never been heard of before; while the remainder consists of fragments, longer or shorter, which the editors of the last century had suppressed. One is amazed at the extent of these suppressions. What have hitherto been regarded as complete letters turn out to be short excerpts, sometimes not amounting to a fifth part of the originals. Further, M. Capmas adduces good reasons for considering his manuscript as the parent of the famous Grosbois manuscript, the discovery of which by M. Monmergné many years ago created such a sensation. But it is in every way vastly superior—firstly, as containing a great deal more matter; secondly, as much more correct; thirdly, as giving complete pieces where the Grosbois only gave fragments.

Mdme. de Sévigné's letters, like all similar literary relics published in France in the eighteenth century, were subjected to a process of mutilation and transformation which to our present notions appears little short of scandalous. It is difficult to suppress a sentiment of anger when we are made aware of the methods which the editors of that age adopted in the treatment of manuscripts committed to their charge. They seem to have been animated by a spirit of wanton mischief. The least of their

perversities was a resolute propensity to correct the style of their author, to polish and round his periods for him, and efface everything that did not fit in with the particular fashion of their day. This would have been bad enough, but they went much further than this. They suppressed, not only such expressions as they deemed unbecoming, but whole pages and sheets which they were pleased to think unworthy of the historical and social dignity of their author, and they carefully avoided giving any warning of these liberties. Their code of literary morals differed entirely from ours. What we regard as a breach of trust they regarded as a solemn duty. To allow their author to appear in his natural dress and *négligé* costume would have seemed to them a violation of all propriety. Their office consisted precisely in attending to his toilette, in powdering his wig, and taking care that not a button, or a ruffle, or a ribbon was wanting or misplaced. The strongest ties of friendship and sympathy were unable to resist this propensity; or, indeed, they only served to intensify it. M. Cousin first gave the note of alarm as to the infidelity of literary executors of the previous two centuries in his famous report to the French Academy concerning the "Thoughts" of Pascal, who it was found had been mutilated and nearly disfigured by his friends of Port-Royal, who regarded him with something like a religious awe. The warning once sounded soon ran along the line of works, letters, memoirs, &c., which had not been published by the authors themselves. The *Memoirs of St. Simon*, of Bussy-Rabutin, of *La Grande Mademoiselle*, were all found to be mines of faithless perversions, corrections, suppressions. The worst case of all was that of *Mdme. de Maintenon*, whose editor, *La Beaumelle*, did not flinch at downright forgery, concocting whole letters out of his head which he impudently ascribed to her, and with such success that to this day *Mdme. de Maintenon* is still presented to us, even in books of such solid merit as M. Henri Martin's *History of France*, chiefly in the fraudulent words and malicious inventions of her editor and traducer. *Mdme. de Sévigné* has not fared so badly as *Mdme. de Maintenon*. The Chevalier Perrin was not so shameless as *La Beaumelle*. But his delinquencies were many and gross. We have not had, indeed, to wait for M. Capmas's volumes to learn this. In the sumptuous edition of *Sévigné* which commenced the series of *Les Grands Écrivains de la France* by MM. Monmergné and Regnier, an example was given of the manner in which Perrin had acquitted himself of his trust. A letter, of which the original had been preserved, was printed in parallel columns with his edition of the same. The suppressions amount to one-third of the whole, and the corrections of style and minute fraudulent additions to the text occur in nearly every sentence. Now M. Capmas enables us to appreciate his faithlessness still better. We find, not only suppressions, varying from short paragraphs to three-fourths of a letter, but fragments of several letters pieced together so as to appear as one. And yet even Perrin was regarded by at least one of his contemporaries as too conscientious an editor, and that contem-

porary was one of the most distinguished letter-writers of his own or of any age, and one of the most zealous admirers of *Mdme. de Sévigné*. Horace Walpole was disgusted with Perrin's fidelity: he writes, on the appearance of Perrin's second edition, to his friend Richard Bentley in these words:—

"Heaven forbid that I should say that the letters of *Mdme. de Sévigné* were bad. I only meant that they were full of family details and mortal distempers to which the most immortal of us are subject: and I was sorry that the profane should know that my divinity was ever troubled with a sore leg or the want of money" (December 24, 1754).

Walpole, with that spice of coxcombry which was his second, or perhaps his first, nature, professed, as is well known, a culte for *Mdme. de Sévigné*, calling her "*Notre Dame de Livry*," or "*Notre Dame des Rochers*." Clearly if he had been charged with the task of publishing her correspondence he would have done worse than Perrin, and have erected his divinity on a still loftier pedestal of good taste and insipidity.

The value of the new matter published by M. Capmas is, naturally, very unequal. Many of the fragments he has printed offer no interest whatever. Others again are as interesting as anything that *Mdme. de Sévigné* ever wrote. On comparing the letters as they have been hitherto known with the suppressed portions now published, we see that the principle on which Perrin acted was to eliminate as much as possible private and homely particulars which "good taste" condemned as trivial or undignified. It often happens that the details thus suppressed are what our less fastidious age regards with more favour than the scandal of Versailles and St. Germain, which Perrin judged to be worthy of all preservation. The second-hand gossip which alone, from her want of a position at Court, *Mdme. de Sévigné* was able to retail to her correspondents has lost much of its interest for us, but of that intimate social life which no contemporary ever thinks of depicting, but which when unconsciously portrayed partakes of the very essence of history, and is as valuable as it is rare, we cannot easily have too much. This is precisely what the good taste of Perrin led him to suppress, and this is what the publication of M. Capmas restores. As regards tangible if minute contributions to *Sévignology*, M. Capmas offers four emendations of current views. It is to be feared that none but very devout Sévignists will receive them with much gratitude, but the esoteric few will duly appreciate them. (1) That *Mdme. de Sévigné* never lived in the rue Sainte-Anastase, as her most erudite biographers have hitherto supposed she once did, but that she went straight from the rue Courteau-Vilain to the Hôtel Carnavalet (which still exists No. 23 rue de Sévigné, formerly known as rue Culture-Sainte-Catherine); (2) that *Mdlle. Montgobert* and *La Pythie* are not two names for one person as they were up to this time supposed to be; (3) a probable and nearly certain derivation of the puzzling epithet *Quantova*, by which she designated *Mdme. de Montespan* in her correspondence with her daughter; (4) that it was the

Maréchale de Villeroi, and not the Duchesse de Ventadour as is generally assumed, who was the cause of Charles de Sévigné's dreadful mishap in 1680, which gave his mother so much trouble and anxiety for several months. In reference to this last point, I will remark, without contesting the plausibility of M. Capmas's reasoning, that his hypothesis is difficult to reconcile with the excellent terms on which M^{de}. de Sévigné was with the Maréchale de Villeroi years afterwards—and not only M^{de}. de Sévigné, but all her family, including the penetrating Philippe de Coulanges. The culprit, whoever she was, M^{de}. de Sévigné considered worthy of the attentions of the Lieutenant of Police. Her independent and upright character was not likely to forgive such an offender and live on friendly terms with her, as she must have done if M^{de}. de Villeroi had been the cause of her trouble.

It is clear that the new matter which M. Capmas has discovered makes a new edition of Sévigné desirable and nearly indispensable. He has given in the present volumes, with few exceptions, nothing but the unpublished and unknown portions of his manuscript. He could not well have done otherwise. But the result is highly inconvenient in this way, that to read a letter of M^{de}. de Sévigné to which his fragments refer we need two volumes before us at the same time—one of the old editions and one of his—and even then we have no indication as to where the new matter should be inserted in the received text. The well-known enterprise of French publishers might have been trusted to promptly repair this defect some years back. Perhaps it will not be so readily done at the present day. Modern France generally has less enthusiasm for the "beau siècle de Louis XIV." than was felt by even the last generation, and a reaction in its favour is in the highest degree improbable. If M^{de}. de Sévigné is removed from her pedestal, while Bossuet, Molière, even Racine and Fénelon, remain on theirs, the reason may perhaps lie in the utter insufficiency of familiar correspondence to found a literary reputation of the first order. The historical value of her gossip is now degraded in the presence of the numerous sources of knowledge which have come to light in recent years. Even these deductions do not fully account for the evident decay with which her fame is menaced; and the wonder is not that it should be beginning to fade now, but that it ever stood so high as it did. More serious views of history and society are probably the cause of the change of estimate. Seen across two centuries, the brilliant Marquise appears as a rather commonplace person, who possessed a free pen, and a daughter of whom she was foolishly, even crazily, fond. But with all her amiability her sympathies were narrow, and with all her vivacity her intellect was mediocre. The way in which she jests about the burning alive of the wretched woman La Voisin and the frightful cruelty which marked the suppression of the Breton revolt at her own doors (see letter, November 3, 1675) is enough to establish the first proposition, as her want of ideas does the second. I do not mean ideas in the philosophical sense. Her freedom from pedantry is one of her charms.

But she hardly if ever lights on a deep pregnant phrase, which gives with a touch the fruitful brooding of an observing mind and a full heart. Her glance is superficial in the extreme, and never penetrates beyond the outward and broadly visible fact. When close on seventy she describes the wedding of M^{lle}. de Louvois with an admiration for finery which would be almost excessive in a country girl or a conscientious auctioneer. Her taste, not to say her weakness, for narrative, and her Boswellian fidelity in it, have attracted those who thought they were reading history when they read her letters. But in her numerous letters she has not told us much, as she had not the eye to see much.

JAMES COTTER MORISON.

Between the Danube and the Black Sea; or, Five Years in Bulgaria. By Henry C. Barkley, Civil Engineer. (London: John Murray, 1876.)

WE open a book professedly dealing with a country on whose fate at the present moment the peace of Europe hangs suspended, to find ourselves regaled with anecdotes about a toothbrush and tattle about a middle-aged gentleman and his monkey. Mr. Barkley has not done justice to himself. No one need expect antiquarian or ethnological research from a maker of railways, but a twelve years' residence in the country he describes, and the natural gifts of a shrewd mind and the art of story-telling, put Mr. Barkley in a position to produce something better than a loosely-connected series of anecdotes *de omnibus rebus et quibusdam aliis*; and the really good points about his book make the impertinent personalities with which it is interlarded the more provoking. Mr. Barkley is outspoken, manly, always good-humoured, and full of healthy spirits. He loves fair play and hates tyranny, as a true-born Englishman should. His emphatic corroborations of the worst that has been said of Turkish misgovernment in Bulgaria have been cited so copiously elsewhere that we need not dwell upon them here. Those who are still sceptical as to Turkish atrocities will find in Mr. Barkley's book a very pretty picture of a raid of Bashi Bazouks on a peaceful Bulgarian village, and a full and particular account of how the Pashà of Varna left the victims of his extortion to be frozen alive. Those who, in the teeth of all trustworthy evidence, persist in regarding the Bulgars themselves as a degraded and demoralised race may consult with benefit the opinions of an English engineer, who, after twelve years' experience of native labour, pronounces the Bulgar workman not only to be the most industrious among those of the surrounding races, but also to be capable of a higher class of work.

On the other hand, when we turn for information as to the great awakening of national self-consciousness which was going on around him, Mr. Barkley fails us entirely. He tells us that the Bulgars are not prone to revolution. Quite true, so far as sanguinary outbreaks are concerned. And yet it seems to have escaped Mr. Barkley's observation that, during the very period in which he was a resident in Bulgaria, a revo-

lution was taking place, admirable in its aims and pregnant in its results, and appealing by its very character to the sympathies of Englishmen, a revolution, peaceful indeed—as accorded with the national temperament—but supported with all the stubborn resolution of the Bulgar race, and only ending with the utter overthrow of the system against which it was directed. We must turn to Herr Kanitz or Herr Jireček to obtain an account of that national *Kulturbekämpfung* against the Powers of Darkness, as personified by the Fanariote Hierarchy—against those Spiritual Pashas, who were picked for their very degradation from the Greek slums of Stamboul, and planted by the Turks in Bulgarian Sees with the deliberate object of striking deadlier blows at the moral and intellectual well-being of the Bulgar rayah than Pashas and Mudirs and Kaimakams, with all their train of Zaptiehs and Bashi Bazouks, could strike at his material prosperity. The Bulgar had submitted to see his garner pillaged, or his crops harried, or his friends shot down by the passing Irregular, but extortion from the altar, the perversion of his religion, the destruction of his national monuments, the ruin of his schools, and the corruption of his children, aroused even in his patient bosom a spirit which centuries of bondage had not utterly crushed out. He did not take arms. He did not stain his cause by a solitary murder. But he felt his strength: and in spite of the resistance of the Fanar and the Porte, his dogged determination won the day. The "Spiritual Pashas" were hounded out, and in the Tuna Vilajet, at all events, the Bulgarians recovered their national Church. Mr. Barkley, though he says nothing of the Fanariote bishops, gives us a speaking portrait of a village priest under the old régime. A peasant, who found Mr. Barkley fumbling in vain at the door of a Greek church one fine Sunday morning, gave him some very satisfactory reasons why there was no service. It seems that the parson—"an excellent worthy creature. Such a good man, Effendi!"—potted such a sum every week by the sale of charms and wax-candles, and spent it in such style of a Saturday evening, "that he is like a dead man all Sunday. He is now lying among the nettles at the back of the drinking-shop there, and will not be able to move till night." "Does he often do this?" I asked. "Well, Effendi, I can't exactly say how often, but this is the fifth Sunday he has spent among the nettles!"

Under such ecclesiastical patronage superstitions have naturally flourished among the Bulgarian peasantry, and Mr. Barkley gives us some amusing instances. Did Mr. Barkley's horse go lame, or was a workman crushed beneath a falling wall—it was all along of the Evil Eye: and grooms and workmen rushed off for a cow's skull to avert the "Gettatura" for the future—a practice common to other parts of Turkey as well as to mediæval Italy: witness a story of Boccaccio's. The distant growl of thunder on the Baba Dag mountains is "God's Buffalo" bellowing for his milk; you may see him yourself of a new moon, his forefeet planted on one mountain and his hind on another; and the worst of it is that with

this portentous beast "l'appétit vient en mangeant," and, though the poor Bulgars begin by supplying him with three hundred pails of milk a day, he soon raises his demands to five hundred! But the introduction of railways among the Turks seems to have produced a class of "Engine myths" new to Comparative Mythology. For what are engines worked by? Steam!—the Turkish wisacres know better. No; a fine young devil is trapped in England, shut up in "that great fire-box on wheels," and bribed to work the crank by the *douceur* of a little cold water now and then, to allay his tortures! Mr. Barkley has found this Devil-theory deeply rooted, and once saw "a Turk stripped, scouring and rubbing at his garments, because a drop of water from a passing locomotive had fallen on them, which he believed to have been produced by the Devil spitting."

The Dobrudže, or "good land," the fertile horse-shoe of country between the Black Sea and the last bend of the Danube, through which the English engineers drove their new railway, is not so interesting as many other districts from the point of view of Bulgarian history. Preslav, Ochrida and Prespa, Serdec, Widdin and Tirnova, each at different times the headquarters of the Golden Lion, lie all of them without its limits. The antiquarian and sentimental interest attaching to the Dobrudže dates back to a period before the Bulgarian Conquest—to the days when the territory answering roughly to the present Tuna Vilajet was erected into the Roman province of Lower Moesia. The very line followed by the new railway between Černavoda on the Danube and Kustendže on the Black Sea is almost identical with that of a mighty line of Roman wall, still known to the Bulgar peasantry as Trajan's wall, which stood to Moesia Inferior in much the same relation as the wall between the Tyne and Solway stood to Roman Britain. Mr. Barkley, in the course of his railway construction, made a very practical acquaintance with one of these mighty *valla*—there seem to be remains of three distinct lines of wall—and, except for the absence of the two minor *aggers* traceable in the British work, and for the enormous size of the blocks employed in the wall itself—from one to six tons' weight apiece—his description might almost have been taken *verbatim* from Dr. Bruce. As in the British work, Chesters for the Roman garrisons were echeloned along the line, and the Moesian wall seems as prolific as ours in remains of Roman buildings, if we may judge by the fact that, being in want of sheds for his workmen, Mr. Barkley, to obtain building material, employed his gang in grubbing up the foundations of numerous Roman buildings, "which," as he remarks, with a kind of grim humour, "those enterprising people had left behind them."

But a more melancholy interest attaches to the spot where the Roman wall abuts on the Euxine, and where the English engineers have lately built their new railway terminus. The Roman town which occupied the site of the modern Kustendže will be remembered through all time as the seat of Ovid's exile. Mr. Barkley describes a Roman wall which still cuts off Kustendže from the plains, and

which, in Roman days, must have made the town "quite secure from the attacks of the barbarians." The wall descended eighteen feet into the outer ditch, but on the inner side was low—"not more than six feet above the ground." But how the Tomi of the *Tristia* and Pontic Elegies rises before us in its utter isolation! Splashed on one side by the waves of the inhospitable Euxine; hemmed in on the other by a restless sea of Scythian nomads, hurtling their poisoned shafts over the same low wall—the "brevis murus" of the trembling poet—on to the roof-tops within—

"Tecta rigent fixis veluti vallata sagittis,
Portaque vix firma summovet arma sera."

At the present day there are Tartar horsemen in the Dobrudže who may not altogether have forgotten the archery of their Scythian forefathers. Descendants of the same Sarmatians may still be seen in the very neighbourhood of Ovid's place of exile, clad in the same shaggy sheepskins and flowing Persian breeks that he describes, and with knives of antique form at their sides, as of old; and how vividly does Ovid's description of the wild Sarmatian horsemen sweeping down on the peaceful *coloni* recall a raid of Bashî Bazonks on a quiet Bulgar village, such as Mr. Barkley has described:—

"Hostis equo pollens longeque volante sagitta
Vicini late depopulatur humum.
Diffugiunt alii: nullique tuentibus agros,
Incustoditæ diripiuntur opes:
Ruris opes parvæ, pecus, et stridentia plaustra,
Et quas divitias incolæ pauper habet.
Quæ nequeunt secum ferre aut abducere, perdunt,
Et cremat insontes hostica flamma casas.
Tum quoque, cum pax est, trepidant formidine belli,
Nec quisquam presso vomere sulcat humum."

The fact that they are blissfully unconscious does not at all detract from the value of Mr. Barkley's commentaries on the Pontic Elegies. In the space of nineteen centuries the great natural phenomena of the Black Sea and lower Danube can have altered little, and it is interesting to observe how they strike minds so radically different. The Euxine is still the same inhospitable sea as it was when Ovid reminded the world of its ill-omened earlier name:—

"Dictus ab antiquis Axenus ille fuit:
Nam, neque jactantur moderatis æquora ventis,
Nec placidos portus hospita navis habet."

Before the English engineers constructed the harbour at Kustendže there was no port between the mouth of the Bosphorus and the Crimea for which a ship could make in a storm.

"And yet," says Mr. Barkley, "the Black Sea bears a bad name with sailors, and deservedly so, for it is swept by the north and north-east winds direct from the steppes of Russia, and the short chopping seas rise very rapidly and are far more dangerous than the long swell of the Atlantic." Ovid explains the chilling force of these northern blasts from the proximity of the Arctic constellations:—

"Proxima sunt nobis plaustris præcipientia formam,
Et quæ præcipuum sidera frigus habent;
Hinc oritur Boreas, oraque domesticus huic est,
Et sumit vires a propiore loco;"

which is at least more poetical. It is to be observed that the Roman does not seem to have suffered from the parching south wind, or Lodos, which comes like the breath of a

furnace, taking all the energy out of a man and making his bones ache. But how terribly those wintry blasts must have smitten the Italian exile, which even our hardy English engineer could scarcely stand! In Bulgaria it was Jack Frost no longer—he was far too awful a personage, and was spoken of by the Englishmen reverentially as "Frost Effendi." A mother and infant were found frozen to death in bed; dead men were brought in daily, and a baker on opening his oven one morning found a poor wretch frozen to death inside it. Referring to the frost near Kustendže, Mr. Barkley says: "One was obliged to bury oneself out of sight in sheepskins to avoid being killed by this Turkish monster." Quoth Ovid of the Tomitans:—

"Pellibus et sutis arcent male frigora braccis,
Oraque, de toto corpore, sola patent."

It does not appear from Mr. Barkley's account that the Black Sea itself is ever frozen, and Ovid's description may after all be simply an exaggerated version of the freezing of the neighbouring lagoons; but the Danube is bridged over still, and may conspire with the Russian to-day as it did with the Dacian of old. One night the Englishmen were startled from their slumbers by what they took to be thunder of cannon repeated at intervals. It was the breaking up of the ice on the Danube; the *feu de joie* for the arrival of spring. For Ovid was maligning his Pontic soil when he complains of it—

"Tu neque ver sentis cinctum florente corona,
Tu neque messorum corpora nuda vides."

On the contrary, there is spring—and a very beautiful spring, too—even about the ruins of Tomi.

ARTHUR J. EVANS.

Remains of Archbishop Leighton: comprising Twenty-Seven Sermons from MSS. recently discovered in the Bodleian Library, also Papers on the Accommodation and Indulgence, from the Wodrow MSS.; and the Rule of Conscience. With a Bibliographical Appendix, and Additional Notes; Corrections of the Text of the Whole Works, and a Glossary. By William West, B.A., Incumbent of St. Columba's, Nairn. (London: Longmans, 1875.)

THAT there is a large ready-buying constituency of readers for our elder divines—Church and Nonconformist—was abundantly evidenced by the welcome extended to the reproduction of the complete works of Goodwin and Sibbes, Brooks and Charnock, Thomas Adams and Clarkson, and various others in Nichol's well-known Series; while the recently-completed collection of the bulky writings of Dr. Thomas Manton, years after the former, has met with equal success. There are other kindred issues that make good the same conclusion; for the aggregate sales mount up to tens of thousands of copies. Place over against this fact the meagre and continuously lessening response to Mr. West's most laborious and elaborate edition of Archbishop Leighton—the entire names of what is called "The Leighton Club" amounting to thirty, and apparently the entire edition to less than 100 copies. One inevitably asks for explanation of the anomaly in the knowledge

(1) that Leighton is of the foremost of our early theologians and devotional writers; (2) that a really critical and adequate edition of his works has long been a *desideratum*—asked from Coleridge onward. The explanation, unhappily, is not far to seek. Editing must be conscience-ruled so as to furnish the author in integrity, in order to commend itself to intelligent and appreciative students. There must be no tinkering, or “improving,” or modernising. What is increasingly wanted are the *ipsissima verba* of whoever and whatever is deemed worthy of reprint. In every possible way Mr. West’s edition of Leighton violates these conditions. It was our painful duty to demonstrate this with lavish proofs; and now Mr. West himself is constrained practically to admit our charges—i.e., to admit the gravity and the manifoldness of his departures from his venerable author’s text. For in the present seventh volume of the Works there is a Supplement of “Corrections, Emendations, and Various Readings,” that extends from page 379 to 426, or nearly fifty pages of very closely packed matter. Taking up one of the earlier volumes, we proceeded to mark in our copy the “corrections” enumerated, and lo! as the somewhat tedious task was prosecuted, the pages became speckled and spotted in a fashion that made it evident how corruptly and inaccurately the text is given, and that no one could reasonably be expected to follow up the endless “corrections, emendations, and various readings.” Even the golden Commentary on the First Epistle of St. Peter has been thus dealt with. It cannot, therefore, be wondered at that any edition of a Christian classic like Leighton worked on as Mr. West has done proved almost from the outset a failure, or that successive volumes have only called forth the indignant protest of all reverers of Leighton in our own country and colonies, and in the United States of America. That Mr. West has at last seen his mistake is so far well; but the sorrowful matter-of-fact remains that Mr. West’s collection of “the Whole Works (as yet recovered) of the Most Reverend Father in God, Robert Leighton, D.D., Bishop of Dunblane and Archbishop (Commendatus) of Glasgow,” is in no sense a trustworthy edition.

We feel bound to reiterate all this; but none the less do we recognise the high, very high, qualifications of Mr. West, and are touched by his pathetic insistence in the face of trying disappointments and, as we are extremely sorry to learn, protracted personal sickness. His search and research; his wide and yet minute reading in every most recondite direction; his culture and sympathetic recollection of the classics, Fathers and poets, in order to illumine and confirm his Worthy; his chatty matterful bringing together of elucidation and illustration in his notes; his fervid admiration, deepening in the successive volumes into a passionate love; his unselfish, self-denying, self-sacrificing devotedness to his task; and his single-hearted resolution to go forward with the new Life, must be recognised and honoured. More than this, as a new edition of Leighton remains one of the most urgent of demands, we cherish the hope of finding Mr. West invited by influential publishers, and

accepting the undertaking of such edition—with a rule absolute to give the text in integrity. This means broken sentences and other imperfections; but these are as the white hairs and wrinkles of the dear old occupant of the “old arm chair.” Footnotes and supplementary annotations can easily make all clear, leaving the text in its truthfulness. That such a genuine edition will receive a wide and eager response at home and abroad is of the certainties; and Mr. West may rest assured that no paltry “Leighton Club,” or aristocratic gifts (however creditable) for separate volumes, will be required. Personally it is a pleasure to us to express to Mr. West our regret that in our keenness of disappointment on the discovery of the vitiated text of Leighton we possibly put the thing too harshly and as though the editor were consciously dishonest. We had not the shadow (nor have to-day) of *animus* or grudge against him. Then, and now, we stood on public grounds alone, and as guarding the interests of our best literature. It only remains to be stated that the present volume of “Remains” contains very important and very precious things. They are printed, to a considerable extent for the first time, from (mainly) the Rawlinson MSS. in the Bodleian. Mr. West’s “find” of the completion of “one of the most characteristic and beautiful expositions of Scripture among all the works of our author”—viz., on Psalm xxxix.—calls for our congratulation and gratitude. There are, besides, sermons and other remains. “Occasional Papers” on “The Accommodation and Indulgence and the Rule of Conscience” are of rare biographical value and interest. Substantively weighty, they have the added charm of revelations of his thorough Scottish metaphysical faculty, and such pleasant humour as George Herbert and William Cowper had. Were it for no more than these “Remains,” Mr. West should deserve our warmest thanks. Surely “lack of funds” will not deprive the lovers of Leighton of an intended but suppressed “supplementary volume, containing a Catalogue of Abp. Leighton’s books, with introduction and notes, selections from his fly-leaf memoranda, and copious indices to the whole works.”

ALEXANDER B. GROSART.

Forty Years’ Recollections of Life, Literature, and Public Affairs. 1830 to 1870. By Chas. Mackay, LL.D. (London: Chapman & Hall, 1876.)

THE author of these *Recollections*, like many other able men, seems to us to have misjudged himself, and not to know where his real strength lies; for he speaks of himself on his title-page as the author of *Egeria*, *A Man’s Heart*, *Studies from the Antique*, &c. We do not question the merits of these works, which Dr. Mackay has selected, we presume, because he holds them to be the best he has done. But we do say confidently that for one English man or woman who has been touched by either of them, there are a thousand who have been at some time of their lives deeply moved by another work of his, which is only referred to casually, and almost apologetically, in a

couple of lines in these volumes. It chanced to the writer of this notice, in 1847, when Chartism was at its height, and the political air here and on the Continent was charged with dangerous electricity, to be present at a gathering of persons engaged in one way or another in the work of social reform, of which the England of that day stood in sore need. To us came, among others, a hard-working clergyman of one of the worst parishes in central London, who, in a discussion which turned upon the special dangers which were threatening from the angry unrest of the great masses of the people, maintained that the greatest danger lay in the writings of literary men who should be among the friends of order. In proof of his contention he produced from his pocket a small volume in a yellow cover, from which he proceeded to read extracts. The first of these began (if our memory holds true, for we have not the book at hand) as follows:—

“Men of thought, be up and stirring,
Night and day
Sow the seed, withdraw the curtain,
Clear the way;
There’s a fount about to stream,
There’s a light about to gleam,
There’s a midnight darkness turning
Into grey;
Men of thought and men of action,
Clear the way.”

His second quotation was from a song entitled “The Good Time Coming,” and before the worthy parson had finished he had at any rate strongly excited the curiosity of the writer, who took up the little volume when he had laid it down, ascertained its name to be *Voices from the Crowd*, and went off forthwith to purchase it. It proved an excellent investment. The other poems were equal to sample. In a short time several of the songs gained very great popularity, and “The Good Time Coming” came to be the “Marseillaise” of the peaceful revolution which has changed England so marvellously in the intervening years.

Having been a warm admirer of the *Voices from the Crowd* thirty years ago, and a sorrowful reader of Dr. Mackay’s letters from America as the *Times* correspondent during the Civil War, we turned to these *Recollections* with much interest and curiosity, in the hope of finding the clue to what had always seemed to us a puzzle—how one who was sufficiently in touch and sympathy with the intense and enthusiastic popular longings of his own countrymen to have written “The Good Time Coming” should have proved wholly unable, we will not say to sympathise with, but to judge with any fairness, or to speak with any patience of, the enthusiasm and resolution, so sorely tested, of the people of the Northern States in their great struggle. We cannot say that the result has been at all satisfactory. The two chapters devoted to Dr. Mackay’s first and second visits to America no doubt account more or less for his bitter and contemptuous feeling towards some of the most prominent of the Northern leaders. In 1857, as the popular lecturer, and representative of the *Illustrated London News*, coming among them with a considerable reputation as a poet and Liberal politician, and introductions from Thackeray, he was *fêted* by the social and political leaders,

and by none more than Mr. Sumner and the leading Abolitionists. In 1862, when he returned as *Times* correspondent, and was found to be indifferent to the preservation of the Union, an upholder of the right of secession, and sceptical about the policy and the justice of immediate abolition, many of his old friends cooled down, while some, and notably Mr. Sumner, were openly and savagely rude to him. And we can quite understand that in the heat of the struggle these insults would give a sting to his writings, and might colour his views of the motives and actions of North and South. But half a generation has passed since those days. The facts of the great struggle are all open enough to anyone who cares to study them; and we must own that the bitterly partisan spirit in which Dr. Mackay still writes makes us doubt whether, after all, in spite of his early poetry, he can fairly be reckoned as anything more than an intellectual Liberal, of the now well-known type of those who admire Liberty in the abstract, but have never a good word or wish for any concrete democratic movement, and a keen eye and scent for all the small vulgarities and selfishnesses which hang round the skirts of the noblest causes. At any rate, to us it was a sad disappointment to find Dr. Mackay in 1876 representing the Union armies as mainly composed of Irish and German immigrants, and giving with evident sympathy a detailed report of a crazy pro-slavery speech of George Francis Train, "than whom," as he writes (vol. ii. p. 426), "a madder and a wiser man never stirred the pulses of a crowd."

But though we can no longer look upon Dr. Mackay as a true people's poet, or a good Liberal in sympathy with the deepest wants and longings of his time, we can recommend him as a very pleasant and amusing companion. There is a certain amount of padding in these two volumes which might well have been left out, such as the history of the proposed Literary Union (vol. i. p. 168), of the Scott monument, of the Burns festival (p. 247), and of the Glasgow election of 1847. The general effect is patchy, as must almost always be the case when a number of subjects of such unequal interest are dealt with in a collection of this kind. And there is a carelessness in detail which somewhat detracts from the value of the book, and surprises us in the work of an expert—e.g., where Lowell's "Fable for Critics" is spoken of as "Table for the Critics" (ii. p. 277); "Thoreau was or is" (p. 280), when Thoreau has been dead these twenty years; "It was not me" (p. 284)—botches occurring in one short chapter, and which a reasonably careful correction of proofs would have avoided. But, having said thus much, our criticism is exhausted, and we can heartily recommend the *Recollections* to our readers as a pleasant and interesting addition to our means of knowing and judging some of the most noteworthy men and doings of our own time.

The author came to London in 1832, a youth of eighteen, an excellent French and German scholar, full of enthusiasm and energy, with very little money, but good introductions. Through these partly, but more through his own merits, he became

known to Dr. Black, then the editor of the *Morning Chronicle*, who inserted his translation of Béranger's poem "Mon habit" in the paper, and gave him a cheque for five guineas for it, saying, "That is as much as Milton's first payment for *Paradise Lost*, and I daresay more than ever Béranger received for the original. It is given not so much as a payment as a retainer" (i. p. 70). No wonder that the clever boy's head was turned.

"This," writes Dr. Mackay, "was the pleasantest money I ever received, before or since—pleasant, yet to some extent fatal, for it tended to fasten my feet in the thorny pathways of literature, and to confirm me in the confidence that the profession of literature was as profitable as it was noble."

Within six months he was assistant-sub-editor of the *Chronicle*, then holding its own against the *Times* for the place of the leading London journal, and, with an interval of three years in Scotland, where he went to edit the *Glasgow Argus*, in 1844, and of a like period in America as correspondent of the *Times* during the war, has spent his life in London as a journalist and literary man. We cannot agree with what we gather to be Dr. Mackay's own opinion that he made a mistake in his profession. He seems to us to have found his right vocation, and though he might very possibly have made more money in some other walk of life, there is no other which would have given him the same chances of intimacy with remarkable men, and of power to help on causes in which he was interested. In these times there is no position which offers so many attractions to a man of vigorous mental and bodily health, as that of editor of a leading journal, and we can quite understand the view of Dr. Black, as given in the characteristic (p. 95) anecdote of Lord Melbourne's offer to him. The Premier had startled the worthy editor by speaking of his conduct as "something uncommon," humorously explaining that he meant that Black had never so much as hinted that he would like a place, though there was no living man to whom he (the Premier) would sooner give one.

"'I thank you, my Lord,' said Mr. Black with the utmost simplicity and *bonhomie*, 'but I do not want a place. I am editor of the *Morning Chronicle*, and like my work and the influence it gives me, and do not desire to change places with anybody in the world—not even with your Lordship.'"

At any rate, his profession has brought the author into relations with a number of men of whom we are never tired of hearing. Rogers, Campbell, Wordsworth, De Quincey, Lord Lytton, Sydney Smith, Douglas Jerrold, Hawthorne, Thackeray, Leech, besides a number of less known but very worthy Englishmen, are all brought on the canvas, and in every case we carry away something worth remembering of the man, a distinct addition to our knowledge—nothing, it may be, of any serious importance, but touches which make the likeness more real and homely. But perhaps the best thing of its kind, and to us certainly the newest, is the sketch of Béranger and Lamennais, those strangely-mated friends, in the first chapter of the second volume. Dr. Mackay saw Béranger frequently in December, 1847, just before

the outbreak of the Revolution; and, as we have no room for any of the excellent stories of any of our native celebrities, we will conclude with this specimen of the author's power of putting a man before us in a few sentences:—

"Béranger had a broad capacious forehead, a very bald head, and a good-natured, benign, but somewhat slovenly appearance. He looked like a man who would not encourage trouble to come to his door, much less to take up its abode in his house. He was encased in such a smooth, well-soldered, and well-fitting armour of Epicurean content as to defy the stings and arrows of fate to pierce it, or even to annoy him. A good easy man, who took things as they came, satisfied with little, fond of the sunshine and of small enjoyments, a Diogenes in his contempt of outward show, and in independence of character; and with a real unaffected good nature to which Diogenes had no pretensions. Béranger was, in fact, a *bonhomme* in the French sense—kindly, without guile or thought of evil; fond of pleasures, but never dreaming of doing any harm to anyone else in order to obtain them; a very child in his simplicity; and yet a very wise man in his knowledge of the world. Such religion as he had savoured of Paganism, and his political faith was ultra-Republican. . . . A most unmitigated *badman*, living in Paris for the sake of Paris, and with no thoughts but such as Paris inspired. He had no love of natural scenery, and confessed as much; had never seen a mountain; and, worst of all, did not remember to have seen the ocean, or heard the solemn music of the shore."

Before parting, however, with Dr. Mackay, which we wish to do in the best temper, we must protest against the right of even so good a song-writer to speak of "the vulgar detestability of 'Sally in our Alley,'" and of Dibdinism "as a school" (of ballad poetry) "which had much better be left undisturbedly to die out." We had hoped better things in this direction from the author of "The Good Time Coming." T. HUGHES.

Shakspeare's England. 1. *Harrison's Description of England.* Part I. Edited by F. J. Furnivall. 2. *Tell-Trothes New Yeares Gift, and the Passionate Morrice*, 1593; *John Lane's Tom Tell-trothes Message*, 1600; *Thomas Powell's Tom of all Trades*; *The Glass of Godly Love* (by J. Rogers?). Edited by F. J. Furnivall. 3. *W. Stafford's Compendious or Briefe Examination of certayne ordinary Complaints of Diners of our Countrymen in these our Dayes*, 1581. With an Introduction by F. D. Matthew. Edited by F. J. Furnivall. *P. Stubbes's Anatomy of Abuses in England*, 1583. Part I. Edited by F. J. Furnivall. (New Shakspeare Society, 1876.)

It is for Shaksperian students to say how far the present issue of the New Shakspeare Society will serve to elucidate Shakspeare. There can be no doubt that the editor has conferred a great obligation on all who wish to understand what the England of their forefathers was like. He does not, indeed, give us anything that is not already accessible, and some of the books have been often enough freely quoted. But it is one thing to be quoted, and another thing to be widely read; and those who know Harrison or Stafford in their original shape on the shelves of libraries will be glad enough to be able to read the well-known pages by their own firesides.

Harrison's *Description of England* goes the nearest of any book in existence to bring before us that life of the people as seen by contemporary eyes which the readers of history so persistently demand, but which it is often so very difficult for the writer of history to embody in his pages. Harrison, in short, did from his own knowledge for the England of the second half of the sixteenth century what Macaulay did from his stores of acquired knowledge for the England of the latter half of the seventeenth century. Harrison, it is true, had not Macaulay's style. Nor had he Macaulay's optimism. He has much to say as a clergyman of the hard lot of the clergy, especially of the heavy weight of the subsidies, which, as every student of the Exchequer Records knows, bore far more hardly on them than upon the laity. At the Universities it was now a "hard matter for a poore man's child to come by a fellowship." "Such packing also is used at elections, that not he which best deserveth, but he that hath most friends, though he be the woorst scholar, is alwaies surest to speed." In Grammar Schools, too, bribery prevailed, and the sons of the rich were taking the places intended for the poor.

Perhaps things, after all, were not quite so bad as Harrison thought. His account of the mishaps of jurymen is at all events such as to raise a suspicion that he was apt to take a gloomy view of affairs:—

"Certes," he writes (101), "it is a common practice . . . for the craftier or stronger rich to procure and packe such a quest as he himselve shall like of, whereby he is sure of the issue before the charge be given; and beside this, if the matter doo justlie proceed against him, it is a world to see now and then how the honest yeomen that have *bona fide* discharged their consciences shall be sued of an atteinct, and bound to appeere at the Starre Chamber, with what rigor they shall be caried from place to place, cuntries to cuntries, yea and sometime in carts, which hath and dooth cause a great number of them to abstaine from the assizes, and yeld to paie their issues"—i.e., fines for being absent from service on a jury—"rather than they would for their good meaning be thus disturbed and dealt withall."

One can hardly help conjecturing that it was sometimes, at least, the packed jury, and not the honest yeomen, who were dealt with in this fashion. At all events, the admission that juries were notoriously packed must have gone far to strengthen the hands of the advocates of the Star Chamber jurisdiction.

It is impossible to do more than refer to one or two passages. The book is a perfect mine of information on domestic and social life of the Elizabethan age. We learn how men built and furnished their houses, and how they cooked and ate their dinners. What Harrison tells us he tells us plainly and distinctly. In the midst of his descriptions, too, comes every now and then a bit of comfort, when we learn that certain faults around us are not such products of the nineteenth century as we are sometimes disposed to think. Even "in great Eliza's golden prime" it would seem workmen sometimes scamped their work:—

"As the workmanship of the later sort was never more fine and curious to the eie, so was it never lesse strong and substantiall for continuance and benefit of the buiers. Neither is there anie thing that hurteth the common sort of our arti-

ficers more than hast, and a barbarous or slavish desire to turne the penie, and by ridding their worke to make speedie utterance of their wares; which inforceth them to bungle up and dispatch manie things they care not how so they be out of their hands, whereby the buier is often more defrauded, and findeth to his cost that hast maketh wast, according to the proverbe."

If we have to be on our guard against a writer like Harrison, lest we take as a special abuse of the age what is, in truth, a common defect of all ages, still more caution is necessary with a professed satirist like Philip Stubbes, the most curious thing about whose book is, perhaps, that its Puritanism should have been dedicated to the Catholic Earl of Arundel. One wonders, as one reads, whether the Elizabethan world was, after all, so very much more wicked than the Victorian. The extravagance of the ladies is painted in the blackest colours:—

"If," we are told, "curling and laying out of their own naturall heyre weare all—which is impious, and at no hand lawfull—it were the lesse matter; but they are not simply contente with their owne haire, but buy other heyre, dying it of what color they list themselves."

The men, too, were nearly as bad, wearing silks and velvets, which were intended only to distinguish the nobility from common persons. At present, however, we have only the first part of the *Anatomy of Abuses* before us, and it is possible that the second part may reveal horrors for which no parallel is now to be found.

The volume which contains *Tell-trothes New Year's Gift, &c.*, is certainly duller than either Harrison or Stubbes. For the most part these treat of what Mr. Furnivall calls "The husband-and-wife question." He quotes from *Henry VI.*:—

"Henry is able to enrich a queen,
And not to seek a queen to make him rich;
So worthless peasants bargain for their wives,
As market-men for oxen, sheep or horse."

And then from *The Passionate Morrice*:—

"Fie, fie! marriages, for the most part are at this day so made, as looke how the butcher bies his cattel, so wil men sel their children. He that bids most shal speed soonest," &c.

This, says Mr. Furnivall, cannot be called an advance on the low part of the earlier *Paston Letters'* view of the marriage-question. The *Paston Letters*, however, give facts. The *Passionate Morrice* gives satire; and it should be noticed that the author of *Henry VI.* refers the custom to "worthless peasants." The question of equality between husband and wife, on which Mr. Furnivall quotes *The Princess*, is after all not a question of theory, but of community of interests and tastes. In the generation which succeeded Shakspeare, nothing is more marked than the different views taken of the position of women by Puritans and courtiers. Charles I. and his queen are justly credited with a pure domestic life, but there was no harmony of equal love between the pair. The Court poets, Suckling, Carew, and the rest, were altogether low and vile on this subject. Even Strafford, pure-hearted as he was, treats his wife too much like a spoiled child to be altogether to our taste. The marriages which realised Tennyson's ideal in those days were on the Puritan side. Governor Winthrop and Colonel Hutchinson, and even that queer antiquarian D'Ewes, who took an

increased pleasure in genealogical studies when he found that they brought him on the traces of so many of his wife's relations, would have understood the meaning of *The Princess*. It is not difficult to see how this was. Very few wives in any age would be capable of entering into Strafford's notions about the government of Ireland, and Charles's particular wife was certainly not capable of entering even into his notions about governing England. But the common Bible and the common Calvinistic creed formed a bond of union between man and wife, when they set themselves thoroughly to realise their beliefs in their lives.

William Stafford—if he it was who wrote the *Brief Concept of English Pollicey*, to take its second and better-known title—does not meddle with such delicate matters. He lays before us the economical, or rather the non-economical, views of the day. There is no mistake into which students are more apt to fall than that which consists of forgetfulness of the economical ignorance of the past. Again and again the serious enquirer finds that acts which have been set down to sheer tyranny or greed on the part of Governments were really done with beneficent, though mistaken, intentions. Stafford's book should therefore be studied as a key, not only to much of the history of his own time, but to much of the history of the following century. As Mr. Matthew says:—

"To call him a scientific economist would be extravagant: he was not two centuries in advance of his time; but his speculations are always acute, and in the course of them he tells us much of the England of his time."

SAMUEL R. GARDINER.

NEW NOVELS.

An Idyl of the Alps. By the Author of "Mary Powell." (London: A. Hall & Co., 1876.)

Coomb Desert. By G. W. Fitz. (London: S. Tinsley, 1876.)

Scenes and Sketches in Legal Life. By a Member of the College of Justice. (London and Edinburgh: W. P. Nimmo, 1876.)

Gerald Boyne. By T. W. Eames. (London: S. Tinsley, 1876.)

Thrice. By W. A. Chandler. (London: E. W. Allen, 1876.)

An Idyl of the Alps is very much what we should expect from its title and its author. It is a seventeenth-century episode in the history of the Cavour family, most of the names being apparently historical. Attilio Cavour, a young Piedmontese officer, pays a visit to La Torre in the Vandois valleys, drawn partly by curiosity and partly by the fame of the beauty of Octavia di Solara, sister of a comrade of his. He finds this beauty equal to its fame, and it prevails on him to bear the discomforts and hardships of mountain life during a second visit, at the end of which he marries the fair Octavia, not altogether to the satisfaction of her parents, and without the knowledge of his own. This concealment is the easier in that he has an independent property, whither he carries his bride and where they spend the winter idyllically. Cavour, how-

ever, rather wearies, not indeed of his wife, but of his solitude and his lack of occupation, and wishes to return to Turin. His parents are informed of the match, and in a manner reconciled to it, though they cannot get over Octavia's religion. She and her husband go to the capital and a good deal of Jesuitry and quiet persecution is brought to bear on her, the last stroke being a manoeuvre which separates her from her husband and keeps him in ignorance of her failing health. He returns only in time to be present at her death-bed; and with her burial the idyl and the book end. The story is told with much simplicity and occasionally some oddity of language. The picture of Waldensian life is attractive enough, but the dialogue is rather stiff and sometimes reads as if it were a translation. Octavia is the only character which is drawn with any elaboration, and the effect is not bad; the other personages are somewhat deficient in life.

Mr. Fitz is an Irishman and patriotic, to neither of which points in his character have we any objection. His nationality is no doubt sufficient excuse for his sending his characters to York in order to see Doncaster races, but his patriotism surely goes too far when he says that "a few years ago" Irishwomen were pictured in England as "loud-voiced, large-armed, and red-elbowed." We had always thought that, uncomplimentary as English opinion has sometimes been to Irishmen, it had never been stingy of admiration to their sisters. "Irish eyes" has been a compliment for many a long year. We are afraid, however, that, doubtless from the innate injustice of the Saxon mind, we cannot find a compliment for Mr. Fitz's novel. His story hangs very loosely together; it contains some remarkably unpleasant characters, and it is written in a very peculiar style. We are favoured with a singularly disagreeable account of a certain Miss Maggie White, who had an "utterly common vulgar expression," a "screaky" voice—whatever that may be—and had "fallen a victim to a married roué," some years before she is brought on the stage, where she has next to no business. The same may be said of a still more detestable Mrs. Mac Tavish, who is very prominent. As to the style, a short specimen will suffice:—"Pride was her besetting sin: not that dirt that apes pride by being haughty to her inferiors." But we have learnt one thing from Mr. Fitz—the reason, namely, for cutting the hair of convicts. It is to prevent them from strangling themselves therewith.

The author of *Scenes and Sketches in Legal Life* (who, by the way, has decorated the outside of his book with a picture of that singularly ghastly object, a wig without a head in it) disclaims, in a rather disdainful preface, any connexion with the detective stories so common some years ago. It is, indeed, a book of a very different kind, aiming almost entirely at character-drawing. The language is very strange—not, as might be fancied, from the use of terms unfamiliar to most Englishmen, but from a singular involution of thought and style. Even if people do not know the exact meaning of poidings and spuilzies, reductions and pre-cognitions, they can do without the know-

ledge; but it requires some painful thought to make out a sentence such as the following:—"Separate from Dowlas, in a solitary lodging, she had again and again at early morn been lively, but not on account of the sunrise, not with the attribute of the fowl to which that period is a cause of excitement; her repose was enforced before Sol had reached the meridian." And when, as sometimes happens, these involved and cryptographic sentences follow each other uninterruptedly, one's brain gets in a singularly muddled condition. There is, indeed, in the book undoubted humour of an uncommon kind, which is perhaps best shown in the sketch called "The Tenants of Ben Eachann." There is also much that is good in "Late Seniors of the Parliament House," though it enters into rather dangerous competition with Lamb's "Old Benchers" essay. But evidences of somewhat inorganic humour abound, humour so inorganic as sometimes—for instance, in "The Founders of Adullam"—to reach the limits of the incomprehensible. These *Scenes* are rococoes sufficiently out of the common track to be worthy of notice, and the question whether the fancies or language are "far-brought" in the good sense, or "far-fetched" in the bad, need not be settled off-hand, but may, in suitable phrase, be taken *ad avizandum*.

In *Gerald Boyne* we come back to the ways, scenes, and language of ordinary life—very ordinary life indeed. This is a book of the kind which used to delight the last generation—a simple history of the lives, loves, and liquid consumption of divers City clerks and medical students, dressmakers, daily governesses, and so forth. The tone is consequently of no very exalted or refined character—indeed, in certain episodes, such as the blackening of a drunken Jew's face, and the administering draughts of ipecacuanha to soothe the waking moments of an intoxicated landlord, it becomes rather unpleasant; but it is not morally bad. The clerks and students mostly marry, and establish themselves in their old lodgings, to the delight of their landladies—landladies of an uncommon order. As the husbands' incomes are low, the wives continue to earn their own living—a nineteenth-century ideal which we have not seen before exemplified in fiction. It is a pity that Mr. Eames did not carry it out loyally, instead of inventing stage uncles in the ordinary way. One grievous error he has committed—having made two of his characters earn large sums of money by writing for the press, he gives specimens of their articles. Now, you may make your hero write the most superlatively witty and profound works, and the reader is bound to believe your assertion; but specimens restore the critic to his judgment-seat. We are bound to say that the labours of Messrs. Carroll and Mompas are scarcely up to the mark.

Mr. Chandler is a man of decided views. He informs us casually that "School Board education will in a generation or two cause the natural death of all homage to the Supernatural," and, in a remarkable preface in verse (which, being unsigned, is, we suppose, his own), observes that critics are "letterless Yahoos." Notwithstanding which opinions, he has made all his pet characters

staunch Churchmen, and his hero the editor of a critical newspaper. There is an engaging inconsistency about this which predisposes one to like the book, and, indeed, it is not devoid of merits. The hero is rather a stick, and his father, a wealthy stock-jobbing heathen, is painfully conventional. But the Rev. Richard Sparman, in his progress from priest to parson—a metamorphosis effected by the combined agency of the Court of Queen's Bench, a good City living, and a pretty girl—is very cleverly though rather superficially drawn. The best character in the book, however, is a Conservative Peer, rejoicing in the odd title of Earl Trampleasure; the final scene in which he kills a burglar purely from the feeling that it is expected of him is decidedly a success. Mr. Chandler's pictures of the interior of an Anglican monastery are also very good. His talent would seem to lie in such disjointed sketches rather than in plot-weaving, which appears as yet beyond him. Meanwhile, he should take a friendly hint from a letterless Yahoo, and not misquote or disarrange Shakspeare. His present practice rather exposes him to the attacks of the objectionable bipeds with whom he is so indignant.

GEORGE SAINTSBURY.

RECENT VERSE.

Songs and Hymns of Earliest Greek Christian Poets. Translated by Allen W. Chatfield, M.A. (Rivingtons.) We take it that the late Dr. Neale translated and adapted from the Greek Christian poets nearly all that was suitable for Western hymnals. These verses are in no sense hymns, nor do they seem specially interesting as religious poems. We do not know the original, but we suspect that the translator rather than St. Gregory Nazianzen is responsible for such stuff as the following. The saint apostrophises his soul:—

"Wouldst boundless gold-roofed mansions,
Gemmed paragons of art,
And master-piece expansions
To life which almost start?
Dost long-for robes wide flowing,
Pride of the untouched great;
And wealth on fingers glowing
Incredible to state?"

It is really "incredible to state" how completely devoid of merit, poetical or other, this volume is.

St. Christopher with Psalm and Song. By Maurice Baxter. (Hodder and Stoughton.) A volume of religious poetry, in which the intention is good and the execution indifferent.

Harp of the Christian Home. Hymns by Living Writers. Edited by the Rev. Charles Rogers, LL.D. (Houlston.) The preface to this little volume of pious lyrics gives us a very fair notion of the compiler's taste and style. "By the use of hymns is domestic worship especially hallowed. Even to the passer-by the notes of household praise are as the scarlet thread in Rahab's window—a comfort and a solace." He speaks also of the contributors as "hymnists." The hymns are for the most part poor, very few, indeed, being by authors of any merit, and the collection is quite curiously meagre and disappointing, considering the very rich stores which exist of modern devotional poetry.

The Crown of Life. Words by M. Y. W. Illuminated by Arthur Robertson. (Hardwicke and Bogue.) It is difficult to know whether to consider *The Crown of Life* as a poem, or as an illuminated work. In neither case is it satisfactory. M. Y. W. has a strange confusion of metaphor, which is fatal to poetry, as

"My thoughts I firmly anchored on this view."

But if considered as a specimen of illumination, the mechanical reproduction divests the design of all true feeling; the tints are harsh and crude, the features of the figures blurred and shapeless.

Heart and Home Songs, Original and Selected. Arranged by M. E. Townsend. (Hatchards.) The short poems—by no means all songs—here collected, have reached a third thousand, and have, therefore, achieved a certain measure of popularity. They are good, bad, and indifferent, the last class being slightly preponderant; they are carefully selected, sometimes needlessly Bowdlerised and weakened: for instance—

"And are ye sure the news is true?
And are ye sure he's weel?
Is this a time to think o' wark?
Ye jades, set by your wheel!"

is softened into

"Mak' haste, set by your wheel!"

There are curious omissions, as among songs of war, only eight in all, are neither Campbell's "Hohenlinden," nor "Our Bugles sang Truce," nor has Wolfe's "Burial of Sir John Moore" any place. The best section in the book is that containing the sacred songs, which is probably what the compiler intended and desired.

Anthony Babington. A Drama, by Violet Fane. (Chapman and Hall.) This drama was in our hands more than two months since, and was therefore antedated somewhat earlier than is the usual custom of publishers. Why should not books always bear the month as well as the year of publication, and no need would then exist for a custom which has little to recommend it? The fiction, however, is a recognised one, but in this case it has a curious effect. We imagine that before the day arrives in which the drama nominally lives, it will be wholly dead, and a curious question of casuistry might arise whether it had ever lived at all. The author admits in her preface that the play is "unfitted in form for the stage, even could an audience be found patient enough to sit out so tragic a tragedy." With *Hamlet*, *Lear*, and *Othello* in our minds, we may say with confidence that it is not tragedy but dullness which an audience resents, but we do not say that they could sit out *Anthony Babington*. It is written partly in prose, and partly in verse, and there is no reason apparent why the one is at any given time exchanged for the other, and there is certainly no merit in either. Elizabeth is made clumsily coarse; Mary swears "by the rood," and her "weary soul is longing for the South." One aspect of each of the characters is carefully kept, but no one is lifelike or attractive. And there are some astonishing blunders.

Falkland; an Historical Play. By Sidney Smith. (Edward Turner.) We have to thank Mr. Smith for a sound and refreshing slumber which overtook us in the act of reading his play. It has no other merit than that of being soporific, but perhaps our readers will be able to bear a few lines while yet awake. Essex (who is one of the *ninety* characters, besides aldermen and other supernumeraries) opens the letter which tells of Falkland's death, and delivers himself, in part, thus:—

"The papers open. Here
He tells the finder that at Binford House
He'll be well paid who takes it. To his steward—
He dates at twelve last night—he signifies
That when it reaches him he'll be no more;
To each dear little one—all orphans then—
He leaves such tender messages of love—
But I must halt, else sure my mother's weakness
Will blind me."

We have not yet developed a new dramatic school.

Boudoir Ballads. By J. Ashby Sterry. (Chatto and Windus.) *Vers de société* must be very good to be tolerable; there should be no allowance for anything second-rate. They should always show that there is a reserve of real poetic power, which might issue in more serious work, even if the lighter fancies only of the writer are given to the

world. The author of "Say, cruel Iris, pretty rake," wrote also "The Deserted Village," and no one can fail to see that a vein of true poetry underlies the graceful trifles of Mr. Locker and Mr. Calverley. But we fail to find any such promise of deeper and truer music in Mr. Sterry, and what he gives us is mere jingle and tinkle. It is fair to say that "The Key Note" bids us expect no more.

"I'd pen a fancy for a flirt,
And rhyme on Beauty's bills,
Or write a sonnet on her skirt
As Laureate of Frills."

Imagination, and other Poems. By the Right Honourable William James Cotton, M.P., Lord Mayor 1875-6. (Chapman and Hall.) Like Mr. Gladstone and Lord Beaconsfield, the late Lord Mayor solaces his leisure hours with literature. We gather that the poems in the present book, which is dedicated to Mr. Carlyle, have already appeared in previous volumes dedicated to Mr. Dickens and Lord Lytton. Mr. Alderman Cotton is good enough to reprint these, which are indeed remarkable specimens of their kind of composition. Mr. Carlyle is understood to set no very high value on verse, nor does there seem any special reason why any of these poems should have been inscribed to Lord Lytton; but the dedication to Mr. Dickens is now seen to have a special fitness. It runs thus:—

"To
Charles Dickens, Esq.,
who,
although surrounded by Labours
that must pre-eminently occupy his mind,
read
with the promptness of a friend the work of a
stranger
and
honored it with his name,
this Poem is respectfully inscribed
by
THE AUTHOR."

Mr. Dickens could better than any one else judge of the excellence of this kind of composition, since he has recorded for us a most exquisite example of it—the monumental inscription drawn up by Mr. Sapsea, himself a mayor, to the memory of his wife, Ethelinda. Our admiration for the verse hardly equals that which we feel for the prose. It is, however, interesting to find that after a long year of turtle-soup, of the splendours of the Mansion House, of the roar of Cheapside and the Poultry, a Lord Mayor's soul still turns to more idyllic pleasures:—

"To see white clouds o'er heaven flying,
To hear the joyful trill of birds
With the maid who loves us sighing
Responsive to our loving words:
To feel the soul then blissful die
To worldly cares—is luxury."

What can be more touching than this revelation of the inner life of a City magnate?

The Monody of Temple Bar. By Charles Baker Strutt. (Curtice.) If the present Lord Mayor has not himself the divine gift of poesy, he would do well to make Mr. Strutt his laureate, who sings the fame of Temple Bar in strains worthy of Alderman Cotton. He writes many stanzas, of which but two need be quoted. Temple Bar is speaking:—

"When Nelson's bones and Wellington's were laid
With solemn pomp 'neath yon Cathedral dome,
Sombre I stood in sable garb arrayed,
And bowed above them passing to their tomb."

But if it had bowed once it would scarcely have recovered itself, and there would have been no need of the following fine lines:—

"Now rid me from the road that roars for room
And murmuring tolerates my longer stay,
Dilapidate me, hasten on my doom,
And to oblivion bear my dust away."

There is good sense here at any rate.

The Golden Lute and Other Poems. By R. Whieldon Baddeley. (Geo. Bell and Sons.) The author of these poems is no longer in the world to listen to the strictures of his critics; so we will only say that we think that his brother, who is responsible for their publication, has committed an error in judgment.

Laurella and Other Poems. By John Todhunter. (Henry S. King and Co.) These poems are reprinted, so the Preface tells us, from various magazines. They are worth collecting, and show very considerable powers of verse, and thought and culture, together with careful workmanship. The longest poem, which gives its name to the volume, is put into metre from a tale by Paul Heyse. It is pretty and well turned, but, though Mr. Todhunter can claim the Laureate's treatment of the *Morte d'Arthur* for this metrical version of already existing prose, we incline to think it not a good plan. To take a story known generally, and without elaborate detail, is of course always allowable, indeed necessary, for all but the highest creative minds—sometimes for them also—but this is quite different to the close following of a prose tale which we have here, and in Mr. Tennyson's *Dora*. We like the original poems the best. Many of them are on, or connected with, music, and show a deep love for that art, and no slight knowledge of the scientific side of it. We can find room only for two stanzas, describing the persistence of a violin-theme amid the variations of an *improvisatore*.

"But ever above the rushing
And agony of the strings
There soared a strain like the rainbow
That over a torrent springs—
A strain like that transient iris
Which gleams and again grows pale,
But wavers not from its poisoning,
However the hues may fail."

At first it was but a yearning
Half-lost in the fierce unrest,
Returning and still returning
Unshattered and unrepent—
So pure, so ghostly, so tender,
So fraught with delicious tears,
So full of unearthly splendour,
'Twill live in our dying ears;
Returning and still returning,
Was ever a strain like this
For sadness of infinite yearning,
For fervour of infinite bliss?"

Sonnets and other Poems, by the Hon. Mrs. O. N. Knox. (Smith, Elder and Co.) Mrs. Knox is more than justified in publishing this graceful little volume, though, judging by a severe poetic standard, it must be said that the thought of the poems is in all cases superior to the form in which it is presented. The following will win cordial acceptance from many who will at once divine to whom it must be addressed:—

"Master, how look the four-score years to thee?
Dost thou regard them with a kind disdain,
As noble natures use? Ah! yet remain
Childhood's pure joys, a sacred memory;
Love given and love received: then for Eternity.
But further—ah! we know not, since that life,
For us a victory, was for thee a strife.
Yet though thy soul retain its mystery,
Thine outer life becomes our legacy,
We bless the fight heroic, well-nigh done;
We know that many in thy winning won.
In noble lives thy words writ large we see,
O noblest!—Blessings gather far and wide
To fall like dew upon thine eventide."

When we say that added to the above there is a melodious threnody on Cromwell, and some lines on Mazzini, in the same spirit as Mrs. Hamilton King's fine Introduction to *The Disciples*, our readers will understand Mrs. Knox's standpoint. Her poems are always interesting; but in the mechanism of her art are manifest imperfections.

NOTES AND NEWS.

AN official report of the National Conference on the Eastern Question has just been published for the committee by Messrs. Clarke, of Fleet Street. The pamphlet—which extends to 136 pages—contains, besides the speeches of December 8, an appendix of reprints of letters by Mr. Carlyle, Sir William Harcourt, and the Duke of Argyll.

WE understand that the next volume of Messrs. Trübner's numismatic enterprise—the *Numismata Orientalia*—is to be an essay on the coinage of Lydia and Persia from the earliest times to the fall of the Achaemenidae, by Barclay V. Head, Assistant-Keeper in the Department of Coins, British Museum. Mr. Head is justly renowned for his *History of the Coinage of Syracuse*, a work remarkable not only for its scholarship and thoroughness, which procured it the honour of being *couronné* by the Institute of France, but also for having positively run out of print in a year, an occurrence, we believe, entirely unprecedented in the history of numismatic bibliography.

MR. REGINALD STUART POOLE, Keeper of Coins in the British Museum, has been elected a correspondent of the Institute of France (Académie des Inscriptions et Belles-Lettres), in the place of the late Mr. E. W. Lane.

THE contents of Vol. VII. of the *Records of the Past* (they are principally translations from the Assyrian) are of rather unequal value. M. Oppert's corrected translation of the Annals of Sargon, his version of the Median text of the Behistun inscription, and Mr. Sayce's curious "Babylonian Saints' Calendar," are proofs of scholarship and ingenuity equal to any in the preceding volumes. Some at least of the remaining translations should, we think, have been omitted or corrected, particularly some of Mr. Fox Talbot's, who, with all his learning, is thoroughly unscientific, and whose work is therefore very misleading to the ordinary reader. All the translators seem to us to betray an undue dogmatism in dealing with the primitive legends. Do the fragments translated by Mr. Boscawen (pp. 129-132) justify the title "The Legend of the Tower of Babel"? Is there any Semitic language in which "counsel" = speech? Is there any force in the reference on line eight to Genesis xi. 7? Surely the "mingling" or "confounding" is an after-thought in Genesis, and can hardly have belonged to the original story. On the whole, the *Records* appear to us to require much more careful editing. Is it desired to produce a series as extensive as the Waverley Novels? If so, the editor is on the right road. But we fear that the contents of the series will soon pall on the taste of the public, as they are already palling on the taste of some critical scholars. Nor is it only a careful examination of the philological character of the contributions that seems to be necessary. The short prefatory notes are not always free from error. The ablest scholars are liable to the weaknesses of humanity, and we have noticed one not very creditable and (in this volume) most singular attempt on the part of a veteran French Assyriologue to disparage the merits of a young and talented English colleague and fellow-contributor. Let M. Oppert criticise Mr. Sayce as severely as he pleases—there is ample scope for it in the works of so rapid a writer—but let not the editor allow him to make such a misstatement as that relative to his translation of Assyrian deeds on page 111.

THE *Revue Critique* for December 9 contains an interesting article on Dr. Land's *Hebrew Grammar*. The points which it chiefly commends are the phonetic theory, and the view of the nominal as preceding the verbal forms. The theory that Hebrew (like Arabic, as represented by the grammarians) had originally but three vowels, is rejected as highly improbable.

A LEARNED and acute reviewer in the *Göttingen Gelehrten Anzeigen* severely handles the inferences so freely drawn by Assyriologues as to the connexion and origin of the early narratives of Genesis. The article (signed "A. D.") does not, however, advance the subject. We knew before that the Biblical narratives could be explained in a way without reference to a foreign religious or mythological system, but no one who has carefully studied Assyrian researches can doubt that there is a real historical connexion between the two. A. D. revives (without acknowledgment) Mr. G. Smith's remark as to the important results which might accrue from the discovery of Aramaic myths. But we do not see how this is likely to disprove the connexion of Babylonian and Israelite stories.

FOR a freshly written survey of the wide field of comparative philology we may recommend Mr. Sayce's introductory professional lecture *On the Study of Comparative Philology*, delivered at Oxford last November (Oxford and London: James Parker and Co.). Beginners will hardly notice the characteristic faults of incomplete statement and dogmatic assertion which to older students mar the pleasure of Mr. Sayce's brilliant and incisive writings. The chief merit of the lecture for general readers is its comprehensiveness, and for its Oxford audience its emphatic demand of a more general cultivation of Sanskrit. The account of Semitic philology will hardly satisfy some critics.

HERR SEINECKE, well known by suggestive works on Job and the Second Isaiah, offers us the first volume of a *History of the People of Israel* (Göttingen: Vandenhoeck and Ruprecht). It is, however, no history at all, but a summary of the Old Testament narratives, with a running criticism on their contents. His fundamental principle is that legends are *only* a reflection of later history; he has no eye for the other elements of legendary stories, mythology, and pure imagination.

DR. J. BARTH'S *Contributions to the Explanation of the Book of Job* (Leipzig: Hinrichs) will be useful to advanced students, though the author is too much under the influence of a purely German critical tradition. In his exegesis of some selected difficult passages he seems more independent.

A MORE important work is the translation and commentary on Job by Dr. J. C. Matthes, a second, much enlarged, edition of which has begun to appear (Groningen: Wolters). It is tantalising that the author reserves his Introduction till the conclusion of the commentary. The first fasciculus takes us down to iii. 19. Every modern critic of importance is cited, and, where necessary, criticised. English works are not neglected, but we must demur to the selection. Canon Cook and Sir W. Martin are not generally regarded with much deference in England. The author's scholarship is competent, and his judgment evidently mature. It is to be hoped that he may meet with sufficient encouragement to go on. Those of our readers who understand Dutch should not omit to order the book; the continuation depends on the number of subscribers.

STUDENTS of the topography of Jerusalem may be grateful to Mr. J. B. McGrigor, who has compiled an index of passages bearing upon this subject from writings prior to the eleventh century. Though printed for private circulation only, it will, we presume, be accessible in our chief public libraries. The compiler aims at, but does not pretend to have reached, completeness.

MR. FREEMAN has accustomed us to look at the construction of a building as a key to unlock the memories which surround it. Mr. Baillie Cochran is content, in his *Historic Châteaux* (Hurst and Blackett), to peg on things which he happens to remember to three buildings with which they have been connected. The result is that the buildings are dragged in for the sake of the stories, which are not handled in such a way as to make us forget the unsatisfactory nature of the device with which they are introduced.

ON Tuesday week Messrs. Sotheby, Wilkinson, and Hodge sold a copy of Earl Russell's edition of Moore's *Memoirs, Journal, and Correspondence*, eight volumes interleaved in fourteen, illustrated with numerous portraits and plates, and containing about seven hundred autograph letters of contemporary authors, artists, poets, statesmen, &c., with whom Moore was intimate, for 23*l.* Among some manuscripts sold on the same day were:—*Horae Beatae Mariae Virginis*, fifteenth century, 12*l.*; another, beautifully illuminated, probably for one of the royal family of France, 13*l.* 10*s.*; *Regola di San Benedetto*, sixteenth century, executed for the Monastery of St. Lorenzo at Venice, 5*l.* 2*s.* 6*d.*; *Officium Beatae Mariae Virginis*, fifteenth century, 6*l.* 17*s.* 6*d.*; another, 6*l.* 10*s.*; *Registrum Brevium*, tempore Edward II., fourteenth century, 2*l.* 4*s.* A collection of Humorous Sketches by Crowquill, with etchings from his designs by George Cruikshank, sold for 9*l.*; three volumes of Political Pamphlets by Hone, Dolby, &c., with woodcuts by Cruikshank, 2*l.* 18*s.*; a collection of etchings and woodcuts, in two volumes, by Cruikshank, 5*l.* 2*s.* 6*d.* The last lot offered at this day's sale was a fine engraving of *David playing before Saul*, by Lucas van Leyden, which fetched 11*l.*

ON Monday week Messrs. Sotheby, Wilkinson, and Hodge sold a collection of choice classical music, from the library of Mr. Thomas Pickering, of Royston. A slightly imperfect copy of Bassani's (Gio. de Ferrara) *Salmi*, for voices and instruments, Op. X., published at Venice in 1697, fetched 2*l.* 6*s.*; a set of Bishop's Glees, Trios, &c., 2*l.* 17*s.* 6*d.*; Handel Society Publications, 1843-58, 5*l.* 5*s.*; Hawkins's *General History of Music*, 1776, 3*l.* 15*s.*; L. Lossii *Psalmodia, hoc est, Cantica Sacra Veteris Ecclesiae Selecta*, Noribergae, 1553, 3*l.* 10*s.*; Musical Antiquarian Society's Publications 1841-47, 5*l.* The few autographs offered were of small value; about the highest price given was 11*s.* for a letter of Samuel Wesley to Novello with some MS. music, &c.

THE first number of a new literary, scientific, and archaeological journal, entitled *La Academia*, is announced to appear at Madrid, January 7, 1877. The editor is Señor F. M. Tubino, the secretary of the Anthropological Society of Madrid. The staff of contributors includes the well-known names of Valera, Amador de los Rios, Madrazo, Vilanova, Arnao, Dios de la Rada, Cayetano Rossell, A. Pascual, Federico Rubio, &c., &c. The journal will also contain literary and scientific correspondence from the chief European centres, those of Spanish America, and from the Spanish colonies. We give a cordial welcome to our namesake. The London agent is Mr. Quaritch, of Piccadilly.

THE *Revue des Deux Mondes* for December 1 contains another instalment of M. Renan's Recollections. He tells us that it was only late in life that he began to return to the thought of his past; he was too occupied at first with the struggle between his training and his intellect, afterwards with the surprises of a world which he found morally far inferior to the seminary, and then with the growing eagerness for literary enterprise. It was when he saw Athens in 1865 that he was tempted to look back. He gives us a long prayer to Athene, which he composed on the Acropolis, which turns upon the difficulties a modern finds in apprehending or resting in pure classical perfection. The rest of the paper is taken up with an explanation of all that there was in his surroundings to make him a "Romantic protesting against Romanticism, a Utopian preaching slow-and-sure in politics, an idealist giving himself much useless trouble to appear a *bourgeois*." He was brought up in a family and in a country where it was believed that everybody who grew rich grew rich at the expense of the public, and where the one rich man known had made his fortune in the slave-trade. There are some interesting particulars about his Legitimist grandmother, and his father and mother,

who in different ways sympathised with the Revolution; also about an old Jacobin known as Bonhomme Système, who kept to the last the bouquet he had worn at the Feast of the Supreme Being; and a certain Noemi, with whom M. Renan was as nearly in love as one can be at thirteen, and who died of sorrow because, do what she would, her beauty exposed her to attentions which she could not bear. We should have been glad to hear more of the semi-pagan legends of Breton saints which influenced the writer's childhood, but perhaps he did not wish to mar the interest of the work which he tells us M. Luzel is contemplating on that subject. M. Othenin d'Haussonville gives an account which is by no means reassuring of the hospitals for sick children at Paris. M. Emile Montégut characterises MM. Gustav Droz, André Theuriot and Alphonse Daudet as the most important new novelists. He regards the present state of the art in France and its immediate prospects as unpromising, and compares the literature of the day with that of the age of Henry IV. and Louis XIII., when there was nothing that could be called a school or general tendency, and a number of second-rate authors each developed their respective specialities. There are some good remarks *apropos* of Droz on the irresponsibility of the rich in a democratic society, and the writer points out that Daudet in his two latest books passes sentence on Bohemianism, as Flaubert in *Mme. Bovary* passed sentence on Romanticism.

MR. ADOLPHUS ROSENBERG announces, under the title of *Eminent Jews of the Time*, the intended issue of a series of biographical sketches, embellished with portraits, of the more prominent members of the Anglo-Jewish community. The work will be issued monthly.

THE following Parliamentary Papers have lately been published:—Reports of H.M. Secretaries of Embassy and Legation on Manufactures, Commerce, &c., Part IV. (price 1s. 1d.); Summary of the Returns of Owners of Land in Ireland (price 3d.); General Digest of Endowed Charities in the County of Caernarvon (price 3d.); Numerical List, and Index to the Sessional Printed Papers, 1875 (price 2s. 8d.); Reports from H.M. Consuls on Manufactures, Commerce, &c., Part VI. (price 1s. 10d.); Accounts relating to Trade and Navigation for November (price 4d.); Statistical Report on the Health of the Navy for 1875 (price 5s. 2d.); Return of Civil and Criminal Cases tried in the Consular Courts in the Ottoman Dominions, 1856-75 (price 2½d.); Further Correspondence relating to the Complaints of the Mercantile Community in Hong Kong against the Action of certain Revenue Cruisers (price 6d.); Returns of Local Taxation in Ireland for 1875 (price 5d.); General Report by Captain Tyler on the Share and Loan Capital, Passenger Traffic, &c., Working Expenditure of the Railway Companies of the United Kingdom for 1875 (price 6d.); Fourteenth Report of Inspector of Reformatory and Industrial Schools of Ireland (price 10d.); Thirty-first Annual Report on Relief of the Poor and Public Health in Scotland, 1875-76 (price 2s. 8d.); Index to Report of Committee on Post Office Telegraph Department (price 8d.); Return of the Number of Lay Vicars or Clerks in each Cathedral or Collegiate Church (price 2d.); General Digest of Endowed Charities for the County of Flint (price 3d.); An Abstract of Income and Expenditure of Turnpike Trusts in England and Wales (price 10d.).

WE have received, from Messrs. Bickers, Southery's *Life of Nelson*, with twelve illustrations by Westall, printed in Woodbury type, an admirable edition of an admirable book; and from the same publishers a second edition of White's *Selborne*, as revised and annotated by Mr. J. E. Harting, including ten recently-discovered letters from Gilbert White to Robert Marsham, with the corresponding replies; *Fifty "Bob" Ballads*, by W. S. Gilbert (Routledge), a selection from *Bab*

Ballads and *More Bab Ballads*, from which all that showed "evidence of carelessness or undue haste" to the author's thinking have been weeded out; *The Harbours of England*, engraved by Thomas Lupton from original drawings by J. M. W. Turner, with illustrative text by John Ruskin, new edition (Smith, Elder and Co.); new editions of *Robinson Crusoe* and the *Vicar of Wakefield*, and of Stephens' *Notes of Travel in Egypt and Nubia* (Marcus Ward).

THE LATE MR. JOSEPH BURTT.

MR. BURTT, whose death we mentioned in our last week's issue, had the advantage of being brought into contact at an early age with antiquaries and men of letters, and this circumstance helped to develop in him those archaeological tastes which he afterwards cultivated with so much ardour. He commenced his official career at the Chapter House, Westminster, under Sir Francis Palgrave. He there made himself acquainted with the various classes of ancient documents deposited in that once dilapidated receptacle for some of the most valuable of our public muniments—among them the "Domesday Book." For many years he continued to be engaged in making a repertory or "Calendar of Contents of Presses," as it was called, chiefly useful for official purposes. He was subsequently employed in making a calendar of the proceedings of the Court of Requests, and under his direction was carried out a work much needed—that of sorting, and to some extent arranging, a vast mass of documents, being the proceedings of the ancient Court of Wards and Liveries, the Court of Requests and the Court of Star Chamber—parchments and papers—which, by some unaccountable means, had been mixed up indiscriminately, stowed away by the waggon-load, and covered with dust in the dark recesses of the Chapter House—*rudis indigestaque moles*. After the removal of the Chapter House collection to the new repository, Mr. Burtt continued to be engaged for some years, among other duties, in examining and certifying office copies, and afterwards in making a calendar of the Durham records.

But it was outside the office chiefly that Mr. Burtt succeeded in establishing and extending his reputation as a record scholar, an archaeologist and an antiquary, in connexion with the Archaeological Institute, of which he was for several years the honorary secretary. His labours were incessant, in season and out of season, and it may safely be said of him that had his zeal been somewhat less, and his discretion in regard to his own health and his private interests been somewhat greater, he might have had sufficient physical stamina and sufficient vital energy held in reserve to enable him to withstand the shock before which he had to succumb. It was often jocularly said of him that he was "an excellent showman," for he had the rare gift of explaining whatever he knew in an easy, colloquial, and pleasant manner, without any pretensions to philosophical depth or profound erudition. It has already been suggested by a contemporary that a selection from the "papers" and correspondence of Mr. Burtt should be published; and should this be done, it may be hoped that the result will not be without advantage to the widow and family of an antiquary and archaeologist of no mean repute, who have unfortunately been left with a very modest provision.

NOTES OF TRAVEL.

MR. R. S. CLOUGH has recently returned to this country after three years spent, in company with Mr. Jacob Reszyk, in pioneering work among the savage tribes on the banks of the Amazon and its numerous tributaries.

THE *Brazil and River Plate Mail* states that Moreno, the distinguished Argentine explorer, has again proceeded to Patagonia, with the view of examining the Santa Cruz and Cis-Andine terri-

tory of Mazzanas, partially traversed by Captain Musters. He expects to return to Buenos Ayres by next July.

MR. R. STERNDALE, of Her Majesty's Indian Service, has, we are informed, a work in the press on the topography and natural history of a district in Central India.

THE new monthly geographical magazine which is to make its appearance in Paris next week under the editorship of M. Ludovic Drapeyron will be styled *Revue de Géographie*, instead of *Revue Géographique*, as originally announced.

WE hear that Captain C. B. Norman, of the Bengal Staff Corps, has been for some time engaged upon a large scale-map of Central Asia, which will be in part based upon the well-known map which was published in St. Petersburg about three years ago.

WE understand that Dr. d'Usson Mora intends to proceed shortly on an expedition of scientific exploration in the district of Cabinda (otherwise called Kabenda), which lies to the north of the river Congo, or Zaire, between the Falls and the coast, and is the most northern of the Portuguese possessions on the West Coast of Africa.

GEOGRAPHICAL Societies are multiplying apace on the Continent. To say nothing of national committees which are being formed in different countries in connexion with the Geographical Conference lately held at Brussels, geographical societies have been established during the year 1876 at Madrid, Lisbon, Marseilles, Antwerp, Bucharest, and, last of all, as we mentioned recently, at Copenhagen.

WE hear that the Italian Geographical Society has received very interesting letters from the Marchese Antinori, giving an account of the successful completion of the first portion of his explorations in Equatorial Africa. After the return to Europe of Captain Martini for fresh instruments, &c., he left the plain of Tuli-Harré, on August 1, with one European companion, Signor Chiarini, and, after a most toilsome and dangerous journey, succeeded in reaching Liccè, the capital of Shoah, on October 7, where he was hospitably received by King Menelik. Since his arrival at Liccè, the Marchese Antinori has been engaged in drawing up a scientific Report of the results of his journey so far—a Report which, coming from such a source, will doubtless furnish details of the greatest interest.

SWISS NOTES.

IN the Eighth Annual Report of the Swiss Gymnasiallehrer-Verein, which has just appeared, Prof. H. Wirz, of Zürich, publishes a statistical notice of the present condition of the higher schools of Switzerland. There are eighteen Gymnasiums in the German cantons, or nineteen with the Real-gymnasium of the City of Zürich. There is a considerable difference between them in the period of time required for completing the prescribed course of study. Basel alone follows the example of the Prussian and Bavarian Gymnasiums, and requires nine years. Bern, Burgdorf, Einsiedeln, Schaffhausen, and Luzern demand eight years. St. Gallen, Maria-Hilf (in Schwyz), and Solothurn, seven years; Zürich, Chur, Frauenfeld, and Winterthur, six and a half years; while Aarau, Altorf, Engelberg, Sarnen, and Zug are content with six years. These latter institutions, it should be said, dispense with the philosophical course (*Lyceal-Kurs*). Prof. Wirz gives a comparative view of the subjects which are taught at all these institutions. Religious teaching is still the aim in all, but since the passing of the new Constitution of the Confederacy, attendance at this instruction is declared to be voluntary in Basel, Bern, Aarau, and Zürich. In most cases the "Real-schüler" and "Gymnasial-schüler" are not separated for the study of religious doctrine, mathematics, French, and the two usually non-

obligatory languages—English and Italian—but learn in common. In Solothurn alone is Italian obligatory, and English only in Schaffhausen. French is obligatory in all except Einsiedeln, Schwyz, Engelberg, Sarnen, and Altorf—that is to say, in the three “streng-katholisch” primitive cantons. Philosophy is the branch about which there is the least accord: only nine institutions adopt it: no report is given of the particular discipline which is taught in each institution under the cover of this very wide title. The average number of hours spent each week in philosophical study ranges from one and a half to fourteen. The average weekly time spent upon the German language stands at four to five; in the higher courses the student spends only two hours weekly on it; Grammar and “Stylistik,” and Old and Middle High German are not yet introduced into seven of the Gymnasiums. Latin absorbs the greatest proportion of the week in all. The Prussian Gymnasiums place the number of hours for Latin at eighty-six, the Bavarian Real-gymnasiums at ninety-six weekly. In the Swiss Institutions the number ranges downwards from sixty-seven to thirty-six, the former being the use of Basel, the latter that of Zug. Greek study in Prussia claims forty-two “Stunden,” and one must not forget that the instruction lasts for a period of nine years. In Switzerland Greek occupies from thirty-eight to eighteen hours; it is only obligatory in the Cantonal schools of Bern, in St. Gallen, Frauenfeld, Einsiedeln, Schwyz, Engelberg, and Altorf. In the other institutions, in which Greek is offered as an alternative, some modern language is now usually demanded in its place. Mathematics, including geometry, ranges from thirty-six to eighteen, the former in Burgdorf, the latter in Altorf. Natural Science (Physics, Chemistry, and Natural History are specially named) is taught everywhere except in Engelberg and Altorf. The number of hours varies here more than in any other subject, and Prof. Wirz gives us no comparative numbers in this branch. The paper contains details upon subsidiary branches of gymnasial instruction—writing, drawing, singing, shorthand, and athletics.

SCARCELY any part of Switzerland is so little known to the rest of the Confederation as the Bernese Jura. Until its union with Bern this splendid stretch of country was titularly a part of the Empire, subject to the Bishops of Basel, who, after their expulsion from the cathedral city in consequence of the Reformation, resided at Pruntrut, or Porrentruy, from which they took the title of Prince. The Bernese Jura has thus led a separate life and had a history of its own, of which even the Swiss historians only take cursory notice. Since the union with Bern the process of assimilation has gone forward slowly but surely, and the Société Jurassienne d'Emulation, which held its annual congress in Pruntrut on September 7, is doing its utmost to quicken the historical sense in the inhabitants. The dwellers in the valleys of the Jura are not readers or book-buyers, and patriotic scholars work under great disadvantages. Delegates from French literary societies crossed the border to take part in the proceedings. Dr. Thiesing, the president, read papers upon “The Conditions of Life of the Earliest Inhabitants of the Jura,” and “The Beginning of Civilisation in the Jura,” and it was resolved to print these and circulate them at a low price. The society has also instituted a monthly organ of thirty-two pages under the title of *L'Emulation Jurassienne*. The incorporation with the Canton of Bern, however fortunate for the old principality of the Bishops of Basel politically and economically, is not without disadvantages in the sphere of historical and antiquarian enquiry. As its common interests with the rest of Switzerland increase, and its trade becomes more prosperous and absorbs its inhabitants, there is a fear that its own interesting past will slide into forgetfulness. Indeed, scholars of other cantons, such as Prof. Vogt and the members of the Antiquarische

Gesellschaft of Zürich, are probably more anxious to prevent the Jura from this fate than the Jurassians themselves. A few months ago, Prof. Vogt gave a sketch of Pierre Pequignat, “the Tell of the Jura” (the leader of the peasant uprising at Ajoie in the year 1740), in which he called the attention of historical scholars to the unwearied and unrewarded labours of M. Quiquerez in the province of Jura history. M. Quiquerez is just about to publish a work upon which he has been engaged for the last ten years. It will bear the title, *Histoire des Institutions politiques, constitutionnelles et juridiques de l'Evêché de Bâle, des Villes et des Seigneuries de cet Etat*. The aged author has worked under great disadvantages: he has had none of those helps from predecessors in the same field which stand at the service of most historians, no well-preserved and well-arranged archives, and he could look for little other reward than the consciousness of having served his native land and historical science. The book will consist of about 600 pages, and in order to tempt the Jurassians to purchase it the price is fixed at five francs.

It is the custom of the “Antiquarische Gesellschaft” of Zürich to undertake two excursions during the year with specific archaeological aims. The members and friends have recently made one such visit to the village of Unterlunkhofen on the Reuss, in the Canton of Aargau. In the woods belonging to this commune there are about forty well-known “Celtic burial-mounds” of varying heights. In the year 1865 certain societies and private persons undertook the examination of single mounds in the interests of prehistorical science. The “find” has usually consisted in a number of potsherds of different sizes, black and brown in colour, of coarse workmanship, formed by the bare hand, evidently fragments of plates; upon some of these lay burnt bones heaped up in layers to a considerable height. These plates were ornamented with geometrical figures scratched into the surface, the indentations being then filled in with chalk. The “Antiquarische Gesellschaft” selected the smallest of the hillocks, one surrounded with a ring of stones, and appearing but a very small height above the ground. They found in this grave neither potsherds nor ashes; but in the middle of the hillock they came upon a fallen-in arch, beneath which they found the bones of a “cremated” man, five pots of different sizes, and a small drinking-cup. They discovered no traces of bronze or iron.

An official report on the Production and Consumption of Timber in Switzerland, lately published, quotes some striking facts from a recent work of Professor Landolt referring to the evils resulting from the disafforestation of the slopes overhanging fertile valleys. As late as 1812, Conrad Escher, in describing the Val Maggia, in the Canton of Ticino, from the village of Someo downwards, observes that the valley is richly cultivated and adorned with chestnut trees, extending almost to the foot of the mountain, which is itself everywhere clad with vegetation; two-thirds of the surface of that beautiful valley are now covered with masses of fallen earth and stone, the river carries away the stoutest bridges, while the overhanging heights are entirely stripped of trees. As an instance of the effect of the clearance of forests upon climate, Professor Landolt refers to the Upper Engadine, where the slopes are still wooded, and where the temperature is milder and more equable than in the denuded valleys of Avers, Hinterrhein, Urseren, &c., which lie 1,000 feet lower. Some valleys, indeed, have become quite uninhabitable through the destruction of the forests, and the consequent disturbances of the temperature, as, for instance, the Kalfenserthal. The water supply, too, is largely affected. Wherever the woods have been destroyed, the character of the water basins has been transformed almost within the experience of a single generation. Navigable rivers have become shallow streams,

brooks have been changed into torrents during one part of the year, and stony tracts during the remainder; while lakes have been converted into pestilential swamps, and fertile plains into arid deserts.

THE Winter-Semester of the Zürich Polytechnicum and University opened less favourably than in former years. In both institutions there is a noticeable decrease of members. The Polytechnicum is affected by the critical state of affairs in the East, which fully accounts for the non-appearance of the customary winter-incursion of young Roumanians, Greeks, and Serbs into Zürich. The fall of numbers in the University is not so readily accounted for; it occurs most conspicuously in the theological and medical faculties. Zürich has lost within the last few weeks the Nestor of her scholars, the venerable Dr. Franz Dorotheus Gerlach. He was born in the year 1793 at Wolfsbühlingen in Gotha, and educated at the Gymnasium of Gotha and the University of Göttingen. He devoted himself to philology while at the Gymnasium, at first in combination with theology and philosophy, but on entering the university gave himself exclusively to philological studies. In 1817 he accepted a call to the Kantonsschule of Aarau, where he worked in harmony with Cortim for some years. In 1820 he was named Professor of Greek and Latin literature in the regenerated University of Basel. He took a zealous and active part in the restoration of the university, and induced many able German scholars to give their services to it. The university sent him upon a literary journey into England, France, and Italy. After his naturalisation in Switzerland, he gave much time to the study of Swiss history, and in company with Hottinger and Wackernagel founded the “Schweizerische Museum für historische Wissenschaften.” Among his philological-critical works may be named his editions of Sallust and the *Germania* of Tacitus, with commentaries. To his specific Roman studies belong the *Marius and Sulla* and *De rerum Romanarum primordiis*, which have passed through two editions, and the *Vorgeschichte, Gründung und Entwicklung des röm. Staats*. The *Grenzpost* of Basel contains a detailed necrology of Prof. Gerlach.

THE new number of *Die Reform*, the serial of which the late Heinrich Lang was co-editor, and which has been adopted as the organ of the active Swiss “Verein für freies Christenthum,” contains an appeal to the “ganze evangelische Volk” for contributions to the “Lang-Stiftung.” The memorial to Lang has taken the form of an endowment for the support of students of theology in the Swiss Church. The committee have resolved that it shall extend to the French-speaking as well as the German-speaking cantons, and that no doctrinal test shall be subscribed by the candidates. Applicants are not bound to hold Lang's opinions, but it is to be equally open to orthodox and to rationalist students, the committee merely taking precautions that it shall be expended only upon young men of undoubted intellectual power and good morals.

DESPATCHES IN THE ARCHIVES OF VENICE.

AMONG the transcripts collected in the Archives of Venice by Mr. Rawdon Brown are despatches to the Doge and Senate by Orazio Lavezzari, “Secretary-Resident” in England during the turmoils of the French Revolution, which are of great value in exhibiting the various feelings and opinions which distracted the nation during that momentous period. The volumes containing this original correspondence, it is worth while to notice, were carried away and preserved at Vienna for many years; but the Austrian Government restored them to Venice in 1868. As a specimen of these despatches we append a translation of the one describing the reception of the French *émigrés* in this country:—

“The King and the Royal family still continue their sojourn in the neighbourhood of Weymouth,

and will not return to Windsor for some three months to come, when the usual weekly Court circles will begin again.

"The awkward and involved look of political affairs has at last called for the attention of this government, in such a manner that very likely the meeting of Parliament, hitherto expected in December, will take place at the end of next month. A thousand subjects of the most delicate nature must of necessity occupy the Cabinet Councils, and one of the most interesting of these is the immense number of French immigrants who inundate the capital and the provinces of Great Britain.

"Since the tragedies of August 10 and September 1 it may be said that upwards of 40,000 of these unhappy natives have arrived from the sea-ports and neighbouring parts of France, and among them some thousands of ecclesiastics, who, fleeing from death, had hidden themselves in the woods near to a place of embarkation until the moment—whether at night or when otherwise unobserved—that they could get on board some kind of boat, however lightly built, choosing rather the perils of the sea than a longer stay in a country where their lives were exposed to almost certain massacre.

"The Cardinal of La Rochefoucauld, the Bishops of Lyons, Rhodes, and Comings, and many other illustrious personages of the ecclesiastical hierarchy, after a thousand dangers are now to be found in London, and even in the least frequented streets one encounters in a crowd, with misery on their faces, the wretched victims saved from the democratic savagery which now governs France.

"The generosity of this nation cannot remain insensible to a spectacle at once so pitiful and interesting. Hence both single families and societies are seen penetrated with the noblest emulation to render timely aid. Houses at the different ports to which the passage across the sea is usually made are set apart for the reception of the immigrants, free of cost; and along all the roads leading to the capital are hostels established to supply them *gratis* with food and lodging. Subscription lists are opened to collect money for the bishops to distribute, and the first families of England vie with one another in dispensing at their country seats the most pleasant and friendly hospitality to the French nobility and clergy.

"But while the claims of humanity are thus duly regarded, some reflections concerning the public safety are not unheeded; for among the immense and daily-increasing number of strangers are seen some figures notoriously attached to the Jacobin party—no slight source of danger to a chief city like London, tending as it does to foment the spirits of malcontents, and in particular those who have urged for a long time the reform in election of members of Parliament.

"Equally deserving of the most serious attention is the almost insufferable height to which the price of the necessities of life has risen during the last few weeks. Should any further advance take place, it will produce disturbances among a people oppressed, as this finds itself, with so many hardships and imposts.

"These dangers, the great confusions which surround France, and the political differences which may at any time rise up and disquiet the rest of Europe are considered most justifiable arguments for demanding a meeting of the British Senate in order to take the most opportune measures, &c.

"London, 18 September, 1792."

THE ARCTIC EXPEDITION.

The Outbreak of Scurvy.

(Second Notice.)

IN the number of the ACADEMY for December 9 we discussed the question of the outbreak of scurvy in the late Arctic Expedition: pointing out that, as regards the sledge travelling-parties, other predisposing causes must be sought for than the absence of lime-juice, because lime-juice was not used as a daily ration by the travelling parties of former expeditions. In the discussion on this subject which has since been continued by some of our contemporaries a very persistent attempt has been made to dispute the facts upon which this argument is based. It is, therefore, desirable that we should now more fully establish the correctness of our premises.

We took as an illustration the expedition of 1850-51, when no lime-juice was used by the sledge parties as a daily ration. In reply to this the *Times*, in a leading article, quoting from the Blue Book presented to Parliament in 1852, alleged that there was an allowance of lime-juice of a quarter of an ounce per day for each man while travelling, and that three of the commanders of sledges referred to lime-juice as a luxury, or as being prized by the men. With reference to the alleged allowance, there is an omission in the Blue Book, which is, however, supplied in Admiral Sherard Osborn's *Stray Leaves from an Arctic Journal*. The allowance per man was not a quarter of an ounce per day, but for ten days—a very different thing. In fact it was only taken as a medicine for use if required, just as it was by Captain Markham in 1876. This is fully corroborated by Admiral Ommanney in a letter to the *Times*, in which he says that lime-juice was not taken as a ration, but merely a small quantity as a medical comfort. As regards the three officers quoted by the *Times*, the first cannot possibly have used lime-juice as a daily ration, even supposing that he had taken a quarter of an ounce per man per day, which was not the case, for he was only provisioned for sixty and was absent eighty days; the second is still alive, and both he and the captain of his sledge affirm that they did not use the lime-juice; the third only commanded a short depot party. The facts, as regards the expedition of 1850-51, are that some sledges took no lime-juice, and others took a few bottles merely as medicine and not as a ration, in most cases the bottles bursting when there was a sudden great fall of temperature a few days after leaving the ships. In this expedition there was no outbreak of scurvy; and thus our premises as regards it are perfectly correct; and the writer in the *Times* has failed to shake them in any material point.

As, however, it is true that lime-juice was mentioned in the scale of diet for travelling parties in 1851, it was thought well to shift the ground of the argument to the cases of the *Resolute* and *Intrepid* in 1853, because, not only was no lime-juice taken on their sledges, but it was not even mentioned in the scale of victualling for their travelling parties; so that, as regards them, there could be no dispute. It was also pointed out that the sledging parties of the *Investigator* took no lime-juice. Meanwhile Commander Herbert, who had been a mate in the *Assistance* during 1852-54, sent a scale of victualling for sledge parties, drawn up by Sir Edward Belcher, to the *Times*, in which the allowance of a quarter of an ounce of lime-juice per man is given. This was, of course, eagerly seized upon as evidence, and produced another leading article, in which, on the strength of Commander Herbert's letter, it was maintained that the travelling parties of 1853 took regular daily rations of lime-juice; while it was argued that those of the *Investigator* must have done so, because the surgeon, Dr. Armstrong, attached much importance to the use of lime-juice on board the ship.

The answer to all this is complete and crushing, though unfortunately the *Times* would not insert the letter containing it. But Admiral Richards, in a letter to that paper, established the fact that lime-juice was not taken by the extended parties from the *Assistance*, while Dr. Scott, the surgeon of the *Intrepid*, gave evidence that no lime-juice was taken on the sledges sent from the *Resolute* and the *Intrepid*, that the travellers went away on the longest journeys ever recorded, and that they returned in better health than the men who had remained on board, and who had taken lime-juice every day. As regards the *Investigator*, the first lieutenant, Admiral Haswell, has assured us that no lime-juice was taken on the sledges.

Thus the attempt to shake the evidence on which our argument was based has completely failed. Lime-juice was never taken as a ration on the sledges of former expeditions; and in the

cases of the *Resolute* and *Intrepid*, for which ships the longest sledge journeys on record were undertaken, there was no lime-juice on the scale of diet, none was taken, and the men returned in perfect health. As the *Times* devoted two leading articles to an attempt to contest the facts on which our argument is based, which entirely failed, it may be presumed that the argument itself cannot easily be answered.

It will be well to repeat it, in a few lines. The daily allowance of lime-juice was issued, with great regularity and in the presence of an officer, on board both the ships of the late Arctic Expedition, every day from the time they left this country until they returned. Scurvy attacked men who had taken it without intermission, and who did not go away with sledges. Consequently the outbreak of scurvy on board was not caused by the want of lime-juice. In former expeditions the sledge travellers, who did not suffer from scurvy, had no lime-juice. Consequently the attack of scurvy experienced by the sledge travellers of 1876 was not owing to the absence of lime-juice.

We have already pointed out the probable causes of the outbreak of scurvy in the late expedition, as arising from conditions never before experienced, and the effects of which could not have been foreseen.

We will now refer to the attack which some of our contemporaries have made on Sir George Nares for not including daily rations of lime-juice in the loads to be dragged by the sledge travellers. The reasons for not doing so are obvious. Captain Nares served in the *Resolute* in 1853, and was one of the sledge travellers. No lime-juice was taken, and the men returned in perfect health. The highest authorities, McClure, McClintock, Richards, Meham, and others, did not consider it necessary to take lime-juice, and their opinions have the concurrence of the able and experienced surgeon of the *Intrepid*. Captain Nares was very properly guided by the experience of former expeditions, and by the opinions of the highest and best authorities. Even if this had not been so it would have been useless to load the sledges of 1876 with bottles of lime-juice. The temperature was never above zero until April 28, and never above freezing until June. Lime-juice in a frozen state alters entirely, and its component parts separate. The whole volume must therefore be melted and mixed again every time it is used. The only means provided for carrying it consisted of bottles or jars. In such a temperature they would have been cracked to pieces on being put near the fire.

If there is any blame it attaches to those who believed that it was essential to take lime-juice as a daily ration on the sledges, and who yet neglected to suggest any means by which it could be carried and used during intense cold, knowing well that the only receptacles provided were jars or bottles.

CORRESPONDENCE.

THE BASQUE ORIGIN OF JESUITISM.

St. Jann de Luz: Dec. 21, 1876.

Mr. Oxenham's review of Cartwright's *Jesuits* in your number of December 16 suggests a question which, as far as I am aware, has never been quite satisfactorily answered. What is the factor in Jesuitism which differentiates it from all other monastic and religious systems? I do not wish to touch on any theological or ethical considerations connected with the history of the Society, but merely to call attention to a possible psychological factor which seems to have been hitherto overlooked. It is this: that Jesuitism is the product of a Basque mind, and is the only point by which Basque thought has come into contact with modern European history. Both Loyola and Xavier were Basques, and Basque names appear in considerable numbers in the early history of the Society. Loyola, it is known, preserved, as far as possible, the dress and habits of a Basque to the end of his life.

Now, is there, as a matter of fact, any mental or psychological peculiarity in the Basque mind which can account for the peculiarities of Jesuitism? I think there is. No one can be long acquainted with the Basques, or with the works of Basque writers, without remarking a peculiar vein of mysticism; a power of representing allegory to the mind as a real fact, and thus allowing the imagination to dominate the will and the whole of the rest of the faculties. The power of allegory is remarked, e.g., by Fr. Michel, *Le Pays Basque*, 226, and note; and is seen in their songs, and especially in the numberless variations in which the allegory is changed yet never confounded. The mysticism is most clearly seen in the fact that scarcely any writer on Basque subjects, even on mere grammar, has wholly escaped it. It may take almost any form, from the republican theosophy of Chahou to that of their last and greatest grammarian, who has chosen as the motto of his most important work, a subject of pure grammar, "In principio erat Verbum." This is, I think, a fact which cannot be denied. Fear of trespassing too much on your space alone prevents me from bringing forward more proofs of it.

Now, what was the personal training of Loyola? What is the theory (psychological) of the "Exercitia Spiritualia"? Is it not in both cases the same; the concentration of the imagination on realising the picture prescribed to it, until it is so vividly realised that the whole mind is dominated by, and absorbed into it? It is contemplated until the will unhesitatingly follows the belief thus branded into it. And from this intense absorption in the idea, which thus becomes the end, the ethical character of the means is overlooked, and becomes of comparatively little account; and may not this complete unconscious subjection of the will to the idea more than any intentional ethical obliquity account for the seeming moral aberrations in the history of Jesuitism?

If there is any truth in the above statements, Jesuitism may be considered as the product, not of an Aryan, but of a non-Aryan mind; and is it not worth while to consider what possible influence this "factor" may have in the unaccountable repugnance which the system has inspired in so many minds of all European nations and of all religious sects?

WENTWORTH WEBSTER.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, Jan. 1, 1877.—5 P.M. Musical Association.
5 P.M. London Institution: "The Analogy of Sound and Light," by Prof. W. F. Barrett.
8.30 P.M. Zoological: "On the Osteology and Visceral Anatomy of the Ruminantia," by Prof. A. H. Gar-

rod; "Descriptions of some new Species of South American Birds," by Messrs. Sclater and Salvin; "On new Species of Warblers in the Collection of the British Museum," by R. B. Sharpe.

TUESDAY, Jan. 2.—3 P.M. Royal Institution: "The Chemistry of Fire," by Prof. J. H. Gladstone.

WEDNESDAY, Jan. 3.—3 P.M. Society of Arts: "The Sun and his Family," by R. A. Proctor.

8 P.M. Microscopical: "On the Relation between the Development, Reproduction, and Surface-Markings of the Diatom," by Dr. G. C. Wallich.

8 P.M. British Archaeological: "Early Churchyard Crosses of Staffordshire," by C. Lynam; "The Megalithic Antiquities at Stanton Drew," by C. W. Dymond.

THURSDAY, Dec. 4.—3 P.M. Royal Institution: "The Chemistry of Fire," by Prof. J. H. Gladstone.

7 P.M. London Institution: "The History of the English Novel," by Prof. H. Morley.

SCIENCE.

Die Nigritier. Eine Anthropologisch-Ethnologische Monographie. Von Dr. Robert Hartmann. Part I. (Berlin, 1876.)

PROF. HARTMANN describes his work as treating principally of the North-East Africans and their neighbours; and, at any rate, this gives a better idea of its contents than is suggested by his title "The Nigritians." This term is not intended to mean the natives of Soudan or Nigritia only, but the author uses it in the general sense of dark-skinned Africans, instead of the term "Negroes," which he objects to. In fact, however, this volume is less occupied with negroes than with the lighter African populations, such as the nations of Abyssinia, Egypt, and Barbary. The discussion of the question, "Who were the ancient Egyptians?" is raised at the outset, and, indeed, this interesting problem seems to be in the author's mind the centre of the whole subject. That the ancient Egyptian race of the monumental period still partially survives in the modern Fellahs is hardly to be disputed. Dr. Hartmann illustrates their closeness of resemblance by the portrait of Rameses II. from Memphis, whose features are almost identical with those of the Fellah placed beside him (Pl. ix.). Thus we have both monumental portraits and living men to use in tracing the origin of the Egyptian race. Dr. Hartmann maintains that the Retu, or ancient Egyptians, were no foreign colony, but genuine Africans, allied not only to the neighbouring Beräbra or Nubians, but to the Berber tribes stretching right across North Africa, such as the Tuariks, and the so-called Kabyls and Moors (pp. 3, 192, &c.). Now, as to the theory of a race-connexion between Egyptians and Nubians, this may be supported by observations made many years ago by Blumenbach, Prichard, and Morton. But Dr. Hartmann goes beyond most ethnologists in allying the Egyptians to the Berber tribes of Algeria and Tunis. He has, however, the opinion of Pruner on his side, thus strongly expressed:—"On the whole, the Berber is in Africa as compared with the Negro and Hottentot what the Finn is in relation to the circumpolar tribes: he is the nearest relative in all respects to the Egyptians, and he constitutes an intermediate form between the Semite and the South African" (p. 264). If this judgment be sound, then the so-called "Turcos" of the French army, so often to be seen in the streets of Paris, and who may stand as typical Berbers, ought to show distinct likeness to the figures of the ancient Egyptians. To the present reviewer, who has seen Berbers at Tangier,

the idea does not seem untenable, but it is far from having been proved even by the excellent set of portraits given by Dr. Hartmann. There is no lack of interest in the question involved, whether an African race with distinct tendencies towards the Negro type produced the earliest high civilisation, built the pyramids, and invented the hieroglyphic writing whence our alphabet appears to be derived. Let us see what other views of the origin of the Egyptians are current. The arguments for their race-connexion with the Aryans, particularly the Hindus, belong to an old-fashioned superficial ethnology in which, regardless of features and language, dark Egyptians building idol-temples and believing in transmigration were unhesitatingly identified with dark Hindus also building idol-temples and believing in transmigration. Writers of more authority maintain the view that the Egyptians were an Asiatic colony, standing to nations of Palestine in some relation like that implied in the Israelite table of nations in Genesis x., where Mizraim and Canaan are set down as brothers. Now, skin and hair, limbs and features, must be accepted as the main clue to race, and there can hardly be a question but that the Assyrian, Jew, or Arab, is decidedly unlike in body to the dominant type of Egyptian, ancient or modern. Looking at philological evidence, however, it is as undeniable that the ancient Egyptian language shows deeplying points of resemblance to the Semitic languages, hardly to be accounted for except as caused by early blending with Syro-Arabian nations. We know of such intercourse or mixture as far back as the Hyksos or Shepherd Kings, and there is no reason why it should not have begun ages earlier. Lastly, Prof. Huxley, comparing the complexion, hair, and features of the Egyptians with those of other peoples, has thrown out the bold suggestion that they are to be classed with the Coolies of India and the Australians (a view which, of course, would not exclude the possibility of connexion of the Egyptians on the other side with the Berbers, or even with the Negroes). One would be curious to have Dr. Hartmann's opinion on this Australioid theory, but he does not seem to be acquainted with it.

Prof. Hartmann is evidently what may be called an "Africanist," apt to look on African people and institutions as native African products, and not readily taking to the idea of their being importations from foreign regions. This tendency must be allowed for in estimating his opinions on the interesting subject of the fair men of North Africa. The blond Libyans were known under the name of Tamhu to the ancient Egyptians, who painted portraits of them which still remain to identify their complexion and features. Anthropologists have generally considered them as representatives of an extremely ancient migration of the white race into Africa, and have reckoned the fair-skinned and yellow-haired families, not uncommon among the Kabyls and Moors, as in general sprung from this ancient stock, though the Vandals and others may also have left descendants showing more or less of the European type. But Dr. Hartmann will have none of this. He protests (p. 264) against going outside Africa for the origin

of this sallow folk, whom both he and Dr. Pruner treat as a xanthous variety of the Berber race, among whom they live.

This leads to another problem. Since the late Henry Christy called attention to the extraordinary abundance of dolmens, cromlechs, and other rude stone monuments in Algeria, the question has been much discussed whether the dolmen-builders, whose monuments may be traced on the map through well-marked districts of Asia and Europe down as far as North Africa, were of one race or nation, and, if so, whence they came. From Dr. Hartmann's African point of view the answer is obvious. He suggests (p. 266) that at the time when Europe and North Africa were still united, hordes of dolmen-building Berbers may have migrated as conquerors across Europe and into Asia. Among effects of African civilisation carried into ancient Europe he claims the introduction of wheat, perfected, if not first cultivated, by the Berber-Egyptian race (p. 120). The cultivation of Egyptian wheat by the Swiss lake-dwellers is evidence in this direction, as is also Dr. Oswald Heer's remark that the mash of roasted and crushed corn eaten by the old Swiss curiously resembled the "gofio" of the Berber natives of the Canary Islands. Another point of comparison is worth notice. Certain objects of stone or terra-cotta belonging to the lake-dwellers, shaped like a crescent moon or a pair of horns set on a central support, suggested fanciful ideas of prehistoric moon-worship to the Swiss archaeologists, until their similarity to the Egyptian pillows or neck-rests of wood or stone was pointed out by Prof. Vogt. To sleep with the neck on such a stand seems miserably uncomfortable to a European, but it is cooler than a pillow, and does not interfere with the artistically dressed hair; its use, Dr. Hartmann tells us (pp. 154, 267), continues, as of old, in Nubia and Soudan.

When the second volume is published, Prof. Hartmann's views on African ethnology will have their full evidence, and will no doubt be discussed with the attention they deserve. It is unfortunate that their effect on the reader should be sometimes marred by faults of manner. Think of a Berlin professor mentioning a Vienna professor's remarks on natural history as "zoological expectorations"—this is how Prof. Hartmann (p. 94) speaks of Prof. Friedrich Müller, the editor of the ethnographic work of the *Novara Expedition*: Prof. Hartmann has himself no patent preservative against mistakes. Thus (p. 216) he argues gravely on the archaeological evidence of the Chinese scent-bottles found in ancient Theban tombs. Had he enquired more carefully, he would have learnt that they have Chinese mottoes taken from poems which were not composed till 2,000 years after the tombs were made—in fact, they are rubbish palmed off on collectors. In another place (p. 186) Prof. Hartmann crushes English anthropologists with a footnote. Attacking the Aryan theory, and inveighing against ethnologists who treat language as of itself a sufficient test of race, he concludes:—

"What anthropologist could, for instance, justify (as has so frequently happened on the other

side) the classing together without more ado as Aryans (ohne Weiteres als Aryas zusammenzufassen) of the Tajik with the Turani, the Beluch with the Khond, Kol, Bhil, or Ghurka? It is to be hoped that the Russian invading expeditions into Central Asia will bring us more thorough enlightenment than *English* exertions in this direction have as yet afforded."

It does not seem that Prof. Hartmann has much idea of the labour which has been bestowed by such Englishmen as Hodgson, Campbell, Dalton, and Caldwell on this very problem of classifying the population of India physically as well as linguistically. Perhaps, also, he will insert in his next volume a few lines (which could not be more irrelevant than his present accusation) to inform the world what modern English anthropologists of authority have classed the Khonds or Kols as Aryans, either by race or by language.

It is on the ground of physical anthropology that Prof. Hartmann is strongest, and his hundreds of portraits, mostly from his own drawings and from photographs, give great importance to his opinions on African races. Some portraits are rendered in a more unreserved way than is usual, the work being strictly intended for scientific readers. As to the last two plates, it may be remembered that Dr. Fritsch, in his *Eingeborenen Süd-Afrika's*, called attention to the wall-sided straightness of the African body as compared with the classic slope inward to the waist and outward to the hips. This curious race-distinction is worked out by Dr. Hartmann, in the plates in question, in two series of torsi, drawn to contrast the figures of male and female African types with the Belvedere Apollo and the Venus of Milo. This is an example of the thorough way in which even minor points of anthropology are worked out.

EDWARD B. TYLOR.

Itala Fragmente der Paulinischen Briefe nebst Bruchstücken einer vorhieronymianischen Uebersetzung des ersten Johannesbriefs. Von L. Ziegler, eingeleitet durch ein Vorwort von Prof. Dr. E. Ranke. (Munich: Elwert, 1876.)

THE refuse of one age becomes the treasure of another; and thus it has happened that in the search for manuscripts, which has been so eagerly prosecuted throughout the libraries of Europe, especial attention has been paid to the fragments of old parchment which have been used for binding other and often later works. One of the most notable "finds" of this kind was that of a number of fragments which originally belonged to the one or more Latin recensions of the Epistles anterior to Jerome. These are now in the library at Munich, but, having been transferred thither from the Archbishop's College at Freisingen, they go by the name of the "Freisingen Fragments." Tischendorf appears to have contemplated an edition of them, and in his latest edition has cited about 180 of their readings, designated by the letter "r." But death overtook him with his task still unaccomplished, and indeed before his death it had already passed into other hands. We have now from the pen of Herr Ziegler an excellent edition, carefully worked out in minute

detail, and with the comments of an able scholar and investigator. The method pursued is thoroughly sound—indeed, the only sound one—viz., first to reproduce the text of the fragments as they stand, and then to compare them closely with the text of other manuscripts and with that of the Latin Fathers to which they show the greatest affinity.

The fragments fall into three classes. The first and latest in point of date (sæc. vii.) contains the verses from 1 John iii. 8 to the end of the Epistle. In this section is included the famous text about the Three Heavenly Witnesses, and it adds largely to the interest of the documents now published that they contain the verse, though not exactly in the form in which it stands in the authorised editions of the Vulgate. It is well known that the earliest copies of the Vulgate, Amiatinus and Fuldensis, do not contain the verse at all. It is found in a curious document generally known as Mai's *Speculum*, which has been thought, but erroneously, to represent the text used by St. Augustine. It is found (though with v. 8 preceding v. 7) in a later copy of the Vulgate preserved in the Benedictine monastery at La Cava, and on this much stress was laid in his defence of the verse by Cardinal Wiseman. It is now found, with an order similar to that of the Cod. Cavensis, in the Freisingen fragments.

These very fragments open out to us a glimpse into the early history of the interpolation. A comparison of their text with the patristic citations has led Herr Ziegler to the discovery that they present a marked resemblance to the text current in Africa at the time of the Vandal domination. In particular they show a close affinity to the text used by the Bishops Fulgentius and Vigilius. Herr Ziegler is of opinion that it was in the province (Byzacene) where these bishops had their sees that the interpolation arose—probably, in the first instance, as a gloss, pointed with reference to the Arian controversy. Fulgentius was Bishop of Ruspe, 508–533, A.D., and the oldest official document in which the interpolated verse appears is the confession of faith which Eugenius, Bishop of Carthage, presented to Hunnerich in 484. We may note, however, in reference to this, that Herr Ziegler seems to overlook the fact that Cyprian was probably acquainted with the verse more than two centuries earlier. It is, perhaps, also rather questionable to say that the Complutensian edition was the earliest Greek text that admitted the interpolation. The Codex Montfortianus, in which Erasmus seems to have found it, may quite possibly be older.

The second class, comprising two short fragments, Phil. iv. 11 to the end, and 1 Thess. i. 1–10, does not seem to call for special comment.

The third, and most important, contains in all 396 verses of St. Paul's Epistles, and eighty-five verses (whole or part) of the Epistle to the Hebrews. Here, again, Herr Ziegler has carried out an excellent and most interesting enquiry. He may be said to have solved once for all the much-mooted question in regard to the so-called "Italic Version," at least of St. Paul's Epistles. All the infor-

mation that we have upon the subject is from St. Augustine, who says that the Italic Version or Itala was preferable to the rest from its superior fidelity and clearness. It is fair to infer that it would be the version that he himself would naturally use. And comparing the text of his citations with that of the Freisingen fragments, a similarity is observed which is much too close to be accidental. The text of the Freisingen fragments was in the main that of St. Augustine, and therefore it may be said to be in fact the long sought-for "Itala."

This is a valuable result to have obtained. And we should only be glad to see a similar enquiry instituted as to the text of the Gospels. We should, however, if we understand him rightly, demur to a conclusion which Herr Ziegler draws in his strictures upon an essay by J. N. Ott. It does not follow that because the Itala was not an African recension—as its name implies that it was not—therefore there was no African version that may have been older still. Rather we should have thought that all the indications to which we have access at present seemed to point to such a conclusion. But, no doubt, the subject needs to be followed out further than it has been.

W. SANDAY.

SCIENCE NOTES.

BOTANY.

On the Formation of the Embryonic Membranes in the Vegetable Kingdom.—Under this title Prof. A. Famintzin contributes a preliminary article to the *Botanische Zeitung*, supplementing a previous one on the same subject. The main purpose of this is to furnish the proofs of his theory of the development of the initial layers, or embryonic membranes, in plants. Hanstein had previously pointed out the existence of three distinct layers in the developing embryo of *Capsella bursa-pastoris*, and several *Compositae*. The further development of these "three systems of tissues," Famintzin asserts, has proved to be perfectly identical with the formation of the embryonic membranes in animals. While the embryo is still quite small, and before there is any trace of the cotyledons, the perlemb forms an axile cylindrical cord, sheathed in two layers of cells, the perlemb and the dermatogen. Soon divisions appear in the dermatogen at the lower end of the embryo (near the suspensor), and the perlemb increases to several layers on the sides of the embryo, but remains one-layered at both ends. As Hanstein has already shown, the root-cap and the primary bark is the result of these cell-divisions. Taking a more fully-developed embryo in which the cotyledons are present as two symmetrical projections, and rendering it transparent by Hanstein's method, three membranes or layers of tissue are as clearly distinguishable in the cotyledons as in the axile portion of the embryo; they appear as outgrowths of the corresponding tissues of the axis of the embryo, and subsequently undergo the same changes. Briefly, says Famintzin, the principal results of my investigations may be thus expressed. "In the earliest stages of the formation of the vegetable embryo three morphologically distinct layers of tissue appear, which during the complete development of the embryo, and most likely during the whole life of the plant, retain, with few rare exceptions (the embryonic vesicle, for instance), their independence, and only certain defined tissues are formed from them. In other words, they correspond exactly to the embryonic membranes of the animal kingdom."

Movements in the Leaves of Dionaea, and the

Phenomena connected therewith.—Two independent observers have been studying the anatomy and functions of the leaves of *Dionaea muscipula*, one of the insect-trapping plants employed by Mr. Darwin in his experiments to elucidate the question of the absorption of organic matter through the leaves of this and other plants—M. Casimir de Candolle, in the *Archives des Sciences Physiques et Naturelles*, April, 1876, and Dr. Fraustadt, in the first part of the second volume of Cohn's *Beiträge*. As might be expected, in regard to the anatomy of the leaves they are in almost perfect accord, but in other respects their conclusions are somewhat different. De Candolle's experiments extended over a period of only six weeks, and, in addition to the question of nutrition, he investigated the mechanism of the leaves. Briefly, his conclusions are these. Animal substances absorbed by the leaves are not directly utilised by the plant, nor necessary to its development. The marginal teeth and edge of the blade of the leaf form a member (organ) distinct from the rest of the leaf, which explains the reason why their movement is not simultaneous with that of the valves of the blade. The stellate hairs and the glands are epidermal structures, whereas the excitable hairs on the surface of the valves are outgrowths of the fundamental tissue beneath the epidermis. The anatomical structure, as well as the development of the different parts of the leaf, favours the hypothesis that the movements of the two valves of the leaf depend upon variations in the turgescence of the parenchyma of the upper surface only of the leaf. According to both observers, no stomates are present on the upper surface of the leaf. Dr. Fraustadt's investigations were of a somewhat different character. Without entering into them in detail we may give the results of his experiments bearing upon the question of nutrition. The cells of the leaves of *Dionaea* exhibit, in many respects, an unusual behaviour towards chemical reagents, which seems to point to the presence of a peculiar substance, the nature of which, however, nobody has yet succeeded in making out. Apparently it exists in the living cells in acid solution; consequently it is precipitated by bases and redissolved by acids. Ammonia colours the red glands on the upper surface of the lamina greenish, and precipitates, in the cells containing starch, a fine-grained substance. And if the ammonia is neutralised by acetic acid the red colour of the glands is re-established, and the granules in the cells are dissolved and disappear. Adding potassium again removes the colour and causes the starch granules to swell up and become transparent. Finally, the green granules are again precipitated. After carefully washing out the potassium, and then treating the tissue with iodine (as iodide of potassium), the cells are uniformly coloured blue or violet. Dr. Fraustadt also found that the cells of those leaves which had caught little animals, or had been fed with albumen, contained no starch, or very much less than those which had access to no organic food, after these substances had been enclosed a few days. When dyed albumen was presented to the plant, the colour was absorbed even into the vascular bundle of the midrib.

Oil Seeds and Oils in the India Museum, or Produced in India.—Uniform with his Report on the gums and resins of India, Dr. M. C. Cooke has prepared a Report on the oils of India. This Report, independently of its commercial value, is an interesting tabular view of the oil products of India. What this Report shows more prominently than anything else is the immense amount of undeveloped wealth that lies dormant in our Indian Empire. Only the fatty or expressed oils are here treated of, under the heads of waxes, solid and semi-solid fats, and fluid oils. The volatile oils have been reserved for a future Report. It only claims to be a digest of scattered and disconnected memoranda, and is not presented as detailing the results of original research. About forty woodcuts intended to illustrate the seeds, fruits, &c., of

oil-yielding plants are introduced, but the majority of them are so rough as to be of little use.

Botanical Collections of the Arctic Expedition.—We have not yet had an opportunity of seeing the dried plants brought home by the Arctic explorers, but it is reported that they are very interesting. It is not expected that many new forms have been discovered; the most important feature illustrated by the collections is probably the additional knowledge of the geographical area of previously known species. It is stated that thirty species of phanerogams were collected between 82° and 83° N. lat. It is worthy of note that grains of wheat left in the Arctic Regions by the American *Polaris* Expedition about five years previously had retained their germinating power.

Cross-Fertilisation in Plants.—Mr. Thomas Meehan read a paper on this subject at a recent meeting of the American Association for the Advancement of Science, at Detroit, taking for his text the query, "Are Insects a Material Aid in Fertilisation?" The general drift of his argument was intended to show that insect aid had been greatly overrated, and that self-fertilisation is the rule. The facts which he adduces to prove his argument appear somewhat beside the real question, and go more to explain why in some seasons fertilisation of any sort is more general than in another when the climatal and other conditions are diverse. In arguing against insect agency, he seems to have missed the main point in Mr. Darwin's theory, and to have developed the beneficial effects of occasional cross-fertilisation into an essential cross-fertilisation as the basis of those not of his way of thinking. He would seek for the cause of unfruitfulness in a failure of nutritive power, and not ascribe it to the absence or rarity of certain insects.

ZOOLOGY.

Extinction of the American Bison.—Mr. J. A. Allen has written a voluminous and exhaustive memoir on "The American Bisons, Living and Extinct," which forms a part of the publications of the Museum of Comparative Zoology of Cambridge, Massachusetts. After describing the remains of the two fossil species, *Bison latifrons*, Harlan, and *B. antiquus*, Leidy, and the structure of the existing *B. americanus*, Mr. Allen passes to the geographical distribution of the latter, which he treats of in great detail. The most important point, of course, is the coming extinction of the species. The commonly accepted statement that the "buffalo" formerly ranged eastwards to the Atlantic sea-board is shown not to be borne out by historical evidence. But its range previous to the present century was still very extensive, reaching from the Great Slave Lake in the north to the Mexican States of Cohahuila and Tamaulipas in the south, and from Oregon in the west to Pennsylvania, Virginia, and the two Carolinas in the east. Since then the pastures of the buffalo have been narrowing more and more quickly every year. By about 1825 it had been driven west of the Mississippi, and at the present day it is only found in two limited districts bordered by the Rocky Mountains and separated by a considerable interval along the track of the Pacific Railway. The more northern of these regions extends through the Athabasca, Lesser Slave Lake, and Saskatchewan districts of the Dominion of Canada, and the United States Territory of Montana, while the southern includes portions of Texas, Colorado, Kansas, and the Indian Territory. This gradual shrinking of the bison's range is admirably shown in the present work in a large map, in which its extent at successive periods is printed in various colours. It is quite evident that the wild buffalo is doomed to speedy extinction as surely as the wild Indian, and the only hope of saving a remnant is by the creation of a sanctuary. Surely the people of America might do for the bison

what the Czars of Russia have done for the aurochs.

Cassell's Natural History.—Last year we stated that Messrs. Cassell, Petter and Galpin were about to publish an illustrated popular Natural History, and that they had secured the services of several zoologists of the highest rank. The first portion is now before us, and quite comes up to the expectations we had formed. This part gives an excellent account of the *Quadrupeds* in general, and of the gorilla in particular, an immense amount of information being conveyed with a most praiseworthy absence of technicality. The author's name is not given, which we think is a mistake; the naturalists who have undertaken the various groups have no reason to be ashamed of their work, and their names would command a respect and confidence which is not generally given to anonymous scientific writing. The woodcuts are both numerous and good, and our only adverse criticism would be the suggestion that the work will reach a portentous size if every animal is treated of as much in detail as the gorilla.

Dr. Taylor on Aquaria.—Messrs. Hardwicke and Bogue send us a handsome volume on *The Aquarium, its Inhabitants, Structure, and Management*, by J. E. Taylor, Ph.D., &c., &c. Its object is not only to form a manual for those who wish to keep aquatic animals and plants for their own study, but to serve as a guide-book to the public institutions which are so fast increasing in numbers. Dr. Taylor insists on the purely scientific uses of public aquaria in addition to their educational value, instancing as examples of results already obtained the demonstration of the truth of Sars's statement that the ova of the cod and whiting float in the sea, the proof of the identity of the whitebait and herring, and the discovery that the "glass-crab" (*Phyllosoma*) is merely the young of the crawfish. The great vexed question of the superiority of the "circulatory system" over the plan of oxygenation by jets of air is fully and fairly discussed, general preference being given to Mr. Lloyd's method, while the advantages of that supported by Mr. Saville Kent are recognised under certain conditions. The illustrations—over two hundred in number—are well executed, but, as usual in such works, the index is curiously defective.

Dr. Jordan on American Vertebrates.—We have received a *Manual of the Vertebrates of the Northern United States*, by D. S. Jordan, M.D., &c. (Chicago: Jansen, McClurg and Co.) It gives lists with brief characters of all the species found east of the Mississippi and north of Tennessee and North Carolina, compiled from the works of the best American zoologists and fairly brought up to date. Following the example of Dr. Coues, Mr. Allen, and other recent writers, Dr. Jordan rejects the claim of many described species to distinction. There can be no doubt that there was much need for such consolidation, but some at least of the American zoologists appear to be inclined to carry it to an extreme, especially in the identification of Old and New World representative forms.

Mr. Dobson on Asiatic Bats.—Through the courtesy of Mr. G. E. Dobson, of the Royal Military Hospital, Netley, we have received a copy of his *Monograph of the Asiatic Chiroptera* (Taylor and Francis). In his preface the author tells us that the work was begun in Calcutta as a descriptive catalogue of the bats in the Indian Museum of that city. Finding, however, that this would embrace almost all the Asiatic members of the order, Mr. Dobson resolved to enlarge his catalogue into a monograph of the *Chiroptera* of that continent, and finally, as only four European species (*Synotis barbatus*, *Vespertilio Daubentonii*, *V. Bechsteini*, and *V. Nattereri*) were not also in the Asiatic list, he has added their descriptions in footnotes, so that all the known bats of the Palearctic and Oriental

regions are now included in the scope of his work. These amount, according to Mr. Dobson's views, to nearly 130 species, belonging to the families *Pteropodidae*, *Rhinolophidae*, *Nycteridae*, *Vespertilionidae*, and *Emballonuridae*. Our author is no admirer of the prevalent fashion for species-making; indeed, he will be considered by many naturalists to be too much of a "lumper." In this we ourselves believe that if he errs it is on the safer side; but we cannot agree with him as to the advisability of separating certain more or less well-marked geographical races as "sub-species." Either such a race is constant, in which case it should receive specific recognition, or it is not constant, when it may be safely regarded as a mere local variety of the parent species. Now that the idea of the separate origin of each species is abandoned (as it is by Mr. Dobson), it seems to us that the more simply the necessary artificial lines are drawn the better. Surely it is better to hold to the Linnean binomial system in its purity than to name an animal "*Vespertilio emarginatus*, subsp. a. *Vespertilio desertorum*." We are sorry to see this custom introduced into this country, for it has already proved a perfect pest in American zoological nomenclature. The arrangement of families and genera is that lately proposed by Mr. Dobson in the *Annals and Magazine of Natural History*, and already mentioned in these Notes. The generic and specific characters are full and clear, and are illustrated by numerous woodcuts. A somewhat fuller treatment of the synonymy, and an account of the reasons for some of the identifications adopted, would have added still more to the usefulness of this very valuable monograph, but these we hope to find in the general work on the bats in the British Museum, on which we believe that Mr. Dobson is at present engaged.

MEETINGS OF SOCIETIES.

PHILOLOGICAL SOCIETY.—(Friday, December 15.)

H. SWEET, Esq., President, in the Chair. Mr. R. B. Swinton read a paper on "Common Tamil," and illustrated the subject by a map showing lingual boundaries, and by alphabets on a large scale, of Tamulian and other Dravidian languages—Canarese, Telugu, Malayalam—for comparison with the Grandonic or Granthan, the character in which Sanskrit is always written in Southern India, and with the Deva-Nagari. Mention was made of the earlier proficients in the language from the Jesuit missionaries down to the present time, and of the earlier grammars produced, and of some marks of distinction between the common and poetical dialects. The difficulty attending the endeavour to trace the letters to a common origin with the Deva-Nagari was remarked upon, and the curious circumstance of the ignorance of the Brahmins of the South, who are otherwise well acquainted with Sanskrit, of the alphabet used by their Aryan brethren of the North. The power of the different letters was illustrated, and especial note made of a cerebral *r* peculiar to Tamil, and the reader noticed, in part, the elaborated system of euphonic changes and interposition of letters between words. The four main divisions of words—the four parts of speech of Tamil grammarians—were touched upon, and case and tense formation explained, and attention was especially drawn to the verbal nouns, and to a conjugated derivative peculiar to the ancient or poetical dialect, and to the complete negative form of the verb, and to participles embodying relative pronouns.—A paper on the "Names of Birds" by Mr. David Ross, of Edinburgh, was then read.

PHYSICAL SOCIETY.—(Saturday, December 16.)

PROF. G. C. FOSTER, President, in the Chair. Mr. Crookes described some of the most recent results he has obtained in his experiments on the radiometer, and exhibited many beautiful forms of the apparatus, most of which have been devised with a view to decide on the correct theory of the instrument. He commenced by describing the arrangement he has used for some time past in studying the resistance offered by air and other gases to the rotation of a mica disc. From the normal atmospheric pressure to the

best vacuum which can be obtained by the ordinary air-pump the resistance remains nearly constant, and these experiments have been carried on in vacua of remarkable perfectness, the highest exhaustion obtained being represented by 1 millimetre on a scale of 10 miles, a point which was attained by means of a Sprengel pump with improvements by M. Gimingham, and measured by a McLeod gauge. Mr. Crookes concludes that in a perfect vacuum a mica plate would not continue to oscillate for ever, a fact probably due to the viscosity of the glass fibre. About fifteen different forms of the radiometer were exhibited, and their inventor has satisfied himself that the theory of their action proposed by Mr. G. Johnstone Stoney is the only one capable of completely accounting for their action, and he considers it to be in all probability the correct one. As, on this, the molecular movement theory, the rotation is due to a throwing off of particles from the blackened surface of the mica, it follows that, if a piece of transparent mica be attached to each fly in front of the blackened surface, the rotation will take place in the opposite direction, and this proved on experiment to be the case. As these facts can be explained on the "molecular movement" or the "evaporation and condensation" theory, Mr. Crookes arranged a radiometer having four transparent mica vanes and mounted in a rather large bulb. At the side of the bulb in a vertical plane, a plate of mica, blackened on one side, is so fixed that the vanes can pass, and when light shines on this fixed plate, the fly is found to rotate, a fact which in itself disproves the latter theory. In conclusion, he exhibited a photometric four-vaned radiometer in which the fly was attached to a small magnetic needle, and this might be so checked by an external magnet that the strongest light would be incapable of causing the needle and vanes to make a half rotation. If the circumference of the globe be graduated and the apparatus be brought within the influence of a source of light, the angle to which the needle is deflected will be a direct measure of the intensity of the light.—Prof. Dewar exhibited a simple electrometer which he has designed, founded on a discovery of Leipman. If a capillary tube be immersed in mercury, and dilute sulphuric acid be placed in the tube above the mercury, and a current from a Daniell's cell be so passed through the liquids that the mercury forms the negative pole, the column will be depressed to an extent dependent on the diameter of the tube. In making an electrometer Prof. Dewar has increased the sensitiveness by connecting two vessels of mercury, by means of a horizontal glass tube filled with the metal, except that it contains a bubble of the dilute acid. The instruments exhibited were constructed by Messrs. Tisley and Spiller, and Prof. Dewar showed that it is possible by means of them to measure an electromotive force equal to $\frac{1}{10,000}$ th of a Daniell's cell; forces capable of decomposing water must be measured by causing two currents to act against each other. The apparatus is very convenient, as it requires no preparation, and is extremely simple in its action. He then showed an instrument, arranged by Mr. Tisley, for producing a current by the dropping of mercury from a small orifice into dilute sulphuric acid; if the vessels containing the mercury and the acid be connected by a wire, a current is found to traverse it. He then exhibited a manometer, suitable for measuring very slight variations of pressure, and he illustrated the use of it for proving Laplace's law that the internal pressure multiplied by the diameter of a soap bubble is constant. It consists of a U-tube, one arm of which is about fifteen inches long, and is bent horizontally, and levelled with great care.

CHEMICAL SOCIETY.—(Thursday, December 21.)

PROF. ABEL, F.R.S., President, in the Chair. Prof. W. N. Hartley made a communication entitled "A Further Study of Fluid Cavities," in which he described the results of his examination of a large number of topaz and of rock sections, mostly granites and porphyries. The fluid contained in the cavities was almost invariably water, but it was very remarkable that the cavities often took the form of the crystals in which they were contained, and nearly always arranged themselves symmetrically with regard to the faces of the crystal.—A paper by Dr. H. E. Armstrong, F.R.S., "On Thymoquinone;" one "On High Melting Points, with special Reference to those of Metallic Salts," Part II.; and another "On the Determination of Urea," by Mr. G. Turner, followed

this; after which Dr. G. Bischof called attention to the rapid corrosion of the so-called "compo" pipe employed by gasfitters when used to convey water, especially when exposed alternately to the action of air and water.

FINE ART.

ART BOOKS.

Home Life in England. Illustrated by Engravings on Steel. With brief Essays by Oliver Mount Wavertree. (Virtue.) This is a collection of plates from the *Art Journal* illustrative of English scenery and English country life. There is only one interior—"The Village School," by Webster—so the title *Home Life* must be understood in the wide sense of England being our home. There are sixteen engravings by Cousen, Bourne, E. Goodall, J. Carter, Brandard, Lemon, and Bentley; from pictures by J. Linnell, Birket Foster, F. Goodall, P. Nasmyth, J. Constable, T. S. Cooper, W. Collins, T. Webster, W. H. Knight, and Turner; the whole forming a pleasant series illustrative, not only of rural life, but also of a certain phase of English art. All the artists, with the exception of Turner, may be said to belong to the same group. The "Brief Essays" supplied by Mr. O. M. Wavertree, in spite of their title, are, unfortunately, of the usual class of descriptive letterpress to "pretty pictures." They tell us nothing about the painters, but consist simply of a little "talkee talkee" about the subjects of the engravings.

Modern Art: A Series of Line Engravings from the Works of distinguished Painters of the English and Foreign Schools. Selected from the Galleries and Private Collections of Great Britain. (Chatto and Windus.) This is undoubtedly one of the most magnificent art gift-books of the season. To lovers of genuine line- engravings, as distinguished from the many modes of reproduction in favour at the present day, it cannot fail to give great pleasure, for the engravings are all India proofs by some of the best modern masters of the art, and are given in the finest impressions. It is difficult to particularise among so much that is, perhaps, as good as it can be in its particular way; but we may mention *The Hindoo Maiden*, engraved by Devachez from the picture by Le Jeune, as especially distinguished by a peculiarly soft rendering of light; *Troilus and Cressida*, engraved by Armytage from a painting by Bromley; Mulready's well-known *Sonnet*, by the same engraver; *The Jester*, by Lamborn, splendidly engraved by E. Mohn; *Strolling Players*, by Pinwell, engraved by Cousen; *The March of Miles Standish*, by Boughton, engraved by G. C. Finden; *The Critics*, by H. Browne, engraved by C. W. Sharpe; and Birket Foster's *Rustic Bridge*, engraved by C. Cousen. These are very few to select from the abundant stores that *Modern Art* offers, but they may serve to show the varied character of the subjects and artists chosen for representation. The English school naturally largely predominates, the French is also tolerably well represented. Portraits stand for the modern Belgian school, but, strange to say, the modern German seems entirely left out. Surely such masters as Kaulbach, Knaus, Piloty, Max, and Ludwig Richter ought to be included in any work representative of modern art.

If anyone question whether the proprietors of the *Graphic* have done a good thing or not in establishing an artistic, though withal popular, weekly newspaper, which has now been in favour for several years, he has only to turn to the big Christmas publication just issued, *The Graphic Portfolio*. That publication, issued in the handsomest form, at a guinea, does not indeed primarily appeal to those who are instructed in art. The really informed in art are few in England, and they would be ill-provided for were it not for one or two foreign papers, of which *L'Art* is now the foremost. The *Graphic*, under existing circumstances, is by

no means beneath their notice, and it has won quite worthily the approval of many. But the hurry of publication inseparable from a weekly newspaper which deals in part with news of the week prevents perfection in printing; and the fifty pictures in *The Graphic Portfolio* are all carefully and excellently printed, and are on luxurious paper; and the difference made in effect by printing and paper is substantial and marked. We do not single out for special praise any particular work here, but among the artists who contribute are the best of their kind in England—Mr. Herkomer, Mr. Fildes, and Helen Allingham—and there are reproductions from illustrious last-century painters: Greuze, for instance, and Sir Joshua Reynolds. A notice of the rise and progress, and, we must add, for many years the decline, of wood-engraving is appended to the fifty pictures. It should have been printed in larger type, even at the risk of making a Christmas book look a little instructive. In it, it is well pointed out that the great German artists who practised wood-engraving were hardly great as engravers, however great as artists. The technical excellence which Dürer reached in his engravings on copper, he never reached, nor could reach, in his wood-cuts. A few years afterwards great technical excellence was reached in wood-cutting. In the end of the last century a Newcastle shopkeeper—Thomas Bewick—revived the art; and the notice in the *Graphic Portfolio* does full justice to his work.

BOOKS FOR THE NEW YEAR.

Paris: December 15, 1876.

F. Plon, the publisher, has devoted himself more particularly this year to what may strictly be called gift-books—books, that is to say, in which the illustrations play the chief part and are the life and soul of the text. I shall begin my notice of the publications of the season with his, expressing the hope that their success will be his reward.

The volume entitled *Bêtes et Gens: fables et contes humoristiques à la plume et au crayon*, par Stop, is a humorous fancy. "Stop" is, of course, a nom de plume. Charles Jolyet's dictionary of *Pseudonymes du jour* tells us that "Stop" is the pseudonym of M. Louis Morel Retz, who owes his popularity to the *Journal Amusant*, "Stop" being the name of a favourite pointer. M. Stop, since we are so to call him, is a clever man. He has written a collection of ingenious and amusing fables, and strewn over them, as a cook strews salt and pepper over the stew, a quantity of little pen-and-ink sketches in which the "gens" are cleverly caricatured and the "bêtes" appear in the dress and character of human beings, as in J. J. Grandville's work.

M. Plon publishes, besides the above, *Les Contes de ma Mère, recueillis et illustrés par Bertall*: again a pseudonym, betrayed, like the former by M. Charles Jolyet! The artist's real name is Albert d'Arnoult, "Bertall" being the anagram of Albert. We are told that it was Balzac who advised him to choose this singular form. Here text and drawing are equally singular. M. Bertall tells us in his Preface that he found these stories in his mother's drawer, and that she used to tell them to her grandchildren. There is an affectation of simplicity about them rather than real bonhomie. But unfortunately I am no longer of an age to be a fair judge in these matters. Some day you shall hear what the children to whom I am going to give the book think of it. M. Bertall is a clever sketcher—rather too clever, for his fertility becomes tiresome. He works a great deal for our few political papers. He belongs to the reactionary camp, and is by no means chary of his arrows.

Amsterdam et Venise, by Henry Havard, both as regards size and subject, is a more important work. M. Henry Havard has visited, lived in and studied Venice and Amsterdam, and has acquired a thorough knowledge of their past and present history. Between the dark and

the fair beauty he is in the embarrassing position described by La Fontaine; to which of them is he finally to offer his heart? Venice has the pure sky that casts a silver light on her artists' work. The skies of Amsterdam are hazy, whereby her school is led to prefer more delicate landscapes and more familiar everyday scenes. Both are situated half on the sea; both were once stirred by a spirit of adventure and the genius of commerce; both have had a republican past, and a wealthy aristocracy, the friend of letters, arts, and sciences. M. Havard gives most excellent reasons for his divided love. That the reader may be of one mind with him he intersperses his text with woodcuts of the celebrated pictures and objects of art contained in the museums, and has besides got Léon Gaucherel and Léopold Flameng to etch in their very best manner, one the narrow streets, the canals, the palaces of Venice, the other, the port, the monuments and the picturesque surroundings of Amsterdam, the Venice of the North.

Here is a book which addresses itself neither to tourists nor children, *Les Amateurs d'Autrefois*, by L. Clément de Ris. M. Clément de Ris has long been attached to the Louvre as one of the Keepers of the pictures. He has published notes on our provincial museums, and has now been appointed Conservateur du Musée de Versailles in the room of the late M. Eudoxe Soulié, because—the reason is one to surprise an English citizen—he is a declared enemy of the existing form of government. The studies now published in a collected form, together with eight portrait etchings, have appeared singly in different collections at different times; the dates he is careful to mention. The volume begins with the famous Jean Groulier—whose motto, *Groulierii et Anticorum*, would incline one to believe that he was vain rather than fond of his library, for it is impossible to admit that it could be the acknowledged principle of a genuine bibliophile to lend rare, well-bound books even to his best friends. It ends with Baron Vivant Denon, clever both as an artist and a writer, for M. Poulet-Malassis has just now conclusively proved him to have been the author of *Point de Lendemain*, the masterpiece of the gallant literature of the eighteenth century, by some attributed to Dorat. They furnish information relating to the family, life, collections, and libraries of J. A. de Thou, Claude Maugis, Cardinal Mazarin, Michel de Marolles, Evrard Jabach (the banker), the Comtesse de Verrue, Pierre Crozat, Antoine de la Roque, the Comte Léon de Lassay, the Comte de Caylus (a pleasing etcher), M. de Julienne (the friend and patron of Watteau), P. J. Mariette (perhaps the most acute amateur of engravings ever known), Blondel de Gagny, Randon de Boisset, De la Live de Jully. Most of these great amateurs were hardly known save by the catalogues made of their collections after their death, on the occasion of the sale, by Mariette, Gersaint, or Pierre Rémy. For a long while that was enough. It ought, perhaps, to be enough still, for a collection becomes a personality with every possible right to occupy in the memory of man the place of the individual who made it; but we are more curious in our generation. We want to see the man himself as he lived and moved in the past, negotiating with dealers, corresponding with bibliophiles, conferring with artists, living among his treasures. Surely the "Curieux," as he was called in the eighteenth century—and M. Clément de Ris should have made that the title of his book—is a type which, in its essential conditions of fortune, patience, and devotedness—conditions to which the complex activity of modern life is antagonistic—is gradually disappearing from among us. Public collections have killed private ones. The keepers of the depositories that are everyone's property are a new form of *curieux*. But, however devoted they may be to their office, they are obliged to be eclectic, and eclecticism is incompatible with the

formation of a series, the completeness and, consequently, the moral value of which depends on the uncompromising rejection of whatever does not strictly belong to it. The book contains a multiplicity of detail, anecdotes, and extracts from catalogues. And thus little by little the artistic physiognomy of the great French eighteenth century, which stirred so many minds, shone with such dazzling light on the world, and is still subject to the slanders of the clerical party, is being fully portrayed. The book winds up with a very complete bibliography of the works consulted.

If we proceed now to Hachette's, our attention is drawn to *La Bannière Bleue*, par M. Léon Cahun. M. Léon Cahun is a distinguished Orientalist. He knows almost all the tongues spoken in the heart of Asia. He has both travelled and read, and writes with remarkable elegance. I called your attention this time last year to his *Aventures du Capitaine Magon*, a Phœnician story, which he had reconstructed bit by bit, and to which he was skilful enough to impart an air of probability. This he has done no less successfully in the case of the present story, describing the adventures of a Mussulman, a Christian and a Pagan at the time of the Crusades and the Mongolian conquest. The drawings of M. Lix, with which the book is illustrated, are no mere fancy sketches. All the details of costume, arms, jewels, and harness were furnished by the author, and satisfy the desire for accuracy so characteristic of our age, an age which promises to produce generations in that respect ever more exacting. The book overflows with good faith and good will, which makes me inclined to dwell more at length upon it. The notes, and all that relates to the Mongolian conquest, a great event in the history of the thirteenth century, the bibliography and compendious analysis of Turkish, Mongolian, and Persian books, the author's explanation of the spelling adopted for the proper names, the proofs adduced in support of singular facts, add their weight to the romantic interest of the story itself. *La Bannière Bleue* first came out in numbers in the *Journal de la Jeunesse*, an illustrated weekly periodical in the style of your magazines, a type of journalism that did not exist before our misfortunes, and helps to infuse a manlier spirit into our younger generations.

The name of Albert Jacquemart is well known to you through his works on ceramic. Only a few months ago, in his notes on the china lent to the Bethnal Green Museum, Mr. Franks was questioning some of his assertions, and at the same time doing homage to his work as a whole. At his death A. Jacquemart left a book, summing up the fruit of his studies for more than thirty years, quite ready for publication. This has just been published by Hachette, under the title of *Histoire du mobilier: recherches et notes sur les objets d'art qui peuvent composer l'ameublement et les collections de l'homme du monde et du curieux*. The book opens with a notice of the author, by M. H. Barbet de Jouy, one of the first to discern the delicate and accurate talent of Jules Jacquemart, the son, and the one who gave him the order for the series of etchings, so truly admirable as regards art and precision, called *Les gemmes et bijoux de la Couronne*.

Jules Jacquemart has accompanied his father's work by 200 drawings, reductions made from the originals, by the Gillot process, and, as such, far more perfect than woodcuts could ever be. I do not know that any book has ever been illustrated with so much truth and character. Photography would do as good service as far as exactness is concerned, but it has great drawbacks owing to the modifications of tone, and cannot therefore be used—at any rate, for the present—save for scientific publications or special series of objects of art. Here M. Jules Jacquemart, while visiting very various collections in the company of his father, has successively drawn furniture, carpets, stuffs, lace, marbles, bronzes, objects of carved or inlaid ivory and wood, terra-cottas, goldsmiths' work, enamels, ceramics, glass and lacquer ware.

In the above enumeration you have the headings of most of the chapters contained in the book. I have not yet been able to read the whole, which numbers 660 pages (!), with the due degree of attention. But I know the spirit that guided the author. I know how careful he was in his verifications of dates, names, and contents. In his classifications he often erred, and was often obstinate in his systems. But he was, on the whole, a good observer. He throws light on many obscure points. He has furnished those who are to come after with a great quantity of material. He was an enthusiastic lover of the East. Japan he knew comparatively little, but he was well acquainted with China, and had contrived to learn the language—as much of it, at least, as he needed for his studies—under the direction of Stanislas Julien.

Having just now mentioned the names of the famous *curieux* of the eighteenth century, it is but fair that I should also give you the names of some of the *curieux* of our own time, although Jacquemart has not knocked at the doors of all, and has even passed over some who might have been useful to him. In this beautiful and most useful volume you will meet with objects which belonged to the collections, more or less valuable, of the late architect, A. Gêrente; of M. Bonnaffé, who published the inventory of Catherine de Medicis; of the Rothschilds; of H. Cernuschi, the owner of an enormous collection of Chinese and Japanese bronzes: of Dreyfus, collector of bronzes of the Italian fifteenth and sixteenth centuries; Charles Ephrussi, whose predilection is for ancient stuffs; M. L. Double, devoted to historical furniture of the eighteenth century; M. P. Gasnault, correspondent to the Ceramic Museum of Limoges; and Dr. Pioget, &c.

PH. BURTY.

ARCHAEOLOGY IN ITALY.

Rome: Nov. 29, 1876.

The late deeply-regretted Mr. Hemans in his last letter announced a very wise decree of the Minister of Public Instruction with regard to the many antiquities which are daily brought to light in the various provinces of Italy. Formerly the Government required accounts of such excavations only as were carried on at the expense of the State, and to the administrations depending on the Ministry was left the option of publishing what they considered most advisable. The administrations, indeed, of Naples and Sicily published regular accounts of discoveries, but few of those interested in the study of archaeology had any means of knowing the discoveries made on State lands in Rome, or in Etruria, where a special deputation presided over the excavations.

Besides, it was seldom that any trustworthy account could be obtained of chance discoveries, or of such as were made at the expense of private persons; for no office existed in the Ministry exclusively devoted to classical antiquities. Hence the institution of Inspectors of Excavations and Monuments in those places where archaeological discoveries are most frequent was extremely opportune, as also the order that the monthly reports sent by the Inspectors to the Ministry should be communicated to the Royal Academy dei Lincei, together with the statements compiled by the offices belonging to Government excavations.

The late Mr. Hemans, announcing that the publication had begun in January, 1876, only mentioned summarily the contents of the notices for June. But other numbers have been published, down to September inclusively, which deserve consideration.

The number for July relates to excavations which have been made at Verralto Pombia; the discovery of a small treasure of consular coins at Cremona, on an estate belonging to the family Jacini; the systematic researches undertaken at Vellein; the continuation of the excavations in

the ancient Felsinean necropolis; the discoveries made at Rome, in Cassino, Piedimonte d'Alife, in Santa Maria di Capua, in Manfredonia, Pompei, and in Selinunte.

The number for August is entirely devoted to the important discoveries made at Palestrina; that for September notices the last discoveries in the excavations made at Concordia and Bologna, also some made in the province of Siena; it enumerates the various parts of Rome in which objects have been found; it announces new discoveries in Offida, Atri, Spoltore, and Pompei; and winds up with an account of the excavations in Sardinia by the Commendatore Spano.

But, as indicated by the title, and as might be expected from the nature of the communications, the Director-General, Fiorelli, limits his notices to the mere facts of the various discoveries, to a very exact account of the localities in which discoveries have been made, and to a very faithful facsimile of any inscriptions found. In doing this he accomplishes all that is required by Government, and by the student, to whom, if anxious to make special studies on any of these localities which throw new light on ancient history and archaeology, every facility is afforded. Moreover, the reader will occasionally find more detailed accounts of anything especially interesting, which will enable him to appreciate fully its importance. Such is the account published in the number for August by Count Giancarlo Conestabile della Stufa, which I have already mentioned.

I am not aware whether an account has been published in any British periodical of this most interesting discovery, made in the beginning of the year at Palestrina. In the district of San Rocco, below the modern town, not far from the place where the celebrated gold ornaments belonging to Prince Barberini were found, a tomb was discovered which contained objects in gold, silver, bronze, and ivory, all in the style which belongs evidently to the most ancient history of Praeneste. The discovery having been announced by the Commendatore Fiorelli (*Notizie degli Scavi*, Febbraio, Marzo, Maggio, 1876), and by Prof. Helbig (*Bullettino dell'Istituto di Corrispondenza Archeologica*, 1876, p. 113), treaties were entered into for the purchase of the objects, and, the question having been brought before the Chamber of Deputies by the Duke Cesarini Sforza, a doubt was raised as to the authenticity of the objects found, a doubt which could only have been entertained by those who had no opportunity of seeing them. I, who had the good fortune to be on the spot when the treasures were found, can only wonder at such doubts being entertained for a minute. A shapeless mass, recognisable as metallic from its weight when plunged into water, when freed from the black mould which covered it, disclosed a most exquisite sheet of gold, of the most delicate workmanship, bearing 131 figures of animals in relief. Deceit was simply inadmissible in this instance, for, even supposing there are those who can imitate such objects so perfectly, it is not credible that they could have been buried in the earth; a very little experience suffices to convince anyone if the surrounding earth has been moved lately, or if it possesses that compactness which the lapse of many centuries alone can give. However, the Ministry, to clear up any uncertainty, named a commission composed of men of high reputation, whose verdict is given in Conestabile's account.

In it he describes the discovery of the treasures, in what position each was found; he takes them one by one, and shows the artistic and historical value which belongs to each. He speaks of the beautiful plate of gold, of three fibulae, and of three small tubes or cases, also of gold, of the remains of some iron arms and of some utensils of various kinds, made of gold, silver, ivory, bronze, and glass. Especially deserving of notice are the gold vases, one of which is a chalice of most elegant shape, perfectly smooth on the surface, the only decoration being four small sphinxes of exquisite workmanship, crouching on

the handles, two on each side. There are also tazze of silver gilt, with engravings similar to the celebrated tazze found in Etruria and Cyprus, which are now in the museums of the Louvre and the Vatican. But for archaeological interest, a silver cup, with hieroglyphics and a Phœnician inscription, far surpasses anything else found here. It has been interpreted by the learned Signore Fabiani, and recently by Prof. Lenormant, who has found nothing to add to what the Roman archaeologist had determined respecting the age of this object, which from the characters of the inscription cannot be later than the seventh century before our era. Connestabile, accepting the interpretation given by Prof. Lignana to a similar cup, as published in the *Annali* of the Institute (1872, p. 231, mon. IX. tav. XLIV.), recognises in the centre the representation of the victory of a Pharaoh; while others are more inclined to see in it annals of the deeds of Osiris. From his examination of the objects Connestabile proceeds to determine their importance for the study of ancient Italic civilisation, and, comparing the objects found in the Regolini-Galassi tomb in the necropolis of Caere, and those of Vulci, of Veii, Chiusi, and Praeneste itself, with those found in Cyprus and other parts of the East, he comes to the conclusion that these new discoveries enable us to determine far more positively the character of the epoch during which Etruria and Latium were not yet influenced by the genius of Greece, but by the civilisation and the industry of Assyria and Egypt; when the Phœnicians carried to western climes the productions of the countries bordering on the Euphrates and the Nile, thus giving rise to imitations of these Eastern types. In this portion of his study Connestabile differs from the opinion of other archaeologists, for he considers that the plate or lamina of gold, the tripods and the bronze shields may be attributed to Etruscan artists, while Prof. Helbig, Prof. Lenormant, and others affirm that the whole discovery is of Phœnician workmanship, apart from any influence of Italian art.

This subject, which I leave for the present, will be more fully detailed in a memoir by Profs. Helbig and Fabiani, which, illustrated by engravings, will shortly be published in the *Annali* of the Institute of Archaeological Correspondence.

FELICE BARNABEI,
Segretario della Direzione Generale
dei Musei e Scavi del Regno.

ART SALE.

Messrs. Christie, Manson and Woods defer until after the holidays the announcement of their more important sales, and the recent sales of Messrs. Sotheby, Wilkinson and Hodge have been chiefly confined to books—the full season in London for the dispersion of works of art has not, indeed, yet commenced—and the collector must still look forward to the sale of the very large collection of engravings formed by Mr. James, of Ludlow, to take place early in the year, and to that of the noteworthy collection of M. Didot, of the firm of Firmin-Didot, which will take place in Paris in February and in subsequent months. Meanwhile, the dispersion of the Liphart collection, at Leipzig, has been the great event of the season.

Herr Liphart has for nearly forty years been a collector, and he had succeeded in bringing together a collection of engravings and etchings, not, indeed, so fine or complete as it has on more than one occasion been represented to be, but still very rich in curious and little-seen works, and containing also some magnificent examples of what are universally allowed to be the masterpieces of the etcher's and the engraver's art, along with many not at all in fine condition nor brilliant in impression. The Liphart collection, in a word, like most collections, had good and bad in it. It was richest in the work of the early German engravers; very rich in the "Little Masters;" and it is matter for rejoicing that many among the finest of its treasures in this kind have been brought over to

England to be added to the store at the Fitzwilliam Museum, the authorities of which have wisely sanctioned a liberal outlay for the purpose of completing as far as might be the museum's assemblage of the best of early German art. We append a price-list of some of the prints by German and Italian masters offered at the sale:—Anonymous Italian engraving, a political caricature, attributed by some, but probably without sufficient reason, to Baccio Baldini, 112*l.* 10*s.* It was bought by M. Clément, of Paris, for Baron Edmond de Rothschild. By Barthel Beham, the Virgin with the Infant Saviour in her arms, and the death's head—a rare work of this Little Master, 13*l.* 10*s.* By Sebald Beham, *The Kiss*, a marvellously fine and fresh impression of a print signed and dated 1526, 11*l.* 5*s.* By Albrecht Dürer, *Adam and Eve*, fine impression with margin, 100*l.*; *Christ Crucified, with the Maries*, known as being designed by Dürer for the sword of Maximilian, 115*l.* 10*s.*; *Die Drei Grossen Bücher*, a splendid example of woodcuts in rare condition, 128*l.* By Aldegraver, *The Virgin and Child*, with crown and sceptre, 5*l.* 10*s.* By Albrecht Glockenton, a German engraver of the fifteenth century, a follower of Martin Schongauer, *Christ Crucified* (on vellum), 45*l.* By Israel Van Mecken, *The Ball Room*, 21*l.* By Martin Schongauer, *The Death of the Virgin*, 252*l.*, and *The Temptation of St. Anthony*—both much restored—175*l.* By Marc Antonio, the exquisite *St. Cecilia*, after Raffaele, 81*l.*, and the rare Bacchanalian scene, the frieze, after an antique bas-relief—an impression unfortunately much restored—31*l.* It was by no means in Marc Antonios that the collection was strongest. By Leonardo da Vinci, the complete set of three impressions from the plates of a design for ornamental work, 60*l.* These are of the utmost rarity: indeed, as a complete set they are believed to be unique, though it is stated that the British Museum owns one, and that Baron Rothschild owns two. Albert Dürer appears to have made a copy of the design. Of the engravings by Lukas van Leyden we note *David before Saul*, 62*l.* 10*s.*; *The Holy Family in a Landscape*, 20*l.*; *The Dance of the Magdalen*—one of the master-works of Lukas van Leyden, but here much restored—60*l.*; *The Fall of Man*, woodcut, 12*l.* 5*s.* The etchings by Rembrandt were of very unequal quality. We note the prices of a few: *Christ Healing the Sick*—the "Hundred Guilder Print"—not a very fine impression of the second state, 100*l.*, the *Landscape with the Three Cottages*, a remarkably fine example, 152*l.*; a restored impression of the *Landscape with the Milkman* 40*l.*; a superb impression of *The Goldweigher's Field*, 52*l.* 10*s.*; *Doctor Faustus*, 32*l.* 10*s.*; *Renier Ansoo*, 65*l.*; *Ephraim Bonus*, 57*l.* 10*s.*; a very beautiful impression of the often badly-printed etching of the portrait of *Jan Sylvius*, from the Weber collection, 70*l.*; and the *Head and Bust of a Youth*—more properly a "child," sometimes thought to be Titus Rembrandt, sometimes a prince of the House of Orange—18*l.*—an impression equal in beauty to that sold in London last June in the collection of Sir Abraham Hume. The entire collection realised about 12,000*l.* It may be of interest to add that the veteran collector, having thus disposed of the greater portion of his cabinet, retains a remarkably fine and extensive assemblage of the work of Ostade.

NOTES AND NEWS.

WE may hope very soon to have the reports of authorised and competent scholars on the astonishing discoveries of Dr. Schliemann at Mykenae, the site having been visited within the last week or two by Prof. Curtius, who is in Greece for the winter, as well as by M. Evstratiades, the Athenian Ephoros of public monuments; each of whom, we understand, has drawn up reports on the subject. In an early number we hope to give an abstract of the official inventory of the objects discovered. Meantime we may warn our readers

that not by any means all the things discovered by Dr. Schliemann belong to the heroic age, as he seems to think. This, however, will in no way lessen the gratitude due to him for his energy and his brilliant success. It is, we believe, arranged that the fruits of his new excavations shall be placed, within a very early date, on public exhibition at Athens. We learn that the operations at Mykenae are now, for we do not know what reason, suspended, and that Dr. Schliemann has left the site.

FROM Olympia there comes news of great interest, and of excellent augury for the future. The excavations, since their resumption at the end of October, have been carried on with increased appliances in the shape of carts, horses, and machinery, but in the face of very unfavourable weather. The plan of the season's work included an extension of the diggings westward of the Temple of Zeus, in search of the boundary wall of the Altis; their continuance on the northern flank of the temple, which had been cleared along one half only (the eastern half) of its length; the excavation of the ground at the western end of the building, and if possible also of the ruins of the Byzantine church built, it is conjectured, on the site of the Heræon, and described by earlier travellers as existing near the north-west corner of the temple. The extensions towards the boundary of the Altis have thus far yielded a number of inscriptions, but no works of art. Up till the middle of December, the chief discoveries of new sculpture had been three in number: viz., a fragment of drapery in strong motion, found at the west end of the building and conjectured to belong to the pediment group of Alkamenēs; and two portions of metope, one a fine male torso, and the other a complete figure of Athene, identical in style and treatment of drapery with the Hesperid of the metope discovered last April. But the last accounts of all, received in Berlin on December 24, speak of richer finds both in the eastern and the western diggings. Eastward, a new female torso has been found, belonging, apparently, like the majority of last season's discoveries, to the pediment group of Paeonios; and westward, better still, a female head, described as of great beauty and in excellent preservation, of which the situation is said to leave no doubt that it belonged to the group of the western pediment. If this is so, then we have the first assured fragment of the composition of Pheidias' greatest pupil, Alkamenēs, and we may entertain good hope that others will speedily follow.

MEANWHILE, a new edition of the illustrated Olympia-publication issued by MM. Wasmuth of Berlin, which was reviewed in our columns (ACADEMY, Oct. 14, 1876), has appeared at a very much lower price than the old edition, and with other differences. The illustrations are, in the new issue, printed by the permanent carbon process. The panoramic landscape-sheet is left out; and the negatives employed have been taken, for the most part, from the casts now at Berlin, it having proved impossible, in the northern climate, to print from those taken by the Patras photographers from the marbles themselves. While something is thus lost, a good deal is also gained; for in this new publication we have the results of the careful and judicious work done by Dr. Treu at Berlin in piecing together the casts of different fragments which turn out to belong to each other. Thus, for one instance, the attitudes and the several identities of the two river-gods at the extremities of the pediment are now definitely ascertained. The text also contains some additions by Prof. Adler.

WE understand that the Royal Academy will proceed next month to the election of three new Associates.

At the annual dinner of the Alpine Club, held at Willis's Rooms, there was as usual a small exhibition of paintings of Alpine scenery. Among

the contributors of works in this kind were M. Loppé, whose mastery of glacier texture is pronounced by mountaineers to be almost perfect, Mr. Crofts, whose work is distinguished by remarkable skill in depicting mountain forms through mist, and Mr. Smith, who seeks out the contrasted effects of valleys in shadow and peaks in light. The water-colour drawings recently noticed in these columns also formed a part of the exhibition, which contained besides several clever statuettes in wood carved by the great Swiss guide Melchior Anderegg. Altogether the Alpine Club is to be congratulated upon the success of its efforts to form a focus for Alpine art.

THE exhibition of the works of the Old Masters will be opened to the public on Monday next. Report speaks favourably of the collection, although the number of great subject-pictures will be found scarcely so large as on some former occasions. The works of Vandyck occupy a prominent position, and there are also as usual interesting examples of Reynolds and Gainsborough. A large landscape by Vincent, one of the great pupils of Cromé, will probably attract attention, and the representation of the portraiture of Raeburn will go far to satisfy those who were not able to see the Raeburn exhibition recently held at Edinburgh. We understand that the catalogue is to be somewhat fuller in its information than usual. Each picture is briefly described; a work of considerable labour, and requiring more care and skill than might be supposed. In this way it will serve as a useful record of the art collections of the country as they are brought together at Burlington House, and a work of reference after the exhibition has closed.

LAST week there was opened in the galleries of the Royal Scottish Academy, an extensive and interesting collection of photographs, brought together from all parts of the world by the Edinburgh Photographic Society. Specimens have been sent from Russia, Germany, France, Italy, Hungary, America, and India, as well as from all quarters of Great Britain. Altogether there are 198 exhibitors, and about 2,000 photographs have been sent, including all kinds, from the daguerrotype to the photo-steel process, also the Talbotype and the various collodion processes, and carbon prints of all descriptions. The contributions include all sizes of photographs, from the vignette to that nearly life-size.

THE *Bullettino di Corrispondenza Archeologica* for November is more than usually interesting from the detailed account which it gives of excavations in the neighbourhood of Montefiascone in Etruria, and at Pompeii. At Montefiascone two lines of tombs were found, cut in the solid rock as usual with Etruscan tombs when not of the earliest period. The tombs in one of these lines had been opened and ransacked long ago, but the other line, so far as the work of excavation has yet gone, has been found intact. Three of them have already been opened and, from their contents, appear to belong to not later than the third century B.C. Each contained a sarcophagus, round which were placed bronze and painted vases, bronze mirrors, and candelabra. One of the mirrors is described as of a good style, and bearing the representation of Achilles and Hector advancing to combat—the name of the former (*Achille*) being incised beside him; of the name of Hector only the *E* remains. Between the combatants is seated a bearded figure with diadem and staff, intended to represent an umpire. His name appears to be hardly legible, but is given conjecturally as *L. tun*. Another group of tombs, to the west of those, at Campo della Quercia was opened without necessity, upon which a new attempt was made in another direction at what is called Campo di Grotto, but here the objects found were mostly of a comparatively late period, including even coins of Constantine. Of the mural paintings discovered at Pompeii two appear to be valuable acquisitions. They are both

large, and represent, the one Theseus abandoning Ariadne, and the other, the judgment of Paris as to the beauty of the three goddesses. Both subjects are already known either from the painted vases or from mural paintings. It is curious, as regards Theseus and Ariadne, that the painters appear to have always chosen the moment when she first awakes to see the ship of her false lover standing out to sea. We do not know of any ancient painter who has chosen what is made a striking moment of by Catullus—viz., when she rushes into the sea. In the same house where these and a large number of other paintings were discovered was found also the following graffito:—

“Quis amat valeat; pereat qui
nescit amare; bis tanto pereat
quisquis amare vetat.”

WE are sorry to find, by the Report of the Higher Local Examinations conducted by the Cambridge Syndicate, that the History of Art is a subject that does not prove attractive to students.

“The small number of the candidates in this paper,” says the Report, “as well as the character of the work done, proves a want of attention to the subject. No candidate showed any acquaintance with the history and principles of architecture, sculpture, or ornament, or with the works of the most celebrated engravers. It is evident that the study has not yet found its place among those seriously taken up by candidates at these examinations.”

This is much to be regretted, for simply as a means of education the study of the History of Art is surely as valuable as that of other histories, while the cultivation of artistic taste which this study naturally produces brings with it a keener enjoyment of the beauties that both nature and art offer to our view. Yet, while 281 candidates went up for arithmetic, of whom fifty-nine gained distinction, not more than half-a-dozen lady students, we believe, went up for examination in Art History, and all of them failed.

THE Belgian landscape-painter, Kindermans, died a few weeks ago at the age of fifty-two. He had attained a high reputation in his own country, though little known abroad. Strange to say, Kindermans is the second distinguished artist who has succumbed to the fearful disease of cancer within a very short period. The French sculptor Cabot died of it last month.

THE Musée des Etudes, as it is called, a museum of casts of ancient sculptures and copies of paintings of all periods, prepared at the cost of the State, was recently officially inaugurated, and is now open free to the public every Sunday. It is estimated that the Ecole des Beaux-Arts possesses already at least 3,000 casts from works of art. Those belonging to the Greek and Roman period are now arranged in large and convenient galleries, where students will find it pleasant to study. Other galleries will shortly be opened for works of the mediæval and Renaissance periods, but these are not yet ready.

As a result, probably, of the complaints that have lately been made on the subject, the municipality of Antwerp have at last resolved to abolish the fees levied on visitors for the sight of the great works by Rubens in their cathedral. This will not, however, be of much consequence if the *Descent from the Cross* should be removed for better keeping to the Museum. This picture was the chief source of income to the cathedral.

THE Städelsche Kunst-Institut, with its fine collection of paintings, is an institution of which Frankfurt may well be proud. It was founded by a certain Johann Friedrich Städel, a banker of Frankfurt, who died in 1816, and left the whole of his large collection of pictures, drawings, and engravings, to his native town, together with a sufficient sum of money (100,000*l.*) to found a school of art in which, according to the instructions in his will, “the children of Frankfurt citizens, without distinction of religion or sex,

might receive elementary instruction in drawing by good masters.” He further decreed that if any of the pupils showed unusual ability, they were to receive more advanced teaching, and even in some cases to be sent abroad for instruction at the cost of the Institute. This will gave rise to a celebrated lawsuit which lasted nearly eleven years, but in the end the town of Frankfurt entered into the possession of the greater part of the gift of its patriotic citizen. Such was the origin of the present Städel gallery, which has since been largely increased both by bequests and constant purchases, until it has become one of the finest of the secondary galleries of Europe. Hitherto, however, although it contains many notable works, this gallery has been little known by means of reproduction. It is probable, therefore, that a work which has lately been published by the firm of E. A. Seemann, of Leipzig, entitled *Die Städelsche Galerie zu Frankfurt in ihren Meisterwerken älterer Malerei*, will be welcome to many lovers and students of art. It consists of thirty-two etchings by Johann Eissenhardt, with explanatory text by Dr. Veit Valentin. The etchings, judging from the examples we have seen, are not as good as those of the Cassel and Braunschweig Galleries by Unger; still they are skilfully executed, and seem to be faithful copies of the pictures. The work is published in three different editions—artist's proofs, proofs before letters, and with the artist's name. Only the first part is as yet out. The second is announced to appear next Easter.

A LIST of the subjects for which prizes will be awarded at the International Art and Industrial Exhibition at Amsterdam in 1877 has just been published. They are divided under the following heads:—1. Ornamentation of Buildings; 2. Furnishing of Buildings; 3. Workmanship of the Common Metals; 4. Workmanship of the Precious Metals and Stones; 5. Glass and Pottery Ware; 6. Articles of Dress and Homely Use; 7. Means of Conveyance; 8. All sorts of small objects; 9. The Graphic Arts; 10. Ladies' Fancy Work; and 11. Means for the spreading of Artistic Feeling and Good Taste. The exhibition will be held in the Paleis voor Volksvlijt (Palais de l'Industrie) at Amsterdam, during the months of June, July, and August, but the Commission reserve the right of extending the time if desirable. Applications for space must be sent in quickly. The prizes will be awarded by an international jury after the Exhibition. They vary in amount from 2,000 fr. to 200 fr.

SEMIERADZKI's powerful painting of the *Burning of Rome under Nero*, which created so much sensation in artistic circles in Rome last winter, and won for the young artist the golden laurel crown of the Roman Academy, is at present being exhibited at the Künstlerhaus at Vienna, where it somewhat overpowers the milder works of the German school. At Munich, where this work was lately exhibited, it met with warm approbation. It is next, we believe, to be sent to St. Petersburg, and will afterwards make its appearance at the French Salon next year.

THE *Gazette des Beaux-Arts* for December contains the first of a series of articles on Andrea del Sarto, by M. Paul Mantz. The subject is illustrated by a somewhat poor engraving of Andrea's well-known *Charity* in the Louvre, and by several worn woodcuts. It surely deserves better treatment than this. The harsh judgment of Vasari with regard to the light conduct of the beautiful wife of Andrea has been criticised by several modern writers, and we imagine M. Paul Mantz is about to espouse her cause, as Herr Thausen has done that of Agnes Frey, who has been similarly handed down to the animadversion of posterity, though for a different cause. M. Paul Lefort finishes in this number his study of Goya, and a good etching is given from a portrait of a young girl by the bizarre Spanish master, also several curious caricatures from his *Caprices*. The

Salle de Michel-Ange in the Louvre and its new arrangement is considered by M. Louis Goussier; Dr. Thausing's *Albrecht Dürer* is reviewed by M. Eugène Müntz; and, under the head of "Les Editeurs Contemporains," the publishing house of Hachette, and the numerous artistic works it has put forth of late years, receive notice. The usual half-yearly bibliography is given this month. It enumerates as many as eight new artistic periodicals published in France during the past six months.

THE *Portfolio* announces, as part of its programme for next year, that Professor Colvin will contribute an important series of articles on "Albrecht Dürer, his Teachers, and Followers," in which he will discuss the influence of contemporary engravers in Italy and Germany upon Dürer's art. As masters whose relation to Dürer is more especially to be studied, the names are mentioned of Martin Schongauer, the Master with the initials M. Z., Israhel van Meckenem, Baccio Baldini, Andrea Mantegna, Jacopo de' Barbari, the Meister W., Marc Antonio, Altdorfer, the two Behams, the other Little Masters, and Lukas Van Leyden. In his present position at Cambridge, Professor Colvin has an admirable opportunity of studying the important, but not very well known, collection of the Fitzwilliam Museum, which is extremely rich in the works of the early German masters. We believe that it is the intention of the *Portfolio* to reproduce some of the rare works in this collection, by M. Amand Durand's process—a process whereby ancient works are copied with such marvellous accuracy and delicacy as to be scarcely distinguishable from the originals. Such illustrations as this will be most useful to students, and any light that Professor Colvin may have to throw on a somewhat perplexed subject, will be extremely welcome as a contribution to the small amount of knowledge that has hitherto been gained respecting it.

In the *Zeitschrift für bildende Kunst*, Herr Anton Springer finishes his article on the Meister W., and concludes, on grounds which we cannot but deem insufficient, that this perplexing signature is only another witness of the hand of that mysterious master whom we already know under the names of Jacob Walch and Jacopo de' Barbari. Such an acceptance, however, darkens rather than enlightens previous researches, and places Dürer in the somewhat discreditable position of having copied and sold the works of a foreign master as soon as that master had left Nürnberg—a thing of which Herr Springer admits he was not likely to have been capable with regard to a fellow-countryman. The other articles of the number deal with art at the Philadelphia Exhibition; the "Latest Development of Architecture in Belgium," and the "History of Donatello," this last being an answer to certain criticisms of date and fact brought against Prof. Semper's valuable monograph on Donatello, by Dr. Albert Jansen. Besides these we have a description of the new Theatre at Bayreuth, built for the Wagner performances, and a good etching by Unger from Lenbach's portrait of Wagner, which will doubtless be interesting to enthusiasts for the "music of the future," and to that master's admirers. The other illustration is a somewhat poor etching from a landscape by Ant. Zwengauer in the Leipzig Museum.

THE STAGE.

M. SARCEY'S "COMÉDIENS."

Première Série de *Comédiens et Comédiennes*. Notices Biographiques par Francisque Sarcey. Portraits gravés à l'eau-forte par Léon Gaucherel. (Paris: Librairie des Bibliophiles, 1876.)

THE better French theatres are institutions of sufficient permanence to have had their

histories written. The position of the Stage itself has always been an assured one in France. We noticed, a year or two ago, a volume styled *Le Théâtre Français sous Louis Quatorze*, the work of M. Eugène Despois, a writer who was always conscientious, though never brilliant. The Odéon has since that time received its due chronicle; and one or two of the theatres which do not enjoy a State subvention and the assured permanence which that implies have, nevertheless, been long enough true to their traditions to deserve a history in their turn. The Vaudeville—by which of course we include, not alone the recently built playhouse at the corner of the Chaussée d'Antin, but the parent-house, which was pulled down some eight years since, on the Place de la Bourse—has not indeed for very many years held much by the form of entertainment which originally gave it its name, but a certain unity in the kind of pieces performed there—steadiness to a scheme more or less taken for granted by the Paris public—entitles it, too, to rank as an institution. And what is somewhat true of the Vaudeville is truer of the Gymnase, where M. Montigny has adhered to the same kind of programme for now about a quarter of a century. There were days when even the Porte Saint-Martin and the Ambigu could likewise have claimed their consecutive chronicle.

How different all this is from anything that we have in London, no London playgoer needs to be told. In the main, indeed, the Haymarket has been true to English comedy, but it has not encouraged a school; it has displayed one or two favourite actors—the rest by no means on the same level of importance—and once or twice the favourite actor has had no pretensions to be a competent performer of what should be the repertory of an English comedian, but has relied on eccentric successes repeated until the number of nights he had performed one part became in itself an advertisement by which people were drawn to see for the hundredth time the same old story. Two theatres of much more recent establishment, the Prince of Wales's and the London Vaudeville appear to be making some traditions for themselves, but these, it is to be feared, hang somewhat too much on the presence of a particular actor or actress, and neither theatre has been open a dozen years. Some traditions of a theatre, and with them some reasonable expectations of performances of intellectual interest, and of a given kind, may be gathered about the Lyceum; but such permanence as can in England be gained by one class of performance must after all depend greatly either upon an actor able to lead or a manager able to direct. There is wanting, necessarily, that guarantee which is given in France by a well-disposed subsidy; and there is wanting also that other given in France by the steadiness of the public taste. Theatrical fashions come and go in Paris, of course, as they do in London; but above the fashions of the day there is the permanent demand caused by a people's genuine and intellectual interest in the stage; so that at no time in the history of the French people, since theatres were founded, has the work of the highest actor

been wasted work; and at no time has the best imaginative writer of the day had cause to feel that in the novel or the poem rather than in the drama lay his chance.

It is by no means a history of the Comédie Française that M. Sarcey has undertaken to write in the work of which the earlier numbers lie before us. In the first number, the *Maison de Molière*, he has but prefixed to the literary and artistic portraits and histories which succeed a quite popular sketch of the constitution of the Théâtre Français—a constitution which, by the by, it is very difficult to precisely define: the exact amount of check which either the members of the society or the Government of the day can place on the proceedings of the manager having perhaps never been finally tested. The whole management is an affair of compromise, but this at least may be broadly said—that the director who produces good plays, and, aided by his subsidy, can make them pay, has things practically very much as he wills. The value of *Comédiens et Comédiennes* is not in its brief sketch of "the House of Molière," nor in its literary appreciations, which are but incidental, of the brilliant work there produced, but in the history and the estimate of the important members of the Society of the Théâtre Français.

M. Sarcey's gifts for this kind of labour are great and exceptional, apart from the accidental circumstance that through the medium of a powerful paper he has been able so far to impress Parisians with the importance of his judgments that the first question asked by many an intelligent playgoer, after a new piece, is not "What say the critics?" but "What does Sarcey say?" Sarcey's negative qualifications for the accurate estimate of actor, actress, or piece, are almost as important as his positive. He is not a critic who has only learnt from books and who brings to his criticism on what is meant to be the representation of life the experience not of life but of the study. When there is nothing concrete to discuss, he likes, indeed, to wander into abstract questions, and for these moments of enforced emptiness he keeps a "theory" as Mr. Dick kept a "memorial." And the theory is wont to crop up in August or September, when theatres are dull. But in the main he is not a bookworm. Again, he is not, above all things, a humourist, occupied with the task of proving to his readers that there is no moment in which he cannot be funny, whatever piece or performer may wait in vain with the expectation of steady judgment. And, lastly, unlike the best known perhaps of his immediate predecessors—M. Jules Janin—he has never made it his one business to say pretty things that the idler should find readable, and the wisest untrue. The cobbler has stuck to his last; the critic to his criticism.

Thus far, in *Comédiens et Comédiennes* M. Sarcey has discussed Regnier, Got, Sophie Croizette, Sarah Bernhardt, Coquelin, Madeleine Brohan, and Bressant—a fair selection, giving comment on some of those whose authority and charm for the playgoer were greatest a dozen years since, and on some of those who were never before so much esteemed as they are esteemed to-day.

The various estimates of these performers show the width of his appreciation—a width and liberality never the result of indifference or of the absence of well defined opinion—and it makes plain also, though in a less degree than his journalistic criticism, that hardly the best critic can be without some prepossession, some leaning in favour, not indeed of a particular actor, but of a particular school of theatrical work. We pointed out, a month or two ago, in words that were at all events plain, in what direction M. Sarcey's own prepossessions lay, and that it would be a mistake for any student of the theatre to imagine that the love of French legitimate tragedy was at all generally and seriously revived, because the authoritative critic desired that that should be, or because one actress had turned out to be a genius, with the inevitable influence of genius over the public. But in the estimate of talent actually before him, M. Sarcey's prepossessions have not had much evil effect. He has recognised power wherever it was to be seen. Being without exclusive devotion to the theatre, he is yet enthusiastic enough to admire warmly wherever admiration is due. He has not sought to gain weight by having recourse to reticence, nor shown the virtue of moderation by the pale praise of great things. Distinct and severe in his condemnation of incapacity, he can be genial to small talents and humble beginnings, and if he can crush a manager's favourite and exalt his own importance in his famous *mot*, "They put her everywhere: she pleases me nowhere," he can think a forgotten *vaudeville* not beneath notice, and the warmest eulogist of tragedy and Sarah Bernhardt is by no means the least sympathetic listener to the wit of Meilhac and Halévy and the jokes of the Palais Royal.

As for the portraits that accompany his text, and will make for the English playgoer much of the interest of the publication, they are, with hardly an exception, spirited and characteristic. Each actor is portrayed, not only in a part and a famous part, but in a part that is typical. All the *finesse* of Regnier, and that under-current of gravity below humour which is marked so strongly in the face of Molière himself, is in the little portrait of the *ex-doyen* of the Théâtre Français in *La Joie fait Peur*. The half-insolent independence of Croizette is in her portrait in the *Sphinx*. Got's large humour is in *Maitre Pathelin*; something of the reverie which seemed to be Sarah Bernhardt's chief gift until *Chez l'Avocat* showed us the bright side of her art, and *Rome Vaincue* its passion of affection, is in the tiny etching of that artist as "the daughter of Roland." Nor are less noticeable characteristics to be found in the portraits of Coquelin and Bressant. M. Jouaust, the celebrated printer, whose work in printing is, in its own way, a work of art, has done a good thing in undertaking the publication of this series; and the book will continue to have value.

FREDERICK WEDMORE.

STAGE NOTES.

MORNING performances have taken away a part of the characteristics of Boxing Night. School-boys and the populace go to the theatre, but the children are mostly absent. Not to speak of the

morning representations at the larger theatres, there is this year, at the Adelphi, a pantomime played by children, for children, and only in the afternoon. Drury Lane holds its own with a holiday audience, Mr. Blanchard's "opening" and Mr. Beverley's scenery having long been traditions at the theatre. Covent Garden, of late years, has shown itself an active rival; and it would require a child—the best judge of a pantomime—to be both very clever and very *blasé* to choose between *The Forty Thieves* at the one house and *Robinson Crusoe* at the other. The child endowed with old-fashioned reverence for old-fashioned tales would, indeed, pronounce in favour of the piece Mr. Blanchard has worked upon, for Mr. Blanchard is always a simple and faithful though withal an ingenious interpreter, while the lover of old friends with new faces would see more that is new in the version of the novel of De Foe given in Bow Street. For grown-up children there is *The Invisible Prince*—a third revival of a graceful work by Mr. Planché, now produced to exhibit the popular talent of Miss Jennie Lee. The outlying theatres have their pantomimes for suburban audiences. The Alhambra has got *Fledermaus*, with the music of the great Viennese master of dance music. And all these things are popular, because everything is popular at Christmas. A few weeks later the public makes its choice, and about the middle of February one can say which has been the best of the pantomimes.

LATE last week Miss Kate Santley opened the Royalty Theatre with Offenbach's *Orphée aux Enfers*.

At the Gaiety Mr. Reece has brought out a burlesque called *William Tell Told Again*—a vehicle for the jokes of Mr. Toole and the oddities of Mr. Collette.

Dorothy's Stratagem, a plaintive little piece, fitly preceding the bustle and laughter of the adaptation from Meilhac and Halévy, has just been brought out at the Criterion. Mr. Mortimer is the author. We shall probably speak of the little play more fully in our next issue.

MR. GEORGE M'DONALD's children, a numerous *corps dramatique* in themselves, are giving a series of juvenile performances, acting charades, stories, and proverbs, at the Town Hall, Bournemouth.

MUSIC.

MESSRS. NOVELLO AND Co. announce that from January 1 proximo the *Musical Times*, one of the oldest and best of our exclusively musical papers, will be enlarged to forty-eight pages monthly. The general scope of the journal will also be enlarged, and it will include foreign items of news, as well as reviews of important works published on the Continent.

THE date of the inauguration of the monument of Auber in Paris is definitely fixed for January 29, the anniversary of the composer's birth. Special representations will be given on that day both at the Opera and the Opéra-Comique.

SCHUMANN's third symphony (the "Rhenish," in E flat) was produced for the first time at the Concerts du Conservatoire on Sunday week. Excepting the Scherzo, the work appears to have been not very warmly received; the music, indeed, is of a character which requires frequent hearing for its full appreciation. At the same concert Mendelssohn's 98th Psalm (a work which some of our choral societies would do well to revive) formed part of the programme. On the same day the late Félicien David's ode-symphony *Le Désert* was performed in honour of the memory of the composer, both at the Concerts Populaires, under M. Pasdeloup, and at the Concerts du Châtelet, under M. Colonne.

THE King of the Belgians has just presented to the Royal Conservatoire at Brussels a very fine collection of all the musical instruments in use in

India, which has been sent him by the Rajah Sourindra of Fagore. The collection is divided into eight classes:—(1) instruments played with a bow; (2) instruments played with a plectrum; (3) wind instruments of the horn family; (4) reed instruments; (5) instruments employed in religious ceremonies—among these are found large trumpets, of the shape of a serpent, which were used to drown by their noise the cries of widows burned in the suttees; (6) pastoral instruments (double flutes, &c.); (7) tambourines, gongs, and various kinds of drums; (8) a set of conches; in all ninety-eight most remarkable specimens.

A NEW *Revue Musicale* is announced to be published at Constantinople, which is to contain especially pieces composed by the amateurs of the Turkish Empire. The work is likely, we should think, to be a musical curiosity.

At the first concert of the Brussels Conservatoire, on the 24th inst., the entire second act of Spontini's *La Vestale* formed the greater part of the programme. The principal solo parts were sung by Mlle. Battu and M. Sylva.

At Mayence Handel's *Solomon* was given by the Liedertafel at their first concert, on the 8th inst., under the direction of Capellmeister Lux.

FRAULEIN HAUPT, who took part last summer in the Bayreuth performances, has married Herr Unger (the Siegfried on the same occasion), and is retiring altogether from the stage.

TSCHAIKOWSKY's new prize opera, *Valka the Smith*, was given with success at St. Petersburg on the 6th inst.
